These models have not only allowed us to codify our knowledge about individual electronic systems but also to approach the task of estimating semiconductor consumption using a bottom-up forecast method. This method was used for the forecast and will be used for future forecasts. The method essentially involves building a forecast of semiconductor consumption for all electronics production by leveraging estimates of semiconductor consumption for individual electronic systems. Dataquest uses individual systems estimates as a forecast base and augments this with estimates of semiconductor consumption for other electronic equipment categories not tracked individually. Precisely because the method uses well-researched knowledge about individual electronics systems that dominate semiconductor consumption, Dataquest believes it is capable of providing far better forecasts of semiconductor consumption than our former top-down method, especially for electronic equipment categories such as computers, where individual systems forecasts account for virtually the entire category.

This change to a new method has a number of consequences. Dataquest has, at least temporarily, eliminated forecasts of specific semiconductor device consumption by electronic application. Although informative, these forecasts were largely an artifact of our old top-down method. Recent research indicates that these forecasts were especially sensitive to the assumptions and balancing conditions of our top-down method. We are still in the process of developing semiconductor device detail for many of the individual systems forecasts that now serve as the basis for our new bottom-up method.

 ©1998 Dataquest

Consequently, our systems forecasts have yet to reach the point at which they can be leveraged to provide reasonable consumption forecasts for specific semiconductor devices. We hope to reinstate device consumption forecasts as soon as possible according to this bottom-up method. In the meantime, we trust that readers will find the added electronics system detail we can now offer in our forecast adequate compensation.

More important, Dataquest no longer insists that estimated semiconductor consumption equal the forecast of semiconductor shipments. In truth, our long-standing insistence that consumption estimates equal shipment estimates was more a matter of mathematical necessity than a reflection of market realities. There are several reasons why semiconductor consumption as we estimate it may differ from a forecast of semiconductor shipments. First, there can be significant slippage between semiconductor shipments and semiconductor consumption by electronics producers over short periods because of changes in the semiconductor inventories held by electronic producers. Electronics producers naturally adjust their semiconductor inventories in response to expected changes in their level of production. Although just-in-time practices are reducing producers' inventories, the continued existence of inventories means semiconductor shipments and consumption may differ.

Second, not all semiconductor shipments are consumed by electronics producers manufacturing new electronics. Some find their way into so-called "aftermarkets" where they are eventually "consumed" by existing electronics. Dataquest excludes aftermarket activity from the estimates of semiconductor consumption. Aftermarket consumption is virtually impossible to track and, in any event, appears to be small relative to the consumption generated by electronics producers. Finally, Dataquest's estimates of both electronics production and semiconductor consumption no doubt suffer from errors of omission. We know our estimates probably exclude at least some current semiconductor applications and certainly exclude more than a few applications that cannot be anticipated now. We have good reason to believe these omissions are minor. Still, they represent yet another reason why estimated semiconductor consumption may differ from forecast semiconductor shipments.

It nonetheless seems reasonable to expect that estimated semiconductor consumption and forecast semiconductor shipments will closely parallel one another, especially over the long term. As already noted, semiconductors are first and foremost intermediate inputs to the production of electronics. Growth in semiconductor shipments is ultimately fueled by growth in the semiconductor consumption generated by electronics production. Growth in the semiconductor consumption of electronics producers is, in turn, fueled by growth in both the volume and semiconductor content of electronics production. In the end, all growth in semiconductor shipments can be attributed to growth in one or the other of these key consumption drivers. Estimation errors aside, persistent differences between estimated semiconductor consumption growth and forecast semiconductor shipment growth prefigure a demand/supply imbalance in the semiconductor market.

©1998 Dataquest

In the past, Dataquest's top-down method obscured potential semiconductor market imbalances by assuming that estimated semiconductor consumption must equal forecast semiconductor shipments. The beauty of the bottom-up method is that we can offer important insights into the future of the semiconductor market. We realize that separate forecasts of semiconductor consumption and semiconductor shipments have the potential to create confusion. However, Dataquest believes that separate forecasts may actually help clarify semiconductor market movements by revealing potential market imbalances.

Forecast Highlights

Dataquest estimates that worldwide semiconductor consumption will increase by 10.7 percent in 1998 to about $160.6 billion. Dataquest expects approximately two-thirds of this growth will come about because of growth in worldwide electronics production, which is now forecast to grow 6.9 percent in 1998 to about $968.9 billion. The remainder will be the result of expected growth in the average semiconductor content of electronics, which we forecast will increase to about 16.6 percent of electronics factory value. Longer-term, we estimate worldwide semiconductor consumption will average 12.2 percent annual growth through 2002. This should raise worldwide semiconductor consumption to about $257.6 billion by 2002. Dataquest expects slightly over half of the longer-term growth in worldwide semiconductor consumption to come about because of growth in worldwide electronics production, which we are now forecasting to average 6.6 percent annual growth through 2002. Once again, remaining growth in semiconductor consumption will be the result of increases in the average semiconductor content of electronics. We now expect average semiconductor content will rise to about 20.6 percent of electronics factory value by 2002.

Japan currently ranks as the world's second-leading regional consumer of semiconductors. Asia/Pacific, in turn, ranks third just ahead of our Europe, Middle East, and Africa region. Dataquest expects at least one if not two significant changes in this ranking as time progresses. It now looks very probable that Asia/Pacific will overtake Japan as the world's No. 2 regional consumer of semiconductors by 2002. An additional possibility is that Europe, Middle East, and Africa will also overtake Japan before the end of the forecast period, placing Japan last among the regions as a semiconductor consumer. These changes appear inherent in the markedly different consumption growth rates anticipated for each region. We are now forecasting Japanese semiconductor consumption will grow just 1.9 percent in 1998. This compares to anticipated growth rates of 17.6 percent for Asia/Pacific and 10.6 percent for Europe, Middle East, and Africa. Longer-term, Japanese consumption is expected to average just 8.8 percent annual growth between 1997 and 2002 as opposed to 16.3 percent for Asia/Pacific and 12.8 percent for Europe, Middle East, and Africa. (Note: All our forecasts are valued in U.S. dollars and thus reflect projected exchange rate movements in addition to expected changes in semiconductor consumption expressed in local currencies.) Underlying these marked differences in long-term growth are equally marked differences in expected sources of growth.

©1998 Dataquest

About 80 percent of Japan's longer-term consumption growth is forecast to come from increases in semiconductor content. In contrast, just over 70 percent of Asia/Pacific's longer-term consumption growth is expected to come from growing electronics production. For Europe, Middle East, and Africa, consumption growth will come from a more equally balanced combination of production growth and increased semiconductor content.

We need to note that our regional forecasts, especially for Japan and Asia/Pacific, are considerably more tentative than usual. Ongoing economic and political events in Japan and Asia/Pacific, some quite dramatic, have introduced significant uncertainty into our forecasts. In particular, Dataquest believes there is much greater potential for downward deviations from our forecasts than in the past. Readers should keep this in mind when using and interpreting our results.

As discussed earlier, this forecast represents an effort to independently forecast semiconductor consumption, free of the assumption that semiconductor consumption must always and everywhere equal semiconductor shipments. At least for the near-term, our semiconductor consumption forecasts generally agrees with our recently published forecast of semiconductor shipments. According to the latter, semiconductor supplier shipments are expected to increase 8.2 percent in 1998 to about $159.2 billion. This compares quite well to our forecast of a 10.7 percent increase in semiconductor consumption to about $160.6 billion for 1998. Given that the downside risks of ongoing turmoil in Japan and Asia/Pacific threaten our forecast, we would not be surprised to see semiconductor consumption growth move into even closer agreement with the growth currently expected for semiconductor shipments as 1998 progresses. In fact, there is a significant chance that both semiconductor consumption and semiconductor shipments growth will fall well below 8 percent before the year is out because of continuing troubles in Japan and Asia/Pacific.

Longer-term, there is significant disagreement between our two forecasts. According to Dataquest's semiconductor shipments forecast, semiconductor shipments are expected to average 14.4 percent annual growth through 2002. If realized, that would raise the value of semiconductor shipments to $287.9 billion by 2002. Recall that semiconductor consumption is forecast to average 12.2 percent annual growth through the forecast period so that it reaches $257.6 billion by 2002. As noted earlier, semiconductor consumption may reasonably differ from semiconductor shipments on several accounts. But even after due consideration of these factors, the $30.3 billion difference between our forecasts for semiconductor consumption and semiconductor shipments appears excessive. The difference suggests there is likely to be a sizable oversupply of semiconductors around 2002. We would especially urge semiconductor suppliers to consider this a distinct possibility and to ponder its consequences.

©1998 Dataquest

There is a strong desire among suppliers to believe that semiconductor shipments, and with them semiconductor revenue, can continue to post high rates of long-term growth. But this desire needs to be tempered with the recognition that long-term shipments growth is only possible so long as electronics makers are able to profitably increase semiconductor consumption, either by expanding electronics production or increasing semiconductor content. A number of fundamental changes are taking place in several key electronics markets that will limit the future ability of electronics makers to profitably increase semiconductor consumption. Semiconductor suppliers would be well advised to acknowledge these emerging limits since failure to do so will only intensify competition and further imperil both future shipment and revenue growth in Japan.

Chapter 1
Japanese Electronic Equipment Production Forecast

Introduction

Electronic equipment production is an important determinant of semiconductor market activity. This is true because semiconductor demand is derived, in part, from the underlying demand for the systems that use semiconductors. That is, the demand for semiconductors is a positive (or increasing) function of the demand for electronic systems. Therefore, forecasting electronic systems production is an essential component of assessing expected semiconductor market activity.

This document contains tables detailing the spring 1998 electronic equipment production forecast. Japanese production is estimated for the years 1992 to 2002. Production tables contain both historical data and forecasts. In most tables, historical data begins with 1992 and ends with 1997, while forecast data provides estimates for 1998 through 2002. The tables detail the type of production data by application market.

Definitions and Conventions

The objective of analyzing electronic systems production activity is to estimate the important implications for semiconductor consumption. Therefore, generalized economic concepts such as production and consumption are tailored to isolate these implications.

The value of production is estimated as factory revenue. Dataquest defines factory revenue as the exchange value of the commodity transaction between the original equipment manufacturer and the point of entry into distribution. In the case of a direct sale that involves no distribution, as is the case with military systems, factory revenue is equal to the final user cost, net of sales taxes.

Production is the value-adding process by which the factors of production (labor and capital) and material input are transformed into the goods and services that are desired for consumption and investment. As such, production can span both time and geography. For example, a Japanese color television company may minimize its cost of production by manufacturing its products (that is, consuming chips) in Asian countries. Dataquest would estimate this as Asia/Pacific production, because we are interested in that portion of the production process that relates specifically to semiconductor consumption. Production would be valued as the exchange value of the transaction between the Japanese company's Asian operations (which is factory revenue) and the European distributor or final user.

©1998 Dataquest

Electronic equipment is divided into the following six semiconductor application markets and is further divided into the designated segments. Japanese production is further divided into specific types of equipment systems.

- Data processing
  - Computers
  - Data storage
  - Input/output
  - Dedicated systems
  - Other data processing
- Communications
  - Premise telecom
  - Public telecom
  - Mobile and radio communications
  - Broadcast and studio
  - Other telecom
- Industrial
  - Security and energy management
  - Manufacturing systems/instrumentation
  - Medical equipment
  - Other industrial
- Consumer
  - Audio
  - Video
  - Personal electronics
  - Appliances
  - Other consumer
- Military and civil aerospace
- Transportation
  - Entertainment
  - Control unit
  - Safety and convenience

Data Sources

The historical information presented in the production data has been consolidated from a variety of sources, each of which focuses on a specific part of the market. These sources include the following:

- Japanese production statistics compiled and published by the Ministry of International Trade and Industry (MITI)

- Estimates presented by knowledgeable and reliable industry spokespersons
- Published product literature and prices

Dataquest believes that the estimates presented here are the most accurate and meaningful generally available today.

Valuation of Production

Japanese production is expressed in Japanese yen and translated into U.S. dollars. To make the worldwide tables in this document useful in comparing different regions, it is necessary to express all values in a common currency, and Dataquest chose the U.S. dollar for convenience. However, the choice of the U.S. dollar or any other currency brings with it some problems that require the readers' careful consideration in interpreting the data, as follows:

- Inflation and deflation—No adjustment has been made in the historical or forecast data to account for the effects of past inflation or deflation or for possible future inflation or deflation. Production is expressed in current dollars (that is, dollars that include the effects of inflation and changes in exchange rates).
- Exchange rates—When forecasting electronic equipment production, it is important to ensure consistency and continuity so that we maintain exchange rates at constant 1998 calendar year values. This prevents any inconsistencies in the conversion of growth projections and currency fluctuations. The estimates in this Market Statistics report are generated primarily on a yen basis and then converted to U.S. dollars. The preliminary 1998 exchange rate estimate is based on actual exchange rates through December 1997, and we assume that the December rate applies for all the future months.

Japanese Electronic Equipment Production Definitions

Data Processing Equipment

Defined as computers, data storage, terminals, input/output, dedicated systems, and other data processing, as follows:

- Computers include general-use computers, office-use computers, personal-use computers, and control-use computers.
- Data storage includes rigid disk drives, flexible disk drives, other drives, and other data storage.
- Input/output includes printers, display units, other input/output units, general-use terminals, terminals for special use, and terminals for supporting systems.
- Dedicated systems include calculators, cash registers, copying machines, typewriters, word processors, and other dedicated equipment.
- Other data processing includes PC cards, single in-line memory modules (SIMMs), and other data processing equipment.

 ©1998 Dataquest

Communications Equipment

Defined as premise telecom, public telecom, mobile and radio communications, broadcast and studio, and other communications, as follows:

- Premise telecom includes telephones (standard, multifunction, cordless, PHS, and others), applied telephone, facsimile, PBX telephone systems, key telephone systems, and modems.
- Public telecom includes carrier transmission equipment and central office switching.
- Mobile and radio communications includes radio communications (radio base station equipment, mobile radio equipment, and mobile communications equipment) and applied radio equipment.
- Broadcast and studio includes all electronic equipment used to make information public by means of radio and television.
- Other communications includes communications control units and other communications equipment.

Industrial Equipment

Defined as security and energy management, instrumentation, manufacturing systems, medical equipment, and other industrial equipment, as follows:

- Security and energy management includes alarm systems (intrusion detection and fire detection) and energy management (air conditioners for industrial use).
- Manufacturing systems/instrumentation includes NC machines, robotics, ultrasonic applied equipment, metering units, measuring instruments, industrial meters, and other instrumentation equipment such as analyzers.
- Medical equipment includes X-ray systems, measuring systems, and other medical equipment such as radioisotope equipment.
- Other industrial includes vending machines, automatic service equipment, commercial-type washers, electron microscopes, ultrasonic equipment, and all other industrial equipment not accounted for in the preceding segments.

Consumer Equipment

Defined as audio equipment, video equipment, personal electronics, appliances, and other consumer equipment, as follows:

- Audio includes audio amplifiers, digital audio disc (DAD) players, radios, stereo sets, tape recorders, headphone stereos, musical instruments, and other audio equipment (tuners and turntables).
- Video includes video cassette recorders (VCRs), video cameras, DVD players, color televisions, and LCD televisions.
- Personal electronics includes cameras, clocks, electronic toys, watches, and game systems and software.
- Appliances include air conditioners for home use, microwave ovens, refrigerators, and washers and dryers.

 ©1998 Dataquest

- Other consumer includes gas heaters, gas fan heaters, oil fan heaters, electric heaters, fans, electric water heaters, gas water heaters, oil water heaters, electric pots, rice cooker and rice jar combinations, gas rice cookers, sewing machines, electric irons, vacuum cleaners, and other consumer equipment.

Military/Civil Aerospace Equipment

Defined as electronic systems for defense agencies, such as communications equipment and instrumentation.

Transportation Equipment

Defined as in-car entertainment systems, control units and safety and convenience electronics.

- In-car entertainment includes FM/AM radios, radio-cassette combination systems, and car stereo cassette units.
- Control units include electronics control equipment for engine, body, and powertrain.
- Safety and convenience includes in-car equipment for safety and convenience, such as car air conditioners.

Chapter 1

Final 1997 Japanese Semiconductor Market Share

Introduction

This document contains detailed information on Dataquest's view of the semiconductor market. Included in this document are the following:

- 1995-1997 market share estimates
- 1996-1997 market share rankings

Worldwide market share estimates combine data from many countries, each of which has a different and fluctuating exchange rate. Estimates of non-U.S. market consumption or revenue are based on the average exchange rate for the given year. Refer to the section titled "Exchange Rates" for more information regarding these average rates. As a rule, Dataquest's estimates are calculated in local currencies and then converted to U.S. dollars.

More detailed data on this market may be requested through Dataquest's client inquiry service. Qualitative analysis of this data is provided in the Dataquest Perspectives.

Segmentation and Definitions

A detailed explanation of device segmentation and related definitions is contained in the Semiconductor Market Definitions Guide (SCND-WW-GU-9801).

Market Share Methodology

Dataquest uses both primary and secondary sources to produce market statistics data. In the fourth quarter of each year, Dataquest surveys all major participants within each industry. Selected companies are resurveyed during the first quarter of the following year to verify final annual results. This primary research is supplemented with additional primary research and secondary research to verify market size, shipment totals, and pricing information. Sources of data used by Dataquest include the following:

- Information published by major industry participants
- Estimates made by knowledgeable and reliable industry spokespersons
- Government data or trade association data (such as WSTS, MITI, and U.S. DOC)
- Published product literature and price lists
- Interviews with knowledgeable manufacturers, distributors, and users
- Relevant economic data
- Information and data from online and CD-ROM data banks
- Articles in both the general and trade press

©1998 Dataquest

- Reports from financial analysts
- End-user surveys

Dataquest believes that the estimates presented in this document are the most accurate and meaningful statistics available.

Despite the care taken in gathering, analyzing, and categorizing the data in a meaningful way, careful attention must be paid to the definitions and assumptions used herein when interpreting the estimates presented in this document. Various companies, government agencies, and trade associations may use slightly different definitions of product categories and regional groupings, or they may include different companies in their summaries. These differences should be kept in mind when making comparisons between data and numbers provided by Dataquest and those provided by other sources.

Notes on Market Share

In the process of conducting data collection and preparing market statistics information, Dataquest will sometimes consolidate or revise a particular company, model, series, or industry's numbers. In this section, we explain any such changes contained within this document for your reference.

Notes to Market Share Tables

1. Cyrix was acquired by National Semiconductor in 1997.

2. National Semiconductor divested itself of Fairchild in 1997.

3. National Semiconductor's 1997 revenue includes all of Cyrix's 1997 revenue and part of Fairchild's calendar first quarter revenue.

4. Power Innovations was formed through the acquisition of the Power Semiconductor interests of Texas Instruments.

5. Melexis was formerly known as Elex.

6. Micronas acquired ITT in 1997.

7. The following companies were added to the market share database in 1997:

- Fairchild
- Vitesse
- TriQuint
- Power Innovations
- Robert Bosch
- Stanley

8. Toko is now tracked in other Japanese companies.

9. IBM's 1996 revenue was restated in 1997.

 ©1998 Dataquest

Exchange Rates

Dataquest uses an average annual exchange rate in converting revenue to U.S. dollar amounts. Table 1-1 outlines these rates for 1995 through 1997.

Table 1-1
Exchange Rates

	1995	1996	1997
Japan (Yen/U.S.$)	93.90	108.81	121.10
France (Franc/U.S.$)	4.97	5.12	5.84
Germany (Deutsche Mark/U.S.$)	1.43	1.50	1.73
United Kingdom (U.S.$/Pound Sterling)	1.59	1.56	1.64

Chapter 1
Executive Summary

Scope of This Report

This report analyzes the following Japanese semiconductor user trends in 1997:

- Overall electronic equipment production and semiconductor consumption trends in Japan
- Electronics production trends of 22 major Japanese semiconductor users
- Semiconductor purchasing trends of each of the 22 companies

Chapter 2 discusses electronic equipment production trends, focusing on four major categories: data processing, communications, industrial, and consumer. Chapter 3 analyzes semiconductor purchasing trends in 1997 for the 22 top-ranking semiconductor users as a group. Chapter 4 discusses the company profile of each semiconductor user, noting major electronic products by category as well as semiconductor purchasing trends, and ends with a "Dataquest Perspective" section.

Research Methodology and Definitions

This Focus Report analyzes the results of Dataquest's recent survey of Japanese semiconductor users. To arrive at the estimates in this report, Dataquest conducted extensive research into semiconductor purchasing practices in the Japanese market. Also incorporated into the estimation is public information on each semiconductor-user company, regarding both electronic equipment production trends as well as semiconductor usage. Based on primary information, Dataquest has estimated the semiconductor purchasing trends of major Japanese companies for 1996 and 1997. All numbers are shown in Japanese yen unless otherwise stated.

The definitions used in this report are as follows:

- Semiconductor consumption—This refers to the number of semiconductors actually used in electronic systems manufactured by user companies.
- Semiconductor purchasing—This refers to the number of semiconductors purchased by user companies. Regional semiconductor consumption discussed in this report refers to the number of semiconductors booked and billed in each region, based on user location.
- Data processing—This is defined as computer systems, data storage, input/output devices, dedicated systems, and other data processing equipment.
- Industrial—This is defined as security/energy management systems, manufacturing systems/instruments, medical equipment, and other industrial equipment.

©1998 Dataquest

- Communications—This is defined as premise telecom equipment, public telecom equipment, mobile communications equipment, broadcast and studio equipment, and other telecom equipment.
- Consumer—This is defined as audio equipment, video equipment, personal electronics, appliances, and other consumer equipment.
- Military and civil aerospace—This is defined as military and civil aerospace electronic equipment.
- Transportation—This is defined as in-car entertainment, body control electronics, power train systems, and safety and convenience systems.

Highlights of the Report

The major points discussed in this document include the following:

- In 1997, while electronics equipment production in Japan grew 7.8 percent, semiconductor consumption in Japan recorded modest growth of 5.7 percent.
- The 22 top-ranking Japanese electronics companies together increased semiconductor purchasing by 2.4 percent in 1997. Individually, however, some leading companies, such as Hitachi and Mitsubishi Electric, decreased their semiconductor purchasing.
- Comparatively strong growth (more than 8 percent) in semiconductor purchasing was seen in the communications category; this was mainly due to a rise in the unit production of that type of equipment, including digital cellular phones and other wireless communications systems.
- Modest growth (approximately 4 percent) in semiconductor purchasing was seen in the data processing category; this was mainly due to an increase in the unit production of computer peripherals and dedicated systems.
- Several products in the consumer category, such as the digital video camera (DV-C) and digital still camera (DSC), recorded strong growth in production, but semiconductor purchasing of consumer equipment was down by 2.4 percent in 1997.
- While production of automotive navigation systems was growing rapidly, semiconductor purchasing trends in the transportation category declined by 1.6 percent in 1997; this was mainly due to sluggish sales and decreases in price.

Project Analyst: Motoya Ohgami, Yoshihiro Shimada, and Hiroyuki Shimizu

Chapter 2
Japanese Electronic Equipment Production and Semiconductor Consumption

In 1997, after a temporary surge in domestic demand prior to the consumption tax hike in April, the Japanese economy was beleaguered by turmoil in the financial system, a decline in consumer expenditure, and a slowdown in capital spending. The economic hardship was amplified by the Asian financial crisis (AFC) toward the year-end.

In 1997, against all of the economic backlash in Japan as well as in Asia/Pacific, electronic equipment production showed stronger growth than expected: 7.8 percent over 1996, reaching ¥23,715 billion (see Figure 2-1 and Table 2-1). Cellular phones contributed greatly, fueled by a series of price cuts and the shift in demand from personal handyphone systems (PHSs). Data processing equipment also outgrew the forecast, despite a slowdown in domestic PC shipments, and consumer equipment added some momentum, which came from video game systems and digital equipment.

The following section provides detailed analysis of electronic equipment production in Japan for the four major categories: data processing, communications, industrial, and consumer.

Japanese Electronic Equipment Production by Application, 1996-1997 (Billions of Yen)

Application	1996	1997
Data Processing	6,811.7	7,379.9
Communications	4,042.2	4,844.2
Industrial	3,647.5	3,908.4
Consumer	6,018.5	6,097.8
Military/Civil Aerospace	197.4	195.0
Transportation	1,283.4	1,290.1
Total Electronic Equipment	**22,000.7**	**23,715.4**

Note: Columns may not add to totals shown because of rounding.
Source: Dataquest (October 1998)

Data Processing Equipment

In 1997, data processing equipment production revenue in Japan soared 8.3 percent to ¥7,380 billion (see Figure 2-2). While PC shipments to the domestic market slowed down to less than 5 percent on a unit basis, the price decline spurred the purchase of peripherals such as printers and display units. Also, storage devices led by high-speed optical disc drives—24x-to-32x CD-ROM and CD-R drives and newly introduced DVD-ROM drives, for example—enjoyed strong growth. This segment is expected to drive the market during the forecast period.

These trends affected various system vendors in this category, such as Canon and Seiko Epson, which are very well known for computer peripheral products such as printers. NEC, Toshiba, and SANYO decreased their semiconductor purchasing mostly because of price cuts and sluggish production. Fujitsu and Matsushita Kotobuki increased their semiconductor purchasing, owing much to the production increase of hard disk drives (HDDs) and CD-ROMs.

Communications Equipment

In 1997, communications equipment production revenue jumped 19.8 percent to ¥4,844 billion (see Figure 2-3). A prime driver was mobile communications equipment; subscribers grew much faster than expected, recording a net increase of 10 million in 1997. While PHS production decelerated by 7 million units in 1997, the market is expected to expand and shift its focus from personal to office use. Nevertheless, the penetration of mobile phones combining PHS and personal digital cellular (PDC) phones has surpassed 30 percent in Japan, and continuation of the previous high growth in domestic demand has become inevitably difficult. Meanwhile, the digitization of infrastructure facilities by Nippon Telegraph and Telephone (NTT) was completed at the end of 1997. This can be translated into the end of robust growth in infrastructure equipment production.

These trends affected system vendors in this category, such as Matsushita Communication, NEC, and Mitsubishi Electric—the top three vendors in the domestic market for digital cellular phones.

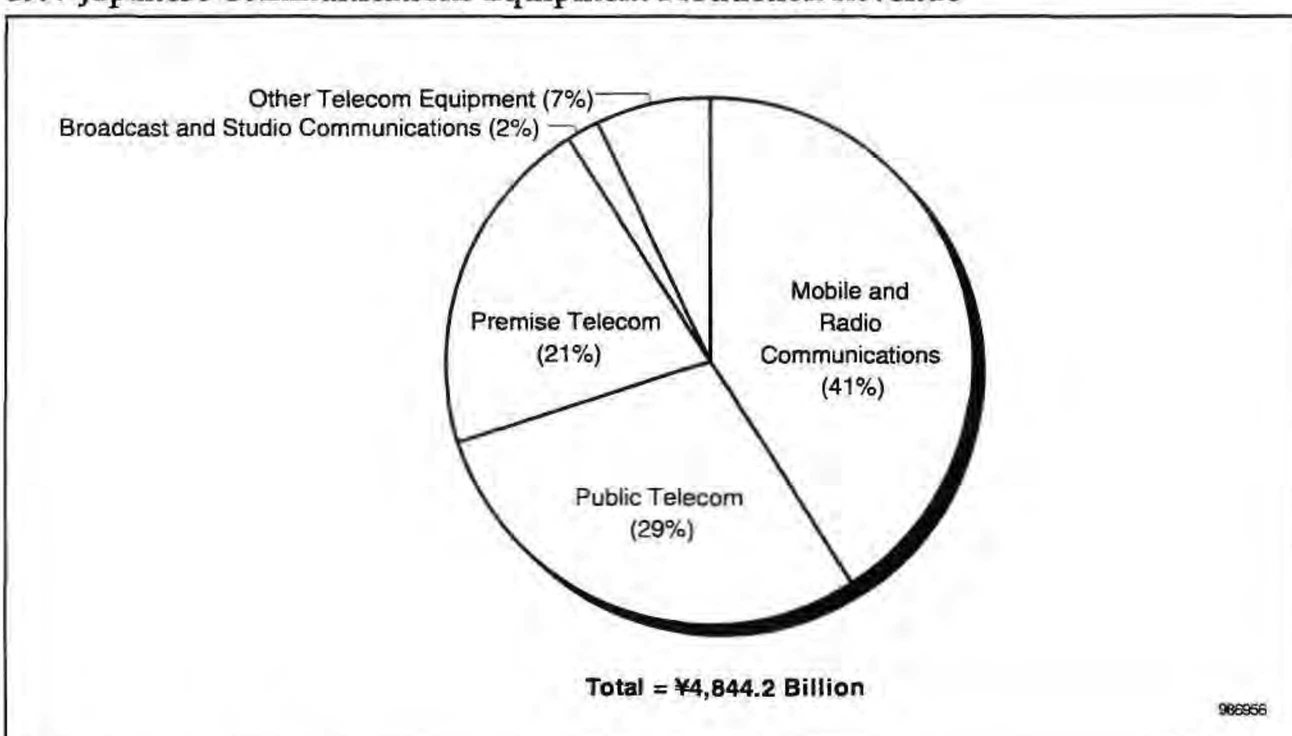
Figure 2-3
1997 Japanese Communications Equipment Production Revenue



Source: Dataquest (October 1998)

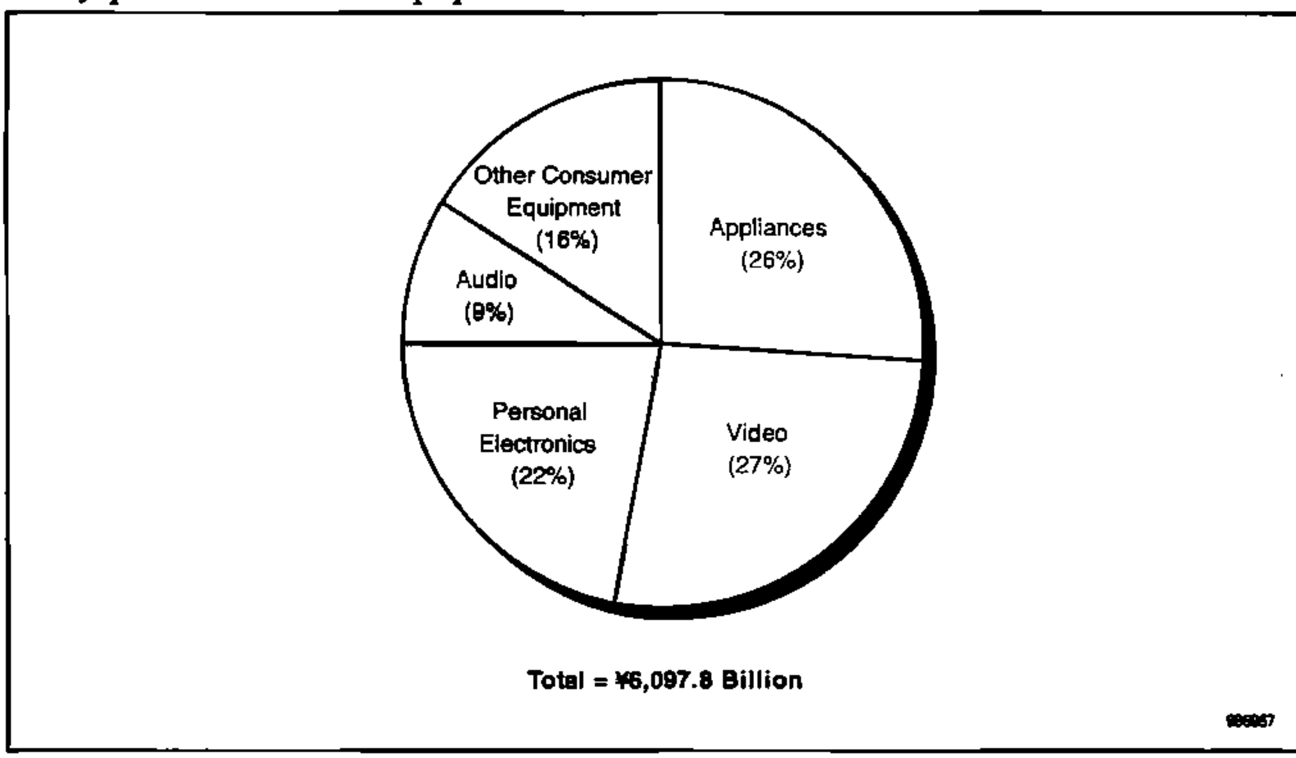
 ©1998 Dataquest

Consumer Equipment

Consumer equipment production revenue recorded a 1.3 percent increase in 1997, reaching ¥6,098 billion (see Figure 2-4). In the video equipment segment, where TVs and VCRs sold in the domestic market are made mostly overseas, replacement demand for wide-screen TVs produced at domestic sites contributed greatly. In the digital consumer equipment market, DV-Cs recorded notable growth, and unit shipments at the end of 1997 were estimated at slightly below 1 million. The DV-C quickly will become pervasive, driven by price declines and the improved availability of key components. Similarly, DSCs will ramp up rapidly because they can be easily connected to PCs or TVs via a flash memory card or standard serial interface. In the audio equipment segment, a sudden rise in demand for minidiscs (MDs) has spurred the introduction of various systems equipped with MD drives. TV games continued to expand the market, helped by price cuts.

