SUBJECT MODULE ALLOCATION

TO Harlan E. Anderson

FROM L. Rittner

In my opinion, the incorrect module mix is being produced. With a decreasing backlog, decreasing sales, increasing production rate and increasing finished goods inventory, either units available in inventory are not being shipped (a real possibility) or the mix of modules is not in balance.

The reasons for this are not entirely clear. However, some of the contributing reasons are in the goal being set at a total number of units per month, the reconversion from actual requirements to job lot sizes, and the "filling-in-jobs" when the modules of high priorty cannot be worked on because of materials or construction problems.

Requirements for the month of June (or overdue before June) numbered roughly 7500 units. Actual production is about 11,000 units. Yet there still remains the problem of shortages on many units.

We should decrease the job lot size of rarely used modules. If we have a requirement of 3, and little usage throughout the year, a sum of 10 rather than 30 may be sufficient. Also, if we must process low or no priorty items, let us do it with high usage modules that will develop requirements in the future.

Perhaps we should even re-load our manpower capability and material availability to build, as 7000 of the perhaps inefficiently correct mix is more beneficial than 11,000 of the wrong mix. We cannot build for requirement only, as we must consider long range plans, but a more concise balance between actual requirements and production of specific units is needed.

We have been very conscientious in using the DEC Dining Room only for business purposes. Since we have taken only business guests, this cannot be considered a form of extra income to the individuals who use the restaurant. However, we do not have any records to prove that we use the Dining Room only for business purposes, and that it is not a place where we give free meals to certain people within the company.

We should keep these records and so we will have to insist that everyone who uses the restaurant notify my secretary or Andy's secretary that they will be using the restaurant and who their guests will be. At the end of the month, the secretaries will match these records with the signed slips from the restaurant. We would like to encourage you to be conscientious about this practice because, to make the records meaningful, they are going to have to be complete.

DATE June 28, 1962

SUBJECT Meeting of Tuesday, June 26th, to discuss future computer development at DEC.

TO

K. Olsen
H. Anderson
H. Morse
A. Kotok
S. Piner
E. Fredkin
M. Gretz
J. Koudela
R. Doane
A. Blumenthal
G. Bell

FROM Bob Savell

The question under discussion was, "Should we build a new machine, and if so what sort of machine should it be?"

It was agreed that we should make the decision not on the basis of what the competition is doing, but on whether we can offer something new and different. Price probably is not of much concern. However, the new machine must be really new and significantly different from anything else in the field, because it is in building equipment that is really new and different that DEC stands out and can make a significantly greater profit than if we are building to compete.

Some discussion was held about the type of clientele and type of business that we should go after, one suggestion being that we might go after the business end of the computer business. Gordon Bell suggested possibly a 1401 type machine with lots of IO gear. Fredkin's comment on this was that he felt it would tend to discourage good people from working at DEC, because this sort of business would be really competitive. The conclusion was that unless someone has a special interest in business data processing we will not try to enter the field.

Large scale 7090 like machines were discussed and the conclusion reached that we would not like to build machines on this scale for many reasons. One is that customers for such large systems are few and far between and they require much sales effort.

The Character oriented machines, such as the Burroughs B-5000, were discussed. There was no definite feeling generated that DEC should build a machine of this sort. The B-5000 is an soft-ware oriented machine, and when one buys a machine of this sort one is buying an entire system rather than just a computer. It was felt that DEC now has in PDP-1 a simple straight-forward machine and that there is much to be said for keeping any computer that we build simple and straight-forward.

John Koudela was pushing for a powerful arithmetic element, also for a longer word length. He felt that the things that people have most asked for are longer word length, index registers, and built-in floating point. The chief objector to this was Ed. Fredkin who is

quite convenienced that five years from now the largest use of computers is not going to be for doing arithmetic primarily, but for doing more routine processing of data.

Ben Gurley inquired whether the group felt there would be a market for a PDP-1D, an improved engineering model of the PDP-1C, possible a smaller or lower cost version, easier to manufacture but other than that identical to the present PDP-1. The general consensus was that we should not devote engineering time to this kind of machine. Ben also brought out the point, in reply to John Koudela's arguments, that machines such as John described with somewhat longer word lengths, 24 bits or so, and with index registers and built=in floating point now exist but they are apparently not selling very well. Ben wondered why. He brought up the example of a machine built by ASI with a 24-bit word length and 2 microsecond memory as an example. The general consensus was that this machine is sort of a "kludge", and that is the reason that it is not selling.

We discussed peripheral equipment very briefly, mainly magnetic tape units, and reached the conclusion that most customers that have bought tapes from us are using them not for storage but to communicate with other machines, and therefore compatability is indeed a prime requirement for any tape system we build. One other suggestion by Gordon Bell was that we build a Jack Brown type Tape Unit. This is a cartridge tape unit with 20 track serial recording, approximately 1000 bits per inch. It would have low access time, simpler mechanics and electronics. Nothing definite was decided to whether we would go ahead on anything of this sort.

I think Ed Fredkin generated themost interest with his suggestion that we should build plug-in processors and plug-in memory modules that will truly allow people to expand their memories up to very large capacities and to plug in extra processors as more computing power is needed. He is talking about ultimate capabilities of millions of instructions per second executed on a number of processors each of which may be capable of doing only 200,000 or so instructions per second.

He proposed a machine using delay lines for storage with a possible delay time of say 15 microseconds with a storage capability of about 500 bits. In this machine all registers with the exception of memory buffer and memory address would be eliminated and storage would be accomplished within the delay lines themselves. Transferring bits from one register to another would be accomplished in external flip-flops and would require very little time in most cases since the registers would be stored in the delay line in an inter-leaved fashion. ie: bit 0 of pc, bit 0 of io, bit 0 of ac, bit 1 of pc, bit 1 of ac, bit 1 of io etc. Ed feels that the cost of building a machine like this would be lower than for a comparable built with our present techniques, however, we are not all convinced of this.

He feels that the computing center of the future will be comprised of large machines of this sort, that have a huge memory available so that all routines may be stored permanently with many users running programs simultaneously on their separate processor. There would be no splitting of programs so that part of one program would run on one processor and another part on another processor, just many users each running single programs on a lot of separate processors. These processors would be simple devices without built in high-speed multiply and floating point, etc. One argument against this is that lots of this large memory would be used up at a great rate for storing tables that would be necessary without the high speed features built into the hardware. Ed also feels that a considerable amount of computer time is spent

today in programming and that if each programmer had his own central processor available he would be much more efficient.

In conclusion the one thing that we all seemed to agree upon was that DEC, if it is going to maintain its place in the computer field must indeed build a new machine within the next few years, and that it must be completely new and different from machines that other people are building.

June 28, 1962

Plant Security - Identification Badges

L. Prentice

Bob Lassen

The following are some suggestions and comments regarding Identification Badges:

1. The badge system will never be completely successful until official company exit/entrances are established. All other entrances should be closed off to prevent people from entering or leaving the plant unofficially.

2. A trained receptionist should be assigned at each exit/entrance The receptionist should be responsible for issuing badges to Visitors, Contract Workers and DEC Employees who forget their permanent badge. Badges should be issued on a sign in, sign out basis - the company register is currently being used for this purpose.

3. Normally Visitor and Contract Worker badges should be issued on a daily basis however, there will be cases where it will be more practical to allow certain visitors and contract workers to keep their badges during extended stays with the company. This could be handled at the discretion of the "host" department head and he will assume responsibility for the badge.

4. We also have a few "permanent" contract workers who should be allowed to keep their badge at all times. Perhaps this badge would contain the person's name.

5. The Personnel Office should have the responsibility for all original badge issues and maintaining appropriate records. This would include ordering new badges, original issuing of badges to employees or receptionists (including temporary badges to newly inducted employees).

6. Enforcement of the system is the responsibility of: the receptionists (for people entering or leaving the plant), the supervisor (for people who may have slipped through unnoticed), the Personnel Office (for people who continuously forget or lose their badge) and the Plant Security Officer who should have the overall supervision of the system.

The system is now in operation and appears to be working reasonably well. If we tighten up some of the areas mentioned above, we should wind up with a good identification security system. It is my observation that our people are taking the system more seriously.

I suggest we meet in the near future to discuss our badge system. It is possible that others have strong feelings on the subject and they might wish to take part in such a meeting.

SUBJECT LRL Shipment

TO Ken Olsen
Harlan Anderson
Stan Olsen
Ben Gurley
Bob Savell
Nick Mazzarese
Gordon Bell
Al Blumenthal
Ken Fitzgerald

FROM Bob Beckman

Attached is a copy of the shipping list for the LRL system and a picture of the system ready for shipment just before the movers picked it up. I don't think that there is any doubt but that this is the best job we've done yet in preparing a large system for shipment. There is no reason why all future shipments can't be as good or better.

Ken Fitzgerald has worked up a set of procedures for preparing a system for shipment. The actual work in preparing the LRL shipment closely approximated these proposed procedures. Definite written procedures of this nature can go a long way toward insuring the quality and appearance of future shipments, and at the same time will help to reduce the cost and time required.

INTEROFFICE MEMORANDUM

DATE 6/21/62

SUBJECT

TO H. Anderson FROM P. Bonner

Mr. Glantz, VO2-6200, Ext. 2286, of ITEK called today inquiring about your quote to them of 5 February 1962. I promised him that you would return his call on 6/21/62.

His purpose in calling was to state that currently ITEK doesn't have enough money to purchase a 16 Channel Sequence Break System, however, they want one and they do intend to purchase one. ITEK is interested in either purchasing a one channel Sequence Break System now and exchanging it later for a 16 Channel Sequence Break System; or, as an alternative, they propose to rent a 16 Channel Sequence Break System and pay for it at some future date next year when money is available. This would immediately give them what they ultimately want. However, by "going the one channel Sequence Break System route first" they wondered about applying the $1,800. against the 16 Channel Sequence Break System.

Also, Mr. Glantz wanted a further explanation of what would be housed in the extra cabinets on Item 6. I told him, unofficially, I thought Items 3 and 7 would be housed here and for final clarification it would be best for him to speak with you.

I believe Jim Myers has the ITEK file.

dec INTEROFFICE MEMORANDUM

DATE June 21, 1962

SUBJECT Minutes of DECUS Executive Board Meeting on Friday, June 15, 1962

TO Ken Olsen
Harlan Anderson ✓
Stan Olsen

FROM Elsa Newman

Present:

C. Walter, Presiding
J. Koudela
E. Fredkin
L. Buckland
E. Cronin
E. Newman (Proxy for William Fletcher)

Summary:

The following is a digest of action taken and items discussed:

1. Candidates Nominated for Offices:

A Slate of Nominees was agreed upon for offices of DECUS for the term beginning September, 1962. Voting will be by mail and results announced in next DECUSCOPE. Elected candidates will take office at the Annual Meeting. (See ballot for names of nominees.)

2. Annual Meeting:

The exact date of the Annual Meeting has not been fixed. The invitation from Mr. C. Walter in behalf of the Cambridge Research Center as Hanscom Field was extended. The Board expressed hope that an invitation from the West Coast might be forthcoming.

3. Revision of By-laws:

The Board is considering revision to existing by-laws on nominations and voting. Provision will also have to be made to permit individual memberships to vote if such a member is authorized by an installation member not wishing to exercise its installation voting rights.

4. Ballot for New Officers:

Elsa will send out ballot, invitations for papers, etc.

5. New Member Welcomed:

Accepted Individual Membership of:

George A. Paquette
United Aircraft Corporation
Research Laboratories
East Hartford 8, Connecticut

6. DECAL:

A brief discussion of documentation of DECAL followed the request of Mr. William Fletcher put to Elsa per phone conversation of June 14. Comment that MACRO was not relocatable was discussed. No conclusions were drawn.

Subject: Meeting to Discuss Memory Production Control

Attendees: R. Hughes
J. Meyers
L. Rittner
J. Smith

It should be possible to quote accurate inviolable delivery dates on Type 12 Memory Modules. Control should also be close enough such that midnight requisitions out of the stockroom are not possible - irregardless of the rank of the requisitioners.

The purpose of this meeting is to set up a procedure whereby one individual will have complete control of memory module production and distribution.

Date: Wednesday, June 20
Time: 1:30 pm
Place: my office

Nick Mazzarese

cc: H. Andersen
B. Gurley
S. Olsen

INTEROFFICE MEMORANDUM

DATE May 16th, 1962

SUBJECT Module Control

TO Harlan E. Anderson

FROM Len Rittner

This is to note some thoughts we discussed yesterday on the module control problem.

1. To obtain accurate consistent information, to eliminate duplicate records and to establish controls and communications not presently available, we have initiated a mechanization of the Finished Goods status.

   a. A master deck of title cards is now available.

   b. A physical inventory has been taken and a stock status will be available in a few days.

   c. Allocation, reserve and in process information is being programmed and a complete stock status summary will be running in a few weeks.

   d. This system will be a prototype and can easily be adapted to pick up the raw materials inventory at a later date.

2. The module comptroller's position should be strengthened with ground rules from management on a percentage allocation for each product line or on a customer priority basis. Based on where the company wants delivery emphasis to be placed, the daily allocation of modules becomes consistent in the overall emphasis pattern. Without exception only the comptroller should allocate the individual modules.

3. Our present projections, both sales and production are probably optimistic. An obtainable projection should be set, approved each month and carefully adhered to. These become sales goals and manufacturing quotas.

   The quotas are broken down to a daily rate and strictly complied with. These rates are tightly tied into the labor and machine loading for each manufacturing operation. The schedule and the load must be completely interrelated.

4. The limits and budget for the inventories must be carefully explored. This is true of not only the module finished goods inventory but must be exploded out into the work in process and raw material inventory.

