

**Management  
Information Systems.**

**Is this the  
impossible dream?**

Or just an  
impossible approach?

## Management Information Systems.

### The MIS.

Perhaps no computer-oriented cc has offered such vast potential for operational control, reductions in the creation of major competitive advantages for any business ente as does the MIS.

And yet, today, as many data proc installations reach points of dimin returns, with rising costs as the ru the successful achievement of ob the exception; and when continu conversion and redesign seem a v life, the MIS is falling into disfavor

It's spoken of as the hopeless obj Viewed as "the impossible dream Cincom Systems believes that the *not* the impossible dream.

The necessary hardware and soft products *are* available today.

A few organizations are utilizing th tools properly. A few are achieving Information Systems goals. And r frustrations are the result of attem reach MIS objectives with an impc *approach* . . .

At Cincom Systems, we believe th successful implementation of info systems depends on a sound four

And we believe this foundation is base itself. It must be properly ma maintained and controlled. It mus common, current, non-redundant repository of data. It should confo the general design philosophies s for data base management system such leading groups as CODASYL GUIDE and SHARE.

We further believe that this data b approach must be made available size users, large and intermediate Large corporations frequently hav divisions with small and intermedi installations. And, many times, sm intermediate installations grow int complexes. For this reason, the ap must be consistent and capable o adjusting both upwards and dow

The data base itself must be readi available to any application progr

properly reflected within the data immediately. The data base and application programs must be inter yet independent of each other. data elements and associations & within the data base, there must be adverse effect on operational pro

The data base must have the ability to survive over time. It must be able to evolve responsively to changing demands within the organization

This data base must be viewed as an asset of the enterprise. And like & assets, must be protected. It must therefore, be independent of its environment. Changes in hardware, operating systems, language or processing should have little or no effect on the user. The user must be able to move from one to another in a modular evolutionary manner. Conversion, as a way of life, must be eliminated.

The data base must be protected from damaging programming, operator error. There must be provision for Dynamic Logging of Transactions to the data base. And protection from Concurrent Updating and Automatic Base Recovery and Restoration in complex situations in dynamic environments.

The system must also provide the means for increasing the productivity of personnel. And should be equally understandable and of use to all levels of staff members.

Finally, this data base system must provide efficient use of *all* hardware resources. The system should *not* demand of the user more hardware or operating overhead just to accommodate the data base approach. The continuous reduction of data processing costs must be the goal.

Cincom Systems is convinced of these "musts." And with this conviction, we have developed the TOTAL Data Base Management System. TOTAL provides for all the foregoing requirements plus many other equally essential data base considerations. For these reasons, TOTAL has become the most widely and successfully used system of its type in the world.

TOTAL users are leaders in manufacturing, education, utility, distribution, insurance and banking industries and a few. Frankly, they are at the forefront.

the technology. For them, the impossible dream. For them, the proper approach, with TOTAL as Data Base Management tool. It is an approach which makes successful Management Information Systems profitable and rewarding reality.

Just as Don Quixote had his quest, Cincom has as its mission to bring every user, regardless of size, the ingredients for success. If you are Data Base or Management Information Systems; or if you would like to improve the results or performance of current systems; or eliminate a lot of current management headaches, or just curious — we invite you to investigate TOTAL.

You may save yourself a lot of expensive jousts with windmills.

*We would welcome the opportunity of discussing TOTAL with you and revealing its potential for successful implementation within the specific design requirements of your firm. Simply write or call Cincom Systems, Inc., 2181 Victory Parkway, Cincinnati, Ohio 45206. 513/961-1111.*

**Cincom Systems Inc. We create efficiency.**