These trends affected system vendors in this category, such as Victor Company of Japan, Sony, and Nintendo.

Figure 2-4
1997 Japanese Consumer Equipment Production Revenue



Source: Dataquest (October 1998)

Industrial Equipment

Industrial equipment production revenue in 1997 was up 7.2 percent, totaling ¥3,908 billion (see Figure 2-5). Among the segments in this category, manufacturing systems and instruments recorded the highest growth rate, with 14.9 percent. As the wave of production site relocation to Asia/Pacific countries subsides, the focal point of the market will shift to computerization and sophistication for adding value and further automation for new products.

These trends affected system vendors in this category, such as Hitachi, Toshiba, and Mitsubishi Electric; these big companies did not contribute much to the growth of semiconductor purchasing in this category in 1997.

Semiconductor Market

Thus, even in the year when the overall gross domestic product (GDP) in Japan recorded negative growth, electronics production increased fairly well. This gain in electronics production, however, did not mean as robust of an increase in semiconductor purchasing in Japan.

In 1997, the Japanese semiconductor market recorded a growth rate of 5.7 percent over the previous year—the only negative growth rate on a dollar basis among the four regional markets in the world: the Americas, Europe, Asia/Pacific, and Japan. The difference in trends between electronics production and semiconductor consumption was caused by two factors: An increase in electronics production took place in categories with lower semiconductor contents, such as industrial equipment, and the price erosion of semiconductor devices betrayed the increase on a unit basis. Also, PC shipments lost momentum in Japan, exerting a negative impact on the consumption of a variety of semiconductor products, including memories, microprocessors (MPUs), and logic.

As a result, the Japanese semiconductor market has become less than one-fourth of the worldwide market for the first time since 1980. It is still the second-largest regional market following the Americas, but both European and Asia/Pacific markets are close behind. In fact, there were months within 1997 when the Japanese semiconductor market fell behind those two markets.

Affecting this is the sluggishness in the domestic market as well as the fast growth in other regions, especially in the Americas and Europe. Semiconductor procurement to support Japanese electronics companies' Asian production sites has moved to each site or to international purchasing offices (IPOs) outside Japan, and the yen depreciation observed in 1997 did not reverse the trend.

Japanese semiconductor consumption by application category in 1997 is given in Figure 2-6.

Chapter 3
Japanese Semiconductor User Trends by Application

This chapter analyzes Japanese semiconductor consumption by application categories, focusing on the 22 top-ranking companies.

It should be noted that the semiconductor purchasing estimated in this report was measured as the amount of semiconductors booked and billed within Japan, regardless of where the bought semiconductors were actually mounted to circuit boards and systems. This implies that if the Japanese electronics companies analyzed here chose to buy semiconductors in Japan and then send them to their overseas production sites, that amount is still included in the semiconductor purchasing in Japan. Therefore, the semiconductor purchasing in this report may not equal semiconductor consumption in the true sense of the word. In Dataquest's methodology, however, even that portion of semiconductor purchasing is regarded as part of the "consumption," measured as the semiconductor companies' aggregated shipments into the Japanese market.

Table 3-1 and Figure 3-1 show the ranking of 22 major semiconductor-user companies based on their semiconductor purchasing trends in 1997. The top three users were NEC, Sony, and Fujitsu. The development of systems targeted at the domestic market tends to be conducted within Japan. The tendency is clearer in areas such as communications, where the differences in each country's format are so conspicuous—to the level of being incompatible with each other—that system development needs to be done within the country or region of its use. On the other hand, consumer electronics have been developed in Japan to be shipped to export markets, resulting in a large number of developed and produced systems.

Data Processing

In this category, there are several products that contribute to the growth of semiconductor purchasing; they are mainly PC peripherals such as printers, monitors, digital copy systems, multifunctional dedicated machines, and optical disc storage, such as CD-ROM/R/RW and DVD players. Table 3-2 and Figure 3-2 show semiconductor purchase ranking in the data processing equipment area. Fujitsu, NEC, and Toshiba have sizable amounts of computer business, resulting in large purchase numbers. Canon follows the top three companies with its expertise in copiers and computer peripherals.

Communications

In the communications area, wireless communications and LAN/WAN equipment, including hubs, switches, and routers, are increasing in production volume, consuming an increasing portion of the semiconductors shipped worldwide. In Japan, the rapid growth in digital cellular phones helped vendors of both handsets and base stations. This contributed to increases in semiconductor consumption at companies such as Matsushita Electric, Sony, Toshiba, and Denso, some of which may not have been giants in the communications area but are growing fairly well in production. Table 3-3 and Figure 3-3 show the Japanese semiconductor purchase ranking of communications equipment.

Table 3-3
Japanese Semiconductor Purchase Ranking of Communications Equipment, 1996-1997 (Billions of Yen)

1997 Rank	Company	1996	1997	Change (%)
1	NEC	113.1	122.8	8.6

Consumer

In the consumer equipment area, Sony, Nintendo, and Matsushita Electric lead other companies by far. In the sluggish domestic market, MD has been showing an accelerating growth, pulling demand for other audio systems as well. Other digital consumer equipment, such as digital camcorders and DSCs, grew, too, and contributed to the semiconductor purchasing of those vendors. Table 3-4 and Figure 3-4 show the Japanese semiconductor purchase ranking of consumer equipment.

Table 3-4
Japanese Semiconductor Purchase Ranking of Consumer Equipment, 1996-1997 (Billions of Yen)

1997 Rank	Company	1996	1997	Change (%)
1	Sony	140.7	165.1	17.3

Industrial

Overall capital expenditure in the Japanese industry declined in 1997, and manufacturing systems and instruments showed growth that was positive but smaller than that of the previous year. A drop in housing and building construction also hurt security and energy management equipment. The onset of the AFC brought down the demand for infrastructure-related equipment for Asian countries. Leading semiconductor users in this area are Toshiba, Matsushita Electric, SANYO, Mitsubishi Electric, and Hitachi. Table 3-5 and Figure 3-5 show the Japanese semiconductor purchase ranking of industrial equipment.

Table 3-5
Japanese Semiconductor Purchase Ranking of Industrial Equipment, 1996-1997 (Billions of Yen)

1997 Rank	Company	1996	1997	Change (%)
1	Toshiba	17.4	17.5	0.6
2	Hitachi	14.0	13.0	-7.1
3	Mitsubishi Electric	12.5	12.4	-0.8

Transportation

Domestic car sales in 1997 declined by around 5 percent. However, automotive equipment production saw a slight increase in all areas except car audio/video systems. Navigation system production, especially, continued to grow very rapidly. This trend benefited the semiconductor purchasing of companies such as Sony, Pioneer Electronic, and Matsushita Electric. The production of automobiles was becoming sluggish, which affected semiconductor demand in equipment in power train and body control, such as electronic control units (ECUs) and antilock brake systems (ABSs). Table 3-6 and Figure 3-6 show the Japanese semiconductor purchase ranking of transportation equipment.

Table 3-6
Japanese Semiconductor Purchase Ranking of Transportation Equipment, 1996-1997 (Billions of Yen)

1997 Rank	Company	1996	1997	Change (%)
1	Denso	65.4	64.2	-1.8

Chapter 4

Japanese Semiconductor User Profiles

This section analyzes each of the major Japanese electronics companies as semiconductor users.

Canon Inc.

Canon is the world's leading manufacturer of cameras, and in the area of dedicated business systems, Canon's copier has a sizable share in the worldwide market. Also, Canon's coverage includes a lot of optical equipment; semiconductor manufacturing equipment, such as steppers; and computer peripherals, such as printers. About 40 percent of Canon's products are shipped to various export markets. Its domestic sales grew in segments such as computer peripherals; multifunctional products such as copiers, fax machines, and printers; and handy terminals.

Canon's production sites are concentrated in Japan and so is its semiconductor usage. In digital camcorders and cameras, Canon has made every effort to differentiate its products by incorporating ASICs with proprietary system function designs.

Table 4-1 shows Canon's major electronic products. Figures 4-1 through 4-3 show Canon's equipment production and semiconductor purchase trends. Computer peripherals, such as printers and scanners, and dedicated business equipment have large shares in Canon's semiconductor purchasing.

Table 4-1
Canon's Major Electronic Products

Application	Products
Data Processing	PCs, midrange computers, flexible disk drives, terminals, laser beam printers, other printers, word processors, calculators, copiers
Communications	Multifunction phones, fax machines
Consumer	Camcorders, cameras, digital still cameras
Industrial	Manufacturing systems, test and measuring equipment

Source: Dataquest (October 1998)

Casio Computer Company Ltd.

Casio was founded to develop and market purely electric calculators applying relays used in telephone exchange systems. Later, Casio diversified its product line to include desktop and portable calculators, electric watches and clocks, LCD TVs, DSCs, and electronic musical instruments. Consumer equipment production was responsible for 52 percent of Casio's revenue, of which a large portion came from the sales of watches/clocks. Another 41 percent came from the sales of data processing equipment, including calculators, handheld computers, and peripherals. Sales of data processing equipment grew in the private-use markets, but business-use products saw a decline in sales because of a drop in unit shipments as well as in selling prices. Exports grew to represent 40 percent of the total sales. Semiconductor purchasing experienced a mild decrease, which was partly influenced by the price cuts of semiconductor devices used in data processing equipment.

Table 4-2 shows Casio's major electronic products. Figures 4-4 through 4-6 show Casio's equipment production and semiconductor purchase trends.

Source: Dataquest (October 1998)

Denso Corporation

Car air conditioners represent one-third of Denso's revenue, having the largest share among all product lines. Another one-third is accounted for by all other automotive electronics. Although Denso is expanding its product lines to areas such as communications and appliances, sales in those areas are still comparatively small. Although car production still holds the key for Denso's overall production, the company has sought a wider customer base among worldwide car manufacturers, which has helped Denso's revenue growth to show steady trends. Semiconductor purchasing has amounted to about ¥73 billion, and 88 percent of this is for transportation equipment.

Table 4-3 shows Denso's major electronic products. Figures 4-7 through 4-9 show Denso's equipment production and semiconductor purchase trends.

Fujitsu Ltd.

Fujitsu has traditionally been dependent on the domestic market. In 1997, however, while its domestic sales grew—helped by sound market share gains in PCs—its sales of data processing and communications equipment in the Americas and Europe grew rapidly, too, contributing to a decline in dependence on the Japanese market. About 70 percent of its semiconductor purchases are in the data processing area, while the communications segment is increasing its share because of increases in infrastructure business in mobile communications handsets and base stations.

Table 4-4 shows Fujitsu's major electronic products. Figures 4-10 through 4-12 show Fujitsu's equipment production and semiconductor purchase trends.

Hitachi Ltd.

Hitachi is a typical Japanese "general electric" company, having its basis on heavy-industry electric equipment and having a wide range of product offerings. Computers and communications are contributing to corporate profits. Data processing and communications products have large shares of semiconductor purchasing.

Table 4-5 shows Hitachi's major electronic products. Figures 4-13 through 4-15 show Hitachi's equipment production and semiconductor purchase trends.

Kyushu Matsushita Electric Co. Ltd.

Kyushu Matsushita has focused on the data processing, communications, and industrial areas, including factory automation (FA) equipment. One-half of its products are exported, while cordless phones are increasing in production targeted at both the domestic and overseas markets. In the FA area, the company has a wide coverage, including chip mounters. The majority of its semiconductor purchasing is in communications and peripheral equipment for export markets.

Table 4-6 shows Kyushu Matsushita's major electronic products. Figures 4-16 through 4-18 show Kyushu Matsushita's equipment production and semiconductor purchase trends.

Matsushita Electric Industrial Company Ltd.

Matsushita Electric had a difficult year in 1997. In the consumer area, audio/video equipment experienced steady sales, helped by MD and digital video equipment, while the sales of appliances such as air conditioners and refrigerators decreased. On the other hand, communications equipment experienced an increase in revenue. Contributing to that growth were fax machines, cordless phones, PDCs, and broadcasting equipment that grew with increasing sales of the new digital video format (DVCPRO) products. The majority of Matsushita's semiconductor purchasing is in consumer applications, while the highest growth rate in its semiconductor purchasing was recorded in communications.

Table 4-7 shows Matsushita Electric's major electronic products. Figures 4-19 through 4-21 show Matsushita Electric's equipment production and semiconductor purchase trends.

Matsushita Communication Industrial Co. Ltd.

Nearly one-half of Matsushita Communication's sales comes from communications equipment, including digital cellular phones for NTT DoCoMo. While the overall Japanese economy is in recession, Matsushita Communication's business has a clear focus on the growing sector of communications, showing a large increase in semiconductor purchasing, too.

Table 4-8 shows Matsushita Communication's major electronic products. Figures 4-22 through 4-24 show Matsushita Communication's equipment production and semiconductor purchase trends.

Matsushita Kotobuki Electronics Industries Ltd.

Matsushita Kotobuki has strength in storage devices such as CD-ROM, CD-R, and the emerging DVD-RAM, as well as in consumer appliances and industrial equipment. The majority of its semiconductor purchasing is in consumer equipment.

Table 4-9 shows Matsushita Kotobuki's major electronic products. Figures 4-25 through 4-27 show Matsushita Kotobuki's equipment production and semiconductor purchase trends.

Mitsubishi Electric Corporation

Mitsubishi Electric is the third-largest "general electric" company in Japan; its products range from data processing, communications, and consumer, to heavy electric and industrial products. It experienced growth in wired communications and data processing, helped by the systems integration business. However, the decline in sales in appliances, heavy electric products, and industrial products brought the overall sales down. Data processing has the largest share of semiconductor purchasing, while the largest gain was seen in communications and the largest loss was felt in the consumer segment.

Table 4-10 shows Mitsubishi Electric's major electronic products. Figures 4-28 through 4-30 show Mitsubishi Electric's equipment production and semiconductor purchase trends.

Table 4-10
Mitsubishi Electric's Major Electronic Products

Application	Products
Data Processing	PCs, midrange computers, flexible disk drives, displays, terminals, laser beam printers, other printers, word processors, calculators
Communications	Corded phones, cordless phones, PHSs, cellular phones, pagers, fax machines, modems, transmission equipment, broadcast equipment
Consumer	TVs, VCRs, camcorders, CD players, appliances
Industrial	Manufacturing systems, test and measuring equipment, medical equipment
Transportation	Navigation systems, car stereos

NEC Corporation

NEC's core business has been in the communications area, while it leads the Japanese computer industry as well. The infrastructure equipment market in various Asian countries brought increases in communications equipment production and sales as well as in domestic NTT infrastructure equipment production. NEC was positioned as the second-largest company in terms of Japanese digital cellular phone market share in 1997.

Table 4-11 shows NEC's major electronic products. Figures 4-31 through 4-33 show NEC's equipment production and semiconductor purchase trends.

Table 4-11
NEC's Major Electronic Products

Application	Products
Data Processing	PCs, workstations, mainframe computers, midrange computers, flexible disk drives, rigid disk drives, displays, terminals, laser beam printers, other printers, word processors
Communications	Corded phones, cordless phones, multifunction phones, PHSs, cellular phones, pagers, fax machines, modems, PBX equipment, transmission equipment, broadcast equipment
Industrial	Manufacturing systems, test and measuring equipment

Nintendo Corporation

Nintendo boasts a wide range of product offerings in game machines, including the 8-bit Game Boy, 16-bit Super Famicon, and 64-bit Nintendo64. In particular, 8-bit machines have experienced constant expansion in market, with their portability and inexpensive pricing. Nintendo's TV games have fared better in export markets such as the United States than in the domestic market, but Nintendo's overall exports are still small in volume. Semiconductor purchasing rose because of production increases of Nintendo64s and 8-bit Game Boys with popular games such as "Pocket Monster."

Table 4-12 shows Nintendo's major electronic products. Figures 4-34 through 4-36 show Nintendo's equipment production and semiconductor purchase trends.

Oki Electric Industries Company Ltd.

Oki has its focus on the domestic communications market, leveraging on its strong tie with NTT. Oki also sought to expand its business in midrange computers and peripherals such as printers, but the lack of integration in product offerings brought growth only to limited segments, and Oki's overall data processing business has yet to become comparable to other leading companies in Japan.

Table 4-13 shows Oki's major electronic products. Figures 4-37 through 4-39 show Oki's equipment production and semiconductor purchase trends.

Pioneer Electronic Corporation

Sales declines in laser discs and karaoke systems hurt Pioneer Electronic's overall revenue, but growth was seen in DV-Cs, MDs, DVDs, and in-car navigation systems. The company's expertise in the optical disc business has encouraged it to penetrate into business-use systems and FA equipment. It is also placing new emphasis on the video business. Pioneer Electronic also has unique product lines in cellular phones and cordless phones, but the business sizes of those areas have yet to grow.

Table 4-14 shows Pioneer Electronic's major electronic products. Figures 4-40 through 4-42 show Pioneer Electronic's equipment production and semiconductor purchase trends.

Ricoh Company Ltd.

Ricoh is a manufacturer of dedicated data processing systems. In 1997, copy machines represented nearly 70 percent of its sales. Ricoh has leveraged on image processing technologies and has become the top vendor of facsimile machines in Japan. Optical products, including cameras and DSCs, recorded two-digit growth in sales in 1997. In the area of data processing peripherals, Ricoh has developed CD-RW media drives, offering new media that enable "Write" and "Delete" in CDs. As the penetration of office-use dedicated systems becomes high, Ricoh's continuous growth in production is not so easy. Ricoh has established global production sites in countries such as the United States, Europe, and Asia, including China, resulting in a comparatively low export ratio of about one-fourth of total sales.

Table 4-15 shows Ricoh's major electronic products. Figures 4-43 through 4-45 show Ricoh's equipment production and semiconductor purchase trends.

SANYO Electric Company Ltd.

SANYO has successfully leveraged on its expertise in digital audio systems by penetrating into storage devices such as CD-ROM. Its audio technology has also helped it to develop communications products such as cordless phones and fax machines, which are growing steadily. SANYO is known to be very aggressive in seeking export markets as well as overseas equipment production. Because of this, its semiconductor purchasing in Japan has demonstrated only a constant trend, betraying its worldwide equipment revenue growth.

Table 4-16 shows SANYO's major electronic products. Figures 4-46 through 4-48 show SANYO's equipment production and semiconductor purchase trends.

Table 4-16

SEGA Corporation

SEGA has a diversified business, including game machines and software for home use, amusement machines for business use, karaoke systems, and entertainment centers (similar to a video arcade but also including restaurants, movie theaters, and so forth) with its own machines. Home-use and business-use machines each represent 35 percent of SEGA's total revenue, and 18 percent of those machines are exported. While SEGA fares well in business-use machines, including pachinko, it is losing ground in the hardware of TV games to two other large competitors. As a result, SEGA's semiconductor purchasing declined in 1997.

Table 4-17 shows SEGA's major electronic products. Figures 4-49 through 4-51 show SEGA's equipment production and semiconductor purchase trends.

Seiko Epson Corporation

Data processing equipment, including PCs and peripherals, represents about one-half of Seiko Epson's revenue, with printers as the leading product. Seiko Epson also has entered the DSC market, along with its traditional product line of scanners. Other product offerings include LCD panels and application equipment, such as TV and video equipment, electric watches/clocks, and FA equipment, but the combined sales of these represent only 10 percent of total sales. Seiko Epson has been aggressive in setting up overseas production in various parts of the world, including the United States, Europe, and Asian countries, resulting in a low export ratio from Japan. Eighty percent of its semiconductor purchasing is in data processing.

Table 4-18 shows Seiko Epson's major electronic products. Figures 4-52 through 4-54 show Seiko Epson's equipment production and semiconductor purchase trends.

Sharp Electronics Corporation

Sharp's technology and products have a clear focus: LCD products. This core competence has led the company to effectively market application products such as note PCs, digital video products, and personal digital assistants (PDAs), represented by the well-known "Zaurus" product line. While Sharp's traditional consumer product lines declined, its communications equipment lines expanded. As a result, Sharp's semiconductor purchasing has increased.

Table 4-19 shows Sharp's major electronic products. Figures 4-55 through 4-57 show Sharp's equipment production and semiconductor purchase trends.

Sony Corporation

The trends toward digital consumer equipment are bringing audio/video equipment another stage of business opportunity. Growth in mobile communications has exceeded expectations. Broadcast equipment has brought sound profits, but Sony is increasingly exposed to harsh competition. Sony has leveraged on its optical disc technology to grow in computer peripherals, such as CD-ROM, but it is not free from intense competition. Sony has experienced outstanding success in the game machine area. Thus, growth in various product areas increased Sony's semiconductor purchasing in 1997, while most other consumer-oriented manufacturers decreased their semiconductor spending.

Table 4-20 shows Sony's major electronic products. Figures 4-58 through 4-60 show Sony's equipment production and semiconductor purchase trends.

Toshiba Corporation

Toshiba has been known as the second-largest "general electric" company in Japan, covering all of the heavy electric, IT, and consumer equipment segments. Its recent focus, however, clearly has been in communications and data processing, where cellular phones and note PCs lead overall revenue growth.

Toshiba's semiconductor purchasing has decreased slightly because of sluggish production in the home appliance area, even though communications experienced an increase in semiconductor usage. In the consumer segment, Toshiba has been spreading production sites, resulting in large semiconductor spending outside Japan.

Table 4-21 shows Toshiba's major electronic products. Figures 4-61 through 4-63 show Toshiba's equipment production and semiconductor purchase trends.

Victor Company of Japan Limited

Victor Company of Japan (JVC) belongs to the Matsushita Group, but it has sought its own proprietary technology and markets; for example, it developed its own original digital camcorders. Victor's core competence lies in audio/video equipment, for both broadcasting and business use; however, it is expanding its product line to include cordless phones and PHSs. The production of computer peripherals—mainly optical discs—is expanding, but fierce competition is hurting its profits. Digital consumer equipment holds the key to Victor's future success. It may also need to explore the possibility of overseas operation.

Table 4-22 shows Victor's major electronic products. Figures 4-64 through 4-66 show Victor's equipment production and semiconductor purchase trends.

Dataquest Perspective

This survey and analysis is based on the results in 1996 and 1997, which were not years when the Japanese market showed a clear direction of future growth. Instead, those were the years when the Japanese market lost ground to foreign markets. Nevertheless, the results of this analysis seem to point out the following key concepts:

- Large companies are not necessarily going to be growth engines in Japanese electronics production, nor will they be stable and strong, if they do not have competitive products in key, growing categories.
- In the consumer category, companies of various sizes are increasing production, leveraging on new, niche product offerings.
- The growth rate of semiconductor purchasing was stronger among smaller users not included in the top 22 companies analyzed in this report.
- The category that is driving growth has shifted from data processing to communications, and in the future, users in this category will be the target customers for semiconductor vendors selling into Japan.
- Companies using semiconductors are changing their business focus, affecting semiconductor purchasing by application. Semiconductor vendors will need to focus more on tracking each user's trends rather than on measuring application markets en masse.

It should be noted that digital consumer equipment is rising steadily even though the market size is still small. Also, the production sites of Japanese electronics companies are becoming more and more regionally diversified. Moreover, sluggishness in Japanese production does not correlate with some companies' worldwide activity.

The previous statements, however, suggest the need for vendors to review customer-support strategies, especially at a time when system-oriented marketing and system-level integration (SLI) are becoming the keys to success, but these are also beginning to represent a larger load for vendors.

A more detailed analysis by application will identify the exact drivers of semiconductor consumption growth for each company using semiconductors. Also, it is essential to look into the technology potential of these companies to decide strategies for each company, both in terms of system technology to be incorporated into system-oriented chips and in terms of supporting the development of such chips, including SLI ASICs. This report does not describe whether internal user divisions are contributing to semiconductor divisions' sales, system marketing capability, and product development.

Dataquest believes that, in the era of SLI, semiconductor vendors face the challenge of strengthening their customer support and system-oriented marketing capability.

Chapter 1
Executive Summary

Japanese companies once enjoyed the largest share of the worldwide semiconductor market, but they are now exposed to aggressive competition, not only from new players in Asia/Pacific, but also from the American companies that the Japanese companies once thought they had beaten. However, the worldwide market continues to see oversupply in various MOS digital products, and prices do not show any sign of tightening up. This market condition is forcing Japanese companies to review their strategies in search of clues to the next growth stage.

This Competitive Trends focuses on the top 20 Japanese semiconductor companies and analyzes their competitiveness from the viewpoint of sales power, manufacturing power, and overall strategy. Sales, regional orientation, and penetration are examined for each company. In analyzing manufacturing trends, manufacturing power, defined as brand shipments plus foundry/OEM shipments, is analyzed for the first time. All metrics except for fabs, capital spending, and R&D spending, are taken from Dataquest's 1996 database because Dataquest is still in the process of finalizing 1997 revenue survey and analysis.

The appendix provides metrics such as product revenue, regional revenue, and market share by region and product for each of the top 20 Japanese companies.

©1998 Dataquest

Chapter 2
Brand Sales Power

In 1996, Japanese companies recorded a combined share of 36 percent of the worldwide semiconductor market. The year was marked by rapid price declines for DRAMs and various MOS digital products, such as flash memories, microcontrollers (MCUs), and application-specific ICs (ASICs). Japanese semiconductor vendors that were largely dependent on those product categories were no exception to the sluggish revenue growth that accompanied continued robust unit shipments. This was also the year in which the yen depreciated against the U.S. dollar, and Japanese companies' revenue in dollar terms was scaled down compared with that of global competitors. As a result, Japanese companies' market share fell four points from 1995, widening the gap with Americas companies to nine points.

In the 1980s, Japanese companies rapidly increased their revenue, pumped by DRAM sales and the consumer applications on which they focused. Their combined revenue showed a record high market share of 51 percent in 1988 to 1989, which has not been achieved by any companies since.

Or take a look at rankings. In 1986 through 1992, six Japanese companies were listed in the top 10 worldwide ranking. For 1985 through 1991, the largest semiconductor company in the world was Japanese—NEC Corporation. For 1986 through 1989, the top three companies in the world-wide market were Japanese. In 1996, however, only one company was among the top three, there were only four companies in the top 10, and the leading company was Intel Corporation. Americas companies enjoyed a combined share of 45 percent in 1996, a seven-point increase over 1988.

Korean companies are quickly catching up. In 1993, when Samsung Electronics entered the global top 10 ranking, Korean companies recorded combined revenue of $5.1 billion, which was about one-seventh that of Japanese companies. In 1996, Korean companies' combined revenue had grown to equal 22 percent of Japanese companies' revenue.

What has caused this decline in Japanese companies' share of the worldwide market? Is the trend going to persist in the near future?

Japanese Companies' 1996 Market Share

In the worldwide market, the Japanese companies' decline in market share was seen in all regions, caused mainly by the DRAM revenue contraction. Non-DRAM revenue showed growth of 10 percent on a yen basis for Japanese companies but a contraction of 5 percent on a dollar basis (see Table 2-1). In DRAM, Americas companies showed the largest contraction of the four regional bases, but they also recorded the largest growth in non-DRAM revenue. This is a result of Americas companies' penetration of the MOS logic area, as well as Intel's increase in MPUs. European companies fared well, too, and surpassed Asia/Pacific companies.

©1998 Dataquest

Table 2-1
Japanese Companies' Revenue Growth: A Comparison between DRAM and Non-DRAM (Percent)

	Total Semiconductor	DRAM	Non-DRAM
Total Companies	-6.3	-38.6	6.2
Japanese Companies (Dollar-Based)	-16.0	-40.3	-5.1
Japanese Companies (Yen-Based)	-2.7	-30.8	10.0
Americas Companies	6.0	-47.6	15.0
Europe, Africa, and Middle East Companies	6.6	-35.0	11.3
Asia/Pacific Companies	-24.1	-30.9	-2.9

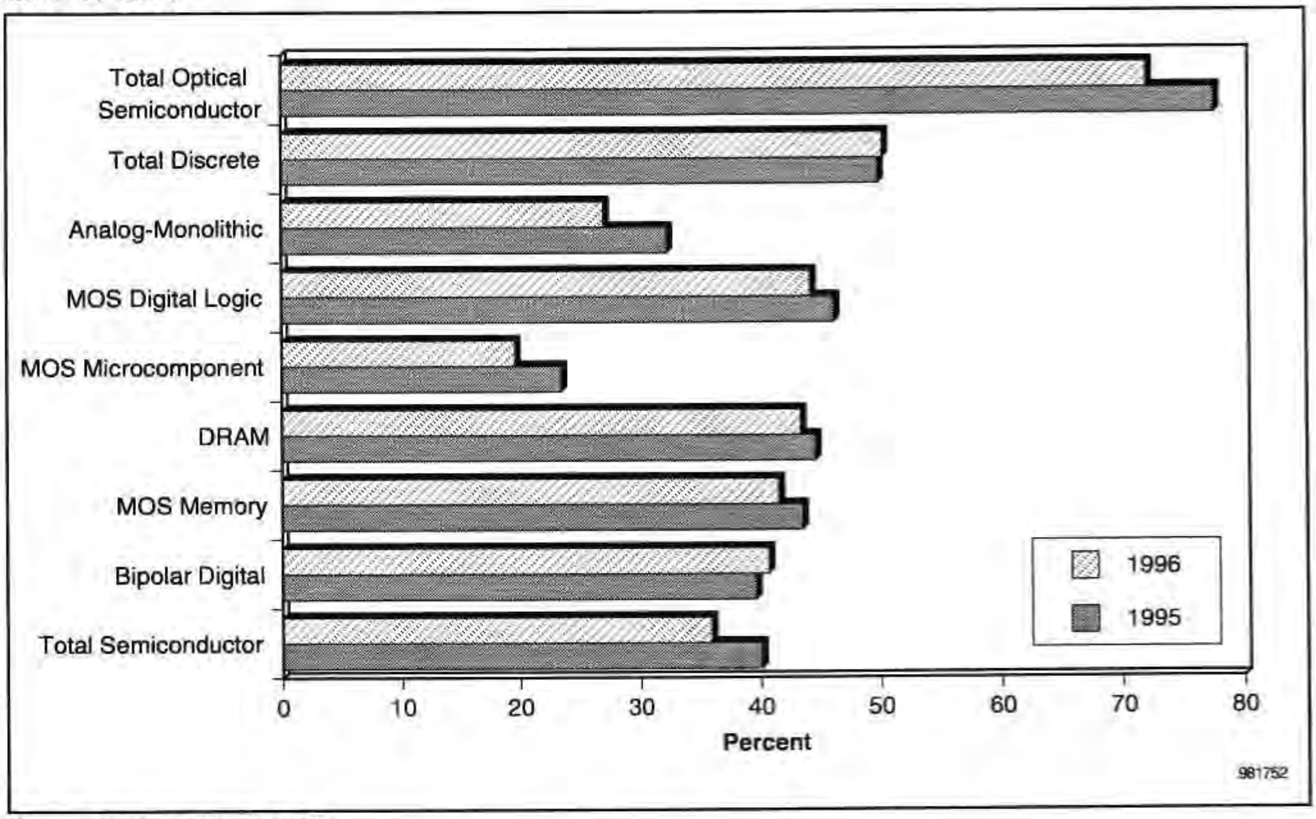
Source: Dataquest (March 1998)

In the worldwide market, eight Japanese companies ranked in the top 20: NEC Corporation, Hitachi Ltd., Toshiba Corporation, Fujitsu Ltd., Mitsubishi Corporation, Matsushita Electric Industrial Co. Ltd., SANYO Electric Company Ltd., and Sharp Electronics Corporation. Only the first four of these made it into the top 10, with Mitsubishi slipping to the 11th position, replaced by SGS-Thomson Microelectronics B.V. This is the first time since 1985 that only four Japanese companies were included in the top 10 worldwide.

Figure 2-1 shows Japanese companies' market share the in major product categories. Bipolar digital is the category in which Japanese companies still rank second to Americas. The devotion of Japanese companies to this product area stems from their internal user in their computer and communications equipment divisions. In this shrinking portion of the market, Japanese companies' combined share amounted to 41 percent in 1996.

MOS memory, especially DRAM, has been the technology driver for Japanese semiconductor industry. In this market, however, Japanese companies are being exposed to a very competitive situation. The 1996 DRAM market declined 39 percent, and it was Americas companies whose combined revenue recorded the biggest decline—negative 48 percent against 1995. Asia/Pacific companies showed the smallest decrease of all—31 percent. Japanese companies recorded a 40 percent decline and had still the largest market share, 43 percent. But a trend among Japanese companies is evident: Larger Japanese companies maintained their respective positions, but smaller Japanese DRAM suppliers showed faster declines in revenue and lower rankings. Because the DRAM market is expanding more rapidly in foreign markets, it is the larger players that can access large-volume users, including PC vendors and module manufacturers, with favorable terms of trade. Dataquest's market share survey in memory revenue and unit shipments indicated a general trend in which smaller companies' average selling prices (ASPs) are significantly lower than those of larger companies.