The G. E. method of inventory management should be utilized here. In any normal inventory, a relatively small number of items makes up the large amount of dollars in the inventory. The inventory is classified not by kind of item, but by dollars. By very careful control and scheduling of the relatively few high dollar items, inventory

investment is kept at a minimum consistent with the company's goals.

Stan Olsen

FROM Kenneth H. Olsen

It was formally decided on June 13th to discontinue all work on DECAL. As far as we can tell, DECAL makes a poor assembler and does not operate as a compiler. Everyone agrees that we can spend money indefinitely on improving DECAL, but no one dares express an opinion as to when it will be useful and no one even knows who would use it if it were done.

It has further been decided that we will, with all haste, do a bang-up job of publishing a complete description of MACRO. We will then ignore all other assemblers and compilers other than MACRO and all our programs, including all those which we distribute, will be in MACRO.

It has also been decided that we will no longer distribute copies of DECUS programs to DECUS members. We will limit our distribution of programs to a copy of MACRO and those maintenance programs which are useful. We should check all tapes before sending them out to make sure that they are nothing that will embarrass us. We should also set up the procedure so that we formally decide what we are going to send out and things are not sent out by any individual in the company who feels in the mood to do so.

Kenneth H. Olsen

INTEROFFICE MEMORANDUM

SUBJECT Progress Report

TO Harlan Anderson

FROM Len Rittner

1. An introduction to the A,B,C inventory management theory was given to the Production Control people. Our raw materials inventory proved to follow a classic pattern. In a study I made, I found that 12 items (1% of all items) equaled 34% of all the dollars. Twenty-nine items (less than 2½%) of the items equaled 50% of all the dollars. By carefully controlling these few items, half of the inventory can be regulated.

2. An analysis into conversion of actual requirements to production job lots showed that we cannot use total modules produced per month against requirements for a break-even point of production equaling sales. Hundreds of units go into stores and have no present requirements. This is because requirements are converted into production lots, and these lots may be considerably more than the actual present needs. We are therefore building an inventory of modules even before many of our requirements have been met. As of the end of May, we had approximately 6,000 module units in finished goods inventory.

3. While 4495 modules have already been completed this month through June 12, my estimate is that only 10,000 units will be built this month as I see a descending trend developing.

4. Delivery dates should be assigned to all manufacturing job lots. This, in turn, will require manpower and facilities loads for each operation in order to arrive at the delivery date. I feel that this is a necessary immediate step that must be taken which will have far reaching effects on not only our deliveries, but also our whole concept of manpower planning.

5. We need better communications on the whole allocation problem between Sales and Production. One method may be periodic meetings to discuss the problem and update information. Another is the assignment of delivery dates as outlined above. Still another is to clearly assign the control and allocation of modules to one area. The physical finished goods inventory itself as well as shipping should be combined with receiving and production stores for consistency and savings of manpower and facilities.

SUBJECT INTERRUPTION IN THE MANUFACTURING PROCESS

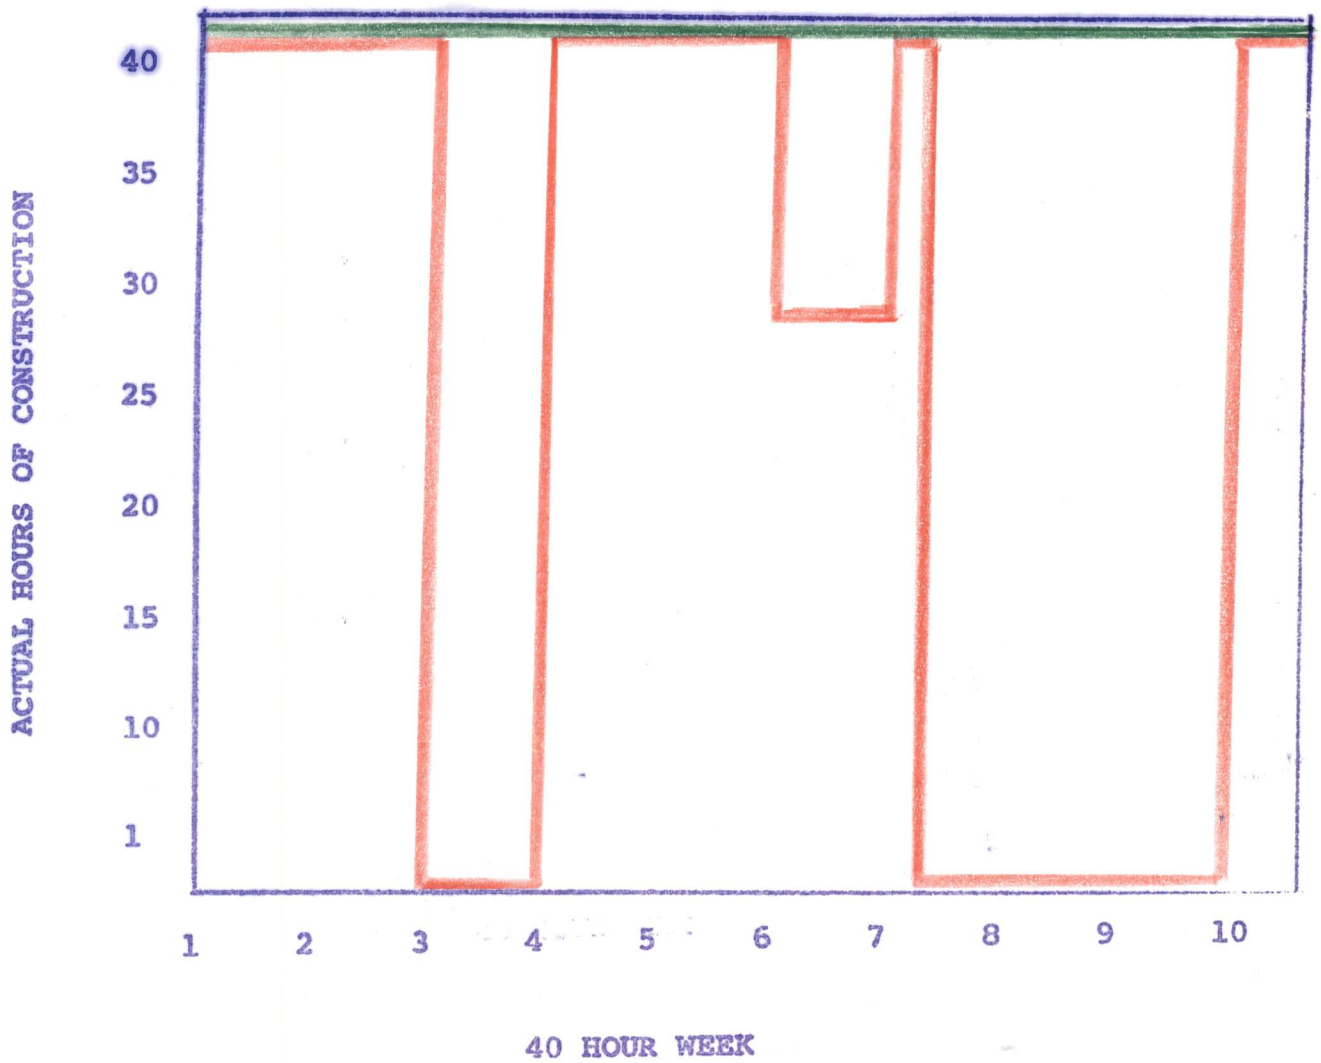
TO

K. Olsen
H. Anderson
M. Sandler
B. Gurley

FROM Jack Smith

Although our present schedule for delivery of Computers to Checkout is progressing satisfactorily, three weeks ago I felt it necessary to investigate the length of time it took to process a Computer from start to finish. I found that the complete process time up to the beginning of Checkout was approximately 9 weeks. This length of time is satisfactory at the present time because we do have the lead time. In the future such a long lead time may not be practical to our operation. This fact coupled with the fact that the cycle time should be reduced to shorten work in process time induced me to plot some rather interesting graphs.

I started with the assumption that once a Computer is started it should be worked on without interruption until completion. At all times some operation of the Manufacturing Process should be undergoing construction. Any interruption in the process increases work in process time and of course endangers the delivery date. I felt quite sure that the interruptions of the process were of a similar nature for each system. To find the areas of interruption, I used the attached graph plotting actual working hours of contruction per week against a standard work week.



ACTUAL HOURS OF CONSTRUCTION
40
35
30
25
20
15
10
1
1
2

8
9
10
40 HOUR WEEK

The ideal plot of course would be a straight line across the graph denoting the utilization of 40 hours of process time per week, green plot. In almost all cases, I plotted seven systems, there seemed to be the same areas of interruption. These interruption areas are denoted by the red plot. There were of course minor interruptions but I have only denoted the major areas. The interruption between the third and fourth week was investigated and I found that it was due to an insufficient number of inspection people to ring out machines. In each case a machine would have to wait until inspection people were available. A second inspection team is now being trained to increase this capability.

The second interruption area was found to be between the sixth and seventh weeks during final construction. This was being caused by the shortage of operation control circuits. The problem was lack of a set procedure for ordering these special circuits. A procedure has been written and put into operation.

Our third and most drastic interruption area was found to be at the very end of the process. This was due to non-availability of Readers, Punches and Typewriters. I have since taken over responsibility of this area and have set up procedures to eliminate the problem.

These interruption areas have of course been suspected for some time. A graph of this type brings them out somewhat more drastically and can also point out hidden areas of interruption.

It can be readily seen that the elimination of these interruption areas of the Manufacturing Process will greatly reduce the work in process time. Similar investigations are being plotted for Mag. Tape and Display construction.

SUBJECT Huston Fearless Building

TO Kenneth H. Olsen

FROM Loren Prentice

The plant consists of an L shaped brick building, the street side of the building is approximately 200 x 60 feet. The wing is approximately 160 x 60 feet, (wing has four floors). There is a boiler house on the south side of the wing, at the extreme distance from the street, and a new extension has been added between the wing and the boiler house, and a new area for offices, shipping and receiving. This area is judged to be approximately 40 x 80 feet, three stories high. This is on the northern end of the larger building and faces the street.

The main buildings were probably built prior to World War I, are brick and wood beam construction. The first floors are concrete, the other floors, or at least those that were visable were three inch pine plank. The new section at the north en d of the building, three stories high, is brick faced on the street side and is made of cinder block. The new sections of the building were probably built about 1945. The windows in the old building are wood and appear to be in reasonably good condition and have recently been painted. Windows in the new section are steel sash. There is a new section between the wing on the west side of the building and the old boiler house. This appears to be used for shops.

The boiler house has three boilers, two old , about 1928 to 1934, originally coal fired - now converted to oil, estimated 125 to 150 horsepower fire tube boilers. A new boiler approximately 1940 to 1950 is oil fired water tube, 150 to 200 horsepower. The main electrical power is brought in at the convergence of the two sections of the main building. Three transformers not over 2,000 amp a 220 v 3 PH.

The headroom in the main building on the first floor is approximately 12 feet. The first floors are concrete. The second and third floors appear to have nearly the same headroom but the fourth floor perhaps only 8 feet. The plant is served by a railroad siding, originally for at least bringing in coal for the boiler.

The plot area at the plant is small, somewhere in the vicinity of 3 to 5 acres and parking would be critical here. I believe that it would be difficult to get in more than 80 to 100 cars. This would require filling in a sump and removing the cooling tower which was apparently needed by the boilers at one time, (probably not needed now as the boilers are probably now only used for heating. Floor area is estimated at 1,000,800 square feet.

The main drawbacks to the plant site and area is that there is lack of expansion space around the plant and too large a floor space. The receiving and shipping area is rather small and somewhat difficult. I believe a large tractor trailer truck would hang well out into the street when it is being loaded and unloaded. Electric power into the plant appears to be inadequate even for present use.

This is very sketchy as we did not enter any section of the plant and only drove into the rear side to observe what we could through windows. We do not have a clear picture of the extent of the plant site, as there is no way to clearly define its boundaries.

SUBJECT Accounts Payable

TO Harlan Anderson
Richard Mills

FROM Henry Crouse

The enclosed list concerns those invoices the Purchasing Department is withholding for payment and the reasons for withholding.

Each and every invoice withheld has had correspondence from Purchasing to the vendor requesting additional information or proof of shipment. Continuous follow-up and effort has been applied to minimize total dollars withheld.

In order to reduce the figures enclosed I suggest a review of general policy regarding authorization and its' limitations.

1 Enclosure

cc: Alma Pontz
Bob Dill

INTEROFFICE MEMORANDUM

DATE 6/8/62

SUBJECT Geotechnical Corporation

TO H. E. Anderson FROM Bob Beckman

I was glad to hear that Dave MacKenzie was happy with what Jack Shields and Don Sordillo did while they were there. I agree with the idea of checking with the customers and have already done some of this.

We've already started work on more and better write-ups for maintenance routines. I'll see that Dave gets Type ECHO and a few other things that are on hand presently, and they are already on our distribution list for this material as it becomes available.

The problem of what to do when reshipping a machine is something that will come up more and more often. I'll work up a set of instructions and recommendations to solve Dave's problem in this respect and while I'm at it, put it in reproducable form so that it will be available in the future. I'll also get together with Dave and make arrangements for one of our field maintenance people and Jim Burley to be in on the installation at the final site.

Finally, I think all our double precision programs are in DECAL, but I'll see what we can do for him in this area too.

6/11/62

P. S. I've been in contact with Dave about their current troubles. If necessary, someone will be going out to help them tomorrow or the next day.

Ken Olsen
Harlan Anderson
Stan Olsen
Dick Best
Jon Fadiman
Ben Gurley
Nick Mazzarese
Jim Myers
Ken Fitzgerald

FROM

Bob Hughes

System checkout sheets must be signed off before systems can be shipped out. These sheets are supposed to include voltage margins for all mounting panels in a given system; a place for the mechanical inspector to sign them off; a place for the electrical inspector to sign them off; then they are supposed to be signed by the responsible engineer, Dick Best, Maynard Sandler, and Robert Hughes.

