The 7030 Data Precessing System is a very large, high speed data proceasing system designed to expleit new technoloylay and advanced developments in both components and aystemy organization. It is designed to fulfill three basic markets.

1. Computing, largely ecientific in zature, requiring vary high speed and large capacity. This includes:
a) Atomic Energy - Applications involviag the cosign and 3imulation of nuclear weapons and reactors.
b) Aircraft - Applications invoiving the dewifn and simulation of aircraft power plants and airframes, the simulation of control syatems, flutter analyais, wind tuanel data reduction, advanced rocket and ballistic missle destin, complex astronomical studies dealing with orbital calcuiations and apace navigation.
c) Military Applicetions - applications involviny the design and simulation of real time and/or direct deta fant systems and the syatems charaselves. The varioum "L' sywtems contractis now being negotiated by the Departanm of Defense typify thene applications.
2. Data Processing requiring either larger capacitit: than are available with the samaller 7000 seriee machines or:
a) The inventory control problems often associnted with Federal Government activities.
b) Real time production control of large single or multiple production facilities.
c) Cooperative multiple cuatomer installations.
d) Data Processing combined with large oxmputim, applicationt.
3. The special contract with the Atomic Energy Cornmis aion and the preposed contract with BuShips.

The growth of data processing and the concerrent: retolution in methods and techniques has bsen rapid and axtonsive. Maty of cur custemers have found that their long range computing requirenuente ard developing more rapidly than was previously expected. These requiremeats exceed the capacities of our currently available equipment. The IFM 7030 Data Processing System is designed to satisfy this maricet.