Figure 2-1
Japanese Companies' Worldwide Market Share in Major Product Categories, 1995 to 1996

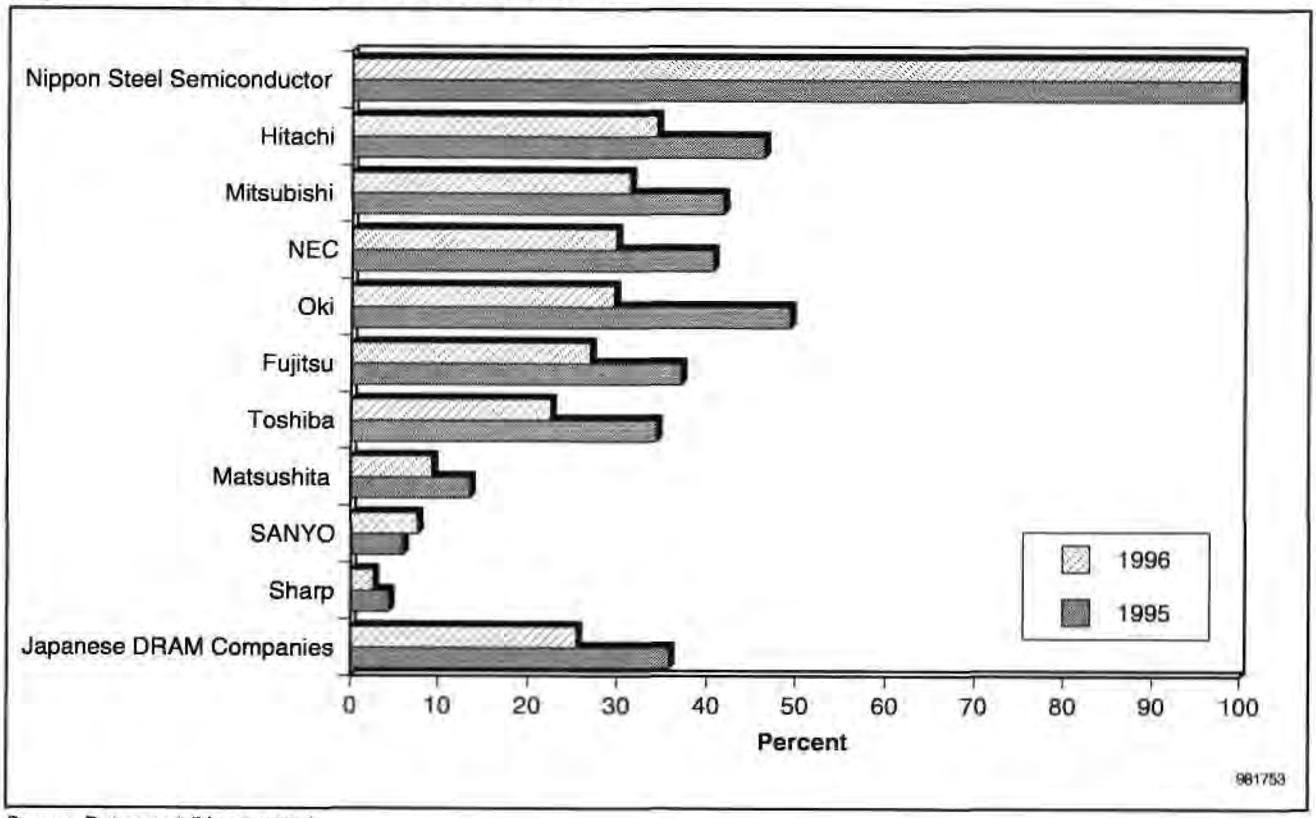


Source: Dataquest (March 1998)

DRAMs account for 22 percent of the total revenue of combined Japanese companies in 1996, a decline from 31 percent in 1995. Figure 2-2 shows DRAM ratio, focusing on Japanese DRAM vendors. After Nippon Steel Semiconductor came Hitachi, with 34 percent, followed by Mitsubishi. Japanese companies are not necessarily going out of DRAM business just because of the severe competition with Korean and Americas companies, but the diversification of products that Japanese companies planned to pursue has not yet brought significant revenue increases, forcing some Japanese companies to be even more selective in their DRAM business.

In the 1996 MOS microcomponents market, Japanese companies have nurtured expertise and consequently have enjoyed a large share of the market in MCUs. This resulted from their users' focus on consumer equipment, which brings a large number of MCU orders. As Japanese electronic equipment production shifted focus from consumer equipment to data processing and communications and as MCUs were upgraded to higher bits, Japanese semiconductor users started to explore a wider selection, including MPUs and digital signal processors (DSPs). As system-level integration (SLI) becomes the key technology for emerging applications such as digital consumer equipment, Japanese companies face decisions about reorganizing their microcomponent and logic operations to offer the best SLI solutions to users.

Figure 2-2
Japanese DRAM Vendors' DRAM Ratios



Source: Dataquest (March 1998)

In the MOS logic market, Japanese companies also leveraged consumer product large-volume orders. Among ASIC products, gate arrays have been the major product offering from Japanese vendors. This dependence caused Japanese companies to lag behind worldwide trends, which show large-scale systems preferring cell-based ICs (CBICs) and smaller systems preferring programmable logic devices (PLDs). Gate arrays fall between those two fast-growing categories, and here again, Japanese ASIC vendors must go through structural changes to refocus their operations. Also a part of the "other MOS logic" category are application-specific standard products (ASSPs); this category includes various consumer-use logic ICs, especially those used for audio and video applications equipment and LCD drivers.

Analog devices also benefited from the traditional consumer orientation of the Japanese electronics and semiconductor industry. As electronic equipment production shifts focus to data processing, communications, and automotive applications, Japanese companies have started to emphasize what they called industry-use linear ICs and then mixed-signal ICs. (The traditional consumer orientation has caused Japanese companies to call all other applications "industrial" in their own categorization.) In the standard product area, general-purpose products have found their way into a wide selection of applications, helping Japanese analog vendors run their fabs, albeit with low profits.

Some dedicated vendors have sought to expand markets and applications for discrete devices, first in consumer equipment and then in peripherals such as flexible disk drives (FDDs), rigid disk drives (RDDs), and, recently, CD-ROMs. Small-signal products, both transistors and diodes, have always found new markets in emerging applications. Because new system designs required new circuit blocks and glue logic, small-signal transistors were the best choice to start with, to be replaced by ICs afterwards. In the fastest-growing area of power devices, there are mainly two lines of products being offered by Japanese companies, power supply devices and radio frequency (RF) power devices. RF products have also become an area in which Japanese manufacturers nurtured expertise, first with radio equipment, then TV equipment, and now mobile communications.

In optical semiconductors, there are dedicated suppliers such as Stanley Electric Co. Ltd. and Hamamatsu Photonics K.K. Although larger semiconductor suppliers also cover optical semiconductors, smaller, dedicated vendors have expanded the market by responding to precise requirements from customers, a practice that big companies found inefficient. As a result, LED suppliers may know of a wider range of users than IC suppliers do. Coupler and sensor markets have expanded because they are used along with microcontrollers and logic ICs and for systems with different voltage blocks. In the traditional model, volume orders for charge-coupled devices (CCDs) came from only a few consumer applications, such as camcorders, and small-volume, high-ASP orders came from broadcasting and various industrial applications. As imaging became a feature of PCs and PC peripherals, CCDs for scanners have come to hold a larger share of the increment of the CCD market. Laser diodes were high value-added products but were a small-volume market until CD players came into production. With the expansion of CD technology applications, demand for laser diodes rose rapidly, which brought costs lower and further expanded the market. Here again, Japanese vendors have leveraged domestic users' orientation in this area.

The Product Mix

Figures 2-3 and 2-4 show Japanese companies' and all companies' share of worldwide product revenue for 1992 and 1996, respectively. Figure 2-5 shows MOS digital product revenue share for Japanese companies and the worldwide market. In 1992, for both, MOS digital ICs represented a little more than half of total revenue, and the difference was negligible—one point—between the two. But in 1996, MOS digital products accounted for more than 70 percent of the worldwide market, while for Japanese companies, revenue from these products accounted for only a little more than 60 percent. Subtracting Intel's microprocessors, a unique situation, reveals basically the same picture—Japanese companies are lagging behind the worldwide market in digitization.

Although it is true that Japanese companies are losing market share to Korean and American companies even in DRAM, which has driven market share for Japanese companies, the lag is more evident in the microcomponent and logic areas, posing a threat to Japanese companies in light of trends toward system-level integration.

Regional Trends of Japanese Companies' Semiconductor Revenue

Historically, Japanese companies benefited from the fast-growing domestic market, where the Japanese consumer equipment manufacturers that dominated the worldwide market increased production of consumer electronics. Thus, the Japanese market was dominated by Japanese vendors (see Figure 2-6), and a large portion of Japanese companies' revenue came from the domestic market (see Figure 2-7).

The first drastic change occurred in the mid-1980s, when the Japanese yen started to appreciate and electronic equipment manufacturers started to move their production sites overseas, mostly into various Asia/Pacific countries. This meant that Japanese semiconductor companies had to have sales offices, technology support centers, and eventually, production facilities in Asia/Pacific.

The second wave came in 1993, when the yen soared again, but this was also a year when the Japanese semiconductor market continued to be sluggish while all the other regional markets began to expand rapidly, driven by the PC boom. This trend prompted Japanese companies to expand foreign operations.

Figure 2-8 compares regional companies' trends in regional sales. Among all regional companies, a sales focus on the company's own region is commonly seen. The extent of focus varies, however, according to market size and growth potentials. A notable difference between Japanese and non-Japanese companies is that non-Japanese companies tend to focus on at least one more regional market, while the domestic market seemed to be the only focus for Japanese companies. With the shift of application equipment production overseas, a focus on the Japanese semiconductor market alone could not bear much fruit. In fact, the sum of the market in Japan and in Asia/Pacific still represents about half the worldwide market, and this has encouraged Japanese companies to do close follow-up of their domestic users at foreign sites.

Tables 2-2 and 2-3 compare Japanese companies' trends in regional sales. Companies that focus on non-Japanese markets are Nippon Steel Semiconductor, Toshiba, Oki Electric Industries Company Ltd., and SANYO. They either followed their domestic users at foreign sites very closely or sought foreign markets for general-purpose products, including DRAM.

Companies such as Nippon Steel Semiconductor, Oki, NEC, Hitachi, Seiko Epson Corporation, Toshiba, and Mitsubishi generate more than 20 percent of their worldwide revenue in the Americas market. Those are the companies that are focusing heavily on either memories or logic in the region. It should be noted that, of these, NEC, Hitachi, and Mitsubishi have wafer fabs in the United States, and Toshiba has set up a joint venture with IBM.

The European market shows a somewhat different trend. Fujitsu leads Japanese companies, with 14 percent of its worldwide revenue coming from the Europe, Africa, and Middle East region. This is a benefit of having an internal user there. Hitachi, Mitsubishi, NEC, and Toshiba have a comparatively high dependence on the European market, and here again, the first three companies have wafer fab operations within the region, while Toshiba has back-end operation.

Source: Dataquest (March 1998)

Many Japanese companies sell hard into the Asia/Pacific market, but are not enjoying a high market share. In fact, when compared with the average orientation of Japanese companies, only Toshiba shows a determined regional orientation across the regions, while most other companies focus either on Americas and Europe or Asia/Pacific. Notably, it is the smaller companies that show high dependence on Asia/Pacific, which seems to represent their efforts to maintain business relationship with the Japanese users.

Matsushita and Sony do not seem to focus on overseas sales, but their internal sales need to be noted: These are the companies with large internal demand from user divisions and companies, and their sales of components tend to take place within Japan rather than at user divisions' actual production sites in Asia/Pacific.

A Quick Look at the 1997 Rankings

Dataquest has completed its annual 1997 market share survey. Details of the survey have been discussed in Perspectives, and trends in the Japanese market will be discussed extensively in an upcoming Market Trends report. Tables 2-4 and 2-5 show worldwide and Japanese market share rankings, respectively.

Table 2-4
Revenue of Japanese Companies in the Top 20 Worldwide Ranking from Shipments of Semiconductors to the Worldwide Market, 1997 (Millions of Dollars)

1996 Rank	1997 Rank	Company	1996 Revenue	1997 Revenue	Growth (%) 1996-1997
2	2	NEC	10,428	10,222	-2.0
5	5	Toshiba	8,065	7,253	-10.1
4	6	Hitachi	8,071	6,298	-22.0
8	8	Fujitsu	4,427	4,622	4.4
11	11	Mitsubishi	4,100	3,925	-4.3

NEC maintained the top position among Japanese companies, but the gap between it and the worldwide top company, Intel, has widened, with Intel recording nearly double NEC's revenue. The second- and third-ranked Japanese companies, Toshiba and Hitachi, changed places, mainly because of the hardship Hitachi faced in 1997 from DRAM price declines and slow expansion of its proprietary microcomponent product line. Other companies maintained their positions, including Toshiba and Fujitsu, but Mitsubishi could not find its way back into the top 10 ranking.

In the Japanese market, there were only a couple of changes in the ranking. Toshiba and Hitachi switched positions, as did Mitsubishi and Intel; all the others maintained their 1996 rankings. NEC not only remained at the top but widened the gap with the followers, showing only a modest decline in revenue.

Chapter 3
Manufacturing Power

This chapter measures and analyzes Japanese companies' manufacturing power, as opposed to their brand sales power in the previous chapter.

Dataquest defines manufacturing power as:

- Manufacturing power = brand sales + foundry sales - foundry purchase

Some Japanese companies choose to announce production numbers on a fiscal year basis. Production numbers usually include both foundry shipments and foundry purchases, but some details remain unexplained. In this analysis, Dataquest applies its own measurement of all three factors in the equation above, based on its proprietary definitions.

1996 Foundry Trends

Japanese companies' foundry activity can be classified as either OEM business or foundry. OEM designates the kind of partnership business in which the provider company designs and manufactures a product sold under the partner's brand. Thus, the basic difference between OEM manufacturing and foundry lies in designing—in foundry, the user of foundry capacity designs the products, the provider manufactures them, and the products are marketed by the foundry user under its brand.

Starting in mid-1980s, Japanese semiconductor companies' foundry activity included a unique business type in which Japanese companies formed a cooperative framework to market their foreign counterparts' products, primarily to enhance foreign vendors' presence in the Japanese market. This took various forms of collaboration, including codevelopment of new products, fine-tuning of foreign-origin products to meet Japanese users' needs, sharing of production capacity and sales channels, and so on. This practice has decreased as foreign vendors built their own business systems in the Japanese market, and the recent rise in foreign companies' combined market share clearly shows that non-Japanese companies can be competitive in this market without the help of domestic competitors. In 1996, the Japanese market share of all non-Japanese semiconductor companies rose to 26 percent, and it is expected to increase further in 1997.

Historically, there was another type of foundry/OEM practice, especially among Japanese companies: fab transition, when old-generation DRAM fabs are refurbished with additional equipment to be used for other products, characteristically for microcomponents, logic, and then analog, or in the final stage, even for discrete. Those non-DRAM products could be produced at fabs that were largely, if not completely, depreciated, and thus the profitability of the overall semiconductor business was secured. Dataquest has identified this trend as the "Japan model," because this transition was possible with wide range of product offerings, which major Japanese companies have managed to grow.

©1998 Dataquest

One form taken by this Japan model was OEM, with the provider offering manufacturing capacity for other companies' non-DRAM products. There were various strategic reasons for this kind of arrangement. Company A might be lagging behind in microcomponents. Rather than develop and manufacture microcomponents starting from ground zero, it might opt to turn to leading company B's product area, and then company A might provide B with A's own products in which B might not have invested as strongly. This kind of collaboration was actually based on very strategic decisions and was usually done among Japanese companies. Dataquest believes the scope and the amount of this kind of practice has largely been reduced in the 1990s.

Pure foundry has been regarded by Japanese semiconductor companies as a zero-profit operation, mostly because Japanese companies, with a few exceptions, used foundry as a way to fill their fabs. This kind of opportunistic foundry sales was encouraged when the market was in oversupply and the utilization of fabs dropped below the sound level. Rather than running the fab at low utilization, Japanese companies opted to find low-margin foundry business. Of course, there were several cases of Japanese companies' seriously seeking foundry opportunities to strengthen ties with foreign companies, especially some American and European companies. This took the form of production capacity sharing as part of an alliance on new product development or on new technology.

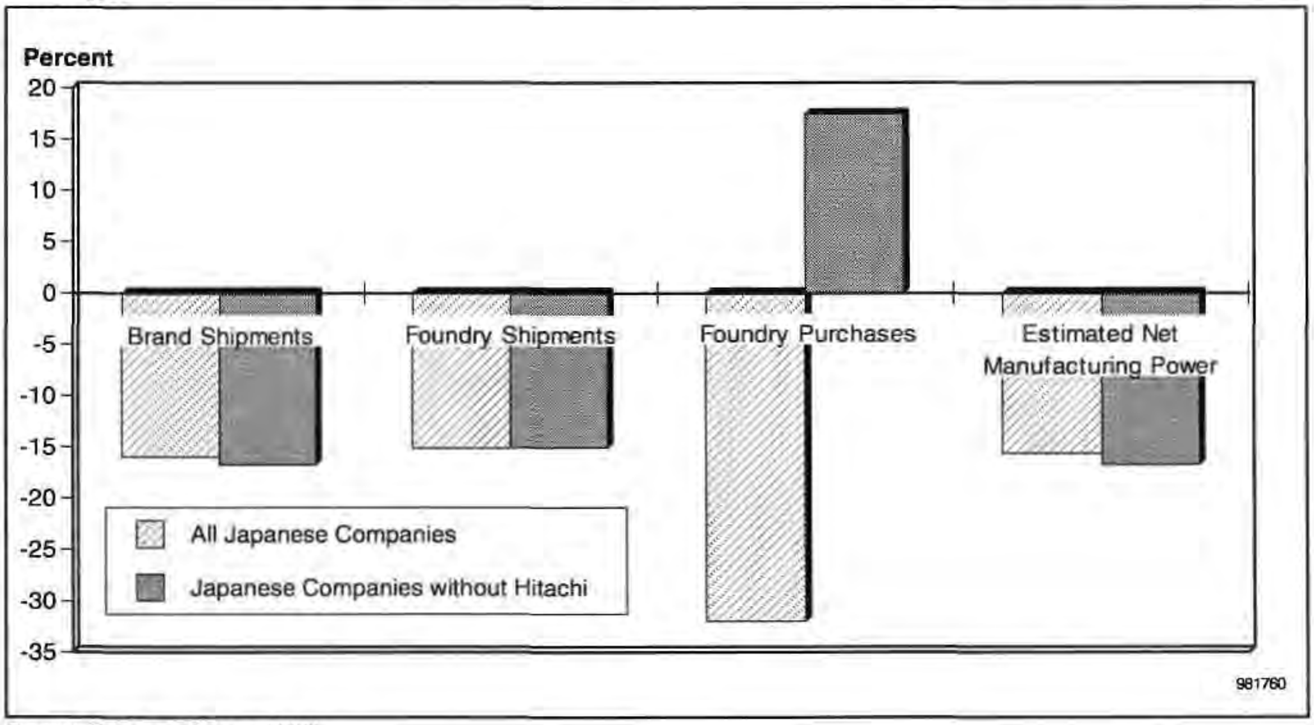
The emergence of dedicated foundry providers, however, has changed the framework. New foundry providers applied leading-edge technology and focused on manufacturing efficiency. (Detailed analysis of dedicated foundry providers is provided in various publications in the Dataquest's Semiconductor Contract Manufacturing Services Worldwide program.) The decline in foundry shipments stems from various factors, such as severance of a company's collaborative framework with its foreign counterparts or discontinuation of old-type Japanese OEM, but the most characteristic reason is weakening competitiveness against dedicated foundries. In view of the continued oversupply in the DRAM market, Japanese companies have sought foundry opportunities. The success of dedicated foundries in both revenue and profit has also encouraged some Japanese companies to include foundry among their business planning options.

1996 Manufacturing Revenue Estimates

Using the formula given earlier, Figure 3-1 shows Japanese companies' total foundry and manufacturing power trends, while Figures 3-2 and 3-3 show estimated manufacturing revenue for each Japanese company for 1995 and 1996, respectively.

 ©1998 Dataquest

Figure 3-1
Japanese Companies' Foundry and Manufacturing Power, 1995 and 1996 (Percentage Change)



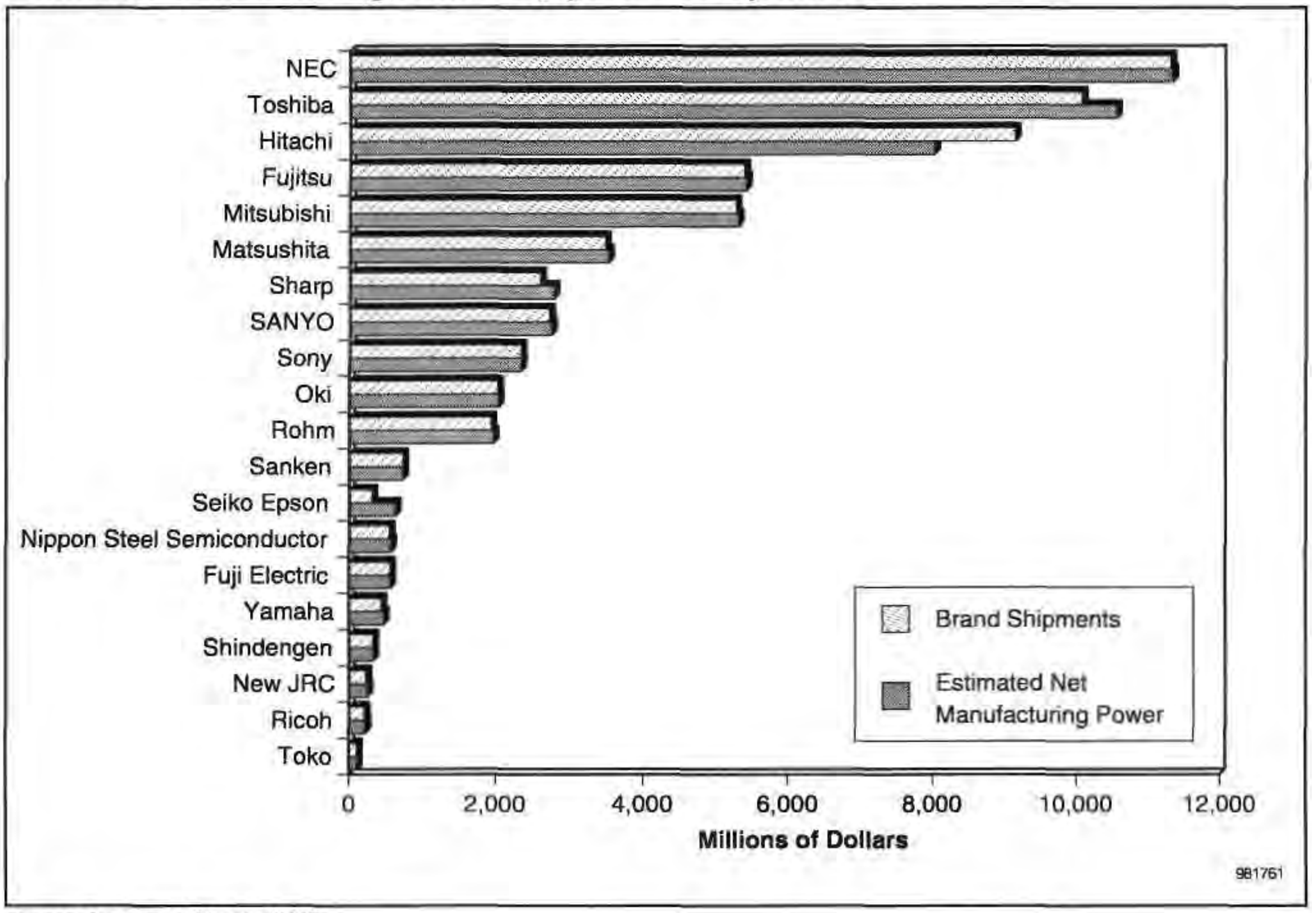
Source: Dataquest (March 1998)

The analysis of manufacturing power reveals some trends. In 1996, Japanese companies' brand shipment revenue was heavily impacted by weak pricing and declined. This was caused by the oversupply in MOS digital products caused by fast expansion of production capacity in the preceding few years. In these situations, Japanese companies have typically made efforts to increase foundry shipments to "fill the fab." Dataquest believes that this opportunism is one of the characteristics of Japanese companies' foundry business, which can still be observed in their business decisions.

But in 1996, foundry shipments declined faster than brand shipments. Revenue information for 1997 is yet to be finalized, but a preliminary look at the survey results indicates another year of declining foundry shipments. This clearly represents the hardship Japanese companies are facing in competition with dedicated foundry providers, such as some Taiwanese companies, as discussed earlier. This also seems to represent another trend—there is very little foundry business left among Japanese companies, except for some examples, such as the Mitsubishi-Seiko Epson agreement on foundry of proprietary embedded DRAM products.

 ©1998 Dataquest

Figure 3-2
Estimated Manufacturing Power of Japanese Companies, 1995

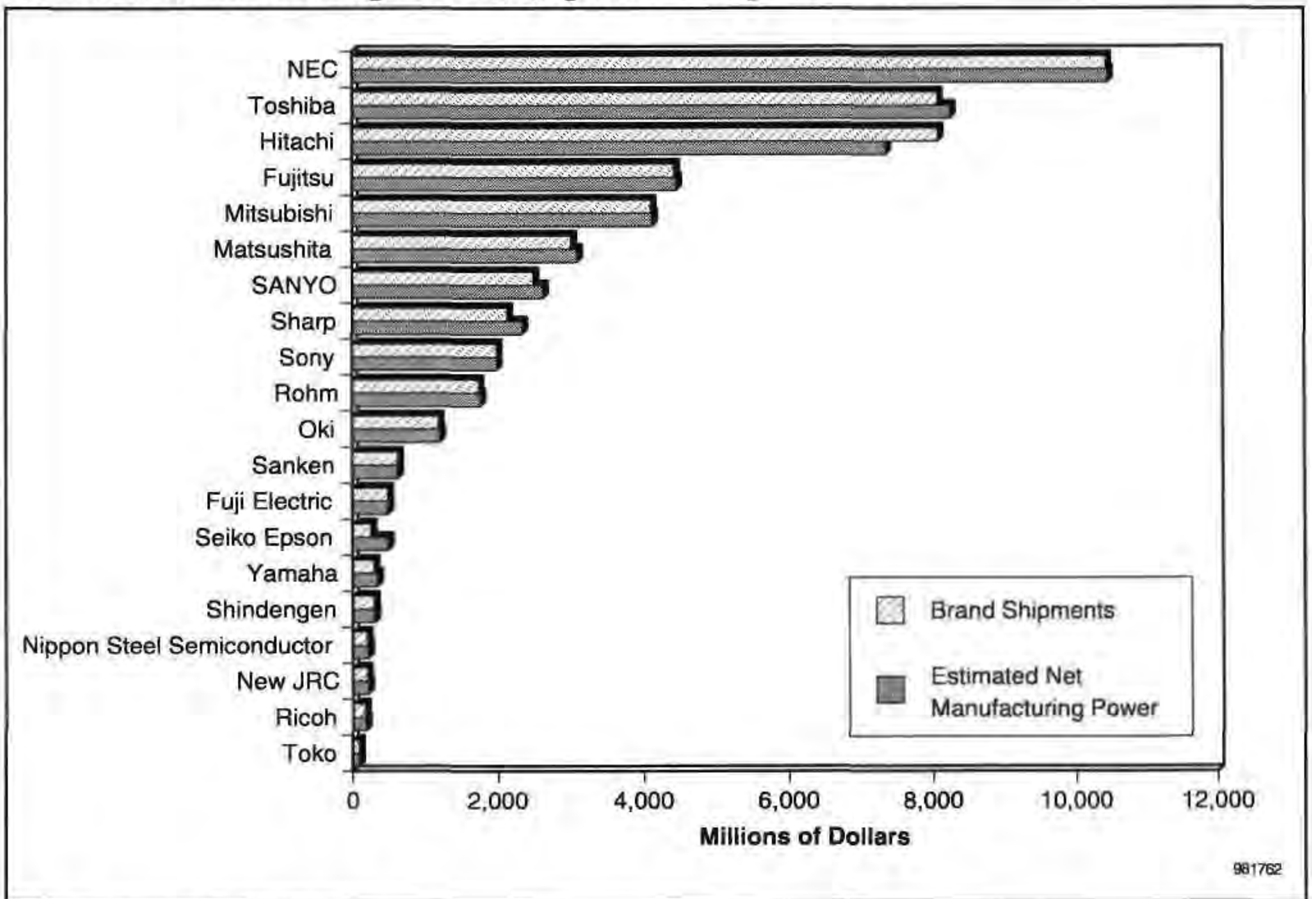


Source: Dataquest (March 1998)

Another trend is becoming clearer: Japanese companies are increasing foundry purchases. It should be noted that DRAM OEM purchasing, such as Hitachi-LG Semicon, has been impacted by the fast price decreases, while, on a unit basis, it is growing. Again, because inter-Japanese foundry is decreasing, this increase in foundry purchases can only be attributed to alliances with non-Japanese companies. Contributing to this trend are examples such as Toshiba-Winbond and Fujitsu-Taiwan Semiconductor Mfg. Co. (Dataquest does not regard Powerchip Semiconductor Corporation as a foundry to Mitsubishi at this time). Although still small, the trend toward increasing foundry purchases is evident, and there will be more of this, both in size and in product categories, as Japanese companies try to focus on a limited number of products for efficient management of their semiconductor business.

 ©1998 Dataquest

Figure 3-3
Estimated Manufacturing Power of Japanese Companies, 1996



Source: Dataquest (March 1998)

1997 Fab Trends

Manufacturing power has been the biggest factor in the rise of Japanese semiconductor companies in the worldwide market. In a fast-growing market, supply capacity played a key role in increasing revenue, and Japanese companies' strategies centered around the decision to increase capital spending on manufacturing capacity.

Trends over Time

Japanese companies' fab construction has been driven basically by two factors—DRAMs for major companies and cyclical business trends.

DRAM companies accelerate fab construction during DRAM boom years, including new shells and even new sites. To simplify the pattern, some of this effort results in oversupply after the boom years, and new shells remain empty for some time, to be filled only in the next cycle. This pattern has caused radical ups and downs in DRAM companies' capital spending.

Non-DRAM companies have built fabs at a comparatively constant pace, but again on a cyclic pattern. To these companies, business cycles were triggered by demand cycles observed up to the 1980s. When such cycles became less visible in the 1990s, the companies started to increase fab capacities at a constant but gradual pace. Some companies have chosen to make certain product areas the driver of technology and fab expansion, such as microcontrollers, analog, or power discretes, depending on product coverage.

Regional Fab Trends

In the rise of the Japanese semiconductor companies, the fast-expanding domestic market was more than enough to consume output from Japanese companies' fabs. As regional market trends changed, however, and Japan became the slowest-growing market and as the Japanese yen appreciated, Japanese semiconductor companies had to expand overseas production operations while they had a way of concentrating production facilities in the domestic region. Only a handful of companies have continuously invested in foreign countries for manufacturing. The few foreign production sites secured by Japanese companies were mostly acquired or built during or right after the semiconductor market boom. Table 3-1 lists major foreign fabs of Japanese companies.

Type of Operation

Japanese companies' foreign wafer fab operations started through acquisition of existing fabs of local companies. Then those fabs were expanded and upgraded to produce DRAMs or logic products to be marketed locally. There were exceptions, such as NEC's Roseville fab, part of the output of which has been sent to other regions to be packaged and marketed globally.

During the PC-driven boom years of 1993 to 1995, Japanese companies announced plans to enhance their overseas wafer fab operations, including new fabs such as NEC Scotland's Phase 2 and Hitachi's HISUS U3, to develop new wafer fabs at back-end sites, such as Mitsubishi's Aachen fab, or to enter joint ventures with non-Japanese companies, such as Powerchip Semiconductor (Mitsubishi-UMAX), TwinStar (Hitachi-Texas Instruments Inc.), Dominion Semiconductor (Toshiba-IBM), or joint ventures between Japanese companies, such as Hitachi-Nippon Steel Semiconductor in Singapore. The strategy varied according to each company's global strategy and the technology alliances the company had formed.