Effective immediately, Ken Fitzgerald will not crate any systems which do not have systems checkout sheets signed by Dave Adams and Dick Gaboury.

SUBJECT Field Report on June 7th

TO H. Anderson
S. Olsen
J. Koudela

FROM E. Newman

Visits To:

1. Cambridge Research Center, Hanscom Field
2. Electron Systems Division, Air Force Systems Command
3. Itek Laboratories, Lexington
4. J. Gilmore

Purpose:

1. To discuss contributions for July DECUSCOPE and September or October DECUS technical meeting.

2. To explore reactions to Nos. 1, 2, and 3 (distributed June issue on the visit).

Results:

1. Cambridge Research Center:

   Mr. C. Walter proposed Executive Board meeting at DEC for June 15th at noon. Elsa to make arrangements and see that other Board Members are notified.

   Mr. Walter will write: "President's Message" column for July DECUSCOPE giving all DECUS unfinished business and urging support of goals.

   A program write-up may be finished in time for July or August.

2. Electronic Systems Division, Air Force Systems Command

   After long and stimulating conversation with Dr. Hayes, several good suggestions evolved.

   Dr. Hayes will write "letter to Editor" stating that more emphasis be placed on contemplated or planned ideas in DECUSCOPE rather than proven and already published papers. He would expand this he said.

Dr. Hayes gave Elsa a schedule of an announced Symposium: "The Automatic Laboratory" to be held in September. Elsa asked for SCOPETRACE tape and got it. (Beverly had also asked for it)

Ed Fredkin was expected and he joined Elsa and Dr. Hayes for lunch. Elsa confirmed DECUS Board luncheon date. Mr. Fredkin was curious about news from W. Fletcher. Elsa will follow this through.

3. ITEK Laboratories

Left DECUSCOPES for (1) Greatorex, Group (2) Earl Pughe, Group

While waiting for Earle Pughe discussed DECUSCOPE content with Miss M. Morello. In course of conversation learned J. Gilmore, Adams Associates was there.

4. John Gilmore

Very pleased, "Primate Research" paper was deleted. I could not gather what specifically was causing him concern but "note" he mailed to me that very morning and which I received today indicates that Government procurement is not yet "in the bag".

Is there any reason for this concern? Is DEC out of the picture or does delivery of our PDP depend upon Adams Assoc. getting Oregon Primate Research Center sole source contract?

dec INTEROFFICE MEMORANDUM

DATE June 7, 1962

SUBJECT Report on trip to Germany, May, 1962.

TO Ken Olsen
c.c.: Harlan Anderson
Dick Mills
Stan Olsen
Dick Best

FROM Jon Fadiman

I spent the first five and one-half days, (May 3 - May 10) installing the Automatic Core Tester, Model 2113C (EN 2164) at Standard Elektrik Lorenz AG, 42 Hellmuth Hirth Strasse, Stuttgart, Germany. The department is MS/LPR, telephone number 89521, Building 58. I spent time with the following people there: Mr. Reiner (ext. 2792), who is the person most responsible for ordering the Core Tester from us. He is in charge of the section that is doing the work on Memory Cores and Planes and is the most knowledgable person there. One of the engineers who works for him is Mr. Irmisch (ext. 3106) who is going to do much of the work on core testing. The Engineer who built the Automatic Core Handler and who is most knowledgeable about memory core testing equipment is Mr. Schneider (ext. 3927). The other people concerned with our equipment are the Quality Control group. The head of this is Mr. Vogt (ext. 2302). Under him are Mr. Templ (ext. 2728) and Mr. Poshar, (ext. 2676). Mr. Templ is the person to whom we should address all future correspondence and parts for the Memory Core Tester. He and Mr. Poshar will be responsible for the maintenance of the Core Tester.

Installation of a system in Germany takes considerably longer than the installation of a similar system in the United States. The main reason for this is that the Germans must carefully check every specification that we write down that our system will meet. Thus, there is a great deal of demonstration work to be done and many measurements to be taken. Any errors or inconsistencies in the machine or in the drawings will be quickly noticed. In general, the installation went reasonably smoothly and the machine is satisfactory except for the drift with temperature of the -10 volt Reference Level Power Supply, Model 1562. We have already sent them a new plug-in-unit which will take care of this problem. They also found out that our current drivers drift approximately 10 ma upwards after setting them to a given value. This problem has been traced to the coarse amplitude control potentiometer and new potentiometers of a lower resistance value will be sent to Standard Elektrik within two weeks. At that time, the machine will be entirely satisfactory and they will pay us for the complete machine. I had to go back to Standard Elektrik for an extra day at the very end of my trip because there was a pulse missing in the pulse train and I could not convince them over the telephone that it was correct that this pulse was missing. However, when I demonstrated it to them in person, they realized that all was in order in the machine. I expect that Standard Elektrik will be happy with our system, and I only hope that the Handler which they have built themselves will not cause them too much trouble. They are a clever group of people with very exact methods and rigorous standards. However, they do not have much experience in the Core Testing business or in the Digital field. By the way, it should be noted that

all work was done in a mixture of German and English and that it is absolutely essential to know something of the language of the country in which we are installing a system. While it is true that many of the Engineers at SEL spoke English, others spoke no English and most of the conversations were in German. (WWB-BF-TEIS).

My next stop (May 11) was at Siemens & Halske, Balanstrasse 73, Munich 8. Telephone number is 4590800. I spoke there mostly with Mr. Gis who is the person responsible for core testing and plane testing. Also at the meeting were Dr. Magner, Mr. Reinil, Mr. Maier, and Mr. Bier. Siemens definitely wishes to purchase an Automatic Core Tester and an Automatic Plane Tester from us. However, our prices are high for them in Germany, and furthermore they are apprehensive about the fact that we do not have any permanent servicing organization in Europe. In spite of this, I think that the chances of selling at least one and probably two systems to Siemens are very good and should materialize in about 6 months. A DEC office in Germany would make this certain. Again the conversation was a mixture of German and English. Although Mr. Gis and I spoke good French, the other people spoke none, and therefore the other languages were necessary. We must send more cataloges to Mr. Gis and make sure that he is kept informed of all future developments in the Core Tester and Memory Tester field.

The next three days, May 14, 15, and 16, were spent at Philips Co. in Eindhoven, Holland. They have done a considerable amount of work on our Memory Tester to bring it up to the standards that they require and incidentally that we promised them. They have installed a dual bus system (a separate bus for positive and negative pulses) which we have already found to be a good idea and which we have incorporated in our newer Memory Testers. They re-positioned the sense switches so as to obtain a shorter lead length between the sense inputs, sense switches, and the sense amplifier. This is also something that we have done on later machines. They have rewired the X and Y lines between the output plug panel and the X and Y switches so as to achieve uniform lead length. This is also something that we have done upon their suggestion. Their one final complaint is that the current drivers drift after setting them to a given value. Their drift is between 2 and 8 ma out of 500. We made careful measurements and traced this difficulty to local heating in the coarse amplitude control potentiometer which is a value of 2,500 ohms. We are replacing this with a potentiometer of 250 ohms which will decrease this drift by a factor of approximately 10. This will be satisfactory. These parts are due in to DEC on June 1, and we will send out replacement potentiometers to Philips. As soon as these potentiometers are installed in the drivers (Philips will do this) and the current drivers no longer have the measured drift, they will pay us the remainder of what they owe us on this Memory Tester. However, they will subtract the amount for the work they have done. So far this totals $2,300. and will probably be about $2,500. when the job is finished. This is an entirely fair and rather low price for the R&D work which Philips has done on our Tester and there should certainly be no complaint on our part about accepting this charge.

We made some careful measurements on the Memory Tester, the results of which I will summarize below:

1. The dual bus give a much better wave form, particularly on the negative driver, and the linearity is better. For a 64 x 64 plane we are able to achieve a rise time of 0.2 microseconds with essentially no overshoot or droop and a good linear wave form. The fastest rise time we could achieve through the plane was 0.1 microsecond, which resulted in an overshoot of about 5%. At this rise time the output pulse from a single core driven by all 64 x 64 switches was 50 millivolts and the spread of the output pulse was 2.5 millivolts. Thus, this is an error of ±2.5% which is the very best we can achieve in our present machine. This same spread was measured at a rise time of 0.2 microseconds. The total indecision read at the MBR flip-flop output with the slicer control was 3.0 millivolts.

2. We then drove a full stack 64 x 64 x 53 planes. The half drive current was 275 milliamps. The rise time is supposed to be 0.2 microseconds. The best rise time we could achieve was 0.4 microseconds and in this case, the overshoot and bite were both equal to approximately 5% of the pulse amplitude.

The final decision from Mr. Sonnemans, the Purchasing Agent, was that Philips will accept the Tester and pay what they owe us as soon as the drift is fixed by the changing of the potentiometers.

I then spent about three hours discussing Memory Exercisers with Mr. Braicks and Mr. Vrolyk. Philips is just starting to make full memories and is interested in purchasing a Memory Exerciser which would be somewhat of a combination of the ME2207 and ME2211. I will send more information and prices on our Exercisers to Mr. Braicks. I think the chances of sale of an Exerciser might materialize about six months from now, provided that we maintain close liaison with Mr. Braicks. Language is no problem here; Engineers at Philips speak English, although German is necessary for purchases in stores, all phone calls, etc.

My final stop was at the Stemag Corporation (Steatit-Magnesia AG), on May 17. Their main factory is located at Porz, which is a town next to Koln, telephone number 3441. However, the Core work is now being done in the nearby town of Siegburg. The address is Wilhelm - Ostwaldastrasse, 17, Siegburg, Germany. The person in charge of all Core work and Core Testing and later Plane Testing work is Mr. Gunter Huwe. Telephone number here is 2451. Mr. Huwe is interested in the almost immediate purchase of a Ramsey Core Handler, Model CH60. After that, he will probably purchase an Automatic Core Tester, Model 2113. At present he has a very old Reese Current Driver system which does not work very well and works in conjunction with some logic which he himself built up. He would definitely like an Automatic Core Tester as soon as the money can be budgeted. A large order is expected soon from another company in Germany for Cores and when this comes in we should receive the order for the Automatic Core Tester. Much further in the future will be an order for an Automatic Memory Plane Tester 1516. Mr. Huwe is much impressed with our equipment, has seen it in operation at General Ceramics,

and will definitely put through purchase orders as soon as the volume of business at Stemag will justify the expense.

After leaving Stemag, I drove back to SEL in Stuttgart in order to clear up some confusion about one of the Core Tester programs. All this was taken care of satisfactorily on May 18, and SEL is now happy with our Core Tester.

The next item of business concerns the possibility of hiring a European Engineer to open a Sales and Service Office in Europe. I have spoken to three people who might be interested in such a job. The best man is Mr. Gunter Hüwe. He is an "Diplome Ingenieur". This means the equivalent of an American Masters Degree. He is about 30 years old and getting married in the next few months. He obtained his Degree in 1955 and has been working first as a Commercial Engineer, working in vacuum tube digital circuitry with customers, and then as head of the Core Development Department at Stemag with transistor circuits and magnetic cores. He is an experienced man with excellent background in Digital techniques. His main interest is in the Digital field and not in the core chemistry and this is one reason he would like to leave Stemag. He is a rather sophisticated man with a good knowledge of European electronics, and has many contacts throughout Europe, most of them of course in Germany, but also in other countries. His English is very good and he knows some French which he would perfect before coming to work for us. His recommendation is to open an office somewhere in the South of Germany, maybe in the Stuttgart or Munich area. His salary of course, would have to be commeasurate with his experience and also with the fact that he at present holds a responsible job. However, his interest is very definite and I am sure that he would be able to do an excellent job for us if we made him a good offer. His home address is as follows:

Porz-Wahn/Koln
Frankfurterstrasse, 97
Germany

The next man I spoke to is at present at Standard Elektrik. His name is Mr. Arndt Irmisch. His home address is Stuttgart-rot, Bockingerstrasse 30, Germany. He is also a Diplome-Ingenieur, with about three years working experience. At present he is working 40% for SEL and 60% on his own. He would like to devote this 60% to working for us to open an office, etc. Later if this became a full time jib, he would quit SEL and work full time for us. He has experience in the Core Testing, Memory Testing field and a good knowledge of Digital techniques. His English is fairly good and he speaks some French which he would definitely have to perfect before coming to work for us. He seems like a very intelligent man but is definitely much younger, much less experienced, and much less sophisticated than Mr. Hüwe. Of course, he also would come to us for considerably less salary, I suspect.

The third most likely candidate, is at present working for Philips. His name is Mr. A. F. Van der Gaag. His home address is Lupinelaan 31, Son, Netherlands. He is not a Diplome- Ingenieur, but is a graduate of a trade school which is approximately equivalent to a BS Degree here in the United States. He is a very intelligent man and particularly clever in the construction of Digital test equipment. He also has a fair knowledge of Memory Systems. He speaks fluent German and English, and good French. However, he does not have as much technical background or experience as the other people and he has not travelled widely, so he does not have the contacts in the European electronics world which the other two people already have.

Another possibility of course, is Mr. Béla Csonth. He is the Engineer responsible for the use and maintenance of our Memory Tester at Philips. He is a Diplome-Ingenieur with a considerable amount of experience. However, his interest in coming to us is more in the future, probably not until a year from now, and there have been no definite discussions concerning this between myself and Mr. Csonth. He is a very intelligent Engineer, extremely capable, whom we will definitely keep in contact with. Someday he may decide to come to the United States to live and might be interested in employment here. He speaks fluent French, German, and English. His home address is Montgomerylaan 587, Eindhoven, Netherlands.

This completes the report on this two and one-half week trip to Europe.