For back-end operation, an increasing portion of foreign operations seems to have been shifted from Japanese companies to local assembly and test houses, but details are yet to be surveyed. Also noteworthy is the increase in module production overseas, where local sales offices and production sites have chosen local subcontractors to assemble memory modules to meet fast-changing local demand as well as stringent price requirements.

©1998 Dataquest

Detailing trends in design is beyond the scope of this analysis, but significant numbers of design centers have been set up around the world in the past few years to meet local system requirement. In a limited number of cases, however, locally designed products can be marketed autonomously—a central control from the headquarters is still the norm for most Japanese companies, which foreign local users may find inefficient and time-consuming.

The Advantages in Constructing an Overseas Fab

There are various reasons for Japanese companies to set up foreign production facilities, which can be classified as demand-side (or environmental) and supply-side (or corporate-oriented) reasons. Demand or environment are also characterized as "pull" factors, because companies are pulled to overseas sites for those reasons, while supply or corporate reasons are "push" factors, for these push the companies to foreign production. The following are the factors pulling and pushing Japanese fab construction overseas:

- Demand/environment
  - Timely response to local demands
  - Enhanced dependability for local customers
  - Fast growth in local demand
  - Avoidance of trade barriers such as tariffs
  - Avoidance of trade friction by substituting export into the region with local production
  - Integration of the production process from design to assembly and test
  - Strengthening of partnerships with allied local companies
  - Alliances with local user companies
- Supply/corporate
  - Sharing fruits of codevelopment with local companies
  - Technology transfer
  - Risk diversification by having multiple suppliers
  - Slow growth in domestic demand
  - Reduction in manufacturing cost
  - Reduction in logistics cost
  - Incorporation of or deployment of local human resources
  - Deployment of various local resources from local allied companies
  - Recycling profits from local sales
  - Ample funding

Characteristics of Japanese Fab Expansion Overseas

Historically, Japanese companies' fab construction has been aggressive during semiconductor boom years. This can be attributed to two reasons. One was the increase in profits generated by the stable prices companies enjoy in up cycles. The other was semiconductor trade friction: Foreign investments were accelerated when a sudden increase of semiconductor exports from Japan caused a trade imbalance. Foreign fabs that have been built or acquired with this kind of background were not exactly based on Japanese companies' own long-term strategies, and, with a couple of exceptions, those fabs remained comparatively small in terms of wafer processing capacity. In back-end operations, reimport of output at Asia/Pacific sites to Japan was seriously considered, and in some cases, actually done to leverage on yen appreciation.

The rush in Japanese companies' overseas fab construction in 1993 through 1995 was characterized by one factor significantly different from the past—foreign markets were expanding much faster than the domestic market and "manufacturing near the market" had become the norm. NEC upgraded its Roseville, California, fab and started constructing a 200mm wafer fab in Scotland for 64Mb DRAM production. Toshiba, for the first time in its history, decided to build a DRAM wafer fab outside Japan, in alliance with IBM. Hitachi made two plans—TwinStar to produce DRAMs and HISUS U3 for production of proprietary microcomponent products. Fujitsu announced expansion at its Oregon site for production of 64Mb. Mitsubishi finally started a DRAM wafer fab at Aachen, Germany, after several years' hesitation. Matsushita decided to strengthen its fab operation in the United States by adding a 0.25-micron fab for 64Mb DRAM production. And Hitachi and Nippon Steel Semiconductor began construction of a joint wafer fab to produce 64Mb DRAM in Singapore. All those plans were aimed at seriously expanding sales of targeted products both locally and internationally.

This sudden flourish of overseas fab construction is, actually, nothing new for boom years. As discussed earlier, there are various reasons for Japanese companies to build foreign fabs, but one reason for all companies and all occasions is the ample financial resources available in boom years. This, in turn, implies that in bust years, Japanese companies' fab expansions dwindle, and in actuality, the record confirms that trend. So will negative attitudes among Japanese companies toward overseas fabs prevail in this adverse environment? There are signs to support that view, but details are yet to be announced.

 ©1998 Dataquest

Regional Spending Trends

Capital spending in Japan has been mostly done by Japanese companies. Table 3-2 shows 1997 capital spending in Japan. In that year, almost the whole amount was estimated to have been spent by Japanese companies. During the 1980s through the early 1990s, when access to the Japanese market was a hot topic on the international scene, Japan was the largest single semiconductor market in the world. In an effort to increase sales here, non-Japanese companies started chip production in Japan. Texas Instruments could be described as one of the most aggressive, in the sense that it moved the headquarters of its DRAM operation into Japan. Some companies chose to set up joint ventures, such as Tohoku Semiconductor (Motorola Incorporated and Toshiba), Nippon Precision Circuits (LSI Logic Corporation and Kawasaki Steel Corporation), and KTI Semiconductor (Texas Instruments and Kobe Steel Ltd.). Fujitsu-AMD Semiconductor became the last to take this approach. Currently the interest of non-Japanese companies seems to have shifted to other regions, especially Asia/Pacific, for both a market and a supply base.

However, Japanese companies' spending still goes mostly into their domestic sites. In the 1980s, Japanese companies are estimated to have spent about 85 to 90 percent of their total capital spending within Japan, while in the early 1990s the ratio has dropped to 80 to 85 percent, leading to an increase in foreign production. This trend was caused by two factors: yen appreciation, which made it more lucrative for companies to produce and sell in the dollar economies, and market expansion. Foreign markets were expanding faster than Japanese markets, and if the name of the game is to "manufacture near the market," it was not advantageous to continue producing within Japan and then export the output. There were other reasons, including political decisions, but overall, the Japanese companies' spending overseas continued to increase up to the year 1996. Because total spending continued to increase in 1996, the ratio of overseas spending against the total peaked in 1995 (see Figure 3-4).

Then the tide changed. The yen started to depreciate, and the semiconductor market showed contraction. Reduced profits constrained capital spending, but Japanese companies also had to maintain capital spending for next-generation technologies and products. This has led them to spend more in advanced fabs within Japan and to review foreign operations. This was a difficult choice, because non-Japanese markets were still growing faster than the domestic market.

Table 3-2
Manufacturing Capital Spending in Japan, 1992 to 1997

	1992	1993	1994	1995	1996	1997
Japanese Spending ($M)	3,958	4,413	6,667	9,912	9,654	8,342
Growth (%)	-30.6	11.5	51.1	48.7	-2.6	-13.6

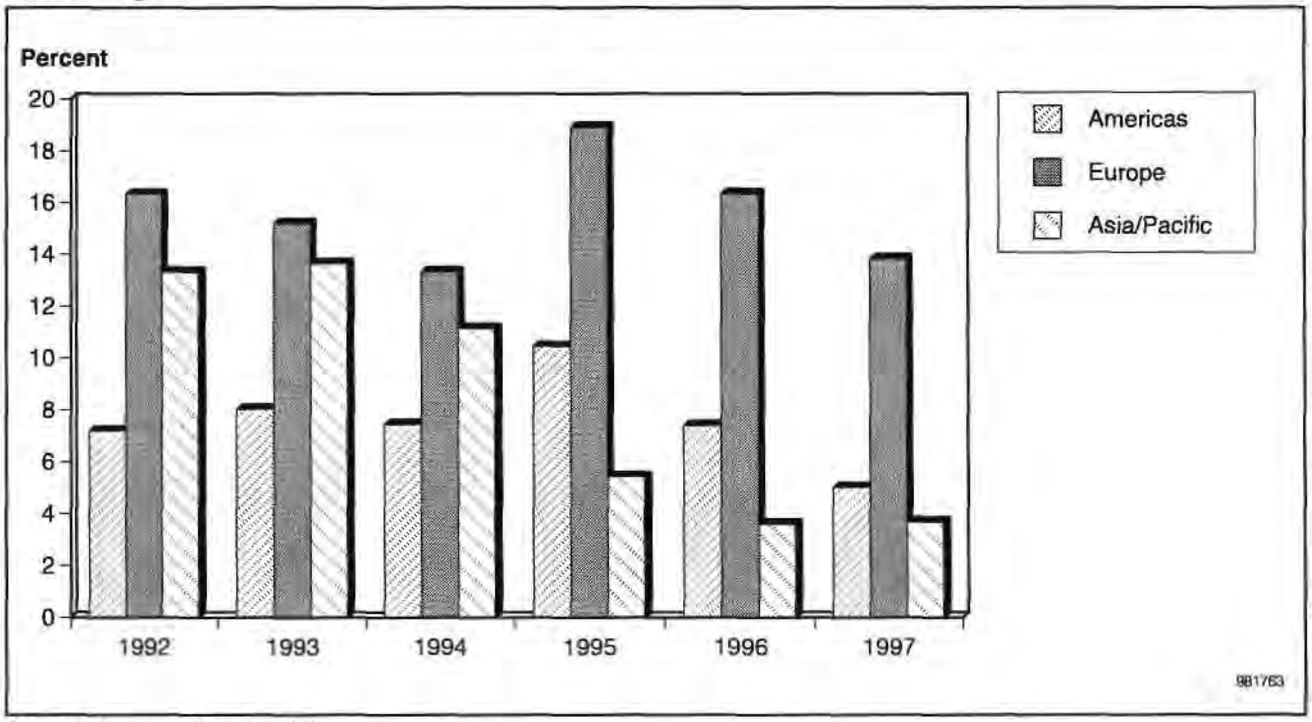
Figure 3-4
Japanese Companies' Overseas Capital Spending, 1992 to 1997 (Percentage of Total Spending)



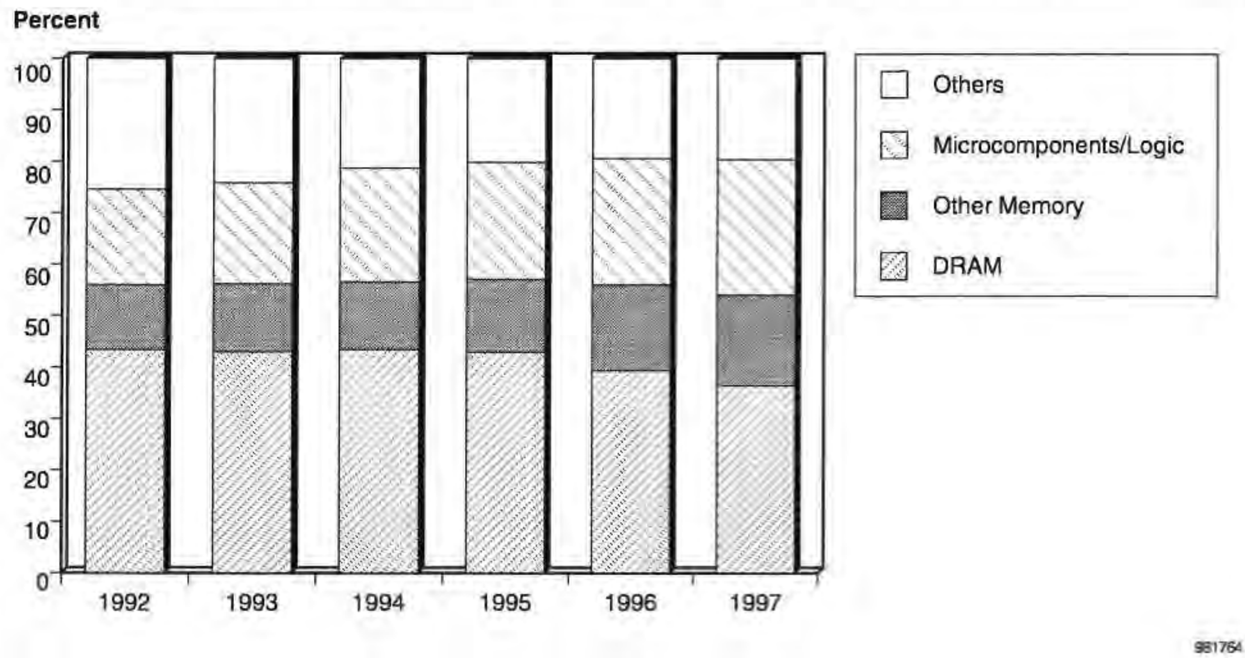
Source: Dataquest (March 1998)

Product Trends

Japanese companies' capital spending trends by product area are shown in Figure 3-5. DRAM alone represented about half the capital spending in Japan in the 1980s and more than 40 percent in the first half of 1990s. As excess capacity prevailed in the MOS digital product area, additional capacity plans for DRAMs were the first to be reviewed and eventually abandoned. Those fabs were then either redesigned for other memory products, such as flash memory, and microcomponents and logic products or postponed. In 1997, the whole memories category still represented more than half the total spending of Japanese companies. This decline in DRAM ratio does not necessarily mean that Japanese companies are abandoning the DRAM business—in fact, an increasing amount of DRAM foundry purchasing indicates that Japanese companies are determined to stay in the market while reducing the burden of capital spending into this volatile product category.

Spending for microcomponents and logic products is on the rise. Japanese companies have repeatedly attempted to focus on non-DRAM MOS digital products when the DRAM market has crashed. This time, however, the situation is quite different, because the market is moving fast toward system-level integration. The emphasis on non-DRAM products meant adding equipment to fabs originally constructed for the most advanced DRAM products, but the current focus on microcomponents and logic, especially cell-based ICs, requires the most advanced manufacturing equipment. Thus, the Japan model does not work anymore, and Japanese companies face the decision of whether to build a fab initially for logic products or memories. This implies that they will either need to prepare products that can fill those fabs afterwards to lighten the depreciation cost or they will have to turn to outsourcing—in other words, foundries.

Figure 3-5
Japanese Companies' Capital Spending Trends by Major Product Category



Source: Dataquest (March 1998)

As discussed in the section on foundry and manufacturing power, Japanese companies are adopting a new business model to make more use of contract manufacturing.

Research and Development Expenditure

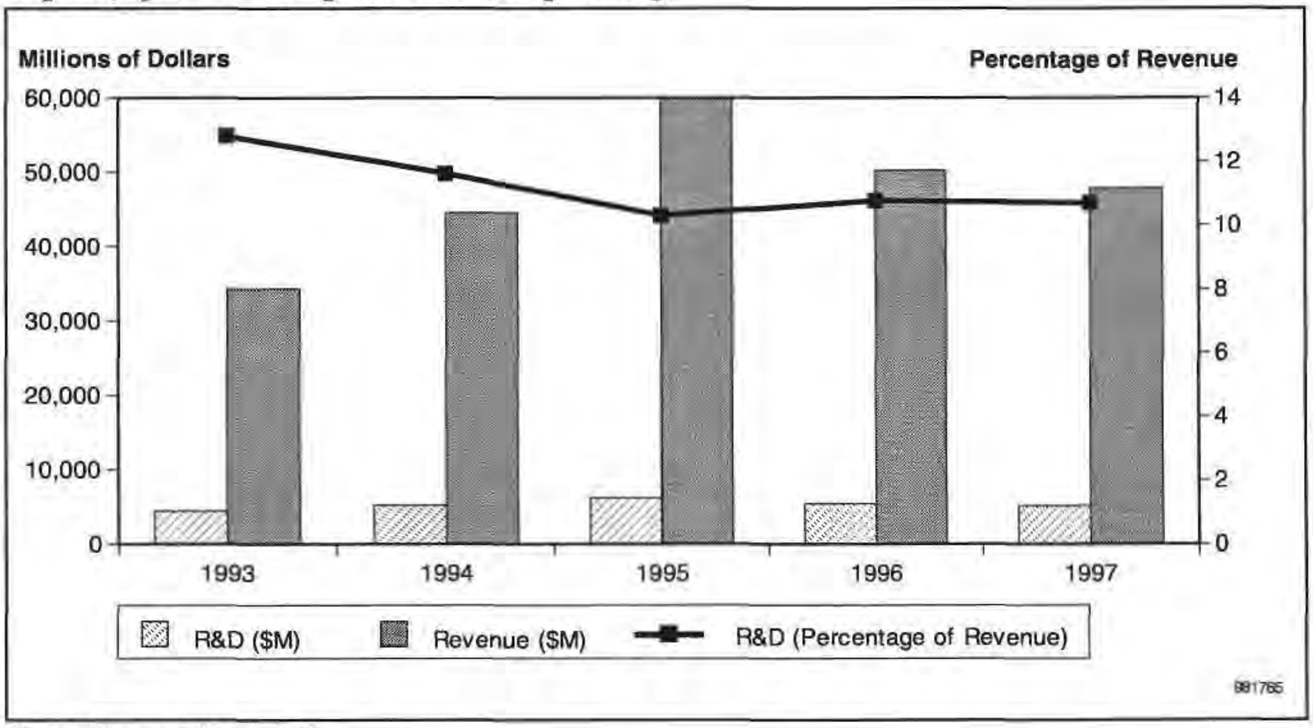
Technology and product development, another aspect of manufacturing operations, will be covered in more detail in future documents. In this section, Dataquest looks only briefly at R&D expenditure; detailed information on alliances will be covered in a future Dataquest document.

The R&D spending of Japanese semiconductor companies was revisited in Dataquest's recent survey to clarify the distinction between manufacturing capital spending and R&D spending. Figure 3-6 shows estimated R&D spending for major Japanese companies. The companies can be divided into three groups according to level of spending.

Top companies spend about 10 to 15 percent of their semiconductor revenue on R&D activities, and they tend to maintain this level of spending over time (see Figure 3-7). These are the companies that lead technology development, competing hard with each other to develop and market new products ahead of everyone else. Not all of their spending brings additional revenue directly, because some part is spent on fundamental technologies and because some R&D is not fruitful. In view of the need to clarify their business focus, companies are changing this attitude and have started to explore the possibility of reducing their spending in areas on which they may not focus.

 ©1998 Dataquest

Figure 3-6
Top 20 Japanese Companies' R&D Spending



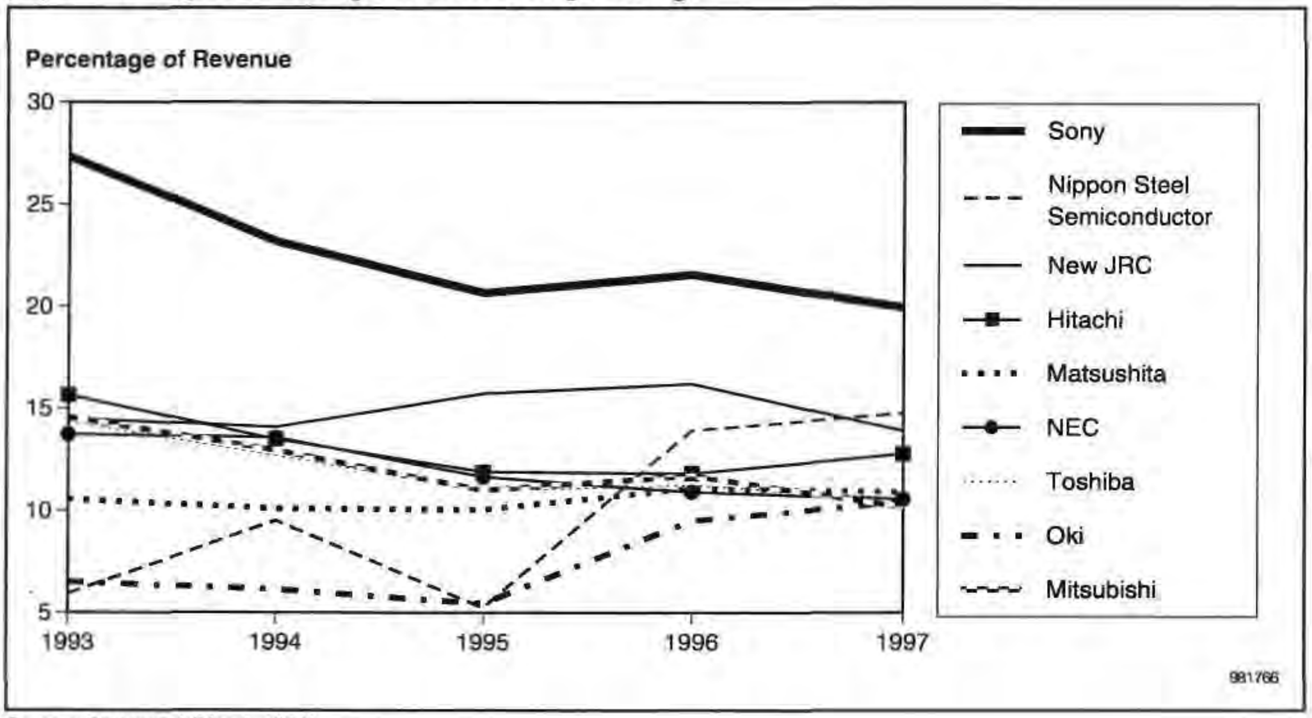
Source: Dataquest (March 1998)

This does not necessarily mean they will reduce their total spending or the ratio against revenue. But the increasing need for a strict business focus will drive those top companies to turn more to outside resources. Hitachi is an example. It is characterized by the large amount of DRAM needed from LG Semicon, as well as from joint ventures with other companies such as TI (TwinStar) and Nippon Steel Semiconductor (Hitachi/Nippon Steel Semiconductor Singapore). DRAMs produced at LG Semicon fabs to be supplied to Hitachi are generally made with Hitachi masks, and TwinStar uses a different mask set, based on codeveloped technologies. Hitachi uses yet another set of masks at its own proprietary fabs. This arrangement has enabled Hitachi to diversify risks, as well as making it easier for partners to participate in Hitachi's production scheme. This arrangement, of course, is not a complete solution and has its drawbacks in technology management, but the eventual result of this attempt will be of interest in the industry.

NEC, however, is going solo in manufacturing while participating in various technology and product alliances. Toshiba has sought alliance and foundry opportunities rather boldly among top Japanese companies. Its collaboration with Motorola on overall semiconductor operation and its codevelopment of DRAMs with Siemens and IBM have both brought about joint ventures—Tohoku Semiconductor and Dominion Semiconductor. Fujitsu followed, with Fujitsu-AMD Semiconductor Ltd. (FASL), as did Mitsubishi with Powerchip Semiconductor. Powerchip is actually a new form of joint venture in that it involves a semiconductor user company as well as financial circles, while other joint ventures have characteristically been between or among semiconductor companies.

©1998 Dataquest

Figure 3-7
Japanese Top-Tier Companies' R&D Spending



Source: Dataquest (March 1998)

Middle-tier companies spend around 10 percent of revenue (see Figure 3-8), and the amount varies over time, depending mainly on revenue fluctuations. Those are the companies still dependent on internal demands, and similar trends can be seen in technology. These companies tend to have smaller application engineering groups, indicating that their system technology advisers lie in their user divisions, in-house.

Companies at the lower end of the list spend between 5 and 10 percent of their revenue (see Figure 3-9). They do not burden themselves with R&D expenditure and instead turn to outside resources, such as alliances. Their alliances tend to focus on specific technology and product areas that they have identified as their "battlefield," and they do not attempt to widen their coverage overnight. The spirit of kaizen, the Japanese term for gradual improvement, persists here. The companies in this group also leverage foundry opportunities, by either starting technology partnerships that include "production cooperation," a euphemism for foundry, or starting foundry businesses with additional (but usually not disclosed) contracts on technology transfer.

Chapter 4
The Future of Japanese Semiconductor Companies

The analysis in Chapters 2 and 3 has illustrated the difficult environment as well as the difficulty in positioning faced by Japanese semiconductor companies. In the coming five years, there will be opportunities and threats for Japanese semiconductor companies. The threats can be summarized as follows:

- Demand side
  - Lack of proprietary system technology
  - Faster advances of system technology at non-Japanese systems companies
  - Diversification of regional demand
  - Sluggish outlook for domestic application equipment production
- Supply side
  - Growth of foreign competitors in the DRAM market
  - Growth of dedicated foundry providers
  - Growth of non-Japanese equipment manufacturers
  - Rising prices for manufacturing equipment
  - 300mm wafer production lead by non-Japanese companies
  - Non-Japanese ASIC companies
  - Expansion in cell-based ICs, an area in which Japanese companies have lagged behind

The opportunities that Japanese companies could enjoy can be summarized as follows:

- Demand side
  - Japanese systems companies flourishing in digital consumer equipment production
  - Expansion in communications applications, including networking
- Supply side
  - 300mm wafer production
  - Having strong manufacturing equipment and wafer companies within Japan
  - Facing, and in some cases actually making, fundamental changes as the profitability of the semiconductor business remains low for major product areas

On the demand side, the realization that the domestic market cannot drive Japanese semiconductor companies' growth is leading to a careful but determined approach toward foreign markets. Globalization has long been a cliché in the Japanese semiconductor industry. There have been efforts made in various aspects of the semiconductor business ranging from sales offices, technical support and design centers, back-end production, and wafer fab operation targeted at capturing local demand efficiently, but these were made mostly after demand prevailed. The globalization that is now required calls for a more aggressive approach toward non-Japanese systems companies, for those are the users that bring faster growth to vendors.

On the supply side, the time has come to give up the conventional Japan model of capital spending and fab utilization. In view of the rapid rise of both manufacturing capital spending and R&D spending requirements, Japanese companies have to seek ways to incorporate outsourcing in their long-term strategies, as opposed to seeking short-term helping hands in partnership. A potential shortage of engineers is also looming globally, especially in Japan, with the size of its younger population decreasing. This also increases the need for strategic alliances and global business operations to make better use of resources outside Japan. And the advent of system-level integration will require a wide range of intellectual property resources that no Japanese company is ready to provide alone. Only through alliances among semiconductor companies and through close ties with semiconductor users in various applications systems can this resource be realized.

These key factors, both on the demand and supply sides, call for organizational changes. Up to this point, Japanese companies have basically run the semiconductor business with product-oriented organizations. A few companies, such as NEC and Toshiba, are developing either virtual or actual organizations that are system- or application-oriented but most companies still follow a manufacturing-oriented organizational model with some application flavor, such as application engineering groups.

A company may have a strong, product-oriented "vertical" organization while struggling to nurture application marketing functions for "horizontal" operation. Those that have been dependent on internal user divisions may not have been burdened with big application engineering groups, but they have faced the challenge of outside system technology. As foreign markets grow faster and emerging system technologies are developed by non-Japanese users, Japanese companies have no choice but to expand overseas operations in all aspects, supported by application-oriented organizations at their headquarters.

Sales integration is also in progress. Japanese companies have had huge sales organizations, either in the form of direct sales or distributors. On one hand, the size of the salesforce not only helped in finding business opportunities, but also allowed the "mother ship" company to gather market information through the sales channel. But the slow growth of the domestic market has made a huge salesforce too burdensome in some cases, and some level of rationalization has been inevitable. One such attempt was to move direct accounts to a big sales agency and relocate the salesforce along with the accounts. Another form was to integrate distributors in the corporate groups to form a bigger entity, in expectation of improved efficiency.

Whether these "rationalization" processes will improve efficiency has yet to be seen, but they have been viewed as inevitable. And whether Japan can revive both as a regional market and as a supplier depends primarily on the overall development of electronics technology in Japan.

Appendix A
Japanese Semiconductor Company Profiles

Basic information such as revenue and capital spending has been covered by a Competitive Trends document in the Semiconductors Worldwide program for the top 20 companies in the 1996 worldwide ranking (Competitive Markets in Semiconductors, 1996, SEMI-WW-CT-9701. December 1997). In this appendix, the basic information for all 20 Japanese companies is illustrated (see Tables A-1 through A-21 and Figures A-1 through A-105).

Table A-1

Chapter 1
Executive Summary

Despite continued economic troubles in Japan and elsewhere in Asia, Japanese vendors still engaged in a relatively high number of semiconductor-related alliances in 1997. For the second year in a row, the number of Japanese semiconductor-related alliances rose. Figure 1-1 illustrates the Japanese semiconductor alliance rate from 1980 through 1997.

There are growing indications from alliance activity in 1997 that Japanese vendors are banking on the market success of merged logic-DRAM technology as the future mainstay of their semiconductor businesses. The timing of a transition from a DRAM-centric to an embedded DRAM-centric strategy is significant, because a miscalculation by Japanese vendors could cause them to lose ground in the development of next-generation commodity DRAMs while they divert resources toward the development of embedded DRAM products. The possible gains, however, are significant because the technology has the potential to increase market share in the application-specific IC (ASIC) and logic businesses, a goal that most Japanese vendors have targeted for several years. Alliances not only will allow Japanese vendors to redistribute their resources from a DRAM to an embedded DRAM production orientation, which would effectively merge their now separate memory and logic businesses into a single unit, but they might also provide a fast-response safety net in case the companies' projected time line is off and they need to retreat to a more conservative strategy. If the embedded DRAM technology, for whatever reason, fails to mature before commodity DRAMs return to a supply-limited market, alliances will almost certainly be used as a mechanism for Japanese companies to get back into the commodity DRAM business.

Project Analyst: Junko Matsubara

Chapter 2
Diversification and Resource Allocation with Alliances

Many parts of the electronics industry were showing signs of weakness as 1997 came to a close. DRAM production lines were either being shut down or had their expansion plans delayed. Semiconductor fabrication equipment manufacturers experienced order cancellations that eventually led to layoffs of substantial portions of their workforces. Even application vendors, such as disk drive producers, were experiencing market pressures that have resulted in corporate restructuring. While the economic crisis in many parts of Asia, particularly Korea, has forced a change in the semiconductor business practices at companies in these countries and will undoubtedly have a ripple effect on electronics companies worldwide, Japan's economy has, for several years, remained in a state bordering on recession. Despite the weak economic condition of Japan, its domestic PC markets were expected to continue the growth trend that had been established during the previous year. During 1996, PC prices had fallen to world market levels, which caused a growth spurt in PC sales. However, by mid-1997, sales had flattened even though DRAM prices continued to fall, lower-priced machines had been introduced into the Japanese market, and PCs had far less penetration in the Japanese home market than in the United States.

The economic crisis that was beginning to affect many Asian countries in the last quarter of 1997 does not seem to have had much impact on the overall number of alliances that Japanese companies signed in specific countries or regions in the past two years. Nearly 60 percent of the Japan's semiconductor alliances formed in 1997 were with U.S.-based partners. This level is more or less unchanged from 1996 and reflects the continued importance that Japanese vendors place on partnerships with American companies. Figure 2-1 shows the percentage of the alliances that pair a Japanese company with a U.S.-based company over the last 13 years.

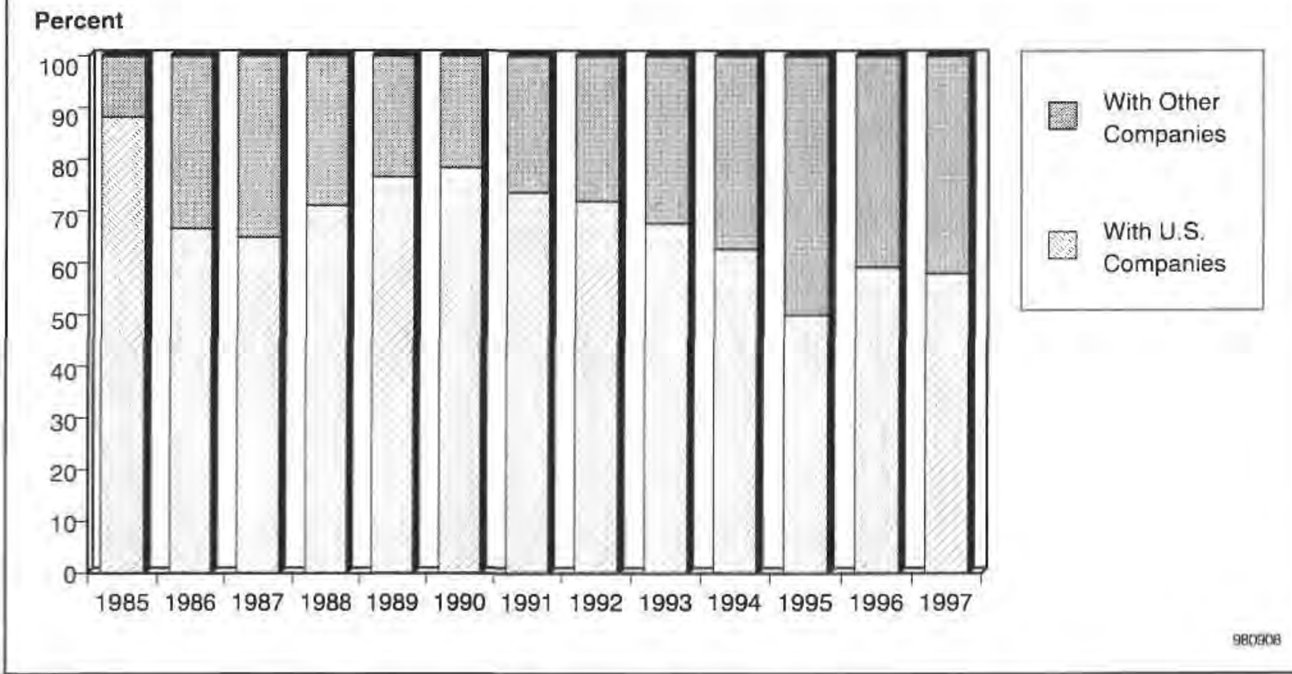
Figure 2-1
Japanese Semiconductor Alliances (U.S. Partners versus Non-U.S. Partners)



Source: Dataquest (March 1998)

DRAMs and 300mm Equipment

In 1997, Japanese vendors continued their quest to diversify away from their traditional overdependence on DRAM revenue. However, in implementing diversification plans, there are often conflicting goals that require a delicate balance of priorities in business strategy, particularly with regard to alliances. A transition to 300mm wafer production is clearly a long-term technology change that all major Japanese vendors will seek to make to remain cost competitive, but it will be difficult to justify the necessary investment in the face of a money-losing DRAM business. Furthermore, most vendors will need to secure permanent sources of commodity DRAMs for both internal consumption and to maintain their semiconductor sales organizations. The difficulty of achieving these goals increased during the year as DRAM prices continued to fall in an oversupplied market. The mass transition to 300mm production technology will occur eventually, but the weak DRAM market will likely delay or slow the adoption rate, because the large-scale equipment consumption of the commodity DRAM manufacturers will be a prerequisite to reducing the cost of 300mm equipment and make it affordable to the majority of logic and ASIC producers. For this reason, commodity DRAM alliances will likely continue with specific emphasis on 300mm equipment development. On the other hand, if DRAMs do not return to profitability before deployment of embedded DRAM products that can generate self-sustaining revenue, then a company could justify minimizing its DRAM-specific investments, farm out commodity DRAM production, and focus resources on building and accelerating its embedded DRAM capabilities. Alliances seem to provide a lot of flexibility for companies to distribute their resources to match their particular array of priorities.

 ©1998 Dataquest

Alliances Send DRAM Production to Partners

Four alliances explicitly involving commodity DRAM occurred in 1997, but almost all can be interpreted within the context of a strategy that diversifies away from an emphasis on the commodity DRAM business (see Table 2-1). This has generally meant developing 300mm technology in joint ventures or licensing DRAM production technology to foreign-based companies, of which the Japanese company may hold a minority stake, in order to secure production output. As an example of transferring DRAM production to foreign companies, Toshiba Corporation agreed in February 1997 to purchase 20 percent of the Austin, Texas-based 64Mb DRAM facility of Samsung Electronics Company Ltd., allowing OEM procurement for Toshiba of 20 percent of the production output. In September 1997, Toshiba also provided Taiwan-based Winbond Electronics Corporation with DRAM production technology, which will secure a supply of both 64Mb and 256Mb from the Taiwan-based facility. Finally, in October 1997, Mitsubishi Electric Corporation agreed to provide Seiko Epson Corporation with 64Mb production technology. Mitsubishi will initially purchase all the production output of Seiko Epson's Sakata plant. Earlier, in May 1997, Mitsubishi had licensed Seiko Epson to produce video memory, also to be built at the Sakata plant, that would integrate 10Mb of DRAM with 2Kb of SRAM and graphics interface logic. All these alliances are consistent with a strategy of diversifying resources away from commodity DRAMs.

The only major joint venture of 1997 involving DRAMs was signed in February by Hitachi Ltd., Mitsubishi, and Texas Instruments Inc. and specified that the partners would jointly develop 1Gb DRAMs. However, this project was put on hold in February 1998. Although the partners have specified that they will resume joint development of 1Gb DRAM in one year, the future of this project will probably depend on the market outlook in 1999.

Table 2-1
DRAM and Next-Generation Wafer/Production Alliances

File Number	Company 1	Company 2	Product	Date

When Will 300mm Standardization Arrive?

Several other alliances made in 1997 address 300mm technology development.

Toshiba and IBM will cooperate in commercializing 300mm production, and will possibly set up a 300mm line at their joint production plant. Similarly, NEC Corporation and Samsung have agreed to share development of 300mm wafer fabrication equipment and technology across their memory plants. Both alliances are expected to have operational 300mm wafer production lines up and running by 1999. The oversupply of DRAMs, along with weak Asian currencies and economies, are contributing to very tentative ramp-ups of Japanese, Korean, and Taiwanese next-generation DRAM and 300mm wafer facilities. However, although no company has voiced concern, it seems that, if Japanese companies intend to focus their semiconductor businesses on embedded DRAM products, then they would not want any delay in the arrival of next-generation DRAM capabilities that would impede the transition to the next level of embedded DRAM products. This, of course, assumes there exists a next-level single-chip device or application that can use the higher amounts of DRAM, and presumably faster logic, provided by the next-generation merged processes. The applications that will drive the adoption of next-generation embedded DRAM products are not clear, but there are a few candidates, as described in the following sections. This uncertainty is a looming factor in the decision process that will dictate how Japanese vendors structure their alliance activities.

From DRAMs to Embedded DRAMs: How Fast Can We Get There?

There are skeptics, including individuals representing companies such as Intel Corporation, who have voiced their conviction that embedded DRAM technology will never become a mainstream technology. The basis of their argument is that the logic and memory processes of the future are incompatible. Nevertheless, if the critics are proven wrong, this would be somewhat ironic because Intel itself has essentially used its own processing expertise, including the use of BiCMOS, to counter the assault of RISC, with its inherent performance advantages, over the last few years. There have been many processing transitions over the years, such as NMOS to CMOS and bipolar to BiCMOS, and with each transition, there were always a few who either did not believe the new technology would ever become competitive or who miscalculated the timing of the transition. Today, there are enough companies that seem convinced that combining DRAM with fast logic is both feasible and an inevitable mainstream technology that one must consider the implications if these companies are correct. History has frequently proven that processing and circuit innovation has consistently surmounted the barriers they have encountered. The accuracy of Moore's law is a testament to the steady progress being made in integration capabilities. Table 2-2 lists the alliances occurring in 1997 that explicitly covered embedded DRAM technology. However, many of the other alliances of 1997, particularly those relating to RISC MPUs—described in a subsequent section—have also been extended to cover embedded DRAM technology. This is a logical extension of these alliances, since many RISC alliances involve the use of cores in ASIC libraries, which have recently been expanded to include embedded DRAM in addition to the usual RISC cores.

Notebook Graphics Accelerators Still the Only Application for Embedded DRAM in 1997

In contrast to the splash that embedded DRAM alliances made in 1996, the alliance activity involving embedded DRAM technology in 1997 was very subdued. Part of the reason for this is that the graphic accelerator market, the initial market to capitalize on the benefits of embedded DRAM technology, had become overcrowded in 1997. Too many players meant steep drops in accelerator prices and shrinking market windows that resulted in some once high-flying start-ups dropping off the radar screen. With these conditions, it wasn't surprising that the shifts in the market diverted attention away from the progress being made on the merged logic-DRAM processing front. Moreover, falling graphics controller and accompanying memory prices may have also confined the embedded DRAM graphics controllers to the notebook segment only, where power efficiency is the primary selling point, and prevented migration to the desktop world, where the ratio of processing power to cost is usually the only criterion that determines market success.

Although only three or four alliances explicitly involving embedded DRAM technology were signed by Japanese companies in 1997, two of the 1997 alliances were inked by Toshiba. In June, Toshiba licensed its 0.35-micron DRAM-mixed logic technology, later to be migrated to 0.25-micron, to Chartered Semiconductor Mfg. Pte. Ltd. of Singapore. Chartered is expected to launch production with this technology in 1998. As an update to a Toshiba-Chromatic Research Inc. alliance formed in 1995, Toshiba has disclosed plans to use the second generation of Chromatic's Mpact 2 core in an embedded DRAM chip targeting notebook computers. The Mpact DSP uses a very long instruction word architecture, and the Toshiba part will be built sometime in 1998 with 4MB of DRAM and a 128-bit internal bus using Toshiba's 0.25-micron merged logic-DRAM process. The Mpact 1 and 2 were originally designed to use the Rambus DRAM and interface, and the move to an embedded DRAM part is expected to reduce power consumption by several watts, an important savings for notebook applications.

Interestingly, Toshiba also signed an alliance agreement in May 1997 to act as foundry for NeoMagic Corporation notebook graphics controllers. Strong demand for NeoMagic controllers has evidently required the company to supplement its supply of controllers being produced by Mitsubishi. Mitsubishi, an original investor in NeoMagic, will continue to make embedded DRAM controllers for NeoMagic; however, both Mitsubishi and Toshiba are, or shortly will become, competitors to NeoMagic because both have plans to build graphic controllers for notebook applications using their own designs and embedded DRAM technology. As seen below, the Mpact digital signal processor (DSP) is not the only device intended to make a transition from an external Rambus memory interface to an embedded DRAM solution.

Teams Research Multiple-MPU Parallel Processing with Embedded DRAM

Although no Japanese vendor has yet announced a formal alliance with the start-up PixelFusion Limited, based in Bristol, England, its work is particularly interesting in that it is specifically addressing the needs of the very high end of 3-D graphics accelerators by using massively parallel designs, developed at the University of North Carolina at Chapel Hill, in conjunction with an implementation in a merged logic-DRAM process. Silicon prototypes have been built by Chartered Semiconductor Manufacturing of Singapore, but the demands of building numerous processing units with large amounts of memory on a single chip may call for cutting-edge processes. It would therefore not be surprising if PixelFusion sought Japanese vendors as alliance partners to build its production designs. Indeed, the work at PixelFusion parallels the three-year research project being conducted at a Japanese consortium formed at the end of 1996. Based on the work of Professor Murakami from Kyushu University, the consortium initially anticipated that media processors using parallel processing architecture would reach the market by 1998. Similarly, a European research consortium, based at a university in Belgium, announced in December 1997 its intention to develop MPEG-4 chips that will be implemented with mixed logic-DRAM technology. Japanese partners have been included in the consortium, and project is also scheduled to run for three years, beginning in January 1998.

Because Japanese vendors arguably have been working on the development of embedded DRAM technology the longest, they have entered into several noteworthy alliances covering embedded DRAMs. This alliance activity is expected to continue; however, it should also be noted that there are conflicts within the industry that seem to be having a distinctly antialliance effect. Japanese vendors are currently suing several of their major Korean DRAM competitors for royalty payments, and, in some cases, seeking injunctions designed to prevent Korean vendors from selling their parts in the United States. With the Koreans expected to follow the Japanese vendors into the merged DRAM-logic markets, it may be that recent legal actions against the Korean companies are designed to force these competitors to pay for some of the cost of developing an embedded DRAM technology that is likely to benefit all manufacturers eventually, including Korean vendors.

As strange as it might sound, the legal action may actually have the effect of promoting alliances involving embedded DRAM development between Japanese and Korean vendors. Considering the lack of profit from the sales of commodity DRAMs, the cost of developing embedded DRAM technology will be difficult to sustain—predicting when a profitable return-on-investment will occur is not trivial, because it is dependent on finding the right uses for the technology at the right time. Furthermore, once an effective embedded DRAM process is achieved, the learning curve for nondevelopers will be simplified by information passing by way of both direct and indirect alliances. The Korean memory vendors will benefit from the pioneering work and probably cannot afford to pioneer the technology independently. The recent legal action by Japanese vendors is expected to force some Korean vendors to at least discuss either royalty payments, which would help defray the cost of developing technology, or more alliances in which vendors share the development cost of next-generation technologies.

ASICs Combine RISC Cores with Embedded DRAM to Open New Application Areas

Embedded DRAM may need to become the primary driver of the transition to 300mm technology if DRAMs continue to provide inadequate return on investment. Intel is sufficiently afraid of a mass vendor exit from the commodity DRAM business and the potential for a subsequent DRAM shortage that might affect its own microprocessor sales that the company is considering boosting its investments in major DRAM vendors by $1 billion. Meanwhile, most Japanese vendors are pushing ahead with research and development of merged logic and DRAM processes that seeks to minimize performance compromises. Besides graphics controllers for portable computing platforms, embedded DRAM products were expected to make their next appearance in hard disk drives. Because the disk drive industry seems to be in turmoil, there is less discussion of this happening soon. However, many other applications are being discussed as possible system-on-a-chip implementations that would include on-chip DRAM. A number of alliances that originally covered collaboration or licensing of RISC technology have been expanded to include RISC microcontroller (MCU) cores combined with embedded DRAM.

Alliances in Video Games, Windows CE Machines, ...

NEC is working with Nintendo Company Ltd. to eventually migrate its MIPS RISC-based video game controllers away from use of a Rambus memory interface architecture to a more efficient embedded DRAM solution. As with most custom ASICs, this can result in a lower cost-to-performance ratio in very high-volume applications only, such as video game consoles. This application is interesting because it represents a mass market product that, unlike the notebook graphics controller, is probably not using the superior power consumption efficiency of the embedded DRAM technology as its primary selling point. NEC expects to have available to ASIC customers by spring 1998 the capability of merging 200-MHz logic with 32Mb of 100-MHz DRAM connected over a 128-bit bus.

©1998 Dataquest

The electrical and market performance of both the Nintendo embedded DRAM video controller and Toshiba's embedded DRAM Mpact 2 chip, both having potentially abandoned the Rambus interface and memory combination, may provide an interesting comparison benchmark for ASIC customers thus far unconvinced of the advantages of using embedded DRAM technology.

In early February 1998, Sega Inc. confirmed a long-rumored alliance with Microsoft Corporation to cooperate on the construction of a game machine. The confirmation by Sega included the revelation that the new platform will use the Windows CE operating system. Just as with the Nintendo-NEC alliance, the Sega-Microsoft game console is an application that can benefit from the use of an integrated game controller that merges embedded DRAM with logic. Dataquest would therefore expect to see in the not too distant future an alliance with a semiconductor producer, such as a manufacturer already building RISC cores for Windows CE platforms and probably at least planning on an embedded DRAM version of the Windows CE device. A large and growing number of vendors would qualify for such a project.

In the first quarter of 1997, Mitsubishi began working with ACCESS Corporation to customize a Mitsubishi chipset for use in portable Internet terminals, which include the M32R/D, a 32-bit RISC processor currently embedded with 2MB of DRAM. This processor family is scheduled to reach a clock speed of 400 MHz with 16MB of embedded DRAM, built with a 0.2-micron geometry, by the year 2000. Mitsubishi will also codevelop, as well as cross license, microcomponent cores embedded with DRAM with Motorola Incorporated, as a continuation of an alliance formed in October 1996. This alliance involves an embedded DRAM version of Mitsubishi's M32R and Motorola's 68EC000 and Coldfire processors.

In the second quarter of 1997, Toshiba partnered with Sun Microsystems Inc. to develop a Java processor for use in network computers. The micro-Java chip will incorporate a picoJava core, a memory controller, and embedded DRAM. Toshiba also announced in July 1997 the development of its MIPS based, Virtual Socket Interface (VSI)-compliant, TX19. This is a low-power, low-cost, embedded RISC processor that Toshiba intends to combine with embedded DRAM in the company's 0.25-micron DRAM-ASIC process.

In the third quarter of 1997, Hitachi announced that its SH-3 and SH-4 RISC MPU cores would be available in an embedded DRAM-enabled 0.35-micron process that ASIC clients can use to add DRAM in 256Kb increments, called "micromodules" by Hitachi. By 1999, Hitachi expects to field an SH-4 core with flash and micromodules based on 256Mb 0.25-micron DRAM technology. The number of RISC core license agreements, combined with embedded DRAM agreements, would suggest that mobile computing devices, particularly Windows CE machines, are expected to become a significant product segment making heavy use of system-on-a-chip designs that include embedded DRAM.

 ©1998 Dataquest

In the fourth quarter of 1997, NEC and Lucent Technologies formalized an alliance that has Lucent licensing NEC's V800 series of RISC MCUs. As part of this alliance and possibly two previous alliances formed between the partners in June and October 1996, the two companies are said to be working together on an embedded DRAM process that Lucent expects to incorporate into its own 0.25-micron ASIC process by mid-1999.

Table 2-3 shows the alliances that covered RISC technology in 1997.

Chapter 3

Displays, Micromachines, and Sensors Also Head toward Merged Processes

The synergy between traditional semiconductor circuits and integrated displays, sensors, and micromachines continues to grow and, in some cases, is already showing signs of merging with mainstream IC manufacturing. Moreover, VSI will facilitate the connection of not only standard IC cores, but also a growing array of new, CMOS-compatible devices that include sensors, micromachines, and even displays. Although start-up companies have always been expected to gamble on some of these esoteric technologies, many traditional IC companies, never having strayed too far from standard analog or digital IC fabrication technologies (at least in production), are also aggressively building exotic production-worthy process portfolios. For example, National Semiconductor Corporation is attempting to build active-matrix LCDs on standard wafers, Toshiba and Atmel Corporation are building CMOS image sensors, and Texas Instruments has made a heavy, highly publicized investment in its micromachined mirrors, also on standard wafers. The integration of such technologies with a memory-logic process should allow for the creation of such things as a true system-on-a-chip digital camera.

Although traditional IC manufacturing processes are incorporating more nonstandard components, from the opposite end of the processing spectrum, flat panel display manufacturers are starting to build circuits on their thin semiconductor films on glass or quartz substrates. There has been a recent surge in active-matrix LCDs research as this segment of the flat panel display industry continues to give upstart flat panel technologies a moving target. Nine new alliances involving LCDs occurred in 1997, which outpaced the LCD alliance activity of 1996. These alliances are listed in Table 3-1. The breadth of the technologies that are being combined with liquid polarizing crystals is beginning to overwhelm the work in other nascent technologies, such as field emission devices (FEDs), to the degree that some may already have missed their window of opportunity for commercialization because of the rapidly falling cost and improving performance of active-matrix LCDs. Active-matrix LCD reflective displays are being touted for their extreme power efficiency in mobile computing and communications applications, as well as for use in head-mounted displays or viewfinders in digital cameras and camcorders. Windows CE machines and personal digital assistants (PDAs) are expected to be among the first application markets to benefit from efficient reflective devices, some equipped with part-time backlighting capabilities. Sharp Electronics Corporation announced in September 1997 a reflective display for Windows CE machines that features a 30 percent reflection and 10:1 contrast ratio.

Table 3-1

Source: Dataquest (March 1998)

On the materials research front, the films used to make active-matrix LCD panels are continuing to reach higher quality levels—meaning fewer defects. Although low-temperature polysilicon films are just beginning to reach commercialization, the films still in development are even closer in characteristics to bulk crystalline silicon. The fundamental materials and thin-film transistor research is yielding advances that suggest that active-matrix LCD and system ICs may well merge into another hybrid class of devices based on yet another merged process. Along these lines, Sharp's continuous grain silicon has continued the trend of improving thin films from amorphous films toward the ultimate goal of crystalline silicon-like electrical characteristics. Achieving this goal would improve the performance of active-matrix LCDs, as well allow the construction of all peripheral circuits right on the same substrate, with improved yield. If this trend continues, the 300mm technology of the silicon wafer industry may begin to have even more in common with the flat panel TFT processing technology than it already has.

Chapter 4

Dataquest Perspective

There is a prevailing notion that for some Japanese vendors, DRAMs and embedded DRAMs have become one and the same industry. During the current DRAM oversupply, it appears that many Japanese chip vendors will continue to use alliances either to shift their commodity DRAM production to offshore joint ventures or to completely transfer their commodity production to licensed Asian partners. At the same time, the major Japanese vendors will attempt to accelerate the transition to embedded DRAM technology for a widening array of multichip products that currently use separate memory parts, particularly those that either require better power-consumption performance, such as notebook computer components, or that rely on high-speed logic-to-memory buses, such as the Rambus interface. There is certainly risk in this strategy, because the Japanese vendors may be forcing themselves to exit the commodity DRAM prematurely, at a time when embedded DRAM revenue may be insufficient to support the upgrades to 300mm equipment. However, the DRAM business for many Japanese vendors is a losing proposition with a cloudy outlook, and the successful deployment of a competitive embedded DRAM technology has the potential to boost the competitiveness of Japanese ASIC and logic businesses substantially. Moreover, alliances may also provide a fast recovery mechanism if the transition to systems-on-a-chip, using embedded DRAM technology, is delayed or the commodity DRAM business again becomes too lucrative to ignore. Regardless of how individual Japanese companies will implement their particular memory and ASIC strategies, the common denominator is certain to be their use of alliances to adapt quickly to market conditions and technology shifts. There are just too many advantages to alliances that outweigh the potential drawbacks.

The last U.S.-Japan Semiconductor Trade Agreement was allowed to expire over a year ago. The robust rate at which Japanese and U.S. companies have entered into new alliances since the expiration, as well as the continuing high market share of foreign companies in Japan, often exceeding 30 percent in the past year, provides some support for those that argue that the decision not to renew the trade agreement at the end of July 1996 was correct.

Appendix A
1997 Japanese Semiconductor Strategic Alliances

Table A-1 lists the companies involved in publicly announced strategic alliances occurring in 1997. The individual alliance agreements are summarized in Appendix.

Dataquest classifies strategic alliances into the following 12 major categories.

- LA—Licensing agreement: A Japanese company receives or issues a license to a partner for an up-front fee or royalties.
- SS—Second-source agreement: Both companies agree to develop consistent specifications to ensure a second source.
- SA—Sales agency agreement: A Japanese company sells its partner's products, either as a sales representative or value-added reseller (VAR).
- FA—Fab agreement: A Japanese company offers fab capacity for a partner's product technology.
- AT—Assembly and testing agreement: A Japanese company sends or receives devices for assembly or testing.
- TE—Technology exchange: Both companies exchange technology, which may or may not include a transfer of money.
- JV—Joint venture: The two companies form a new joint-venture company to develop, manufacture, and market new products.
- JD—Joint development: Both companies agree to develop new products jointly, which may or may not be marketed separately.
- IV—Investment: A Japanese company invests in a partner company to secure new technology or access to new markets.
- CO—Coordination of standards: A Japanese company and a partner agree to device standards to ensure compatibility.
- PC—Procurement agreement: A Japanese company agrees to buy more foreign semiconductors as part of market access program.
- OT—Other: Joint symposia and programs

Appendix B
1997 Alliance Agreements

Access

1. National Semiconductor (United States), September 1997

National Semiconductor Japan has teamed up with Tokyo-based software developer Access in the systems development for Internet-capable home electronics. The Japanese subsidiary of National Semiconductor intends to supply home electronics makers in Japan with a system-on-a-chip LSI that supports Access' Internet connection and search program, Netfront. The system-on-a-chip LSI centers around National's NS486 processor core, complying with Intel's x86 architecture, and integrates PCMCIA controller, IrDA, and other peripherals, providing all the functionality necessary to give a TV or satellite receiver Internet connectivity.

Asahi Glass

2. ASPEC Technology (United States), January 1997

Asahi Glass will market ASIC libraries developed by ASPEC Technology of the United States in Japan. ASPEC already handles ASIC libraries supporting the production processes of 15 chipmakers. The price is ¥300 million per kit. Asahi Glass has also started taking orders from customers in Japan for the ASIC Division of Hyundai Electronics, which uses ASPEC's libraries.

3. Advanced Micro Devices (United States), March 1997

Asahi Glass will step up sales of Advanced Micro Devices microprocessors this fiscal year. The company deals with AMD's Windows PC MPUs and in-built processors. For Windows PC MPUs, Asahi Glass hopes to tap demand for the K6 chip from domestic PC makers. In a move to market built-in processors for numerical control and point-of-sale systems, Asahi Glass has signed a distribution agreement with Microsoft to obtain an MS-DOS license. Plans also call for commercializing AMD MPU boards that incorporate Asahi Glass hybrid ICs.

Canon

4. Scientech (Taiwan), January 1997

Canon set up a stepper sales and support joint venture in Taiwan in early February. The company's third service center in Asia, Canon Semiconductor Equipment Taiwan will be headquartered in Taipei and will be capitalized at about ¥300 million, 80 percent by Canon and 20 percent by a local distributor, Scientech. The new company will initially be staffed by 22 employees. Canon, which has already won an order for more than 20 steppers from ProMos Technologies, a joint venture between Siemens and Mosel Vitelic of Taiwan, is aiming to nearly double its share to about 50 percent of the Taiwanese stepper market by 1999.

Dainippon Screen

5. Kyoto Technica (Japan), March 1997

Dainippon Screen Manufacturing and Kyoto Technica will jointly set up a semiconductor/LCD equipment maintenance service company. Based in Kyoto, DS Tec Kansai is capitalized at ¥50 million, with Dainippon Screen investing 82 percent and Kyoto Technica 15 percent; it will start operations with more than 100 employees. Dainippon Screen, which has entrusted maintenance service to a subsidiary and Kyoto Technica, will commission delivery and maintenance of equipment for its customers in the Kinki, Chugoku, and Shikoku regions to the new company. DS Tec Kansai is expected to achieve annual revenue of ¥1.1 billion in its first year.

DSI

6. Korean company (Korea), October 1997

DSI, a Japan-based semiconductor equipment production venture, will establish a joint venture in Korea in October to manufacture vertical electric furnaces for use in next-generation semiconductor production. To be capitalized at ¥40 million, DSI Korea will be owned 70 percent by a local company and 30 percent by DSI. With an initial staff of three salespeople and two engineers, the joint venture will have a clean room at its main office. DSI, which has been assembling vertical high-vacuum annealing systems at its Shizuoka plant, intends to scale down its domestic operations and shift manufacturing technologies and equipment to the Korean company.

Emplas

7. Hicad (China), June 1997

Emplas will set up an IC test socket sales joint venture in Shanghai with its Singapore distributor, Hicad. To be capitalized at $600,000, Emplas Hicad National Trading will import IC test sockets from Japan and launch sales in late July. The joint venture will target chipmakers, including NEC and Motorola, with IC manufacturing operations in China and will aim for annual sales of ¥2 billion in three years.

Fuji Film Microdevices

8. Kopin (United States), November 1997

Kopin and Fuji Film Microdevices, Japan, announced a strategic business agreement under which the companies will incorporate Kopin's CyberDisplay active-matrix LCD into Fuji's digital camera chipsets. Fuji and Kopin will work together to integrate Fuji charge-coupled device analog and logic circuits with Kopin's CyberDisplay. The goal of the strategic alliance is to make the chipsets available to Fuji internal and external customers by the second quarter of 1998. Based on Kopin's patented Smart Slide technology, the CyberDisplay is a 0.24-inch diagonal transmissive active-matrix LCD imaging device that displays information at 320 x 240 full-color-pixel resolution. It enables portable communications devices and personal information products to display photographic images and other data or video sources.

 ©1998 Dataquest

Fujitsu

9. Advantest (Japan), February 1997

Fujitsu and Advantest will concentrate their joint electron beam (EB) exposure system business at Advantest. The two companies jointly developed the F5120 EB exposure system for use in 256Mb or larger DRAM production, and Advantest has started marketing it. From April 1997, about 50 Fujitsu employees engaged in EB systems development will be on loan at Advantest's R&D center now under construction. Advantest expects to sell five of the ¥1 billion systems the first year.

10. LG Semicon (Korea), March 1997

Fujitsu and LG Semicon in Korea will unify the design guides of their proprietary chip-scale packages under the name "USON," for ultrathin small-outline nonleaded package. The companies plan to ask the Joint Electronic Device Engineering Council (JEDEC) to designate USON as a new standard package for memory devices. Fujitsu developed a chip-scale SON package, which has been used for its flash memory since September 1996. Compared with the conventional thin small-outline package (TSOP), the company claims, the SON package takes up about half the space in mounting, is two-thirds of the thickness, and is half the weight for 16Mb flash memory. LG Semicon developed the bottom-leaded plastic (BLP) package and has been using it for DRAM packaging. BLP is almost the same size as SON.

11. Sand Microelectronics (United States), March 1997

Fujitsu will license Virtual Socket Interface (VSI)-compliant Universal Serial Bus (USB) microcomponents from Sand Microelectronics and will commercialize a microcontroller with integrated USB microcomponents for use in monitors. The USB interface allows peripheral equipment to be connected with the PC with ease. By supporting the USB macro, Fujitsu will be able to offer LSIs that support various standard interfaces, including IEEE 1394, SCSI, and IrDA.

12. Nantong Huada Microelectronics (China), May 1997

Fujitsu has reached agreement with leading Chinese chipmaker Nantong Huada Microelectronics to establish a semiconductor assembly joint venture in China in late June. To be capitalized at $10 million, Nantong Fujitsu Microelectronics will be owned 40 percent and 60 percent by the Japanese and the Chinese companies, respectively. The joint venture will initially employ 400 people to assemble 10 million microcontrollers and linear ICs per month and will construct a new facility starting in fiscal 1998 to raise output to 40 million units.

13. Rambus (United States), July 1997

Fujitsu will team up with Rambus of California in 64Mb high-speed DRAM technology. Fujitsu will receive high-bandwidth Direct Rambus DRAM technology to develop memory systems with gigabyte-per-second-class data transfer speeds. A major reason for the alliance seems to be Intel's plan to use DRAMs with the Rambus interface as the main memory for PCs that will ship starting from 1999. Rambus' high-speed DRAM technology has been transferred to most of DRAM makers including NEC, Toshiba, Hitachi, Samsung, LG Semicon, and Hyundai.

 ©1998 Dataquest

14. Orckit (Israel), August 1997

Fujitsu Microelectronics and Orckit Communications are teaming up to produce a single-chip, discrete multitone-standard-based Asymmetric Digital Subscriber Line (ADSL) modem. The companies will recast Orckit's two-chip digital solution and its analog front-end, currently based on discrete components, into a 0.35-micron mixed-signal CMOS chip. They will also add Asynchronous Transfer Mode (ATM) and rate-adaptation features in line with a new definition of ADSL known as Issue II. Fujitsu will market the device commercially and to Orckit. The chip is expected to be available in mid-1998.

15. Advanced Micro Devices (United States), October 1997

Advanced Micro Devices and Fujitsu will codevelop a serial NAND-type flash memory architecture, and they expect to begin production with a 64Mb device by October 1999. The two companies currently manufacture NOR-type flash at a joint-venture fab in Aizuwakamatsu, Japan, and have not sold serial flash, which offers a smaller cell size at the expense of random access speeds. A team with staff from both companies is being formed to develop the NAND-type architecture.

16. Sun Microsystems (United States), November 1997

Fujitsu has reached agreement with Sun Microsystems to license Sun's picoJava I, a Java microprocessor core. The company will develop 32-bit RISC microcontroller core specialized in Java software using 0.35-micron technology in 1998 and begin marketing the core for use in PDAs and cellular phones in 1999. The Java processor based on picoJava I is reported to outperform conventional RISC processors such as the SPARClite by a factor of five, and Fujitsu plans to use 0.25-micron technology to expand the core's applications to Network Computers. The company is aiming for Java MPU core sales of ¥10 billion in 2001, and ¥50 billion, or 30 percent of the dedicated Java MPU market, in 2003.

Furukawa Electric

17. Lucent Technologies (United States), February 1997

Furukawa Electric and Lucent Technologies have established an optical semiconductor assembly joint venture in the United States. Finet Technologies will assemble laser diodes, photo detectors, and other optical semiconductors starting in April and will market the products through the partners' sales channels in Japan and the United States. Furukawa and Lucent, already joined in an optical fiber cable manufacturing venture, Fitel Lucent Technologies, plan to invest a total of about $10 million in the new joint venture by fiscal year 2000.

Gunze Sangyo

18. Plasmaquest (United States), February 1997

Gunze Sangyo has acquired a capital stake in Texas-based semiconductor equipment maker Plasmaquest. Gunze, which has been distributing plasma etching and plasma chemical vapor deposition systems made by Plasmaquest in Japan since 1993, has bought with its U.S. subsidiary, Gunsan America, 14.81 percent of the U.S. company for $1 million. Plasmaquest needed financial support to expand production capacity to keep up with brisk demand for etching equipment in the North American market. Gunze wants to expand Japanese sales of Plasmaquest products to ¥1 billion in two years.

Hitachi

19. Mentor Graphics (United States), April 1997

Hitachi will work with Mentor Graphics to strengthen its 32-bit RISC processor development environment. Plans call for jointly developing SeamlessCVE, a hardware/software coverification tool for the Hitachi SH series microcontrollers. The tool, which will support MCUs in the SH-1, SH-2, and SH-3 series, will allow system designers to verify hardware and software and debug the software in the early stage of SH MCU-based equipment development, slashing development time by over one month. The tool is priced at ¥12 million.

20. Seiko Epson (Japan), November 1997

Hitachi and Seiko Epson announced an agreement concerning the licensing of Hitachi's 32-bit RISC microprocessor core technology to Seiko Epson. Seiko Epson intends to combine its low-power semiconductor technology with Hitachi's SH-3 core to build new ASICs and application-specific standard products (ASSPs) that better meet system requirements. Hitachi has been actively forming partnerships as part of establishing its 32-bit SH RISC engine family as an industry standard. The present agreement makes Seiko Epson the first Japanese partner and, for customers, will mean that more PC peripheral devices and portable information products built around SH MPUs will be available. Seiko Epson has developed 4-, 8-, and 32-bit CPUs. With the SH-3, Seiko Epson will address the need for products with a standard embedded CPU capable of running a standard operating system with its associated development environment.