SUBJECT REQUISITIONING PARTS FROM THE STOCK ROOM DATE June 4, 1962

TO All Project Engineers
All Department Heads

FROM Jack Smith

cc: K. Olsen
H. Anderson

It has been noticed that drawing of parts from the Production Stock Room has become a bottle-neck for people from other departments. Requisitioners seem to arrive at the Stock Room all at the same time and then must wait their turn to requisition out parts. There are times when there are 6 or 7 people waiting for parts. We realize that this is of major concern to you because of the valuable time being lost from your projects. In order to alleviate this problem we feel it would be a good idea if requisitioners could call in advance with their order, in return they would be given a pickup time. When they arrive at the Stock Room, their order would be waiting for them to pick up. If there are any problems in instituting this procedure please contact me.

dec INTEROFFICE MEMORANDUM

SUBJECT **EMPLOYEE TERMINATIONS**

TO K. Olsen
H. Anderson
S. Olsen
R. Mills
M. Sandler
B. Charnock

FROM Bob Lassen

The following is a breakdown of employee terminations of employment from May 1961 to May 1962. For purposes of analysis, I have broken the reasons for termination into two basic categories; those over which we had little or no control and those which in some way are a reflection on the company.

Terminations Over Which We Had Little Or No Control

Child Care/Housework	12
Military Service	3
Travel/Commuting	3
School	1
Death or Health	7
Relocation	1
Marriage	1
Pregnancy	9
	37

Terminations Which In Some Way Reflect Upon the Company

Left Without Notice	3
Discharged	3
Continued Absence	3
Dissatisfied	8
Accepted New Jobs	9
Not Suited For Work (Mutual Agreement)	1
	27

Total Terminations May 1961 - May 1962 64 Male - 22 Female - 42

Observations

50% of those who were dissatisfied enjoyed the company and its environment but did not enjoy the particular work they were doing. The remainder were mal-contents and generally poor employees.

The major reason for employees leaving to take another job was to obtain a higher rate of pay. Secondary reasons were, to go into business and position advancement.

To reduce employee terminations, I feel we must do the following:

1. Tighten our selection process - analyze the applicant more carefully with respect to such things as home care problems, commuting, apparent adaptability to job, previous working background and interests.

2. More effective communication from all levels of management through supervisors to employees.
Recently, I have observed that we have some unhappy people, To the best of my knowledge this is not yet a serious problem however, these problems will undoubtedly increase if we fail to recognize and do something about them. These problems must come to light through feedback from the supervisor. Most employee problems should be solved by the supervisor however, unless the supervisor has been trained to cope with difficult situations and unless he receives continuous communication from management with respect to company activities, policies, plans and philosophy, he will not be effective in this area.

3. Continuous review of wages, fringe benefits, promotion policies and intangible benefits.
We have already taken major steps with respect to hourly salary reviews and some fringe benefits. I feel our weakest area is promoting from within. Because of our heavy need for people over the past year, I am afraid we have overlooked some of our own people because of individual departmental personnel problems resulting from heavy work loads. This is a joint problem which must be worked out between Departmental Supervisors, Managers and the Personnel Department. Individual recognition is an absolute must.

SUBJECT

TO Ken Olsen

FROM Ed Harwood

Regarding our conversation concerning some of the staff people, I have two suggestions which might be worth considering at this time:

1. Any staff member in the employ of DEC on June 1st of any year and who has been employed by DEC for 3 years or more as of June 1st of the current year will be eligible for 3 weeks vacation with pay.

2. Any staff member in the employ of DEC for 3 years or more will have his company insurance paid in full by DEC.

SUBJECT USE OF XEROX COPIER AND STENCIL NEGATIVES

TO Secretaries and Typists FROM Jack Atwood

We now have a new press designed specifically for fast, economical printing of letter-size and legal-size jobs. It is ideal for memoranda, manuals, form letters, office forms, and other routine work.

This press utilizes small, low cost paper masters - the kind which are easy to type, easy to correct and easy to draw on with a reproducing pen or pencil when you want to add lines or illustrations. To make these even easier to use, we are ordering a supply of masters preprinted with guide lines for memorandum and manual typing.

The addition of the press and the availability of the new masters should help us overcome two current operating problems:

1. Excessive use of the Xerox Copier - During May over 8,000 copies were made on this machine. This resulted mainly from its use for running from 25 to 100 copies (or more) of straight typewritten material. This type of copying is exhorbitantly expensive, not only because of the cost of the copies but also because it ties up valuable clerical and secretarial time on work which can be done much faster and cheaper on an offset duplicator.

2. Dependence on Offset Stencil Negatives - Too much work is now being done on stencil negatives. This is a relatively expensive method, since it requires the use of a metal plate for the press. Thus the total cost includes the price of the stencil negative, the price of the metal plate, and the cost of exposing and developing the plate. Practically all of this work can be done more easily and economically on paper masters.

Your cooperation in using paper masters and planning your work for the new Davamatic press instead of the Xerox Copier will be appreciated.

SUBJECT Amrad Project at Lincoln Laboratory

TO Stan Olsen FROM Dick Mills

As mentioned to you this morning, through my contact with John Adams who is an engineer with Lincoln Labs. in the Radiometer Division, I was notified last night that the Receiver Group, which I gather John is concerned with in some way, is building a computer under the Armad Project at Lincoln and will be using DEC modules for the job. John called me to give me this information and also to give me the names of the two men deeply involved in the project, who may be calling on us for information and counseling at various points along the way. This project is to run for two (2) years and will be "substantial" in the use of digital modules. We should pay special attention to the following two men, who also have asked for our new Modules catalog.

Dr. John Perry
Mr. Gerald McCulley

The address given me was - B370
Lincoln Laboratories
Lexington 73, Massachusetts

I wish I could be more explicit about the Amrad Project, but to date haven't been able to uncover what this stands for. My impression from John was that this has something to do with space shooting.

SUBJECT

TO K. Olsen
H. Anderson
M. Sandler
B. Gurley
A. Blumenthal

FROM Jack Smith

Our Computer scheduling program of two Computers per month is progressing very well. A control board is set up in my office with all the necessary information on schedule date and schedule progress. In order to present information on Computer scheduling and to review our progress I would like to hold a meeting at 2:00 P.M. the first and third Wednesday of each month. I would like the meeting to be in my office where we could review the control boards. If this is not to everyone's convenience, the board is mobile and the meeting could be held elsewhere. If I do not receive negative replies to the suggested meeting, I will consider it accepted and schedule the first meeting for 6/6/62.

DATE May 22, 1962

SUBJECT Status of PDP-4 Project/Request for Review

TO Ben Gurley
Ken Olsen
Harlan Anderson
Stan Olsen
Richard Mills
Dick Best

FROM Gordon Bell

Introduction:

I would like to review the PDP-4 project relative to production, sales, and engineering. The goal is to form a plan which can be carried out within the framework of DEC organizational policies (regarding growth, management, etc.). The most important factor in the formation of a plan is assumptions regarding sales for a certain production rate, (or production, assuming a certain sales rate). Therefore, I would like to discuss the sales-production schedule for the coming fiscal year in order that a profit and loss statement and general forecast plan can be made.

Prototype/Programming Status:

At this time, the PDP-4 prototype is ready to be turned over to the computation group of DEC for general internal use. The Anelex Line Printer is to be connected by June 15, and a Magnetic Tape System and Card Reader must be connected prior to June 15. A Card Reader/Magnetic Tape/Printer, PDP-4 should enable most of DEC's computational problems to be solved including addressing, payroll, and inventory control. A second DEC machine will be available July 7, for operation with the module testing operation. At this time, module testing with machine, though relatively straightforward, requires a large amount of peripheral equipment, design, and programming effort.

The MIT summer people, will devote time to module testing, DECAL modification, (PDP-1), PDP-4 software, and DEC computation problems.

Production Status:

The second PDP-4 will be ready for checkout in 2 weeks. The schedule is:

	From Production	Module Delivery	Customer Delivery
Foxboro-Nabisco	June 7		July 31*
DEC-Modules	June 21		July 1
Corning	July 5		Sept. 15

*Final delivery, actual delivery is July 1 to Special Systems Group for integration of system.

Group Functions:

PDP-4 Group:

1. Coordinate the manufacture of the standard PDP-4 according to a schedule derived by the PDP-4 group. Checkout the PDP-4 and integrate checkout with Quality Control.

2. Provide consultation in special applications.

3. Supply a Project Engineering Group* and specifications to Sales department.

4. Apply standard DEC I/O equipment to PDP-4.

5. Provide documentation and documentation control.

6. Design special equipment for PDP-4 (including Mag Tape Systems and Input-Output Equipment) when necessary.

7. Provide backup to field service department.

8. Provide initial training class to Sales department.

The Sales Department:

1. Proposal negotiation/sales/order processing.

2. Customer liason.

   a) Programmer training
   b) Machine care training
   c) Field service during warranty

3. Distribute programs, maintenance manuals, etc.

4. Special applications, Project engineering*.

5. Shows/displays.

6. Advertising, printing, etc.

Magnetic Tape Group:

1. Deliver operating type 50 Tape Units, and type 52 Tape Control.

2. Consult (or design) special tape control.

I/O Group:

1. Deliver I/O equipment including scopes, card equipment, printers, etc.

Production:

1. Manufacture wired mounting panels.

2. Manufacture stock items: power supplies, cabinets, consoles, etc.

3. Manufacture and test modules.

4. Order necessary manufactured parts (readers, core starters, etc.).

Special Systems Group:

1. Apply the PDP-4 to special problem, and be responsible for complete system (given, PDP-4 at a preassigned time).*

Engineering:

1. Design all modules, power supplies, power controls, memory systems, and system components.

2. Documentation.

a) Provide mechanical drawings
b) Provide documentation storage
c) Control documentation changes

Accounting:

1. Do Cost Accounting to predetermined specifications.

Mechanical Design:

1. Provide consultation to Drafting department, and be responsible for mechanical prototype design.

*May be handled by a project engineer within computer group, sales, or special systems group.

Present PDP-4 Group:

Gordon Bell - Project leader, Documentation controller, special design, group planning.

Dit Morse - Programming, special applications, sales.

Steve Lambert - Project Engineer, coordinator system aspects of PDP-4, work on system design, work with checking programs.

Dave Pinkney - Technical controller, design checkout procedures, responsible for reliability of PDP-4.

Bill Colburn - Production liason, provide working drawings to production, handle delivery of PDP-4 to checkout.

Larry Conley - Work on production details, assist in programming.

Al Yurkstas - Documentation.

Bill Kellicker - (on loan to Drum System) - integration work, production testing.

George Rice - (Sales) - Liason with sales, project engineer for Nabisco system including literature and manuals.

Bob Buyer - (Engineering) - F-41, F-45 descriptions.

Summary:

I would like decisions made regarding PDP-4 in order to proceed with future production-Sales plans. These plans are particularly vital, considering that approximately 3-5 summer programmers will be with us.

24 May 1962

Scientific Method

Dick Best

Judith Ebner

May I first give you a very brief introduction to how I use language and point out the difference this makes in my approach to anything in which I engage.

First....I try to make my language have as close a resemblance to what I am talking about as is possible. Mostly I try to use verbs instead of nouns since I recognize that I am talking about a process ...a continuous active world of events...therefore nouns or labels do not serve me very well since they are static whereas verbs denote action, and so more accurately describe the event.

I try to date and index my statements thereby keeping them as much in tune with what I am talking about as possible.

Third I try to realize that no matter how much has been said, there is always more to be said. This would apply to talking about a person, thing or event since all are a part of a total process and in a constant state of change; there is always more to be said. And so I add etc. to all my sentences.

This is, of course, an oversimplification, of the scientific method which I am applying.

However, taking this thinking as a base...DEC becomes the total organism...under constant change. The Information Retrieval Center (Library is the static label) is a part of this organism through which information flows. The people involved in this operation must be aware of the need for having information flow being more important than just storing it. They must be interested in and aware of the need of searching for information. Research must seem necessary to them...not a nuisance. They must constantly be aware of the total organism (DEC) and think how a bit of information is related to the total organism and through whom it must flow in order to serve the best overall purpose.

The following pages and exhibits will show what is presently a part of (Library) Information Retrieval Center; projects still to be done; suggestions and floor plan as to how to organize the new section; a proposal of an engineering service which would affect a saving in valuable engineering time...no doubt affect drafting, etc., etc. Also, how many people of the above type, would be needed to carry out this total service. (In fact, you very rarely find them; so they would have to be trained...but you would have to start with a "research-type-thinking-person".)

dec INTEROFFICE MEMORANDUM

H-3.9.

DATE May 22, 1962

SUBJECT Ampex Tape Unit

TO Ken Olsen
Ben Gurley

FROM Roland Boisvert

I am presently gathering all the information available on the Ampex unit. As a first estimate, I think it will take about a month to get the unit back in suitable running condition.

From all reports we should have no trouble with the present unit at 37 1/2 inches/second. This speed is more than ample for the application in mind.

The representatives of Ampex who have seen the unit here have asked us to trade it in for their new TM-4 solid state transport. The amount they are asking is $3500 and our Ampex. This unit is a TM-2 redeveloped into solid state circuits. The head has been considerably improved but mechanical features are the same.

Proposed Tape Projects:

The primary project I feel we should consider at this time is a tape control for the IBM 729 IV tape unit. At the present time, company knowledge of how the tape control 52 functionally works in conjunction with the PDP-1 is limited to a few individuals. To bring myself more into this end of the system, I am attending the school by Bob Beckman on the computer. After this I would like to attend IBM customer engineering school in Chicago. I feel at this time the company will have somebody who is completely familiar with the IBM tape systems. I think you will agree that this is quite desireable. In addition, I think this is a much better approach to designing a tape control for IBM tape units than just buying the OEM's and starting from that point.

The National Security Agency has offered a 729 IV to us for development of tape control for a price consideration on the tape control.

As for projects projected further in the future, there are several pieces of conversion equipment such as card to tape, tape to card, etc. that should be considered.

I think we should also investigate your previous idea for a single capstan, slow and rugged type tape unit of our own. With many companies now selling component parts such as clutch assemblies this is definitely an area to be considered.

dec MEMO

DATE 5/22/62

TO Harlan Anderson FROM Ted Johnson

It would appear that Datamation is quite unaware of our existence. The May edition neglects to mention the PDP-1 installed at MIT (page 29) and their editorial comments are significant in their omission of mentions about the PDP machines. We should be in next month's article on computers in the medical field.

SUBJECT SUMMER EMPLOYEES PROGRAM, PRODUCTION

TO K. Olsen
H. Anderson

FROM Maynard Sandler

cc: S. Olsen
R. Mills
R. Lassen

As we have done in previous summers, we plan to hire a number of people for "summer work only". Our open vacation plan means that we must augment our capabilities if we are to maintain production levels.

The areas which we must cover are:

1. Janitors and Maintenance
All of our janitors will qualify for two weeks of vacation this year. We should have three or four young boys to help with plant cleanliness-three of last year's summer boys are returning.

Raytheon will move out and our Building #5 move program will require 5-6 helpers. We already have one and have applications for several additional boys.

2. Assembly
I would like to plan on 20-25 girls for Assembly and Inspection work. At this time we have 6 girls already returning or newly hired. Offers have gone out to additional girls and we have at least 9 other good prospects.

3. Production Control and Stockroom
The fiscal year end inventory and vacations pose a special need for help in this area. One accounting school student and one industrial engineering student have been hired and I want to add two summer clerks and a stockroom helper to this group.

4. Wiring and Test
I plan to use summer students in wiring and test to ease the vacation burden. I believe 5-6 boys could be used here to good advantage. We already have 2

SUMMER EMPLOYEES PROGRAM, PRODUCTION (con't.)

boys on file who might fit this category.

I have talked with Personnel about my thoughts on the criteria for choosing from among the summer job applicants. We should weigh favorably those young people who:

(1). Have done well in school
(2). Are taking courses of study which may be of value to us
(3). Seem to be earnest and sincere about their education and this opportunity to earn
(4). Are children of our good employees. Good workers are usually good parents.

MEMO TO : See Distribution FROM: S. Olsen

SUBJECT : 1962 Vacation Schedule DATE: May 17, 1962

In order to allow sufficient time for processing vacation pay, departmental vacation schedules must be submitted to the Accounting Department by Friday, June 1, 1962. Attached you will find printed vacation schedule forms for this purpose. Please list the name of each employee in your department and indicate their planned vacation periods by placing an "X" in the appropriate square. If an employee does not plan to take a vacation, please indicate by drawing a line through the squares opposite his name. The amount of vacation pay to which each employee is entitled will be determined by the Accounting Department.

If a subsequent change is made in an employee's vacation schedule, the Accounting Department must be notified two weeks in advance.

DEC VACATION POLICY

1. Employees who have been employed three months or more on July 1 are allowed a vacation.

2. DEC Vacation Year (for determining the amount of vacation accrued) runs from July 1 to June 30.

3. Vacations are accrued at the rate of 5/6 of a day for each month of employment commencing from the employee's starting date.

4. An employee who has been with DEC one year or more shall receive a vacation of 2 weeks with pay equal to 80 hours pay at his then current straight time rate. Each accrued day of vacation shall be paid at the rate of 8 hours pay.

5. Vacations are scheduled by the supervisor and may be scheduled between June 15 to September 30. Exceptions to this are to be referred to the Personnel Department.

REQUESTS FOR PERSONNEL

S. Olsen

Bob Lassen

The following technician and wireman needs have been reported to me by the Engineering Group.

Technicians

R. Hughes - 9
G. Gerelds - 2 (includes one replacement)
G. Bell - 4
R. Boisvert - 1
16 Total

Wiremen

G. Bell - 4
G. Gerelds - 1
5 Total

We currently have seven technicians who have accepted our offers as a result of Wentworth recruiting. Four more are yet to be heard from.

I have three or four additional candidates from other schools to whom offers have not been made. Our people have expressed an interest, particularly George Gerelds and Roland Boisvert.

If the above requests are going to be approved, we should make offers immediately or we stand a chance of losing them.

Steve Lambert and I are going back to Wentworth on May 16 in hopes of attracting one or two of their top men who thus far have not taken the bait.

May I have your answer as soon as possible with respect to the approval or disapproval of the above request.

dec INTEROFFICE MEMORANDUM

DATE May 15th, 1962

SUBJECT

TO Gordon Bell
Bob Beckman
Ben Gurley
Stan Olsen
Harlan Anderson

FROM Kenneth H. Olsen

Gordon Bell has suggested that we use a PDP-4 as our internal accounting computer. This does have several interesting advantages. It costs less and it might be the machine which we someday will suggest for this type application.

Using a PDP-4 for this application seems to be a good idea, but no one is clear just as to what this machine will be used for and what its relationship will be to the prototype PDP-1. Before making a final commitment, I would like to hear from Gordon as to how he thinks the machine should be used and I would also like to hear the same from Bob Beckman on the prototype machine. I think that each should assume a reasonable amount of equipment. I would suggest the following list of equipment for each of the machines.

Prototype PDP-1

1. One type 51 tape control.
2. One type 58 handler.
3. One Burroughs card reader.
4. One 16" oscilloscope.
5. Maybe, one color display.

PDP-4

1. One tape control.
2. One type 50 tape handler.
3. One 523 card reader.
4. One anelex line printer.
5. One 16" display oscilloscope.
6. One 523 card punch.

In addition there should be two more type 50 tape handlers which can be used on the machine which needs them the most. I think that we should give the PDP-1 first pass at the Burroughs card reader because they are almost ready to use it. But, if they don't appear to have a good proposal or are not ready to use it right away, we may give it to the PDP-4.

We should include in the proposal time for modernizing the order code of the PDP-1 prototype. We should probably immediately order the list of In-Out equipment

which we want. It would be good to get as much of it delivered before July 1st, so that we can take this years depreciation on it.

Kenneth H. Olsen

dec INTEROFFICE MEMORANDUM

DATE May 15th, 1962

SUBJECT Capital Equipment definition.

TO Dick Mills
Henry Crouse

FROM Kenneth H. Olsen

I suggest that we need a simple and commonly agreed on definition of Capital Equipment. It is very important that the people who buy the equipment understand what will be capitalized. There are many things which we are buying now which the people putting in the order do not believe is Capital Equipment, but after payment is made, the Accounting Department defines it as such.

I don't claim to know what this definition should be, but it would seem to me that any purchase beyond $200.00 is Capital Equipment. It would also seem to me that anything which is Capital Equipment should be able to be found a year later. Only by shelving it, it indeed comes to a large amount of money, and the parts get mixed up with interchanges and some never get used because they come almost as requisite parts, only to move from one building to another and some end up never being used again. All one can say about shelving is that we bought that much, paid for it, and unless someone stole it, it is still in the building, but no one can possibly prove that we still have it.

The $35.00 gray cabinets which we buy in large numbers now are so cheap and so flimsy that I can't imagine this being Capital Equipment, even though we do buy them in fairly large dollar quantities. Electric clocks are also somewhat doubtful. There must be some value at which it is not worth capitalizing them even though the total purchase order comes to over $200.00.

There also has to be some feedback as to what the Accounting Department has defined as Capital Equipment so that people have a chance to make corrections. For example, we have some odd $500.00 worth of heat sinks on our Capital Equipment list. From the Accounting Departments point of view this seems reasonable because that much plumbing should be capitalized, but in truth this is raw material components which go into the power supplies for our PDP computers. If accountants are the only ones who look over the Capital Equipment list we might develop even stranger bits of Capital Equipment. If our auditors were suspicious that we were trying to inflate our profits, they would be very critical of some of these decisions.

I suggest that each month we list all our Capital Equipment acquisitions in the Bi-Weekly Report and suggest that people who do not agree with the category in which these items are put, speak up.

In addition, I suggest that we have special purchase orders and special purchase requisitions for Capital Equipment. We now have the Purchasing Department sign many

purchase orders which appear to be straightforward, but if these are different or at least rubbed stamped with large red letters, they would receive more respect and we could insist on all of these being signed by certain people.

Before we approach the end of the year, I think we should go over our definitions of Capital Equipment to make sure that we have them all because I am quite sure that many of the items are gone now and that our Capital Equipment account is unduly inflated. This might be very small from a percentage point of view, but I think it would be worth the effort to go over it.

SUBJECT PRODUCTION EXPEDITING

TO K. Olsen
H. Anderson
S. Olsen
M. Sandler

FROM Jack Smith

During a meeting 3 weeks ago, it was decided that Production expediting could be done directly by Production personnel. Bob Maroney and Bill Brackett who place most of the Production Orders have also been expediting those orders and by calling the sub-contractors directly much time is being saved. Henry and I are making the choice of sub-contractors.

As hoped this new system ---Production personnel expediting directly with the source--- is proving successful as can be seen by a more rapid receipt of incoming stock of standard power supplies and mounting panels, etc. The time saving factor here is no doubt the direct expediting by Production to source.

At an informal meeting with Maynard, Henry and me, it was decided that at the present time the typing and processing of Purchase Orders would remain with Purchasing.

J. Brown
D. Mills

dec INTEROFFICE MEMORANDUM

DATE May 10, 1962

SUBJECT PDP-4

TO B. Gurley
G. Bell

FROM Jack F. Smith

cc: K. Olsen
H. Anderson

It was agreed at our meeting of May 12th to construct three PDP-4 systems. Delivery dates of systems to Checkout June 7, June 21, and July 5.

I have taken the following steps to assure these delivery dates.

Assignment of EN and JN

PDP-4-2	Foxboro	EN 2210	JN 100-1284
PDP-4-3	Dec #2	EN 2286	JN 100-4759
PDP-4-4	Corning	EN 2287	JN 100-4760

We are currently wiring the first system here at DEC. The second system will also be wired here. Wiring will not begin until May 24th on the second system because of expected engineering changes during the next two weeks. The third system will most likely be wired by an outside vendor.

I have received a new modified print of the operator control panel from Drafting. A requisition has been written for the construction of (3) panels, required delivery date May 24th. This required delivery date has been confirmed. Art work has been checked and is available for silk screening.

To date the new end panel has not been designed. What I plan on doing is having Scott mark up a print and rework a standard end panel which will arrive May 17th. I have talked to Scott and there seems to be no problem here.

Requisitions for cabinets have been written with required delivery dates of May 24th, June 7th, June 14th. These dates have been confirmed, which will enable plenty of time for the installation of equipment.

PDP-4 (con't)

Our biggest problem seems to be with the delivery of the Digitronics reader 2500. Presently we have on order two readers, the first of which has a delivery date of June 15th. This date is not adequate and I am trying to move it up; you will be informed of any additional changes.

The table has not been redesigned. Scott is now working on the redesign and is confident that it will be ready on time.

Power supplies have been ordered and are available. Cables have been ordered and will be available.

I plan on meeting with Jim Myers on the module requirement tomorrow.

dec INTEROFFICE MEMORANDUM

DATE May 9, 1962

SUBJECT

TO K. Olsen
H. Anderson
B. Gurley
G. Bell

FROM Steve Lambert

Charlton Walter and three others from AFCRL visited the plant late yesterday, May 8th, to see the progress being made on the two CRC machines. He seemed to be pleased with everything that he saw with exception of the Color Display. He was disturbed over the fact that the Color Display takes 250 micro seconds to display a point. Another thing that bothered him was the convergence of the red, green, and blue. The third problem was that the red did not look like a pure red.

We had working for him today: the precision display operated by the tester; info exchange between the two CRC computers; Mag. Tape 52 on one computer; Mag. Tape 51 on the other computer; F-M A-D transfer; and Color Display operated by the display tester.

I mentioned to Charlton the possibility of generating a new display which would have built into it a character generator, operational amplifiers that would generate curves, circles, lines, etc. In addition it would operate through the use of a high speed channel where two word transfers would be requested. These words would contain the necessary info for generating display commands.

Eunice Cronin mentioned that AFCRL may order another Tape Control 52 and that they have also decided to purchase a standard black and white display.

While talking with Charlton, he hinted that AFCRL may order another PDP-1 in the near future.

DATE May 9, 1962

SUBJECT Visit to Wentworth Institute

TO Kenneth Olsen
Stan Olsen
✓Harlan Anderson
Ben Gurley
Bob Hughes
Gordon Bell

FROM Steve Lambert

On Monday, May 7, 1962, I visited Wentworth Institute--the purpose being to investigate the need for Laboratory Modules in the Electronics Class.

The gentlemen with whom I spoke were Mr. Powers, Assistant Head of Electronic Department, and Mr. Kain, Instructor, Semi-Conductors. I also spoke to Placement Directors, Mr. Nickerson, and Mr. Linton.

Mr. Powers and I had a lengthy discussion on the use of modules for classroom demonstration purposes and laboratory experiments. He mentioned that Bob Lassen and Bob Hughes had discussed sending some Classroom modules for the use of demonstration during lectures. I tried to find out what Mr. Powers had in mind as to types of modules he would like to receive. His response was that he really didn't know what he wanted, although he had general ideas on what might be necessary. In discussing the course involved in teaching Digital principles, it became evident that Mr. Powers would most likely need sets of Laboratory modules for use in laboratory experiments.

Not knowing what we had available, I suggested that we send Wentworth 20 modules of whatever we could obtain so that the instructors could get used to our logic symbols and methods.