21. NTT Electronics (Japan), November 1997

Hitachi and NTT Electronics will work together to develop a low-power SH-3 RISC microprocessor using a 0.25-micron process technology. Hitachi will provide its SH-3, designed for a 0.35-micron process, while NTT Electronics, which develops and manufactures ICs for its parent company, Nippon Telegraph & Telephone, will provide its 0.25-micron technology. Hitachi expects the collaboration will help it lower the power consumption of the SH-3 nearly 3 percent and shorten the 0.25-micron SH-3's time to market. The CPU is expected by spring of 1999.

 ©1998 Dataquest

22. SGS-Thomson (France), December 1997

Hitachi and SGS-Thomson Microelectronics formally unveiled plans to undertake joint development of 64-bit microprocessor cores for the Super-H family. The processor architecture will be backward compatible with Hitachi's SH-4 and is being targeted as a general-purpose engine for a wide range of products. The architecture of the first core that the companies will work on together, called SH-5 by Hitachi and ST50 by SGS-Thomson, is due to be disclosed in 1998, with first implementations sampled in the second half of 2000 and volume production in 2001.

Hitachi/Mitsubishi

23. Texas Instruments (United States), February 1997

Hitachi, Mitsubishi Electric, and Texas Instruments have signed an agreement to jointly develop 1Gb DRAM. The agreement, part of a trend toward huge investments to develop complex and expensive technologies, will allow the three chipmakers to share resources and leading-edge technologies. The three companies are aiming for sample shipments of the next-generation chips by early 2000, sharing the estimated development cost of more than ¥100 billion. Since 1988, TI and Hitachi have been teaming up to research and develop 16Mb, 64Mb, and 256Mb DRAMs, while Hitachi and Mitsubishi have jointly developed 8Mb, 16Mb, and 64Mb flash memory chips. In 1995, Hitachi and TI formed a joint venture, Twinstar, a $0.5 billion wafer fab located in Richardson, Texas.

Hitachi Chemical

24. DuPont (United States), September 1997

Hitachi Chemical and DuPont of the United States will jointly set up ventures in both countries to produce and market liquid polyimide materials for semiconductors and other electronic devices. The two companies have established Hitachi Chemical DuPont Microsystems LLC in the United States, slated to open in April 1999. An initial capital contribution of $14 million for the venture will be shouldered equally by DuPont and Hitachi Chemical's sales subsidiary, Hitachi Chemical America. The new joint venture will then establish Hitachi Kasei DuPont Microsystems K.K., as a wholly owned subsidiary in Japan, with capital of ¥400 million and a targeted operation date in 2002.

Hitachi Construction Machinery

25. Hitachi Medico (Japan), December 1997

Hitachi Construction Machinery has formed a partnership with Hitachi Medico in the semiconductor inspection equipment business. The company will procure as an OEM two types of x-ray-based semiconductor inspection systems from Hitachi Medico. Its goal is to nearly double its factory automation system sales to ¥3.6 billion by 2001 by broadening its x-ray inspection system product line. The MF130M and the MF80M feature focuses of 10 micron, and 8 micron, respectively.

Hitachi Maxell

26. Singlechip Systems (United States), December 1997

Hitachi Maxell has teamed up with Singlechip Systems of California to enter the IC tag business. The partners will combine Hitachi Maxell's non-contact IC card production technology with SCS' single-chip technology to manufacture and market an IC tag that will measure 10 x 60 x 0.25mm and have a memory capacity of 1,024 bits. A reader/writer will use 2.45-GHz signals to simultaneously read data on more than 30 write-once tags that can be 35cm apart. A set of the reader/writer and 100 tags will be priced at ¥600,000 to ¥1,000,000.

Innotech

27. Credence Systems (United States), November 1997

Innotech has established in Yokohama a semiconductor tester production joint venture with Credence Systems of California. Capitalized at ¥100 million, Innotech Credence is 49.9 percent owned by the Japanese semiconductor equipment distributor and 50.1 percent by the U.S. tester maker. The joint venture will manufacture logic and memory testers and put them on the market by spring 1998, aiming to ship a total of 50 units the first year. The first-year sales target is set at ¥4 billion.

Itochu

28. Grand Pacific Petrochemical (Taiwan), April 1997

Itochu, in cooperation with Fukushima-based technical consulting company Sumcon and Taiwanese chemical company Grand Pacific Petrochemical, will set up a joint LCD production company in Taiwan. The new company, Grand Pacific Optoelectronics, will be capitalized at about (4 billion, in which Itochu, Sumcon, and Grand Pacific Petrochemical invest 25 percent, 5 percent, and 70 percent, respectively. The joint venture expected to start constructing a plant in the Hsinchu industrial park in April 1997 and to produce sub-10-inch STN color LCDs for portable information devices and notebook computers from June 1998, aiming for first-year sales of about ¥10 billion.

29. Comdisco Inc. (United States), September 1997

Itochu and U.S. semiconductor equipment leasing company Comdisco have established a joint semiconductor equipment leasing company, Commit Equipment Management Service. Capitalized at ¥490 million, the joint venture is owned 60 percent by the U.S. company and 40 percent by the Japanese trading house. The joint venture is aiming for 20 billion in leasing contracts by 2000. Predicting that demand for used equipment may expand in Asia, the partners plan to sell used equipment to Taiwanese and Korean chipmakers. The used semiconductor equipment market in Japan is estimated at ¥5 billion, about 1/10th of the size of the U.S. used equipment market.

Kaijo

30. Robotic Vision Systems Inc. (United States), November 1997

Kaijo has teamed up with Robotic Vision Systems Inc. of New York to expand its inspection system business. Kaijo will start marketing and providing support for RVSI's ball grid array (BGA) inspection and bump attachment systems in December. Through an alliance with Kaijo, RVSI wants to boost its Japanese market share, currently about 20 percent of the market.

31. Quad Systems (United States), December 1997

Kaijo has begun marketing a flip-chip bonder made by Quad Systems of Pennsylvania, signing an exclusive domestic sales contract with the U.S. company. The Advanced Packaging System APS-1 supports various types of packaging, including chip-scale package (CSP) and chip on board (COB) and uses an optical noncontact alignment system to achieve a high level of alignment. The price is ¥40 million.

Kanematsu Semiconductor

32. Intergraphics Systems (United States), September 1997

Intergraphics Systems of California will team up with semiconductor distributor Kanematsu Semiconductor and software house Access to market in Japan the CyberPro2010, a system-on-a-chip LSI enabling users to browse Internet home pages on TV. The chip integrates monitor output circuit and image control functions and a flicker-prevention function and features a built-in interface called Flexibus that makes the chip usable with all existing CPUs, including x86 and PowerPC microprocessors and Hitachi SH series microcontrollers. Intergraphics Systems claims that the chip helps Internet TV makers slash development time and design costs by nearly 60 percent, enabling them to lower retail prices from the current ¥300,000 to ¥100,000.

Kyocera Electronics Inc.

33. Johnson Matthey (United Kingdom), October 1997

Kyocera has signed a cross-license agreement with Johnson Matthey of London in the semiconductor plastic package business. The company will introduce plastic package technology from Johnson Matthey and start mass production of plastic land grid arrays (PLGAs) for microprocessors at its Sendai plant in Kagoshima Prefecture in January 1998. In return, Kyocera will provide the U.K. company with build-up substrate technology. Plans call for launching production at 500,000 units per month (45 x 45mm, 540 pins) and boosting output to 1.5 million units by July 1998, when the company will complete a new 10 billion production facility at the plant. Kyocera is aiming for PLGA sales of ¥5 billion to ¥6 billion in fiscal 1998.

Lapmaster SFT

34. Super Silicon Crystal Research Institute (Japan), August 1997

Lapmaster SFT of Tokyo will collaborate with Super Silicon Crystal Research Institute of Gunma Prefecture to develop a fully automated chemical mechanical polishing machine for processing 400mm wafers. Super Silicon will provide wafer samples, while Lapmaster will be in charge of hardware design and software development. Development costs are estimated at (100 million. Scheduled to be developed by May 1998, the machine will achieve a wafer-processing flatness of less than 0.13 micron, a surface particle diameter size of 0.04 micron, and a surface metal impurity level of 10 x 8 stoms/cm^2. The 400mm wafer-processing machine is likely to be priced at about ¥200 million.

Matsushita

35. Texas Instruments (United States), January 1997

Texas Instruments Japan and Matsushita Electric have jointly developed a digital video camera DV terminal IC that conforms to IEEE 1394, a high-speed serial bus standard for next-generation PCs and consumer electronics. The TSB13LV01 integrates on a single chip the functions of conventional LINK and PHY chips and is available in a 144-pin CSP. TI Japan will initially mass-produce the new IC exclusively for use in the latest NV-DE digital video camera from Matsushita Electric.

36. CBL (United States), July 1997

Matsushita Electronics signed an agreement with a California-based venture CBL under which the companies will jointly develop a blue-light laser. Matsushita is aiming by 1999 to commercialize a blue-light laser, necessary for next-generation DVD drives with a storage capacity of 15GB, three times the current level. Set up by Stanford University researchers, CBL has developed large-diameter gallium nitride substrates. Use of this type of substrates increases the life of a blue-light laser from the conventional 30 hours to 5,000.

Mitsubishi

37. Compaq (United States), January 1997

Compaq Computer Corporation has teamed up with Mitsubishi Electric and with Advanced Display, Mitsubishi's LCD production subsidiary, in PC LCD monitor development. The alliance brings together Compaq's understanding of customer needs, Mitsubishi's flat panel technology, and Advanced Display's motherboard and glass processing technologies. The companies developed an LCD monitor and put it on the market in the second half of 1997. Compaq will be in charge of sales and will initially target the financial and health care sectors.

©1998 Dataquest

38. Access (Japan), February 1997

Mitsubishi Electric has teamed up with Access, an Internet appliance operating system developer, in the development of a portable Internet terminal chipset. The two companies will jointly develop a three-chip set including Mitsubishi's M32R/D DRAM-embedded microcontroller and a mask ROM and market the chipset at $30 to $40. Mitsubishi plans to develop a two-chip set in 1998 by integrating an ASIC and the M32R/D on a single chip. Mitsubishi, which started shipping samples of the DRAM-embedded MCU in October 1996, will launch production in April and produce 1 million units a month in late 1997. Access' Internet OS has been adopted by Sharp in its Internet TVs and word processor.

39. Wind River Systems (United States), March 1997

Wind River Systems, Japan, will develop the Tornado embedded system development environment for Mitsubishi Electric's 32-bit M32R/D RISC processor, based on an agreement the two companies have signed. The agreement will allow domestic M32R/D users to collectively purchase from Mitsubishi the license to use the VxWorks real-time operating system that is integrated into the Tornado development environment, helping them reduce system development time. Mitsubishi, which teamed up with Integrated Systems Inc. of the United States regarding its pSOS real-time OS in 1996, will support the real-time operating systems that account for some 70 percent of the world market.

40. Rambus (United States), April 1997

Mitsubishi Electric has licensed the Rambus interface technology needed to make 1.6GB/sec Direct Rambus DRAMs. The company has previously been a vocal proponent of other next-generation DRAM technologies. Nine DRAM makers have taken Rambus licenses, and some of the holdouts are believed to be negotiating with Rambus. IBM has a license for the Rambus logic interface but has yet to take a license for the memory-interface technology.

41. Seiko Epson (Japan), May 1997

Mitsubishi Electric will license 3-D video memory technology to Seiko Epson. Mitsubishi's 3D-RAM integrates 10Mb DRAM, 2Kb SRAM, and logic functions on a chip. Seiko Epson is expected to ship samples of the SDM 10092, a 3D-RAM-compatible chip, this fall and launch volume production at 20,000 units per month at its Sakata plant next spring. The sample price is likely to be set at about ¥5,000.

42. Chunghwa Picture Tube (China), May 1997

Mitsubishi Electric and Advanced Display have agreed to license their advanced thin-film transistor (TFT) LCD technologies to Chunghwa Picture Tube, a cathode-ray tube (CRT) manufacturer in Taiwan. Under the agreement, Chunghwa Picture will receive key technologies for the manufacture of TFT LCDs from Advanced Display. The displays to be manufactured by Chunghwa include 12.1-inch SVGA and XGA and 15.1-inch XGA and SXGA models. Volume production is expected to begin in January 1999. Chunghwa, an affiliate of Tatung, develops CRTs for the television and display market as well as super-twisted nematic (STN) LCD flat-panel displays.

 ©1998 Dataquest

43. Stone Group (China), June 1997

Mitsubishi Electric has teamed up with Chinese electric equipment maker Stone Group in semiconductor sales. Mitsubishi, Stone, and Mitsui & Co. established a joint venture in Beijing in 1996, and the joint venture is building a semiconductor plant expected to be ready for operations in April 1998. Mitsubishi plans to market semiconductors to be made by the plant for use in electric appliances. First-year China semiconductor sales are expected to be ¥10 billion, including sales to be generated through distribution via Hong Kong.

44. Mentor Graphics (United States), June 1997

Mitsubishi Electric will develop system-on-a-chip LSI development software with Mentor Graphics. Hardware-Software Cosimulation Environment, the software the two companies will develop, will combine Mentor's Seamless CVE and Mitsubishi's 32-bit M32R RISC microcontroller core instruction set simulator. The new software will allow system-chip LSI design engineers to test software as hardware is being designed, helping reduce design and development time from the current eight months to five months. Sample shipment is slated for late this year.

45. Powerchip Semiconductor (Taiwan), November 1997

Mitsubishi Electric expects to provide Powerchip Semiconductor of Taiwan with DRAM-embedded microcontroller production technology in early 1998. A joint venture established by Mitsubishi, a trading company, Kanematsu, and a Taiwanese electronics maker, the UMAX Group, Powerchip will begin to produce eRAM, a system-on-a-chip LSI that integrates Mitsubishi's proprietary 32-bit RISC MCU and DRAM on a single chip. Slated to begin in mid-1998, production will reach 4,000 eight-inch wafers per month by September 1998.

Mitsubishi Materials

46. Symmetrix (United States), December 1997

Mitsubishi Materials has licensed technology to produce and market ferroelectric materials from Symmetrix of Colorado. Plans call for producing Y-1, a ferroelectric material developed by the U.S. company for forming thin-film capacitors through enhanced metallorganic deposition (EMOD) at a mass production facility under construction in the company's Mita plant. Construction will be completed by year's end, and operations have been slated to start in March 1998. The company is aiming for sales of ¥200 million in 2000.

 ©1998 Dataquest

Mitsui & Co.

47. Micron Communications/ID Micro Systems (United States), April 1997

Mitsui & Co. will work with Micron Communications and ID Micro Systems, both of the United States, to develop a low-cost noncontact tag. The new tag will have a storage capacity of 256 bits and use the spread spectrum format to read and write data. The companies aim to price the product at about (100, enabling it to be used as a disposable tag in production and distribution management and IC card applications. Mitsui and Micron Communications will share the development cost, while ID Micro will provide noncontact tag technology. Mitsui will sell the tag in Japan and overseas, except for the United States. The tag was expected to reach the market in late 1997, with a first-year sales goal set at 10 million units.

Mitsui High-Tec

48. Ball Semiconductor (United States), August 1997

Mitsui High-Tec has invested in Ball Semiconductor of Texas, acquiring nearly 50 percent of the U.S. company for $26 million. Ball Semiconductor was established by former Texas Instruments vice president Akira Ishikawa in October 1996. Ball has developed technology to create semiconductor circuits on the surface of a silicon ball in order to increase the level of integration. The U.S. company claims that the silicon balls are easier to manufacture than silicon wafers and that a silicon ball semiconductor plant can be constructed at lower cost than conventional chip plants. Semiconductor equipment maker Disco is also reported to have chipped in more than ¥100 million to the U.S. venture.

NEC

49. Wind River Systems (United States), January 1997

NEC will procure an embedded RISC microprocessor operating system from Wind River Systems. NEC and the Japanese arm of Wind River have signed an agreement, under which the U.S. software company will develop a version of the Tornado operating systems supporting NEC's V830 series of 32-bit RISC MPUs. The B830 family is popular among office business machines and car navigation system applications, and the combination of the RISC MPU and Tornado will allow designers to develop such application systems easily. Japanese customers have been able to purchase the Tornado runtime version license together with the MPU from April 1997.

50. Datapath Systems (United States), February 1997

NEC has teamed up with U.S. venture Datapath Systems to develop an extended partial response maximum likelihood (EPRML) LSI for use in large-capacity hard disk drives (HDDs). NEC will continue its process technology with the U.S. company's circuit design technology to develop as early as this year the LSI that will enable 30 percent HDD capacity expansion over the conventional PREL system. NEC, which has to date manufactured HDD write and read LSIs, intends to expand its semiconductor business by moving into the HDD LSI market, a promising segment with huge growth potential.

51. Synopsys (United States), April 1997

NEC and Synopsys of California have reached an agreement to jointly develop microcontroller-embedded ASIC design verification technology. The move is aimed at providing a tool to enable single-chip embedded system designers to simultaneously verify both hardware and software functions and at reducing development lead time. For the development of embedded systems, hardware functions are typically verified using EDA capability and software functions using an in-circuit emulator. NEC expects the new tool will help expand sales of its V850 family of ASICs.

52. Shanghai Hua Hong Microelectronics (China), May 1997

NEC announced that it will set up a joint venture with Chinese chipmaker Shanghai Hua Hong Microelectronics to supply technology to a Chinese national project to boost domestic semiconductor output. Shanghai Hua Hong is affiliated with the Chinese government. The Chinese government will own about a 70 percent stake in the venture, to be capitalized at $700 million, and NEC will own the rest. The project, which is part of China's five-year economic plan, is called Project 909. Running through 2000, the venture will produce 20,000 chips a month. NEC will provide technology for processing memory chips.

53. Cadence Design Systems (United States), July 1997

Cadence Design Systems has signed an IC design tool contract with NEC. The three-year, $18 million contract will allow NEC to use Silicon Ensemble-DSM, an IC design tool, for deep-submicron design at its design centers worldwide. The tool boosts circuit design speed more than 20 times that of conventional tools.

54. Samsung (Korea), July 1997

NEC and Samsung have decided to cooperatively design a plant for 300mm wafers and help each other in equipment development. The alliance is aiming to get its 300mm wafer line up and running around 1999.

55. Tseng Labs (United States), September 1997

NEC Electronics announced the availability of an OEM reference design that combines the PowerVR PCX2 3-D graphics accelerator with Tseng Labs' 128-bit ET6100 2-D graphics and multimedia engine. NEC has formed a strategic alliance with Tseng Labs to develop PCI-compliant single-card reference designs based on the PowerVR architecture. This design offers PC OEM and graphics board manufacturers an all-in-one graphics solution that delivers arcade-quality 3-D rendering and high-performance 2-D acceleration for Windows applications. The single-slot PCI card supports game and entertainment titles written for Direct3D, PowerSGL, and DirectDraw, including more than 100 game titles that have been developed for or ported to the PowerVR architecture. VideoLogic's Apocalypse 5-D graphics board is the first product using the technology from NEC and Tseng Labs.

©1998 Dataquest

56. Philips Semiconductor (Netherlands), November 1997

NEC and Philips Semiconductor have reached agreement to jointly develop system-on-a-chip LSIs for use in digital consumer electronic products. They will use the 64-bit VR4300 RISC microprocessor based on MIPS Technologies architecture as a core for the system-chip LSIs and share peripheral circuit libraries. Consumer sales account for 15 percent of NEC's semiconductor sales and 45 percent of Philips', respectively. The two companies plan to begin to commercialize system-chip LSIs in the second half of 1998, cooperating in production as well as marketing.

57. Lucent Technologies (United States), December 1997

Lucent Technologies' Microelectronics Group and NEC announced that Lucent has licensed NEC's 32-bit V850 MCU family core. Lucent will integrate the core into its 0.25- and 0.35-micron Silicon Suite system-level IC offering, enabling customers to design system-level integrated circuits based on NEC's 32-bit RISC MCU architecture. The agreement means the V850 core will now be available from the two companies. The core will be available to Lucent customers for integration in April 1998.

Nichimen Electronic Components

58. Luxsonor (United States), May 1997

Nichimen Electronic Components has teamed up with Luxsonor of California in DVD chip sales. The U.S. fabless company focuses on MPEG-2 decoder part development, and Nichimen planned to release as early as June the LS220, a DVD decoder chip built into a PC motherboard. To be made in Taiwan, the chip will be sold for less than 4,000. The Japanese distributor is aiming for first-year sales of ¥500 million. Luxsonor is working on the LS240, a power-saving chip, and Nichimen intends to market it, targeting notebook computer makers, within the year.

NKK Corporation

59. Toshiba (Japan), September 1997

NKK will reorganize its semiconductor business by introducing state-of-the-art semiconductor technology from Toshiba. Plans call for starting 32-bit RISC microcontroller production within the year. The steel company will pay Toshiba a one-time fee of an estimated ¥1 billion as well as license fees and will manufacture RISC chips at its Ayase Research Laboratory. NKK, which entered the semiconductor business in 1992, hopes to put its semiconductor operations into the black by fiscal year 2000, reducing its dependence on the memory business significantly.

Nomura Microsciences

60. Ionics (United States), July 1997

Nomura Microsciences has teamed up with Ionics Inc. of Massachusetts to market pure water-processing electrical deionization (EDI) equipment targeting semiconductor, pharmaceutical, and food processing companies in Japan, Korea, and Taiwan. The EDI system uses no chemicals and requires no waste water processing and therefore can remove 99 percent of silica, a task considered difficult. The U.S. company has supplied its EDI equipment to more than 50 plants worldwide, and Nomura is aiming to sell ¥20 billion to ¥30 billion worth of ultrapure water-processing systems over the next five years.

Nozaki Industry

61. High Yield Technology (United States), May 1997

Nozaki Industry will import a particle monitor system from High Yield Technology of California. The In Situ Particle Monitor (ISPM) is attached to vacuum process semiconductor equipment and eliminates use of a dummy safer. The standard system is priced at about ¥4 million. Nozaki is aiming first-year shipment of 100 ISPM systems.

Oki

62. Synopsys (United States), January 1997

Silicon Architects of Synopsys has announced that Oki Electric of Japan has licensed Synopsys' cell-based array (CBA) architecture for its 0.35-micron ASIC products. Oki will use the CBA architecture to develop 0.35-micron ASICs for both internal and commercial use. Other products will include microcontrollers, MPU and peripheral ICs, speech ICs, and telecom ICs. Oki will develop designs using CBA design tools, which integrate CBA libraries, CBA compilers, the CBA Design Systems, and commercial EDA tools. Over the past year, Synopsys has also announced CBA licensing agreements with Fujitsu, Matsushita, Mitsubishi, NEC, Toshiba, and TriTech.

63. Artisan (United States), April 1997

Artisan Components, formerly VLSI Libraries, a supplier of embedded memories and other physical component intellectual property (IP), has received a multimillion dollar worldwide purchase agreement from Oki Electric. Oki has selected Artisan as its sole external supplier of memory generators and has agreed to incorporate Artisan's family of physical IP components into all of its new 0.35- and 0.45-micron internal standard products and ASSPs. Under the agreement, Oki will purchase a complete family of Artisan's memory generator, including standard single-port and dual-port SRAMs. Also, Oki's R&D centers in both Japan and the U.S. are adopting Artisan's technology.

Rohm

64. DSP Group (United States), March 1997

Rohm will license DSP core technology from DSP Group of California. Rohm will use DSP Group-developed 16-bit fixed-point PineDSPCore and OakDSPCore to develop system-on-a-chip LSIs for mobile communications and multimedia equipment. Specifically, Rohm expected to commercialize controllers for cellular phones, high-speed modems, and CD-ROM/DVD drives by the end of 1997. DSP Group licenses its audio-compression technology to a dozen companies, including AT&T, Intel, and Microsoft, and its DSP core technology to more than 20 companies, including Asahi Chemical, Kenwood, and NEC.

Ryosho Electronics

65. NeoParadigm Labs (United States), April 1997

Ryosho Electronics signed an exclusive agreement to sell in Japan LCD signal processing ICs developed by NeoParadigm Lab (NPL) of California, a start-up developer of multimedia LSIs. Designed for large STN LCD panels, the new LCD signal-processing IC directly processes analog RGB signals from the PC, reducing the signal-processing circuit cost to less than ¥10,000. Sample shipment was expected to begin in September, and Ryosho aims to sell 50,000 units the first year. Ryosho was established to sell DRAMs produced by Powerchip Semiconductor, a Taiwan-based joint venture, and by Mitsubishi Electric, Kanematsu and the UMAX Group of Taiwan, and aimed for fiscal 1997 sales of ¥6 billion.

Sankyo Engineering

66. Sugai (Japan), April 1997

Japan-based Sankyo Engineering and Sugai revealed that the companies will form a partnership for developing new auto wet stations, which can be used for 256Mb DRAM cleaning processes and new processes for 12-inch wafers. The companies will also begin developing common part specifications for their equipment in order to reduce parts inventory, and hence cost, while maintaining availability. According to the announcement, Sankyo Engineering and Sugai will consider exchanging stock or further investment in future partnerships if they find enough benefits.

Santoku Chemical

67. Mitsui & Co./Merck (Germany), October 1997

Santoku Chemical, Mitsui & Co., and Merck of Germany have established a joint venture in Singapore to produce ultrapure hydrogen peroxide water for cleaning semiconductor chips. Capitalized at about ¥700 million, Santoku Merck is owned 49 percent by Merck, 31 percent by Santoku, and 20 percent by Mitsui. The partners will invest ¥2 billion to construct a plant with an annual processing capacity of 10,000 tons, which will start operations in November 1998. Plans call for producing hydrogen peroxide water with particle per trillion-level purity. Santoku Merck is aiming for sales of ¥2.5 billion in 2005.

 ©1998 Dataquest

Seiko Epson

68. Lattice Semiconductor (United States), March 1997

Lattice Semiconductor has signed an agreement to advance Seiko Epson up to $150 million to assist in the funding of a new 8-inch wafer fab, currently under construction in Sakata, Japan. The agreement calls for Lattice to make a $90 million advance payment to Seiko Epson to set up the new fab over the next two years, with an option for an additional $60 million advance. In return, Lattice will receive guaranteed 8-inch, sub-micron wafer capacity. The advance payments will be repaid by Seiko Epson with wafers over a multiyear period. Lattice planned to manufacture next-generation, high-density, in-system programmable logic devices (PLDs) at the new facility beginning in 1998, initially using 0.35-micron CMOS process technology and later migrating to 0.25-micron process technology.

69. Exemplar (United States), June 1997

California-based logic synthesis tool supplier Exemplar Logic announced an agreement to jointly develop libraries for Seiko Epson/SMOS ASIC libraries for Exemplar's Leonardo design environment. As a result of this agreement, Seiko Epson/SMOS ASIC libraries are being distributed by both Seiko Epson and Exemplar Logic, and Exemplar's Leonardo becomes part of Seiko Epson/SMOS ASIC design flow worldwide. The high-precision delay models jointly developed by both companies interface to the Seiko Epson ASIC development system, Auklet. They are available to Seiko Epson/SMOS customers.

70. Mitsubishi (Japan), October 1997

Seiko Epson has tied up with Mitsubishi Electric in the DRAM business. The companies have agreed that Mitsubishi will provide Seiko Epson with 64Mb DRAM design and production technology and that the latter will launch production at 1 million units per month at its Sakata plant from the second quarter of 1998. Mitsubishi will initially purchase all units to be produced at the plant, but Seiko Epson is considering marketing the memory chips under its own brand name. Seiko Epson, which recently completed a ¥100 billion semiconductor production facility at the plant, had been looking for memory products, which will help with stability of operation.

Seiko Seiki

71. Jenoptik Infab (Germany), December 1997

Seiko Seiki, a Seiko Instruments Group company, will team up with German automated semiconductor production system maker Jenoptik Infab. The companies are signing an agreement concerning the standard mechanical interface SMIF() system, a localized clean environment system for wafer transport. Under the agreement, Seiko will provide installation, maintenance, and servicing in Japan for Jenoptik's SMIF systems, which are widely used in Europe, the United States, and Taiwan.

Sharp

72. SanDisk (United States), January 1997

SanDisk and Sharp signed a cross-licensing agreement that gives the companies worldwide rights to each other's patents for flash memory products. Terms of the agreement were not disclosed.

Shin-Etsu Handotai

73. Soitec (France), May 1997

Shin-Etsu Handotai will form a partnership with France-based Silicon on Insulator Technologies to mass-produce next-generation SOI wafers. Soitec has a cutting-edge SOI wafer technology known as Smart Cut, which combines a hydrogen ion implantation process with a conventional wafer-bonding method. This process seems to have an advantage in fabricating so-called ultrathin-film SOI wafers. Soitec has shipped the wafers under the Unibond name since the middle of 1996, and the company plans to expand its production facility in Grenoble, France. SEH and Soitec will develop mass-production technology for this process, and SEH also will construct a factory for SOI wafer production in Japan. Both companies plan to provide 1 million 8-inch wafers per year by 2000.

Sony

74. Toyoda Automatic Loom (Japan), June 1997

Sony and Toyoda Automatic Loom, the funding company of the Toyota Motor Group, are negotiating joint manufacturing of low-temperature, polysilicon active-matrix LCDs. The arrangement would give Sony the production capability to take advantage of emerging high-volume display opportunities, including the enormous automotive market, and it would provide Toyota with captive access to leading-edge display components.

75. Advanced RISC Machines (United Kingdom), July 1997

Sony has forged an alliance with Advanced RISC Machines of the United Kingdom in the 32-bit RISC processor business. Sony will develop and supply system-on-a-chip LSIs based on the ARM7TDMI RISC processor core targeting digital AV equipment, cellular phone, and PDA applications. Sony positions the ARM7 core as an MPU core for its 0.4-micron ASCS ASIC products. ARM's MPU core has been licensed to about 20 chipmakers and used for a range of applications.

76. Sharp/Philips (Netherlands), July 1997

Sony, Sharp, and Philips are jointly developing a next-generation large LCD for such applications as a wall TV. Not to be outdone by its competitors, including Fujitsu, that are leading in the large-screen display competition by concentrating on plasma display panels, the three partners will develop a plasma address LCD that they believe can be as large as 40 inches. Plans call for installing a pilot line at Sony Mizunami, where the partners will send their engineers to develop mass production technology. The companies are aiming for commercialization in 1998.

 ©1998 Dataquest

77. Oki (Japan), August 1997

Sony and Oki Electric will team up in the system-on-a-chip LSI business. They are discussing mutually commissioning production of a chip that integrates a microprocessor and DRAM on a single chip using a 0.25-micron process technology. The two companies, which reached agreement to jointly develop 0.25-micron system-chip LSIs in May 1995, are independently marketing system-chip LSI made using a 0.35-micron process. Sony and Oki, which are about to see the result of their joint development effort, seek to effectively use their management resources by commissioning production to each other.

Sumitomo Chemical

78. Olin (United States), September 1997

Sumitomo Chemical announced that it will cooperate with Olin, a U.S. chemical company, in the area of i-line photoresists used in production of 16Mb to 64Mb memories. Olin will have exclusive manufacturing rights to Sumitomo Chemical's advanced i-line photoresists in the United States and Europe. Olin, a supplier of i-line photoresists in the U.S. and European markets, will also have nonexclusive rights to sell such materials in those regions. Use of Olin's production facilities will enable Sumitomo Chemical to secure a foothold in these markets. Sumitomo Chemical is planning to increase annual sales of i-line photoresists from the current ¥12 billion to ¥30 billion in five years.

Sumitomo Corporation

79. Tokyo Kaseihin and others (Japan), January 1997

Tokyo Kaseihin will establish a lead frame production venture in Singapore with two Japanese manufacturers through its local subsidiary. To be capitalized at $50,000, the new venture will be owned by Tokyo Kaseihin subsidiary TOK Singapore, Osaka-based parts maker Iijima Metal Seisakujo, and Osaka-based packaging materials maker Shinko at a ratio of 1:2:2.

80. R. Howard Strasbaugh (United States), June 1997

Sumitomo Corporation set up in July a joint venture with R. Howard Strasbaugh of California to sell next-generation wafer-polishing machines developed by Strasbaugh. SC Semicon Technology is capitalized at 300 million, in which Sumitomo and Strasbaugh invested 85 percent and 10 percent, respectively. The CMP machine developed by Strasbaugh features a wafer surface roughness of 250 angstroms, 10 times the precision of conventional machines, and can process about 60 wafers per hour, three times the usual throughput. It is priced at ¥200 million. SC Semicon is aiming for first-year sales of ¥3.5 billion, targeting manufacturers of 64Mb DRAM chips.