While talking to Mr. Kain, he mentioned that Digital had sent him a large quantity of transistors and he expressed his appreciation for them. They have already been put to use by the students for various laboratory assignments.

Wentworth now has a Heathkit Analog Computer and a Minivac Training Computer for Lab. use. Approximately one-third of their systems class is devoted to Servo, Analog and Digital principles. However, by giving them Laboratory modules possibly more time may be devoted to Digital principles alone. The Systems class consists of four hours of lecture and four hours of lab. per week.

One good reason for sending Digital modules to Wentworth is to inspire students to look at Digital as a future job prospect.

SUBJECT DECUSCOPE SCHEDULING

TO Elsa Newman

FROM Jack Atwood

CC Harlan Anderson
Stan Olsen

It will be necessary for us to establish very simple but fairly firm ground rules with respect to DECUSCOPE copy preparation if we are to integrate your project with the work we are doing for other people.

I propose the following schedule to be effective with the next issue:

Major portion of the draft copy for IBM Executive typing - not justified but to approximate final column widths	12 working days before date of issue
Balance of draft copy for IBM Executive typing - as above	9 working days before date of issue
Approved draft copy for justified typing to final column widths	7 working days before date of issue
Final additions and changes for justified typing - as above	5 working days before date of issue
Approved mechanicals ready for camera	4 working days before date of issue

This would enable us to handle the job from start to finish in a manner that would be most helpful to you as the editor and to us as the publishers. You would always have typed copy in the most usable form for editing purposes, and we would receive the copy and any alterations in easy stages at the proper times for painless production.

The schedule is limiting in that it provides for only four "consultations" during which copy can be submitted. On the other hand, I think you will find it easier to gather your material together and present it to us in this manner than to go in search of typing assistance wherever you can find it and make as many trips to the "printer's" as you now do.

INTEROFFICE MEMORANDUM

DATE

May 7th, 1962

SUBJECT

TO

Harlan Anderson
Dick Best
Ben Gurley
Bob Hughes
Dick Mills
Stan Olsen
Maynard Sandler

FROM

Kenneth H. Olsen

I met Ed McLaughlin who is heading up the group which Raytheon left in the old mill. He said that he tried to talk his management into keeping that floor when they gave up the lease last year, but he lost the argument. Now he is taking over a lease on half of the floor below and is looking for bids to fix it up. He feels it will cost $30,000.00 - $40,000.00 to paint it and put in fluorescent lights.

I feel a little guilty taking advantage of their unwieldy large organization, but not enough to sacrifice any of our plans. If they can get the work done, they plan to move down the first or second week of June, which means that we can take over our area fairly soon. They have a lot of equipment to move down and set up and we offered to allow them to go through our area.

They have a large temperature testing oven that they used to use for checking out klystron tubes. This unit has large heaters in it and a dry ice cooler. There are several compressors with it and two brown recorders. The Air Force is going to put this up for bid and I suggest that we consider bidding for it. It cost them $750,000.00 to install it and it might sell for $10,000.00. I doubt it is worth $10,000.00 but we should bid what we think it is worth. It will probably go as junk except that some of the compressors are worth some money.

They also have equipment in the tin shed on the outside of the pond. This is on rented land, but I think they will open up the shed with all of its contents for bid. Most of its contents is probably radar type equipment. We will be put on the bidder's list. Maynard Industries will bid on the shed and its contents.

The people at Raytheon will enter through the present entryway and go down to the floor below. This disrupts our plan for security through the door, but I am not sure that there is anything we can do about it.

Alongside the cafeteria they have a fire-proof storage area for their inflammable liquids. It is a water-proof floor and asbestos panel walls. We might consider salvaging this for our own use.

dec INTEROFFICE MEMORANDUM

File

DATE May 4th, 1962

SUBJECT

TO Gordon Bell

FROM Kenneth H. Olsen

Dr. Ervin from Mass General Hospital called late on Thursday. He is still very interested in this computer and is more or less holding back CDC on the assumption that we will come across. However, he realizes that he is the gift receiver and, therefore, not in a position to pressure us and so he only hints at the need to come to some conclusion.

While we have been doddling on the medical computer question, CDC has sold a computer to the Albert Einstein College of Medicine and UCLA. If Mass General gets a CDC computer, I think they'll have the medical field pretty well sewed up.

MGH has some young programmers who are full of ideas as to how to convert programs from one computer to another. Dr. Ervin asked if we could have one or two of our people listen to their ideas to see whether they are worth pursuing. I asked him to have the men call me next week and I will arrange a date with Gordon Bell and Dit Morse. Dr. Ervin is going to be in California for two weeks and so one of the programmers will make the arrangements. The man's name is Bill Lennon.

I feel that we should consider the possibility of hiring James Nortman to head our medical work. This man seems to have the qualifications and interests which would be ideal for this type job.

dec INTEROFFICE MEMORANDUM

DATE May 3, 1962

SUBJECT Raw Materials Stock Status

TO File

FROM L. R. Rittner

Before we go into a full-fledged stock status on tabulating control, there are several policy and procedure decisions that have to be made. If we don't make them at this time, it will mean doing and re-doing the whole stock program at some future date, which would be somewhat inefficient. Very basic questions involved go into things such as the part numbering system, which seemingly has to be revised, so that it's a partially coded number, and strictly numerical. This ties in with the purchase specification program, and also the advisability of having stock books and cross references between stock parts, and vendor and other types of numbers. Also involved is the decision involving the changing of the source documents, changing, for example, the many stores requisitions that we have hopefully into one form, two at most. Also, the handling of receiving reports which should be tied in with the purchase order

and purchase requisition, rather than having a blank one the way we're doing it now. These and other areas should be resolved first before we get into a full-fledged stock status. It is my opinion that the ramifications of this stock status are pretty widespread. It involves more than changing of some source documents and the part numbering systems and goes beyond that into the whole procedure of handling engineering information that's released to manufacturing, the manufacturing processes, etc.

We should define our over-all objectives and plans and state the long-range program for material management, and then go into our stock status and other material tools.

DATE May 3, 1962

SUBJECT Stock Status of DEC Modules

TO File

FROM L. R. Rittner

The first thing we should do is set up a master deck of cards for the DEC modules. This master deck should include the very basic things, such as the official description of the module, the module number and the IBM code. This master deck can be used for all runs that are made in the future for whatever purpose on modules. – complete

The second step is to make up a quantity stock status. This should be a very basic tool that will record the balance on hand which we'd pick up from a physical inventory, the receipts into finished goods stores which we should probably pick up from the job lot sheets in manufacturing, the withdrawals which ← not using yet - not available will be the actual stores requisition taking modules out of stores or customer invoice, and by simple tabulation, have the tab machines come up with a new balance on hand. – Complete

The third step is one in which we can get a little bit more sophisticated

and get involved in such things as setting up planned requirements, these requirements broken out by where the unit is going to be used, which computer or system is going to use them, reserve requirements, availability, in-process and manufacturing, going into job lot sheets, numbers, operational numbers, horizontal time sequence and other items as required. — plans about done here

The basic point, however, is to do this in a series of steps rather than attempt to accomplish the whole thing at one time. It's most important that we allow enough flexibility in the system, however, to take care of the future things we want to do with it. Because of this, we want to check the amount of space we have on the IBM card, and the amount of machine availability to take care of all the programs we have in mind, even though only a small part of it is used at the very beginning.

One point that we should look into is the possibility of using the withdrawal cards themselves from reserve requirement cards. This may not be possible if we don't know the quantity to be issued in advance. The card should be coded,

however, to show exactly where it's being used, so we can break this out by need, which, of course, will have a direct relationship to the date that the unit is to be delivered. If it's not an internal system or computer, perhaps this can be coded by customer number, or if not the customer number, by priority of delivery.

On the design of the cards themselves, some of the things we should have room for are: 5 digits for module number; 3 digits for quantity; 5 digits for where unit is used; 5 digits for cost of the unit (2 decimal places); 5 digits for manufacturing lot number (the in-process); 6 digits for the source document code and number; approximately 25 digits for description; 5 digits for either date or period required; 2 digits for manufacturing lot quantity; and a 3-digit IBM code. This gives us approximately 64 places to be used.

On the withdrawal slips themselves, we are presently using several documents called, (1) "Requisitioned from Finished Goods," (2) "Modules for Systems and/or Computers," and (3) the "Customer Order." We should give some thought to the standardization of one type of withdrawal for consistency purposes.

done

~~also checking mat'l out of Stock Room~~
~~Job Lot Sheet~~
~~SR now~~
~~1/2 slips with stores~~
~~1/2 slips out of stores~~

Picking up the starting balance is fairly simple, as we simply take a physical inventory. However, in picking up the requirements, this is somewhat of a problem in that there are several different types of input information that are utilized here. A construction requisition can be used, as well as an internal purchase order, a sales order, a break-out sheet for a computer, plus there may be other possibilities, too. Again, we should have some kind of consistency in our input information in determining what our requirements really are. It looks like there may be some advantage in getting the thing moving so that some type of report comes out in the very near future, and this will give the principals encouragement to go further and get involved in some of these more complex areas of allocation, horizontal time sequence, and the like. One other thing that we should look into is the possibility of using something else other than the job lot sheet, as this seems to be problematic at the moment. One way of doing this would be to take from our master deck of description cards of modules and run some of these in advance, give these to the production control people, and this would go

along with the lot sheet. All that would have to be written on there would be the lot number and the actual quantity that was completed. This same card obviously could be used for the other program that we're working on in determining the average time to do different lots, where the only missing information there is the quantity per job lot.

We have received a purchase order from General Electric Co. in Syracuse, New York, for a Memory Tester, Model 1516H, EN 2238.

This system is due for shipment on or before August 17, 1962. The Purchasing Agent is Mr. Joe Schill, and Engineer in charge is Mr. Ed Koenig.

All modules have already been ordered by Lee Butterworth.

FROM Kenneth H. Olsen

When I was at the MIT conference for local company presidents last fall, I met Mr. W. T. Handle who is chairman of the Industrial Liaison Office at MIT. He had been talking with Jay Forrester lately and said he would like to move on from MIT into industry and Jay suggested that he talk to us with the possibility of joining us here. I told him that we didn't have any definite openings, but that we would very much like to talk with him. He is coming out next Wednesday, May 9th at 8:30 a.m. and it would be good if you could spend a little time with him at that time.

SUBJECT

TO "Mothers"

FROM Maynard Sandler

Last November we started the Mothers' Shift as an experiment. Because all of you did so well your group has grown from the original 10 to 25.

Your supervisor, Dick Mangsen, has been working longer and longer hours and we have now chosen Thelma Patterson as his assistant to help out with job assignments and paper work. Thelma previously had been employed as a payroll machine operator and spent some years in Production Control work, so we feel she is well-qualified for her new assignment.

I know you will continue to make a fine contribution of your interest and energy to our work here at DEC and that especially you will continue to give your supervisors your utmost cooperation.

Maynard Sandler
Production Manager

SUBJECT

TO Harlan Anderson FROM Kenneth H. Olsen

On Thursday, April 26th I received a call from Mr. O. M. Spaid from Internal Inspection Company, Summit, New Jersey asking if we would join with them in a bid to the government for running feasibility studies and supervisoring computing installations overseas. I told him that we are not well suited for that type job and that they would do better looking to someone like Charles Adams Associates or Bolt, Beranek and Newman. I told him that if he asked advice from our people, they would always suggest that they build it themselves or that it was impossible.

I gather he heard of us from American Research and Development but, he did not know them well enough to have their name straight.

SUBJECT

TO Harlan Anderson
Ben Gurley
Stan Olsen

FROM Kenneth H. Olsen

I had a call from Jack Gilmore on Thursday, April 26th. Adams Associates has been approached by Friden Corporation to see if they wouldn't be a vehicle for renting Flexowriter typewriters. They knew that we were approached and turned down the project, but Adams Associates were thinking of going into the systems business and thought that this would be a good start. They are thinking about having the typewriters painted their own color and put Adams name on it.

Jack asked if we would let them know who our customers are so that they could offer to rent Flexowriter typewriters to them. I told him that, in general, we would be willing to do this, but there might be areas in which we would do business with competitors which we may be reluctant to do it and he understood this. I told him that I would call him back if you had any negative reactions to this.

The monkey farm would like to rent the PDP computer and so Charles Adams is thinking of purchasing it and renting it to them. I don't know how Adams plans to make money with their systems division, but I do think they know arithmetic and they probably know what they are doing. It can't help but do good for us.

SUBJECT Anelex Printers

TO Ken Olsen
H. Anderson

FROM R. Mills

The two (2) Anelex Printers we have received have been charged to our 130 Raw Material Account - one to be used on the LRL machine (EN 2078) and the other to be used on the DEC machine (EN 2126). The net effect on our P & L for the fiscal year ending June 30th, will be to have the DEC Anelex Printer in Work in Process Inventory versus the unit being charged off to an EN 1000 account. If there is a possibility that we receive a PDP-1 customer order, which will take the DEC unit and also, provided it will be shipped before June 30th, the result will be to have both units charged against Cost of Sales.

SUBJECT Meeting at CRC

TO Harlan Anderson
Ben Gurley
Gordon Bell
John Koudela

FROM Steve Lambert

-

On April 25, John Koudela and I went to a meeting at the Cambridge Research Center, AFCRC. The meeting concerned all contractors who will be working with the 2 PDP computers. Present were Wolf Associates, Adams Associates, and representatives from O.A.L. and from the Cambridge Labs. The meeting was held in Charlton Walter's office.

Topics of discussion were what assembly system would be used. The outcome of the discussion was in favor of using DECAL. A major portion of the time was spent on flicker free displays, and Charlton Walter suggested that they buy an ITEK Disc File along with a display.