 ©1998 Dataquest

81. Pixtec (United States), November 1997

Sumitomo Corporation has bought exclusive domestic sales rights to field-emission display (FED) panels from California-based Pixtec. The company, which is also authorized to market the products in Asia, will invest $10 million in the U.S. company in return. Pixtec plans to commission 5.2-to 8.0-inch FED panel production to leading Taiwanese LCD maker Unipac and ship 10,000 units per month starting in April 1998. Sumitomo, which handles ¥50 billion worth of CRT and LCD materials and products annually, is aiming to expand FED sales to ¥3 billion and ¥10 billion in the first and third years, respectively.

Tokyo Seimitsu

82. Super Silicon Institutes (Japan), March 1997

Tokyo Seimitsu will develop a 400mm-wafer wire saw jointly with the Super Silicon Institutes (SSI). The company will deliver a wire saw to the SSI by November, and the parties will jointly make enhancements with the goal of completing a practical unit by 2001. The SSI is a Gunma-based institute specialized in 400mm wafer technologies, established in March 1996.

83. Seiko Seiki (Japan), December 1997

Tokyo Seimitsu will form an alliance with Seiko Seiki in the semiconductor equipment business. The partners will combine Tokyo's alignment-measuring technology with Seiko's high-precision processing technology to develop wafer dicing and other technologies. In the meantime, Seiko Seiki, which has been marketing dicing saws since 1995, will stop production and procure products from Tokyo Seimitsu.

Toshiba

84. Unigen (United States), February 1997

Unigen announced that it will work with Toshiba America Electronic Components as a manufacturer of Toshiba-certified memory modules for sale under the Toshiba brand name. Toshiba expected to audit and qualify Unigen's production facility in the first quarter of 1997, and the Unigen/Toshiba team could begin shipping Toshiba product in the second quarter. Unigen is a Fremont, California-based third-party memory module manufacturer that focuses on the OEM channel.

85. Samsung (Korea), February 1997

Toshiba will acquire 20 percent of Samsung Austin Semiconductor of Texas, a Samsung Electronics subsidiary, and procure the 20 percent of 64Mb DRAMs the Texas company will manufacture for sales under its own brand name. Slated for completion in June 1997, the first facility of the Korean subsidiary, in which Intel also has a capital stake, expected to launch 64Mb DRAM production by year's end and have a monthly output capacity of 2.3 million units by the end of 1998, when it expects to be fully operational. Samsung Austin Semiconductor plans to invest $1.3 billion to construct three facilities by 2003.

 ©1998 Dataquest

86. Motorola/Fairchild (United States), March 1997

Toshiba, Motorola, and Fairchild Semiconductor will jointly develop next-generation high-speed CMOS standard logic ICs. The three companies will work together to develop 2.5- and 3.3V CMOS standard logic ICs with a propagation delay time of 2ns. The new devices will be suited for ATM and ISDN network and engineering workstation memory address control use. They will introduce compatible products simultaneously to develop an untapped market. Plans called for commercializing the fast standard logic ICs by the end of 1997. The high-speed standard logic IC market is forecast to grow to ¥35 billion in 2000.

87. Sun Microsystems (United States), April 1997

Toshiba and Sun Microsystems have agreed to develop a Java processor chip for use in network computer terminals. The chip will consist of picoJava, microJava, and ultraJava. PicoJava will be the microprocessor's core, and microJava will integrate DRAM and a controller into picoJava. UltraJava will be an advanced model. Toshiba will be involved in developing a low-power microJava chip, with commercialization by Sun in 1998.

88. MIPS Technologies (United States), April 1997

Toshiba has licensed RISC microcontroller technology from the MIPS Group. The MIPS 16ASE is a 32-bit MCU core that helps to reduce the size and power consumption of printers and portable information devices. It allows for significant reduction of overall code size by compressing some instruction sets to 16-bit. The company plans to commercialize TX19 series MCUs based on the licensed core. The RISC type accounts for less than 10 percent of the company's total MCU sales in volume terms.

89. Technology Modeling Associates (United States), April 1997

Toshiba and Technology Modeling Associates have entered into a multi-year agreement in which the two companies will work jointly on development of software for 3-D simulation of semiconductor processes. The software tool will perform advanced modeling for diffusion, oxidation, ion implantation, rapid thermal annealing, silicidation, and point defects modeling. Toshiba is expected to use the simulator for the development of future generations of memory, microprocessor, and ASIC devices. Under the term of the agreement, Toshiba will provide funding, deep-submicron process technology development requirements, and test data. The TMA product, part of TMA's suite of semiconductor simulation tools, is expected to be released in late 1998.

90. NeoMagic (United States), May 1997

Toshiba announced in May that the company was about two months away from first silicon on a notebook graphics controller, with embedded DRAM, that will be manufactured for NeoMagic. To date, NeoMagic has worked with Mitsubishi Electric as the foundry for its graphics controllers. Toshiba will employ a 0.25-micron process optimized for embedded memory and a 128-bit on-chip memory bus.

91. Chartered Semiconductor (Singapore), June 1997

Toshiba will license DRAM-mixed logic IC technology to Chartered Semiconductor of Singapore, to which it licensed CMOS logic technology in November 1994. The Singapore company will use Toshiba's 0.25- to 0.35-micron process technology to launch production in 1998. The DRAM-mixed system-chip LSI market is expected to reach about ¥400 billion in 2000.

92. iReady (United States), June 1997

Toshiba will license Internet access LSI technology from iReady of California. The company has signed a five-year contract to use the U.S. company's Internet tuner technology for providing Internet access using an LSI, which eliminates control by a CPU and cuts power to 1/700th the level of software-driven Internet access. Toshiba planned to develop by the fall a functional block that will be embedded on a system-on-a-chip LSI to be built into cellular phones and TVs.

93. ViewLogic (United States), July 1997

Toshiba has teamed up with ViewLogic of the United States in the ASIC business. The companies will support Motive, a static timing tool that helps significantly reduce the time needed to design system ASICs with 1 million gates, and Testgen, a tool to automatically generate test patterns to test path delay trouble. Toshiba explained that, with the tools, logic testing time can be slashed to 1/40th the time it takes now. They were expected to become available starting in October.

94. IBM (United States), July 1997

Toshiba and IBM will form an alliance in new memory plant construction. The two companies will cooperate in commercializing a 300mm wafer by exchanging equipment technology information and are considering installing a joint production line at their joint production plant.

95. Winbond (Taiwan), September 1997

Toshiba has expanded its relationship with Winbond Electronics of Taiwan to include 256Mb DRAM production. Toshiba will provide Winbond with 256Mb DRAM production technologies and procure chips as an OEM starting around 2000, when demand is expected to pick up. As part of its move to establish a global DRAM production system, Toshiba expected to begin procuring 64Mb DRAMs from the Taiwanese chipmaker in January 1998.

96. Worldwide Semiconductor Manufacturing Co. (Taiwan), October 1997

Toshiba has teamed up with WSMC of Taiwan in semiconductor production. Toshiba will provide 0.25-micron logic PC process technology to the Taiwanese chipmaker and commission some of its logic IC production. A dedicated foundry set up in May 1996, WSMC is expected to start foundry production in July 1998 and launch a new line in 1999.

©1998 Dataquest

Tosoku

97. Samsung (Korea), October 1997

Automotive part and precision machinery maker Tosoku has teamed up with Samsung Aerospace of Korea in the semiconductor wire bonder business. The partners planned to begin in December marketing a IC wire bonder they developed cooperatively by combining the Japanese company's semiconductor equipment and the Korean maker's linear motor technologies. The wire bonder achieves a leadframe transfer speed of 0.5 seconds/26.42mm and can process 400 42SOJ packages per hour. The companies are inclined to set the price below ¥9 million and intend to sell 100 units the first year.

Ulvac

98. Ramtron International (United States), March 1997

Semiconductor equipment maker Ulvac teamed up with Ramtron International of Colorado in ferroelectric RAM (FRAM) technology development. The companies will jointly develop ferroelectric materials such as lead zirconium titanate, ferroelectric thin-film process technology, and sputtering, etching, and ashing equipment over the next four years. Ulvac will start in 1999 to supply the new equipment it is developing in the joint project to chipmakers such as Hitachi, Rohm, Samsung, and SGS-Thomson, which uses Ramtron's FRAM technology.

99. Idemitsu Kosan (Japan), June 1997

Ulvac and Idemitsu Kosan will jointly develop a TFT panel transparent conductive film for larger substrates. They will combine Idemitsu-developed indium lead-based IDIXO film and Ulvac's sputtering equipment and process techniques to develop a transparent conductive film for use with LCD substrates of 13 and 14 inches to 17 and 20 inches. At present, polycrystal indium thin oxide film is typically used for TFT transparent conductive film. Ulvac and Idemitsu expect that LCD panel makers will start using the new film on production lines as early as 1998.

Yamaha

100. Xicor (United States), February 1997

Yamaha has teamed up with Xicor of California in the EEPROM business. Initially, the U.S. company will commission the Japanese company to manufacture EEPROMs, and both companies will cooperate in process technology development. Yamaha Kagoshima Semiconductor will start production in May 1998 at 2,000 six-inch wafers per month and will supply EEPROMs to cellular phone makers under Xicor's brand name. The world's No. 3 EEPROM maker, Xicor is reported to control the largest share, 30 percent, of the Japanese market for EEPROM used in cellular phones. Yamaha projects that Xicor-brand sales will reach ¥2 billion in the first year.

Perspective

Semiconductors Asia/Pacific

Market Analysis

Asia/Pacific Semiconductor Industry Summary Report

Abstract: *Foundry profit is much higher than that earned by producing DRAM or other products. Considering profitability and great production capacity, no wonder global semiconductor manufacturers rush to enter the foundry market. Foundry products may actually be the battlefield we can count on. However, not every company entering this market will be able to keep its business running smoothly and make reasonable profits.*

By Jerry C. J. Yeh

An Overview

In the Asia/Pacific region, foundry is more heavily weighted in semiconductor manufacturing than before; manifest sales growth can be found in this area. Now, it is the major product of Asia/Pacific semiconductor manufacturers—especially during 1997 and 1998 when DRAM price was getting soft, foundry became the major product of semiconductor manufacturers. Although it is rather difficult to find a product able to sustain its profit at a certain level during years of economic recession, this business fills production capacity.

Integrated Device Manufacturers—A Great Source of Foundry Customers

From the foundry client point of view, besides fabless companies that are surely in need of foundry capacity, integrated device manufacturers (IDMs) are also a great source of customers. In the past, when foundry capacity was limited and competition was less harsh, fabless companies were the major source of customers, although their order amounts were not large. However, at present, foundry capacity is increasing at a fast pace. How to get big orders from large IDMs has become a very important issue. The order amounts released by IDMs far exceed the amounts released by fabless companies.

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Therefore, it is a good idea for foundry companies to seek more orders from IDMs.

As to whether IDMs will require great amounts of overseas foundry service, it depends on changes in the manufacturing environment, such as the trend of professional division of labor, the change of production processes, equipment, production costs, and so on. Besides, one also has to observe whether IDMs will experience great change in their OEM policies. Another consideration is that European countries and Japan are less willing to seek foundry partners. Thus, although foundry business grows, it may not suddenly increase in the market. After all, it takes time and needs the change of the overall environment to encourage the large international plants to hand out their production to other semiconductor manufacturers.

Foundry Competition—Magnificent Force from U.S. Companies

There is fierce competition among many companies, including Taiwanese companies such as Taiwan Semiconductor Manufacturing Company Ltd. (TSMC), United Microelectronics Co. (UMC), and World Semiconductor Manufacturing Co. (WSMC). Korean companies such as LG Semicon Co. Ltd. and Samsung Electronics Company Ltd.; Singaporean companies such as Chartered Semiconductor Manufacturing Ltd. (CSM); Japanese companies such as Toshiba Corporation and Seiko Epson Corporation; and American companies such as IBM undertake many foundry orders. All of these companies have extraordinary business operation ability. With the exception of TSMC, UMC, CSM, and WSMC, these companies do not treat foundry as their core business. Even so, they still occupy a large market share of the foundry business. Also, some joint ventures have undertaken many foundry orders from stock companies and nonstock companies. Because these companies are supported by their mother companies, they represent a magnificent force that is not to be ignored. This is also one of the key points that will affect foundry business in the future.

An analysis of competitive ability shows that manufacturers from Japan, Korea, Southeast Asia, and Europe may not be strong enough to threaten Taiwan, the country that is the dedicated foundry giant. Mainland China may grow stronger in the future, perhaps in the next five years. The semiconductor foundry industry should pay close attention to the U.S. market because the largest clients are located in the United States. Besides, American clients are keen to the market trends, although their present disadvantage is their inability to lower their production costs, and they do not yet treat the foundry business as their core business. Even so, U.S. competing parties such as IBM are worth observing.

Korea—Conservative in Production Capacity Expansion

Korean manufacturers have largely increased their market share of DRAM. According to 1995 and 1996 statistics, the three major Korean manufacturers represent more than 30 percent of the market share. Although the overall market share is less than that of Japan, Korea is starting to play an important role and is becoming more influential in the market. From 1993 to 1995, the DRAM market experienced about three highly profitable years at market climax. Under such high profitability, Korean manufacturers invested more capital to expand their production capacity in order to create more profit in the DRAM market. However, as DRAM production capacity has been overexpanded and the production process has continuously improved since the end of 1995, the supply of DRAM started to exceed market demand. New production capacity has been released continuously, but the problem of overproduction was never improved through 1996 or 1997. During this time, the price of DRAM plunged. Although Korean manufacturers continue to expand plants and rush to occupy more market share of DRAM, since 1996, earnings and profits have been on the decline. Eventually, under severe price competition, manufacturers lost money in 1997.

Through the 1997 economic turmoil, Korea accepted the International Monetary Fund's (IMF) financial relief conditions. Although in the short term Korea's economy will be largely damaged, in the long run, it will be able to rebuild itself more steadily. Under the financial relief conditions, Korea must adopt retrenching measures. Certain relevant investment plans must be retrenched. Credits of Korean banks were downgraded one after another. The Korean monetary system will certainly face a great rearrangement. Financing for Korean manufacturers will not be as easy as before; it will only be more difficult. Besides, Korean currency keeps depreciating, and Korean manufacturers keep building more debt. Korean manufacturers' investment costs and business costs will largely increase. Therefore, plans for semiconductor plant expansion in Korea will also be affected. According to the initial forecast, the investment amount in 1998 will be reduced by more than 50 percent of that in 1997. However, the semiconductor industry has become one of Korea's most important industries being developed. Because of the economic crisis of 1997, Korea will be more conservative in production capacity expansion in the future. The country will focus more on the development of production processes and product technology, especially in the development of logic products, which seem to have become the business to which each manufacturer is devoted.

Taiwan—Rushing into the Foundry Business

While the DRAM industry is slowing, foundry is becoming more prosperous. As market demand is growing strong and prices are decreasing, even the maximum productivity of the two professional domestic foundry companies cannot meet the great market demand. Therefore, their profitability in 1997 was quite good. This is also the reason why more and more companies are swarming into this field. Except for very few companies, most domestic semiconductor manufacturers plan to enter this field to divert risks that may occur by making overconcentrated products. In the meantime, production capacity can be fully utilized. At the same time, these manufacturers can also learn part of the technology of logic products.

Now that companies are rushing into the foundry business, the market is similar to that of three or four years ago when many companies were swarming into DRAM production. In the foundry business, some companies may lose in the battlefield, but at present, we cannot yet judge the extent of the negative effect that such a situation will bring to the market. Because semiconductor manufacturers always pursue economic value, it seems that the only alternative, particularly when productivity is growing at a rapid pace, is to fully utilize production capacity, which has become an important issue to all business operators. In the competitive world of the global semiconductor industry, Taiwan is only a technology pursuer; its advantages are largely built in the mode of mass-production or flexible-production capability. Under such circumstances, choosing a single product such as DRAM or combining many factories to undertake foundry seems to be the way to go.

With a limited scale of individual domestic companies, capital and specialists in this field are not easy to be found. It will certainly be difficult to expand the production lines of each company to divert risks. This situation is the optimistic factual limit. In Taiwan, when an 8-inch wafer fab has been established, it is very difficult to find a way to fully utilize the production capacity of large production equipment for 8-inch wafer fabs. Because of this, it is not hard to imagine that it will be even more difficult when 12-inch wafer fabs are established in the future. Under such great pressure of production capacity—except for DRAM and foundry—hardly anything else can be found to fill the production capacity. Therefore, seeking orders from other companies has become a market trend, and foundry certainly has become the business that most people are interested in. This is also an inevitable market trend. However, under such circumstances, industrial competition is becoming more fierce, which will force profits to decline to a more reasonable level. This may be an inevitable market trend as well.

Singapore—Government Participates in the Investment and Planning of New Wafer Fabs

Singapore is a city state that lacks various kinds of natural resources. Even Singapore's water source depends on the supply from Malaysia. In order for people to enjoy prosperous lives, developing high-tech industries has been the only way to go. Through the efforts of a few far-sighted leaders who provided favorable measures through the government to encourage industries, and with other conditions such as Singapore's excellent geographic location, a few semiconductor manufacturers—such as Philips Semiconductors Inc., Texas Instruments Inc., and Hitachi Ltd., among others—from Europe, the Americas, and Japan started to set up plants in Singapore. Local low-cost, high-quality labor is utilized to undertake the work of "high-tech processes." Also, Singapore's excellent geographic location is utilized as a transit station in the Asia/Pacific region. Most Singapore manufacturers have sealed packaging plants that have the most extensive history in the country. Singapore has become one of the most important countries with the most sealed packaging companies in Southeast Asia.

Most foreign companies consider Singapore to be a "high-tech assembly center." To further increase its added value, the Singaporean government has used the same methodology in recent years as was used before to develop other industries, trying to introduce foreign companies to further develop the production of IC wafers. Also, the Singaporean government participates in the investment and planning of wafer plants. In 1994, the Economic Development Board (EDB) set up the Cluster Development Fund (CDF) to proceed with various strategic investments. The main purpose of the CDF is to encourage establishment of technology-intensive companies (as opposed to labor-intensive, manual assembly companies), to promote the development of industry clusters, and to solidify the industrial basic structure. Recently, EDB Investments of Singapore formed a joint venture to build a new wafer fabrication facility in Singapore's Pasir Ris Wafer Fab Park. The partners include the Royal Philips Electronics of the Netherlands and TSMC.

Dataquest Perspective

Recently, under the pressure of the declining global DRAM market, manufacturers that focused production on DRAM now have to expand their product lines to divert risks. On the other hand, under the global embedded-device trend, business operations between DRAM and logic products are no longer separate. To meet embedded and system-level integration requirements, manufacturers must obtain the new technology that they did not specialize in previously. Therefore, foundry has become one of the methods to obtain logic technology. Recently, foundry profit has been much higher than that earned by producing DRAM or other products. Considering profitability and greater production capacity, it is no wonder that global semiconductor manufacturers are rushing to enter the foundry market. Foundry products may actually be the battlefield that we can count on. However, not every company entering this market will be able to keep its business running smoothly and make reasonable profits.

Semiconductors Asia/Pacific
Market Analysis

Asia/Pacific Semiconductor Market Forecast, Fall 1998

Abstract: *Dataquest forecasts that Asia/Pacific semiconductor revenue will grow 14.6 percent in 1999, totaling $36 billion, following an unexpected 3.5 percent decline for 1998. By 2002, Asia/Pacific semiconductor revenue will total $61 billion, which marks a 13.3 percent-plus CAGR for the five-year period from 1997 to 2002.*
By C.S. Kim

Asia/Pacific Semiconductor Forecast Assumptions

Macroeconomic Assumptions

By all indications, Asia's economic conditions have worsened. Economic activities have slowed across Asia, and most of the region's economies now find themselves cornered and battered by a flurry of economic ills that defy easy, unilateral solutions. Meanwhile, Asia's troubles are imposing punishing economic strains on emerging economies elsewhere. From Russia and Africa to the Middle East and Latin America, emerging economies outside of Asia find themselves struggling with the depressed commodity prices and general wariness of international investors toward emerging markets that have followed in the wake of Asia's turmoil.

The 1998 outlook for the world's developing economies has dimmed. Naturally, much of this change reflects the significant downward revision of forecasts for Asia/Pacific Basin economies. Dataquest estimates that growth among Asia/Pacific's emerging economies, including China, will average just 1.8 percent in 1998. Just when and how Asia will recover remains an open question. Macroeconomic conditions among the individual economies of the region range from shaky to disastrous. In many countries, domestic spending has been crushed by high interest rates and export growth curtailed for want

of scarce credit. More importantly, foreign-capital inflows have all but ceased, and intraregional trade in Asia has virtually collapsed.

A number of forecasters now believe that resolving the economic crisis requires new policies that concentrate on the region as whole, including Japan, rather than individual countries. Such policies would give top priority to reviving intraregional trade and reducing the threat of competitive currency devaluation. Dataquest expects that there will be gradual improvement in Asia beginning next year. Dataquest expects emerging Asian economies' growth to jump to 4.3 percent next year and average upward of 6.0 percent through 2002. Still, these results can hardly be considered a sure bet. Between Japan's distressed state and the apparent antipathy of foreign capital toward the region, Asia's economic future faces significant downside risks. Table 1 shows Asia/Pacific's projected GDP change from 1997 to 2002.

Table 1
Asia/Pacific Gross Domestic Product Growth, 1997 to 2002 (Percent)

Assumptions for Electronic Equipment Production

Assumptions for Data Processing Equipment Applications

Data processing equipment will continue to be the mainstay of Asia/Pacific electronics production. PCs and PC-related components (such as motherboards, rigid disk drives, CD-ROM drives, and application boards) will continue to constitute the backbone of regional data processing electronics.

The graphics chip market will face pricing pressure even as manufacturers continue to add features. The corporate computing market will continue to be slow to demand 3-D graphics features. While it is difficult to buy non-3-D products today, the issue is one of corporate users buying down on the value scale rather than buying up.

 ©1998 Dataquest

The audio market will face increasing competition from integrated designs with sound chips on the motherboard. Price pressure is extreme and will continue for at least one more year.

A cyclical upturn in DRAM revenue in 2000 and 2001 will be the primary drivers of overall PC semiconductor market growth. PCs' main memory sizes will track historic trends and grow in the range of 40 percent to 45 percent annually.

Assumptions for Communications Equipment Applications

Communications equipment manufacturing is expected to grow at average annual rates in excess of 10 percent. Strong growth in mobile communications and public telecommunications equipment will provide the spark for this growth. Asia/Pacific will continue to remain the world's fastest-growing and most economically active region through the end of the decade.

The region's developing economies are expected to generate a huge demand for communications equipment of all types, but most especially, for premise and mobile equipment. Dataquest expects this surging local demand to stimulate the region's communications industry, generating high growth rates for premise telecom as well as mobile communications equipment.

Digital cordless telephones will retain continued popularity beyond 1999. The third-generation cellular technology is not expected to have a significant impact on semiconductor consumption during the 1997-to-2002 forecast horizon.

Driven by Internet bandwidth upgrades, semiconductor consumption by the public infrastructure equipment market will remain strong. Cable modems and xDSL modems are on track for deployment in the 2001/2002 time frame.

Assumptions for Consumer Electronics Applications

Consumer electronics will remain the second-largest segment of the region's electronics industry. Despite the recent retreat of the yen against the dollar, Dataquest expects Asia/Pacific to continue benefiting from Japan's production shift. In fact, Dataquest now expects Asia/Pacific to be the world's dominant producer of consumer electronics by 2002. Overall, consumer electronics is anticipated to average about 7 percent growth in the forecast period. Video and audio equipment will remain the mainstays of Asia/Pacific's consumer electronics production.

The Chinese demand for Asia/Pacific-produced consumer electronics could well rival export demand by 2002 if economic development in China continues at it dizzying pace.

The need to maintain low manufacturing costs for low-value-added products is likely to diffuse production of low-end consumer electronics into other parts of Asia/Pacific, especially Southeast Asia, in the forecast period. At the same time, rising labor costs in established manufacturing centers (that is, the Four Tigers) are likely to induce a shift in these centers toward higher value-added, higher-end consumer electronics.

Figure 1 illustrates the comparison by application type in Asia/Pacific electronic equipment production for 1997 and 2002.

Figure 1
Asia/Pacific Electronic Equipment Production Comparison by Application, 1997 and 2002 (Millions of U.S. Dollars)

Asia/Pacific Semiconductor Forecast

Forecast Outlook

Table 2 shows that Asia/Pacific's semiconductor revenue will increase by 14.6 percent in 1999 and total $36 billion, following a 3.5 percent decline for 1998. In the long term, regional revenue will grow at a 13.3 percent CAGR and reach $61 billion by 2002.

The industry now moves toward the end of its third straight year of lackluster performance. The prior expectation had been for 1998 product market rebounds. The Asian financial crisis, along with low prices for DRAMs, cell-based ICs (CBICs), analog ICs, and other semiconductor devices, hindered semiconductor revenue growth this year. Few product segments will achieve more than marginal 1998 revenue growth, and year-end results remain a concern for semiconductor vendors.

The 1999 forecast assumes a sluggish demand in Asia/Pacific—at best—but also stable DRAM pricing. Most product markets will not strengthen until mid-1999, so next year's growth will concentrate in the second half of 1999. In addition, the long-term growth rate is slower than the prior forecast.

China/Hong Kong's semiconductor market will grow by 13.6 percent in 1999 and total nearly $7.9 billion. By 2002, the China/Hong Kong market will total $15 billion, which marks a 17.5 percent CAGR for 1997 to 2002.

Singapore's semiconductor market will grow by 13.7 percent in 1999 and total $5.4 billion. In the long term, Singapore's semiconductor market will total $9 billion in 2002, which means a 13 percent CAGR for 1997 to 2002.

South Korea's semiconductor market should increase by 13.7 percent in 1999 and reach the $5.7 billion level. By 2002, South Korea's semiconductor market will total $9.7 billion, which is a 12.1 percent CAGR for 1997 to 2002.

Taiwan's semiconductor market will increase by 15 percent in 1999 and reach about the $7.9 billion mark. By 2002, the Taiwanese semiconductor market will approach about $12 billion, for a nearly 12.3 percent CAGR for 1997 to 2002.

Table 2
Asia/Pacific Semiconductor Market Forecast by Country, 1997 to 2002
(Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002

Source: Dataquest (October 1998)

Forecast by Product

Asia/Pacific's semiconductor revenue will grow by 14.6 percent in 1999, totaling $36 billion, following an unexpected revenue decline of at least 3.5 percent for 1998. By 2002, Asia/Pacific's semiconductor revenue will total $61 billion, which marks a 13.3 percent-plus CAGR for the five-year period from 1997 to 2002. Table 3 provides the five-year forecast through 2002 by product type for the Asia/Pacific semiconductor market.

MOS Memory Forecast and Assumption

Table 3 shows that the Asia/Pacific memory market will increase by 23.7 percent in 1999 and total $6.2 billion, following a steep 23.6 percent decline for 1998. In the long term, the Asia/Pacific memory market will grow at a 14.5 percent CAGR and reach $12.8 billion by 2002.

The DRAM revenue for Asia/Pacific will increase by 28 percent in 1999 and total $4 billion, following a 33.6 percent decline for 1998. In the long term, it will grow at a 14.2 percent CAGR and reach $9 billion by 2002.

The Asia/Pacific SRAM revenue will increase by 20.1 percent in 1999 and total $792 million, following a 10.1 percent increase for 1998. In the long term, it will grow at a 19.8 percent CAGR and reach $1.5 billion by 2002.

Source: Dataquest (October 1998)

Nonvolatile revenue will increase by 14.6 percent in 1999 and total $1.4 billion, following a 3.4 percent decline for 1998. In the long term, Asia/Pacific's nonvolatile memory revenue will grow at a 13.1 percent CAGR and reach $2.3 billion by 2002. Flash memory and EEPROM will drive the nonvolatile market growth.

The following summarizes Asia/Pacific memory forecast assumptions:

- Nearly all memory prices will continue to suffer because of industry overcapacity.
- No near-term changes are anticipated in already existing bit or unit consumption trends.
- The effects of embedded memory on existing markets will be negligible.
- DRAM consumption will catch up with capacity in 2000, and an undercapacity will occur in 2001, which will be corrected in 2002.
- Flash memory will displace EPROM, but other memory markets will continue along their current paths: strong growth for EEPROM and modest growth for mask ROM and SRAM.

 ©1998 Dataquest

MOS Microcomponent Forecast and Assumptions

The Asia/Pacific MOS microcomponent market will increase by 10.5 percent in 1999 and total $12.2 billion, following a 1.5 percent growth for 1998. In the long term, it will grow at a 12.5 percent CAGR and reach $19.6 billion by 2002.

The Asia/Pacific microprocessor (MPU) revenue will increase by 14.4 percent in 1999 and total $5.3 billion, following a 3 percent increase for 1998. In the long term, it will grow at a 12.5 percent CAGR and reach $8 billion by 2002.

The microcontroller (MCU) revenue in Asia/Pacific will increase by 10.9 percent in 1999 and total $2.5 billion, following a 4.5 percent decline for 1998. In the long term, the Asia/Pacific MCU revenue will grow at a 12.6 percent CAGR and reach $4.2 billion by 2002.

The Asia/Pacific microperipheral (MPR) revenue will increase by 1.5 percent in 1999 and total $3.3 billion, following a 0.8 percent decline for 1998. In the long term, it will grow at an 8.9 percent CAGR and reach $5.1 billion by 2002.

The digital signal processor (DSP) revenue will increase by 21.9 percent in 1999 and total $1.2 billion, following a 19.9 percent increase for 1998. In the long term, it will grow at a 23.7 percent CAGR and reach $2.3 billion by 2002.

The following are Asia/Pacific MOS microcomponent forecast assumptions:

- Intel Corporation's high-end Xeon processors will begin to offset desktop MPU average-selling-price erosion in the second half of 1998, but they will not be able to offset such price declines completely until 1999, when Intel offers support for four- and eight-way server configurations.
- Throughout the forecast period, general-purpose, "PC-like" devices will continue as the dominant mechanism for users to access the Internet and to perform other data processing functions in the home and office.
- PCs' average selling prices will continue to decline, as users see little reason to buy high-performance (and expensive) systems to use with current applications software that places few demands on CPU performance.
- In the later years of the forecast period, new software applications and usage paradigms will evolve, which will tax the processing power of the much faster processors than available and motivate users to replace older systems. Some of these new applications will expand the market by making computers relevant to users who previously had no need for such devices. Vast increases in communications bandwidth to homes and small office environments will enable many of these applications.
- Demand remains suitably strong for proven embedded applications, such as office equipment, routers and hubs, video games, satellite receivers, and set-top boxes.
- The attraction for building an ASIC with a deeply embedded MPU core will take away some embedded MPU business.

 ©1998 Dataquest

- Prices for MCUs eroded rapidly during 1998, suggesting low 1999 price levels.
- Growth for 16- and 32-bit MCUs will increase more quickly than previously expected.
- More exotic features (such as flash memory) will be offered at low prices.
- Demand for cellular phones, modems, and risk drives is no longer increasing as fast as for DSPs.
- New architectures of high-performance DSPs reduce the cost per function in high-density DSP arrays.
- DSPs can open a host of new applications for mobile and Internet communications and consumer interactivity.

MOS Logic Forecast

The Asia/Pacific logic revenue will increase by 9.2 percent in 1999 and total $4.3 billion, following a 0.5 percent decline for 1998. In 1998, the ASIC market experienced the worst percentage revenue change in history. Gate array revenue declined by 13 percent, while revenue from CBICs increased marginally. In the long term, the Asia/Pacific ASIC revenue will grow at a 15.8 percent CAGR and reach $3.5 billion by 2002. This growth will be fueled, in part, by the trend to system-level integration (SLI).

ASIC and logic market growth stalled during 1998 for the following three main reasons:

- General industry slowdown
- Asian financial crisis
- An associated accelerated rate of average selling price declines

The following summarizes Asia/Pacific MOS logic forecast assumptions:

- Logic markets will remain flat into 1999. There will be no significant increase in ASIC/logic quarterly revenue until the second or third quarter of 1999.
- Other logic devices, which include application-specific products (ASSPs), should show strong unit growth but with above-average price declines.
- Custom ICs are rapidly being replaced by ASICs because they offer shorter time to market.
- Standard logic devices have a small number of suppliers, and the market remains relatively flat.
- ASIC growth will be driven by CBICs and PLDs at the expense of gate arrays.
- SLI will fuel the growth of the CBIC market as MPUs, DRAMs, and other intellectual property (IP) blocks get integrated on-chip.
- Key ASIC/ASSP application market drivers include disk drives, workstations, servers, digital cellular, LAN/WAN, premise and central

office switching systems, set-top boxes, video games, digital camcorders, still cameras, and digital TV.

- ASICs will be converted to ASSPs as each application market matures.

Analog Forecast

The Asia/Pacific analog IC revenue will increase by 22 percent in 1999 and total $7.9 billion, following disappointing marginal growth for 1998. In the long term, the Asia/Pacific analog revenue will grow at a 17.3 percent CAGR and reach $14 billion by 2002.