I suggested that it was possible to attach to the second memory, which they are getting, a high speed channel system connected to a display that would sweep the second 4K memory. At the same time, another high speed channel would read in data from Mag. tape to this memory, thus the display would be operated at a repetition rate of 35 msec. Charlton Walter would like to know more about such a system, and he is interested in displaying 100,000 points or close to 100,000 points flicker free.

The breakdown was that Adams would write the display programs and Wolf would write outline and execution routines. Ed Fredkin was also present, but did not receive any contract. The meeting adjourned at noon.

I spoke to Eunice Cronin about the delivery dates of the two computers and she stated that CRC could not accept these computers at DEC due to a clause in the contract, and due to the fact that they are not able to get a room. She would like to have us keep the computers at DEC long enough to check our every option on the computers and she also said that acceptance must be made at CRC.

To: ALL EMPLOYEES

From: Kenneth H. Olsen

Subject: Parking April 25th, 1962

We have been concerned for some time that our employees have had to park their cars three deep in the very limited parking area in front of building 12. This has not only meant delays in leaving at night, but has also meant that people have been called out during the day to let other people out of the lot. We thought we had solved this problem by moving much of our facilities to building 5 where there is unlimited parking available, however, people are still parking three deep in building 12. It must be that they do not realize that the parking is unlimited and easy at building 5 or else they do not realize that it is close, or closer, than building 12.

We are enclosing a map which will show where the new parking area is for those who do not realize where it is, and too, to try to convince everyone working in buildings 4 and 5 that it is indeed most convenient. It is definitely closer for all the people in building 5. For those working in building 4, and parts of building 3 it is closer if one considers the extra stairs used if he parks in front of building 12.

For your own convenience, and the convenience of those who have to park in front of building 12, we would urge everyone to try to park in the lot near building 5.

Bradley Container Company has complained that DEC employees are using their parking lot. I told them that I was sure that our employees would not do this because it is definitely marked as private property, but I did agree to remind all our employees of the fact.

April 24th, 1962

Subject: Company Security Proposal

On Monday, April 23rd we met to talk about company security problems. It is obvious that we are much too lax in our security and have to enforce it much more vigorously. In July, the Purchasing Department will move over to building 5 and so, in general, the company will have only two entrances, the main one in building 12 and the one near the shipping dock in building 5. We are, however, going to put the prototype computer in the large classroom on the top floor of building 4 and we are going to have a separate entrance to that so that we can allow outsiders to have access to that room and not to the rest of the company.

We will allow out only a very limited number of keys, and those who have to work nights, will check out individual keys that will be on very large markers so that although the temporary keys are given out freely they will not be easily forgotten and no one will put them on their own key ring.

Loren Prentice will be responsible for all our security, but he, in turn, will use other people to carry out the work. I think that Brad Towle should continue to be the dispenser of temporary keys. It should be someone in the Sales Department because the temporary keys should be readily available, but they should be called back immediately after use.

We have broken down the outside doors into four groups:

1. Front door of building 12 and the door from the fifth floor of building 3 to the Machine Shop in building 4.

2. Front entrance of building 5 and the two entrances from the elevator shaft to the center of building 5.

3. The Computer Room in building 4.

4. All side doors and elevator shafts.

There will be sub-master keys which will open all four groups and will be given to a small number of people. Those needing access to only one group will be given only that key. There will be temporary keys made up for all four groups, but it will be in only extremely rare cases that a temporary key will be needed for group 4. If people need a key for group 1 and 2 on a temporary basis, they will be given two temporary keys and then they will have access to the whole plant.

In addition, there will be several inside key groups. These will all be opened by the grand master key. The inside groups are as follows:

5. Manufacturing.

6. Advertising.

7. Tool Crib.

8. Finished Goods.

9. Archives.

We would also like to have a master lock system and a sub-grouping lock system for all our gray cabinets and for all our file cabinets. The emergency is not as severe on these, so we can let it slide a little while.

Most doors which would possibly have to be opened for emergency, but which we don't want opened normally, we are going to have installed with alarm type locks. In order to get through these locks one has to break glass which allows the door to be opened, but also sets off an alarm. If they are opened with a key, they work like any other lock. The following doors will have this type lock.

1. Between the Machine Shop and the fifth floor of building 3.
2. Walnut Street end of the fourth floor of building 5.
3. Walnut Street end of the fifth floor of building 5.
4. Elevator tower door on the fourth floor of building 5 and elevator tower on the fifth floor of building 5.
5. Front fire escape fourth floor of building 5.
6. Front fire escape fifth floor of building 5.
7. Stairway between floors three and four at main entrance of building 5.
8. Between Computer Room and Sheet Metal Shop of building 4.
9. In door to be added at present Purchasing entrance.
10. Door by Drafting Department.
11. Door in building 3 to General Radio area.
12. Door in building 3 to Country Store.
13. Side door on first floor of building 12.

For this long list of bell type locks we perhaps should order a spare even though

they cost $60.00 each. All of these, but the first two, are in key group number 4.

Also, in key group number 4 are padlocks to be put on the following areas:

1. Shipping door on the first floor of building 12.

2. Door to the hoist in the second floor of building 12.

3. Elevator near the eating area in building 3.

4. Elevator on the far end of building 3.

5. Elevator on the third floor of building 4.

6. Elevator on the fourth floor of building 4.

Loren Prentice is going ahead and buy the alarm type locks and he will settle on a master keying system.

As a temporary measure, Loren is immediately going to change the locks in building 5 and the main door in building 12 so that they all open on the present standard door key.

Loren Prentice

FROM Kenneth H. Olsen

We have striven to have an unusually high illumination level in most working areas. Even though the cost is high, we feel this is a good investment, because it makes the mill look bright and pleasant. However, one interesting disadvantage develops. Some areas which are not as bright as others give the impression of being dark, even though their level may be well above standard. Because there have been some complaints about the level, we had our electrician, Bernie Joyce, make a survey of the plant to check on the illumination level.

The following list gives the result of Bernie's survey in which he used a Weston light level meter, held at about bench level. The conclusion is that there are only two areas which have low light level. They are Jack Smith's office and my own office. I suggest that for the time being we consider increasing the level in these two offices only.

The recommended light levels start at about 5 - 10 foot candles for corridors, and for areas in which very close work is being done, they recommend between 50 and 100. We have over 50 in almost all areas. Our mechanical inspection has a level of 125 at the bench level, and drafting has between 125 and 150.

Kenneth H. Olsen

SUBJECT Display Booths

TO Jack Atwood
Harlan Anderson
Stan Olsen

FROM Kenneth H. Olsen

Several years ago, I designed a display booth and with some amount of effort, proved that we could make one cheaper than we could have one made outside. This might have been a great disservice to the company. The result of our success in making this booth has initiated a company policy that we make all booths. Now we postpone construction of the booths until the last week, and we are very free in adding frills, making changes in the booths, and adapting them to the current ideas.

I suggest that we change our policy now, and that we purchase all booths. This will have several advantages. We would be forced to make our decisions well ahead. We will have an exact cost on all the novel ideas and frills that we might request. We will also know whether or not it's worth making a new booth, because we'll have a price tag on it. If someone wants to propose a booth made here in the house, he could then present drawings and sketches and prices, and we can see how they compare with the outside.

I suggest that we clean up the odds and ends that we now have around the plant, and that we then end up with two or three 10' booths, one 20' booth, and one 40' booth. These should be general purpose booths that we don't feel obligated to modify for each show. We should then take space at trade shows which will fit our standard booths, and not try to do anything tricky like the EJCC last December.

We should always have the display booth set up two or three weeks before the shipping date, so that we can correct for things we don't like. The booths we used in the IRE Show and the one now going to the Spring Joint Computer Conference looked quite homemade, but only in details which could be readily fixed up if we had a few more days. I am very reluctant to criticize these booths, because people worked so very hard and such very long hours at the last minute to do them. But on the other hand, if we started them earlier and simplified our ideas, we could avoid some of these long hectic hours before the show.

SUBJECT BBN Meeting on DECAL

TO Ken Olsen
✓H. Anderson
B. Gurley
B. Beckman

FROM R. Mills

I talked with Dave Mittleman this morning regarding a meeting with them on final settlement on DECAL programming. Doctor Labate is away for the rest of the week but Bill Pickett called later and confirmed a Tuesday, April 24th meeting at 3:00pm at their place and Doctor Labate will be there.

Dave was at a loss to understand why we should feel that a meeting was necessary in order to settle the DECAL matter since it appeared to be a pure obligation of $10,000. in our letter which we would be obligated to pay and that would be the end of it. All I said was, that under the circumstances we didn't feel that we were obligated to pay the full $10,000. due to amountsthat had already been expended. After this, he agreed that we should have a meeting.

SUBJECT Gold plated eyelets for test equipment.

TO Harlan Anderson
Stan Olsen
Jack Smith

FROM Kenneth H. Olsen

Because we have been having trouble consistently with the electrical contact in our test equipment patch cords I would like Henry Crouse to find out what it would cost to have our patch cords gold plated and to have our eyelets gold plated.

In addition to the simple contact between the eyelet and the banana pin we also have suffered because of the connection between the eyelet in the wire and because of the flux inside the eyelet. I would like Henry to find out what it would cost to have special eyelets made exactly like our present eyelet, but which have a tab for soldering or for spot welding leads on the back side of the panel.

SUBJECT Report on Results of Newspaper Employment Advertising

TO K. Olsen
H. Anderson
S. Olsen

FROM Bob Lassen

Attached is a summary of people who were hired in February and March of 1962 and by what means they were contacted.

Out of a total of 73 hires, 34 were as a direct result of newspaper advertising. There is no way of measuring how many of the others may have first learned of our company through newspaper advertising.

For several weeks Alec Stevens and I have been evaluating the effectiveness of newspaper advertising and we have instituted some cut backs particularly in the Boston Globe Basically we have eliminated a few of the local papers and we have confined the Globe to Mechanical, Technical and Drafting people only. We have also reduced Globe advertising to every other week. I feel very strongly, however, that the Boston Globe employment section is widely read by non-professional people. Our interview response from the Globe over the past several months has been good.

I do feel however, that we can do an even better job in selecting the most effective media This can be done by constantly reviewing the results - perhaps on a monthly basis.

We are also starting to learn that certain areas provide particular types of help. Although the attached summary gives no credit to Worcester and Lowell papers, we have found that these areas have served us fairly well in the past with respect to Mechanical and Drafting people Although the interview response in these areas is fairly good the quality of the applicant leaves something to be desired therefore we probably can save money by being more selective in these two areas.

It is my opinion that newspaper advertising is effective and that it is necessary if we wish to hire sufficient numbers of competent people to fill our growing needs.

In view of the above and in view of the findings on the attached summary sheet, I propose that we continue employment advertising on an increasingly selective basis as we gather more facts and that we budget ourselves to a maximum average of $3,500 per month. We should bear in mind that the amount of money spent for employment advertising will largely depend upon the urgency of our need for new people.

In passing it is interesting to note that the fees charged by an employment agency for the 34 people hired through newspaper advertising would have amounted to approximately $4,000. However, most agencies do not effectively handle lower levels of hourly and clerical people.

SUBJECT PDP-1 Prototype Scheduling

TO PDP-1 Distribution List
All Prototype Users

FROM Bob Beckman

The following procedures have been established for the scheduling of the PDP-1 Prototype.

1. Until further notice the Prototype will be scheduled on a weekly basis. Schedules for the following week will be published on Friday afternoons. Copies of the schedule will be posted on the Computer Room bulletin board and by Ben Gurley and Al Blumenthal. These posted copies are for information only and "write-in" scheduling on the posted copies must be included on the master schedule to be valid. The master schedule will be retained and updated by Customer Relations.

   It is anticipated that scheduling may eventually be on a daily basis.

2. Requests for computer time must be submitted on the established form. A copy of this form is attached and additional copies are available from Customer Relations and from the supply maintained in the Computer Room. It is important that all pertinent information be included on this form. In cases of conflict the information on the form may determine which user has priority. DEC employees requesting time for customers or potential customers should make the requests in their own name with appropriate comments.

   Unless specifically requested, no confirmation of time assigned will be made other than the published schedules. Individual confirmation of time must be justified in the "comments" section of the form. Telephone number (or DEC extension number) should be included even though no specific confirmation is requested.

   Requests for computer time must be submitted to Barbara King of Customer Relations by 9:00 A.M. on the Friday preceding the week involved. Requests may be submitted as far in

advance as desired, but actual schedules will be established on a week by week basis. A separate request form must be used for each calandar week (i.e. a request for time on a Tuesday of one week should not be included on the same form with a request for time on Thursday of the following week).

3. Contact Barbara King on Extension 346 for changes or additions to published schedules. Such changes and additions must be kept to a minimum and will be on a "first come, first serve" basis.

4. Prototype users are invited and encouraged to make time swaps and other arrangements with other users on an individual basis. Questions that cannot be resolved by the master schedule will be referred to Bob Beckman.

Every effort will be made to satisfy everyone. However, to paraphrase a bit, "You can satisfy some of the people all of the time, etc." The intention is to provide adequate, efficient use of the PDP-1 Prototype.

SUBJECT Initial clean-up of Prototype Computer Room

TO PDP-1 Distribution List
All Prototype Users

FROM Bob Beckman

The attached memo dated April 23 will go into effect on that date. The week of April 16 will be devoted to an initial clean-up of the Computer Room.

Anyone who has material in the Computer Room that they want to keep is requested to remove it by Wednesday of this week. On Thursday all material left in the Computer Room will be placed in a temporary circular file which becomes permanent on April 27.

Those people who are occupying space in the file cabinets in the Computer Room are requested to re-examine their need for this space and to contact Barbara King on Extension 346 if they wish to retain it.

####

INTEROFFICE MEMORANDUM

DATE April 23, 1962

SUBJECT Cleanliness and upkeep of Computer Room

TO PDP-1 Distribution List
All Prototype Users

FROM Bob Beckman

In order to improve working conditions and the appearance of the Prototype Computer Room, the following procedures have been established. The cooperation of all concerned will be appreciated.

1. All Prototype users are requested to remove all of their material after each use of the computer. The console table and the other tables provided should be cleaned off and all unwanted type-outs and tapes placed in the wastebasket. A limited amount of space is available for storage of materials between use of the computer. Anyone desiring such storage space should contact Barbara King on Extension 346.

2. The Computer Room will be cleaned each morning by building maintenance personnel. Their instructions are to remove all loose material from the console and other working areas. Recognizing the possible value of material inadvertently left behind, type-outs, tapes, etc. collected during the clean-up will be placed in temporary storage and retained for approximately one week before final disposal.

3. Coffee cups, cokes, ashtrays, etc. must be kept off of the console table.

If everyone will cooperate with these few simple rules, it will make a big difference in the appearance of the Computer Room and provide a much more pleasant place in which to work. Any suggestions as to how to further improve the condition of the Computer Room will be appreciated.

SUBJECT

TO Loren Prentice
John Culkins
George Brown

FROM Kenneth H. Olsen

I stopped in Sunday afternoon at the plant and was very surprised to find the shipping door on the first floor of building 12 completely unlocked and the elevator door on both ends of building 3 unlocked. This points up the need for an immediate security plan. I would like Loren Prentice to meet with who ever he feels is necessary and to propose a workable and consistent plan. This plan should be put down on paper and then we should have a meeting later this week to approve it.

I also noticed that the power was off on the first floor of building 12 and all the coolers and clocks were off. I am very sympathetic with the problem because when I tried to turn the power on it wasn't at all obvious how this should be done. When we have the meeting on security, I would like also to have George Brown prepare a proposal for how we turn power off in building 5 and John Culkins do the same for the other buildings. We may want to re-do some of the wiring in order to make it easier. As a minimum, we should have the boxes labeled and a memo posted at various places indicating how it should be shut down.

If someone needs help in preparing notes or memos, my secretary will be available to do this.

Girl's Softball League

K. Olsen
H. Anderson
S. Olsen
M. Sandler
R. Mills

Bob Lassen

I have been approached by members of the General Radio Company asking us to participate in a local informal girl's softball league. The basic purpose of the league is to provide employee recreation and the philosophy is "every girl gets to play".

General Radio has done a wonderful job over the years in building a healthy employee dedication to their company. Their expanding recreational program has done much to create this very desirable spirit.

As we grow larger and busier we are in grave danger of becoming more and more divorced from our people - their feelings and their well being. I think it would be wise to take a cue from General Radio now while we're still young and start building an employee morale program through company sponsored recreational activities.

I propose we take part in this girl's softball league and other forthcoming worthwhile activities. This activity should be sponsored by DEC and we should provide the necessary equipment. (Uniforms are <u>not</u> necessary).

If approved, I will take care of the details in setting up a committee and finding a suitable coach (male) to assist the girls who may become interested.

OK by me

Andy

SUBJECT Negotiation Meeting On the CRC Logical Connector

TO Fixed Price Contract Audit File
USAF

FROM R. Mills

This morning at 10: O'clock, Mr. Geary, Price and Cost Administrator, Mr. Balboni, possible Contract Administrator for this contract, and Mr. O'Donnell, Team Captain on Negotiated Contracts, came here to discuss the three items which arose from Mr. Louis Green's audit of our rates used in submitting Form - DD-633-4. The discussion centered around the philosophy of advertised vs. negotiated contracts, then leading thru with their disagreement with our application of SG&A expenses on the cost of sales vs. their porposal of manufacturing and engineering overhead. They also discussed the deduction from SG&A for advertising and contributions. We contended that the advertising expenses were not those disallowable under the ASPR 15-205.1, as these are technical instruction manuals and catalogs vs. pure advertising media of a radio or magazine nature. They also questioned our application of SG&A against purchased materials but our discussion never really got very heavy in this regard as our counter proposal was to remove from this purchase request and cost analysis all standard proprietary items of DEC and then submit a Form DD-633.4 for only the remaining items of a special nature. They did not want to accept this today, but preferred to think it over with another meeting later.

I believe there was some doubt in their minds as to whether or not we were a major manufacturer of standard items but after their plant tour, they were thoroughly convinced that we were and the comment of Mr. Geary upon leaving was that, " I'm sure we'll have no trouble with this".

DATE April 5, 1962

SUBJECT LOBBY REDECORATION

TO Ken Olsen
✓Harlan Anderson
Stan Olsen
Dick Mills

FROM Jack Atwood

This is a rough estimate of the cost of redoing the lobby in Building 12 as shown in Jim Lozouski's sketches:

	Materials	Labor	Total
Translucent ceiling	$ 395	$165	$ 560
Walls and booth	250	150	400
Cork flooring	220	50	270
Furnishings	800	25	825
Total	$1665	$390	$2055

The ceiling is a two-part plastic ceiling designed so that dirt and insects falling on the top panel are not visible through the bottom panel. The materials figure includes foil for the present ceiling, translucent tile, accoustical tile for the border, metal supports for the tile, and hangers for the supports. The labor figure is the vendor's quotation for installation by his crew.

The materials figure for walls and booth provides for a mixture of wood panelling and painted sheet rock. This figure also includes the cost of converting the north wall into a showcase for modules and accessories. The labor figure is an estimate of the cost for contract carpentry.

Cork is the first choice for flooring because of its resistance to wear, especially with respect to high heels, and its ease of maintenance. This type of flooring would look well under most conditions, and it would provide a safety factor in wet weather which is entirely lacking in asphalt or rubber tile.

The figures for furnishings include two new groupings for the outside wall, auxiliary seatings along the north and south walls, chairs for the operators, and a planter box on the south wall. The labor cost is a wild guess at what we might have to pay to have the bricks for the planter slapped into place.

dec INTEROFFICE MEMORANDUM

DATE 4/4/62

SUBJECT Systems Design Corporation

TO Harlan Anderson
Stan Olsen

FROM Ted Johnson

Systems Design Corporation in Las Vegas, Nevada is a new group of ex-ITT people who have communicated with me on some possible applications of PDP Computers and the possibility of representing our modules in that area. The following are summaries of my discussions with Mr. Charles Pettis by phone on 4/2/62.

1. Service Bureau Data Processor

They are interested in a new computer for processing department store sales data. See the attached letter. Their present largest prospect is one chain store which is rapidly expanding to the point where it might have as many as 90 point-of-sales registers. They have another large prospect in Salt Lake City. The latter customer would require a machine capable of processing more than 999 items and performing some sales analysis. Pettis has been thinking in the direction of a 70 to 90 thousand dollar machine, 18 to 20 bit word and 4K of memory with an expandable feature.

2. PDP or Special Computer Systems for Hotels

Pettis feels there is a strong market in local hotels for installing central data processing equipment to total customer bills from data received from any hotel charge stations, (keyboard input and printed invoice output). There is also a requirement for up-dating present room status systems which would present some graphic display information to the room clerks indicating the status of all the rooms in the hotel, (occupy, ready-to-rent, not yet cleaned). Figures he used for a system of this type were $60 per room and typical hotels included approximately 1,000 rooms. These two possibilities might be incorporated into one central processing station.

3. Representatives

They indicated an interest in representing our product to local cusomters, principally EG&G and Reynolds Electric. I indicated our policy of direct sales from this office.

Los Angeles 45, California

Attention: Sales Manager

Gentlemen:

As we maintain a full sales staff who call on large industrial and government contractors, we very often receive requests to supply your products.

Some of these people such as Reynolds Electric and EG&G have been buying as OEM accounts, which of course they should not be doing as they hold AEC contracts. Even though this has been the practice in the past, they realize the need for a local firm who can handle their orders, as many times the time requirements don't allow them the use of normal correspondence and therefore they must revert to long distance telephone calls which has drastically increased their purchasing costs.

We are in a position to supply their needs and if suitable arrangements can be made we would be very glad to represent your products on a local level.

At present we represent such firms as ITT Industrial Products Division, Industrial Electronics Engineers, Inc., and many other fine lines, in addition to contracting for complete systems involving Microwave, Closed Circuit Television, data processing and related fields. Our staff also includes three engineers who are utilized in research and design of new systems as required.

We feel that we are in a position to increase your sales with both parties making a reasonable profit. If you would like to work with us, please send complete catalog data, including pricing and discount schedules.

Hoping to hear from you soon, we remain,

Very truly yours,
SYSTEMS DESIGN CORPORATION

ENGINEERS AND MANUFACTURERS

March 28, 1962

Digital Equipment Corporation
8828 Sepulveda Boulevard
Los Angeles 45, California

Gentlemen:

We are in receipt of your brochure on the PDP-1 Data Processor.

We are contemplating the establishment of a service bureau for Las Vegas and are now running a survey on small computers to use in this service.

The local processing market is almost entirely in the form of punched tape with one large chain store presently processing out of state, about 100,000 store items per week. The tape is the product of Monroe - Sweda point-of-sales registers.

The required printed page output is an accumulation and sorting by item, of department store sales. The point-of-sales tapes can code up to 999 item numbers with sell price.

The required processing is merely a total by item number summary, on a daily, weekly, and 30 day accumulative basis.

The present processing is being handled by a Monroe Distributape which of course cannot really be considered a computer.

We are seeking a computer with input from punched tape and output to printed page, expandable to card and magnetic tape input and output as the need arises. For this reason we have ruled out the Distributape as not being flexible enough.

It would please us to receive your rental and sell prices on your PDP-1 or your comments on how the PDP-1 would fit into a service bureau. We would like to talk to your representatives concerning the possibility of establishing a PDP-1 as a service bureau computer.

Sincerely yours,
SYSTEMS DESIGN CORPORATION

Charles D. Pettis

INTEROFFICE MEMORANDUM

DATE 4-4-62

SUBJECT Procedures for Updating PDP-1 Module Chart Drawing No. B20074

TO			FROM
	K. Olsen	J. Koudela	P. Bonner
	H. Anderson	P. Bonner	
	B. Gurley	A. Hall	
	A. Blumenthal	N. Mazzarese	
	R. Savell	B. Beckman	
	G. Bell	L. Prentice	
	J. Brown	J. Myers	
	E. Harwood	S. Lambert	
	B. Reed	T. Johnson - W. C. O.	
	M. Sandler	R. Melanson	

As of this date, any and all known changes relating to the PDP-1 Module Chart Drawing No. B20074 should be submitted to E. Harwood. Ed, in turn will submit these updatings to R. Melanson who will incorporate these changes on the chart thus necessitating periodic re-issuing of the chart. Succeeding printings of the chart will be governed directly by the rate at which changes occur.

The goal of this system is to keep this chart as current or as up to date as possible for both engineering and sales purposes.

Changes will only be accepted and incorporated by Roger upon written or verbal authorization by Ed.

INTEROFFICE MEMORANDUM

DATE April 4th, 1962

SUBJECT

TO Dick Best
Ben Gurley
Jon Fadiman
Stan Olsen
Harlan Anderson

FROM Kenneth H. Olsen

Holly Rising of Mitre Corporation (Crestview 4-9586) called me last week to see if we were interested in making a 2 microsecond memory for him. He had already talked to several other manufacturers and he found their prices were much too high. When he called back, I told him that we were interested, but, it would take us a while to decide on what approach we should take and to figure out whether we have the manpower or not. Ben thought we should very carefully consider this because it is so much in line with what we wanted to do anyway and so I invited them out to meet with us on Thursday, April 5th at 1:30 pm.

They want about 22 or 24 bit word length and 4,000 words. He would need about two of these units.

I think it would be a good idea if we looked over what cores are available and what transistors would be used to see if we should encourage this any further.

Kenneth H. Olsen

INTEROFFICE MEMORANDUM DATE: April 3, 1962

SUBJECT: Foxboro Specifications Meeting Thursday, March 29, 1962 - For Nabisco

TO: Ben Gurley
Ken Olsen
Harlan Anderson
Robert Beckman
Jon Fadiman

FROM: Gordon Bell

Ben Gurley, Jon Fadiman, George Rice and I met with Saul Dinman and Ralph Gymon of Foxboro.

We agreed on the technical specifications and a revised copy will be shortly forthcoming. Dick Sonnafild, manager of the Digital Systems Group of Foxboro, wrote the clauses of disagreement regarding acceptance, maintenance, and warantee and they are:

ACCEPTANCE

Prior to shipment, DEC will satisfactorily demonstrate the operability of the system on the vendor's premises. The operability will again be demonstrated upon arrival at the Natick plant.

System acceptance will be demonstrated by the running of a system program in conjunction with a system simulator to be supplied by Foxboro, Natick. The test will be run at Natick.

MAINTENANCE

DEC will provide service and parts for maintaining the digital equipment while it is at Natick on an on-call basis.

WARRANTY

The warranty period starts from the arrival of the equipment at its final destination in Chicago and is the standard DEC warranty.

I propose:

1. The acceptance test must be run at DEC according to our criteria, or specified by Foxboro.

2. Interface tests can be made either with the Foxboro Simulator or on a simplified DEC simulator - tester at DEC.

3. Warantee begins with delivery.

Revised specifications are to be forthcoming and a meeting is to be held on Thursday, April 5, 1962.

INTEROFFICE MEMORANDUM DATE: April 3, 1962

SUBJECT: Adams Associates Proposal for PDP-4 Utility System

TO: Ben Gurley
Harlan Anderson
John Koudela
Harrison Morse

FROM: Gordon Bell

The following proposal was sent to me by Jack Gilmore.

A price will be forthcoming which is supposedly $30,000 - $40,000 and represents 10 - 14 man months.

Ed Fredkin entends to propose an assembly program and writeup.

The enclosed proposal is sent without comment for future use in decision making.