The following summarizes Asia/Pacific analog IC forecast assumptions:

- Demand has slowed PC, communications, consumer, and industrial equipment markets, among others.
- The Asian economic downturn and its rippling effects on the rest of the world are the main reasons for the demand slowdown.
- A recovering Asian economy and continued growth in the Americas and Europe in 1999, combined with the inventory reduction at analog IC suppliers in 1998, should bring strong growth back to analog ICs in 1999.
- A semiconductor boom cycle starting in 1999 will continue to result in strong growth for analog ICs in 2000 and 2001.
- The year 2002 could see a slowdown in analog IC growth, as the semiconductor market enters its next cyclical downturn.

Discrete Product Forecast

Asia/Pacific's discrete semiconductor revenue will increase by 10.3 percent in 1999 and total $4.3 billion, following a marginal 2.2 percent increase for 1998. In the long term, Asia/Pacific's discrete revenue will grow at an 8.7 percent CAGR and reach $5.8 billion by 2002.

The following summarizes Asia/Pacific discrete forecast assumptions:

- Product price instability across all discrete devices, which was prevalent through the first half 1998, has subsided. All discrete product groups are still in a state of ready availability. However, prices are returning to a state of stability.
- Continued instability in consumer electronics, data processing equipment, industrial equipment, and automotive equipment sectors indicate a slower-than-normal growth path for discrete devices through the second quarter of 1999.
- The delayed recovery in the semiconductor market may delay some competitor and user decisions to shift to the slowly evolving power discrete (MOSFET and IGBT) products. While large suppliers in the Americas (such as Motorola Incorporated) have lost product share to some of the European competitors, the consolidation of vendor activities and new market entrants may change the balance of supplier share and product activity in the next two years.

 ©1998 Dataquest

- The long-term growth prospect appears moderate, as competitors and users transcend to power management devices. Consolidation or acquisition of competitors' products appear along with even more price instability for developing product areas.

Optoelectronics Product Forecast

The Asia/Pacific optoelectronic semiconductor revenue will increase by 8 percent in 1999 and total $1 billion, following a 3.5 percent growth for 1998. In the long term, Asia/Pacific's optoelectronic semiconductor revenue will grow at a 10.2 percent CAGR and reach $1.5 billion by 2002.

The following summarizes Asia/Pacific optoelectronics forecast assumptions:

- LEDs and laser diodes are the key market drivers.
- The LED growth has been moderated from the last forecast by the general industry slowdown caused by the Asian financial crisis.
- The laser diode market has been negatively affected by the slow consumer markets and positively influenced by the demand for bandwidth in the Internet-driven telecommunications market.
- Demand PCs and wireless handsets will return to higher levels in 1999.

Dataquest Perspective

In the long term, the total Asia/Pacific semiconductor market will grow steadily, at a 13.3 percent CAGR. Most semiconductor products—including analog ICs, digital ASICs, and DSPs—will grow steadily because of expanding production in digital consumer electronics and communications equipment. Their yearly growth rates will range from 16 percent to 24 percent, which mirror the total market growth rate. Following the post-1996 market decline, the DRAM market in 1999 will grow by 28 percent and reach $4 billion. The DRAM market should jump dramatically in 2000 and 2001.

Microcomponents will become the largest product market in 1999, with a $12 billion revenue. The microprocessor market growth will be slower starting in 1998 than in the high growth years of 1997 and before. In the long term, the microprocessor market will grow by 12.5 percent CAGR over the forecast period and reach $8 billion in 2002.

Non-PC applications (such as digital cellular, digital consumer electronics, and communications equipment) will drive demand for MCUs and DSPs, including embedded versions.

ASICs are a steadily growing semiconductor market. The trend toward SLI means high growth for CBICs but a long-term decline for gate arrays. The ASIC market should grow by 11.6 percent in 1999 to total about $1.8 billion. The SLI trend should drive Asia/Pacific's digital ASIC market to nearly $3.5 billion in 2002.

Analog ICs, which are used in a very wide range of products, are the second-largest product market in 1998 at $6.5 billion. Analog devices will remain the second-largest market over the forecast period. The analog device market will grow by 17.3 percent CAGR over the forecast period to total about $14 billion in 2002.

Looking at the long-term trends to 2002, mixed-signal ICs will experience solid growth, driven by applications such as digital cellular handsets. In addition, new emerging applications in consumer electronics and communications equipment markets will contribute to the growth of mixed-signal ICs. In the more traditional standard linear-product area, voltage-regulator products will continue to enjoy strong growth, as the demand for smart power continues to grow, especially in the portable electronic equipment markets.

Perspective

Semiconductors Asia/Pacific

Vendor Analysis

AIC Semiconductor Sdn. Bhd.

Abstract: *AIC Semiconductor Sdn. Bhd. is the latest Malaysian company to enter the local semiconductor industry as a packaging subcontractor. This Perspective reviews the company's business operations and its expansion plans going forward. As semiconductor vendors continue to restructure manufacturing, AICS is positioned to gain from the trend to outsource assembly and test activities.*

By Ken Ng

Company Statistics

AIC Semiconductor Sdn. Bhd.'s company statistics include the following:

- Chairman—Haji Sarip Hamid
- Chief Executive Officer—Dr. Kuong Hoo
- General Manager—Beng Chooi Lim
- Number of Employees—518
- Estimated Fiscal 1998 Revenue—$19.2 million
- Fiscal Year-End—December 31

Company Milestones

AIC Semiconductor's two-year milestones are as follows:

- 1996
  - AIC Corporation Bhd. entered into a joint venture with Atmel Corporation to establish AIC Semiconductor Sdn. Bhd. (formerly known as Nucleus Semtek Sdn. Bhd.)

Dataquest

Program: Semiconductors Asia/Pacific
Product Code: SEMI-AP-DP-9813
Publication Date: November 9, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

- November—Began construction of production building
- 1997
  - June—Production building completed
  - July—Equipment installation
  - October—First production rollout and release of assembled ceramic BGA package type. Qualification release of assembled MCM-BGA package type.
  - November—Qualification release of assembled SO and PLCC package types
- 1998
  - January—Changed company name to AIC Semiconductor
  - February—Started SO package test operations
  - August—Qualification release of assembled VSOP package type
  - September—Qualification release of assembled PDIP package type

Vision Statement

The company strives to "to do an excellent job for customers, employees, and shareholders by becoming Malaysia's leading industrial group through continuously harnessing innovations and advanced technologies," according to its mission statement.

Company Structure and Operations Overview

AIC Semiconductor Sdn. Bhd. was established in May 1996 (then known as Nucleus Semtek) as the semiconductor unit of diversified Malaysian-listed AIC Corporation. AIC Corporation owns 97 percent of AIC Technology, which in turn holds the majority 55 percent stake in AIC Semiconductor. On top of this, AIC Corporation has a direct 10 percent stake in the company. The other equity owners are Atmel Corporation, with 20 percent, and Sierra Way Sdn. Bhd., a technical consultancy, taking up the remaining 15 percent stake.

AIC Semiconductor (AICS) is an assembly and test subcontractor located in the Kulim Hi-Tech Park, about 25 kilometers from the island state of Penang. The facility is sited on 11.8 acres of industrial land. The first production rollout delivered assembled BGA packages to Atmel in October 1997. A month later, the company moved into ramping output for PLCC and SO products. Packaging capacity is estimated to reach an equivalent of 312 million assembled PLCC 32-pin units. At this time, the types of packages have also increased to include PDIP and VSOP devices. AICS now operates three full production lines running on two 12-hour shifts. Table 1 presents an overview of the company's operations.

©1998 Dataquest

Table 1
Overview of AIC Semiconductor's Operations

Item	Description
Location	Kulim, Malaysia
Start of Production	1997
Build-Up Floor Area	95,000 square feet
Workforce	518
Packaging Capacity (Units per Year)	312 million
Assembled Package Types	PLCC, PDIP, SOIC, TSOP, VSOP, BGA, MCM-BGA

Source: AICS and Dataquest (October 1998)

AICS' single customer, up to now, is Atmel. The five-year commitment from Atmel to take up to 100 percent of production capacity has provided the company with a stable road map to plan for increases in manufacturing volume and product range. According to Dataquest, Atmel was ranked as the third-largest worldwide vendor of nonvolatile memory devices in 1997. AICS receives probed wafers from Atmel on a consignment basis. The company returns the finished products to its customer after the assembly and test process. AICS ships the products to Atmel's three plants in San Jose and Colorado in the United States and Rousset in France.

Testing operations have started during the past six months. AICS has relied on Atmel's demand to ramp up its test operations. Total capital spending in 1997 was $24.1 million, including $7.3 million invested in land and plant construction (see Table 2 for exchange rates applied). The company expects to raise capital investment a further $6.7 million by the end of this year.

Table 2
Exchange Rates Applied, 1996 to 1998

Year	Malaysian Ringgit per U.S. Dollar
1996	2.52
1997	2.82
1998 (Projected Annual Average)	4.04

Source: Dataquest (October 1998)

Since October 1, 1998, capital controls were imposed by the Malaysian government to stabilize the ringgit and U.S. dollar exchange rate. AICS does not expect the fixed RM 3.8/U.S.$1 rate to impact its capital spending plans or direct material purchases. Instead, the controls should minimize risks from volatile, short-term currency movements. Although certain materials procured are denominated in the local currency, the majority of material purchases—such as gold wire, epoxy resin, and lead frame/substrate—are paid for in U.S. dollars. As the company's revenue is booked in U.S. dollars, the cost of material supply should be naturally hedged against proceeds from sales.

 ©1998 Dataquest

Financial Results

AICS started initial product delivery late last year. In the first full year of operation, revenue is expected to reach $19.2 million, as production volumes and utilization rates have risen in tandem with Atmel's requirements. Assembly is estimated to account for nearly 70 percent of the 1998 revenue. The company's sales performance has also been advanced by the inclusion of the higher value-added test business. Since mid-1998, AICS has started to turn in positive cash flows on a monthly basis. However, initial expectations to record a profit for the entire year were adversely impacted by the semiconductor market downturn and the regional economic crisis. The AICS management predicts the company will just break even for the entire year. Steeper-than-expected average selling price (ASP) erosion and a delay in securing financing facilities have offset reductions in operational costs.

The company's management maintains an upbeat outlook for 1999. AICS is projected to register a twofold revenue expansion when extra production capacity and new products come onstream. AICS plans to increase the total number of production lines to five in the next fiscal year. The expansion will enable it to assemble new BGA and CSP devices. Other sources of additional revenue should come from the increased scope of test activities, finished product packaging (tape and reel type), and providing drop shipment services by the end of next year.

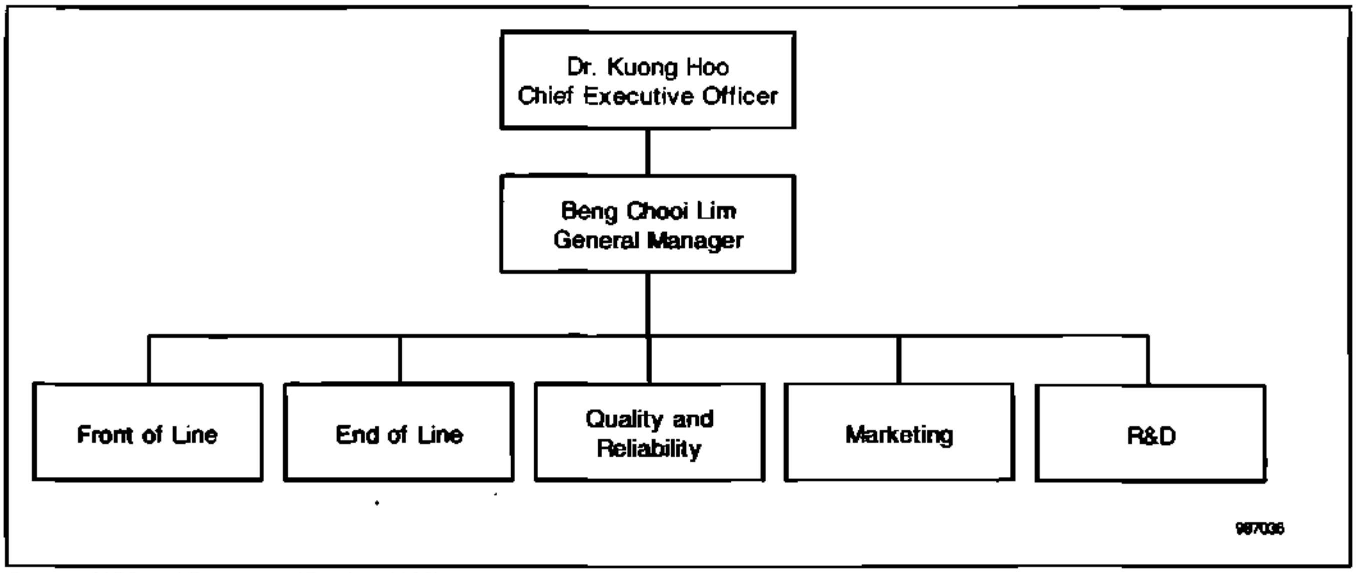
Organizational Structure

AICS has a total head count of 518 people, with 73 percent employed in the direct labor category. The management organization is staffed by a team of experienced industry personnel. Figure 1 illustrates AICS' senior management staff. This team is led by Dr. Kuong Hoo, the chief executive officer. He was previously with Intel Penang for 17 years, with the last two years as its managing director.

Supporting Dr. Hoo is a team of managers, each with more than 10 years of relevant experience in various multinational semiconductor companies in Malaysia. AICS has an experienced team to fill the production roles in the organization. To grow the company in the longer term, AICS intends to increase its customer base in the Asia/Pacific and North America regions. Although Dr. Hoo is leading the marketing function, AICS is also working with another partner in the United States to promote its services there.

 ©1998 Dataquest

Figure 1
AIC Semiconductor's Organization



Source: AICS and Dataquest (October 1998)

Production Capacity and Growth

AICS has realized significant ramp-up of production output in its first year of operations. The facility's packaging capacity stands at an equivalent of 6 million assembled PLCC units per week, or 4 million assembly units and 2 million test units per week. Current utilization rates are estimated at 75 percent for assembly units and 25 percent of total production capacity. Recently, the company achieved full matching of assembly and testing for its SOIC package. It has managed to tool up capacity based on Atmel's demand for commodity products.

Table 3 presents AICS' packaging capability. Four more products slated for introduction in the last quarter of 1998 are PDIP 28-pin and TSOP 28-pin/32-pin/48-pin types. In addition, the packaging of smart card modules is expected to start later this year. Turnaround cycles for assembled products are comparable with industry lead times.

New products presently under development include higher value CSP (LAP) and BGA devices. AICS intends to introduce several versions of these two package types in the course of the coming year. The company's advantage lies in its fast adoption and transition into volume manufacturing of BGA packages. In 1999, unit production of smart card modules is expected to reach double the 1998 output level.

 ©1998 Dataquest

Table 3
AIC Semiconductor's Packaging Capability

Package Type	Size
SOIC 8L	4.9mm x 6mm
PLCC 32L	12.4mm x 15mm
PDIP 28L	37mm x 16.5mm
PDIP 32L	42mm x 16.5mm
TSOP 28L	8mm x 13.4mm
TSOP 32L	8mm x 20mm
TSOP 48L	12mm x 20mm
VSOP 40L	10mm x 14mm
BGA 200 I/O	19mm x 19mm, 1.0mm ball pitch
MCM-BGA 120 I/O	14mm x 14mm, 0.8mm ball pitch

Source: AICS and Dataquest (October 1998)

The company plans to grow revenue next year by raising unit production and expanding its product range. In the volume-driven assembly business, economies of scale contribute to bringing down unit costs. Next year's capital spending budget calls for the addition of another two full production lines, requiring a commitment of $14.5 million. As installed production lines now occupy more than half of the built-up area, another 40 percent of production space is still available for expansion. In the longer term, the company also plans to reduce costs by developing materials in-house. Because there is currently only one customer, pricing agreements with Atmel have a direct impact on the company's performance. AICS strives to maintain a competitive cost structure since the benchmark prices for mature packages are based on market rates.

Strategic Alliances

AICS' capital requirements are provided by the holding company, AIC Corporation. This structure allows the start-up company to focus on its core activities, as the listed parent already has access to the capital markets. The company's strategic business partners are Atmel, its sister companies in AIC Corporation, and key suppliers.

Atmel, as the primary customer and a 20 percent stakeholder, collaborates with AICS to develop advanced packages and manufacturing processes. These include BGA, MCM-BGA, and CSP packages. Besides the in-house team of R&D professionals, this alliance represents an important source of technology transfer for the company. AIC Microelectronics Sdn. Bhd., the IC design sister company, cooperates with AICS to lay out BGA substrates. Another subsidiary in the AIC Corporation stable, Prodelcon Sdn. Bhd., supplies the assembly subcontractor with some of its packaging equipment and tooling requirements.

The supply of substrates is critical as the company targets to increase output of higher-value-added packages. Working relations have been established with key suppliers in the industry. Besides cooperating with Japanese multinational companies, the company has also engaged other suppliers in neighboring countries to develop a wide range of substrates for its products.

Future Direction

The Malaysian economic downturn has influenced AICS' growth plans. AIC Corporation had earlier intended to list its subsidiary on the proposed Malaysian technology board, called MESDAQ. However, the introduction of MESDAQ was delayed as a result of the deterioration in the local economy. AICS will now rely on financing from the parent company and Khazanah Nasional Berhad, the government's investment-holding company. Khazanah has decided to enter into a subscription agreement to participate with 25 percent equity interest in AIC Technology. This alternative source of equity injection should meet AICS' capital needs to drive growth going forward.

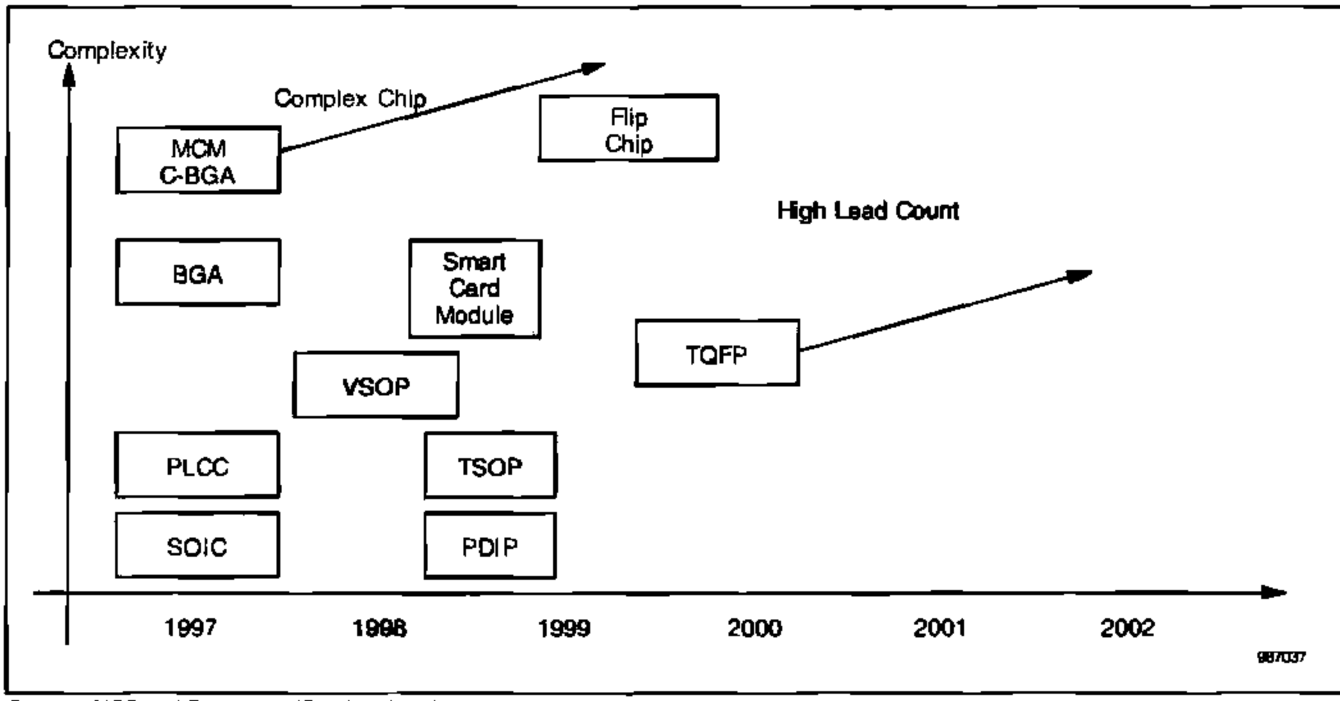
A continued weakness in the global semiconductor market caused Atmel to slash its capital spending plans. In May, Atmel announced the deferment of a $850 million joint-venture wafer fabrication project. The proposed 8-inch wafer fab is also located in the Kulim Hi-Tech Park. Dataquest estimates that this decision should delay the initial production start date at least until the year 2000.

Although AICS' business plans are not directly tied into this investment, output from the fab would have contributed significant positive gains to its revenue. Front-end wafer production will introduce demand for higher margin services (such as wafer probe test) and further raise assembly and testing volumes. The company's position as a major subcontractor for Atmel will be enhanced further. However, with production not expected until late 2000, AICS' revenue growth now depends on orders from Atmel's existing fabs.

To meet the quality requirements of current and prospective customers, AICS is working to obtain ISO 9002 certification by the beginning of next year. This undertaking is aligned with the company's quality policy of "total customer satisfaction." Besides the new products outlined in the previous section, the AICS road map includes new packages such as flip chip and TQFP series. The planned introduction schedule of these products ranges from mid-1999 to 2000. Figure 2 illustrates the AICS packaging road map. In the longer term, the company intends to shift production of lower-value-added products to other cost-competitive locations. Two possible countries identified for the proposed investment are China and the Philippines.

©1998 Dataquest

Figure 2
AIC Semiconductor's Packaging Road Map



Source: AICS and Dataquest (October 1998)

Dataquest Perspective

The evolution of worldwide semiconductor manufacturing activities has created growth for packaging subcontractors. According to Dataquest, worldwide IC packaging unit production is forecast to grow by 10.9 percent between 1997 and 2002. Among the package types, CSP and BGA devices should record the highest growth, with a compound annual growth rate (CAGR) exceeding 26 percent. AICS is poised to benefit from the growth.

AICS' smooth progression into volume production is attributed to the parent company's joint venture with Atmel, and the organization's team of experienced managers. In the highly competitive packaging business, emerging start-up companies outside the established first-tier subcontractors are challenged to become viable and to succeed. The struggle to keep afloat is even more pressing in light of the global semiconductor industry decline this year. AICS' 1998 performance reflects the tough market conditions, but on the positive side, a continuing trend by semiconductor vendors to increase outsourcing of production functions.

Other than incremental capital spending in plant and equipment, the company has already invested in methodologies to raise manufacturing efficiency. Information system investments will enable it to support other transactions and cost controls as the scope of services increases. As the company's production output rises rapidly, spare capacity would eventually become available. AICS is actively seeking out prospective customers, especially for its commodity products, to reduce reliance on a single customer. Diversification of the customer base would enable AICS to benefit from the outsourcing trend and realize balanced growth in the longer term.

Perspective

Semiconductors Asia/Pacific

Vendor Analysis

Anam S&T Company Ltd.

Abstract: *This Perspective describes Anam S&T Company Ltd.'s financial overview, company history, and product summary and analysis. This report highlights Anam's activity in the semiconductor industry. Anam's revenue increased at an impressive 27 percent in 1997, to W 1,428.4 billion. Dataquest predicts that Anam's revenue will continue a steady growth owing to strengthened foundry business in nonmemory products, as well as packaging business.*
By C.S. Kim

Company Statistics

Anam S&T Company Ltd.'s company statistics include the following:

- CEO: In Kil Hwang
- Number of employees: 9,630 (as of June 1998)
- Fiscal 1997 company revenue: W 1,428.4 billion
- Fiscal year-end: December 31

FILE COPY:
MARIA VALENZUELA

Company Milestones

Anam's company milestones since 1968 include the following:

- 1968—Anam Industrial Co. Ltd. was founded in Seoul, Korea
- 1970—Started production and export of semiconductor products (TR, IC)
- 1977—Listed shares on the Korea Stock Exchange
- 1983—Established R&D Institute in Seoul

Dataquest
Program: Semiconductors Asia/Pacific
Product Code: SEMI-AP-DP-9812
Publication Date: November 9, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

- 1984—Started to produce semiconductor ICs in K2 plant
- 1988—Started to produce semiconductor ICs in K3 plant
- 1989—Established Amkor/Anam Pilipinas Inc. in the Philippines
- 1992—Achieved a cumulated export of U.S.$10 billion in the semiconductor business
- 1995—Announced entry into wafer fabrication foundry business
- 1996
  - Achieved total exports of U.S.$20 billion in the semiconductor business
  - Completed K4 plant and Buchon Fab 1
- 1998
  - The 30th anniversary
  - New CI announcement
  - Changed company name to Anam S&T Company Ltd.

Company Overview

Semiconductor Company Offers the Total Solution

Starting out as the first domestic company in South Korea's semiconductor industry in 1968, Anam has been able to maintain its leading edge in semiconductor packaging.

By adding wafer processing to its technologies in semiconductor design, photomask, packaging and testing, materials and equipment, Anam now possesses the capabilities necessary to offer total solutions for semiconductor businesses.

Anam Is a World Leader in the Packaging Market

Anam is always a step ahead of competitors in dealing with the fast-changing business management environment, especially in areas of technology innovation and the development of new materials, high-technology equipment, and new technology.

The world's major semiconductor companies pay royalties for Anam's independently developed Power Quad 2 (PQ 2) and super ball grid array (SBGA). Anam also enjoys the distinction of being the only company to export the semiconductor technology back to its country of origin, the United States.

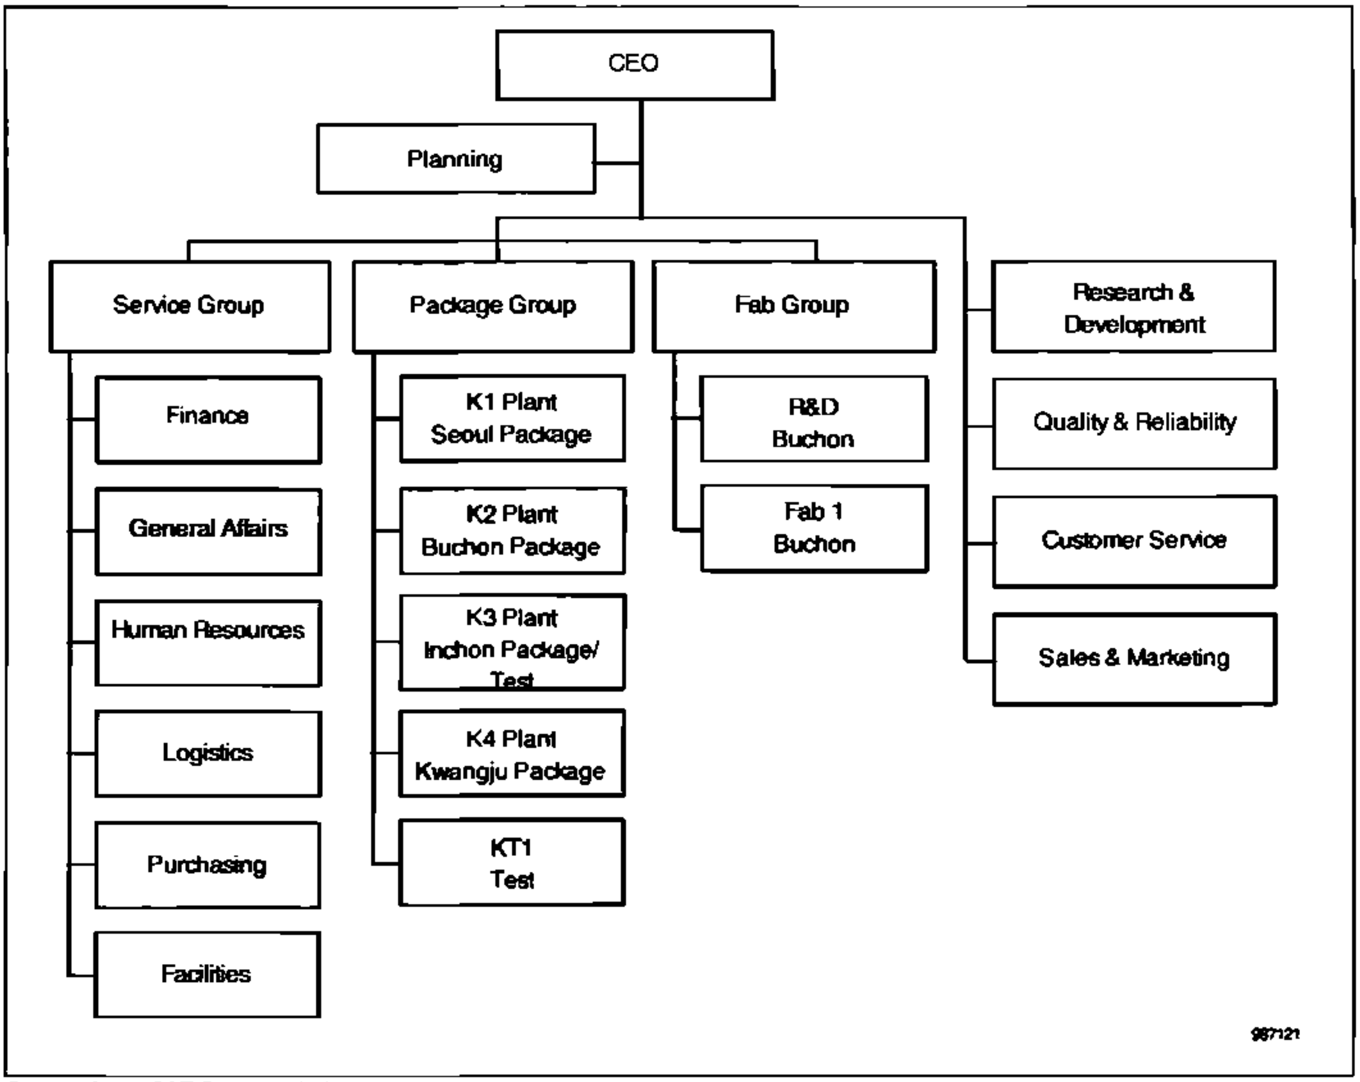
Before selecting the most optimal packaging design, Anam tries to reflect on the customer's needs and determine the affordable prices right from the product design stage.

Developing key component technologies—such as large die, fine pitch staggered bonding, multichip, and flip chip—enabled Anam to create light, simple, diversified, and highly efficient products to exert dominance in the packaging technology. It intends to continue its dominance in the world's packaging market into the next century by promptly developing and supplying the type of packaging customers want.

Organization

Anam's organization is divided into three core operating divisions. Figure 1 illustrates the structure of Anam's organization.

Figure 1
Anam S&T Company Ltd.'s Organization



Source: Anam S&T Company Ltd.

 ©1998 Dataquest

Organization Scope

Package and Test Business Unit

Anam Will Implement Management System to Satisfy Customers

Pursuing global network and forceful marketing activities, Anam seeks effective ways to meet the total needs and demands of its customers. Its quality control is monitored by differentiating key technologies and eliminates defective products to near zero rate. Therefore, Anam's customer services are maximized.

Anam Is the World's Largest Semiconductor Packaging Company

Anam is utilizing 30 years of its accumulated technology and know-how to produce a variety of high-tech packaging. It has more than 200 customer-affiliated companies worldwide in the areas of semiconductors, electronics, information, and telecommunications. Its semiconductor IC packaging and testing company is the largest in the world. Anam has four plants in Seoul, Inchon, Kyonggi, and Kwangju, and their combined annual exports total more than U.S.$5 billion.

By 2000, the new semiconductor factory totaling 429,754 square meters will be completed at the science industrial development complex located in Kwangju, South Cholla Province. Upon completion of this large-scale plant, exports there and at plants in Manila and Laguna, the Philippines, will exceed U.S.$1 billion. This plant will have the world's largest production capacity and will corner more than 50 percent of the international semiconductor market.

Fabrication Business Unit

Anam Entered the Fabrication Industry, the Ultimate Business in Semiconductor, in September 1996

With 30 years of experience in the semiconductor business, Anam's fab division represents the ultimate semiconductor business. Equipped with 0.35-micron circuit-size high-technology and production facility, Anam's fab division will lead South Korea as the nonmemory, specialized semiconductor production company. With aggressive investment in technology development, it will become a world-renowned semiconductor foundry company.

Sales and Marketing

Anam Established a New Global Management System

Amkor Electronics Inc. was established in Philadelphia as a United States-based company to deal with Anam's overseas semiconductor marketing business. Working closely with Amkor, Anam had a head start over others in establishing a truly global management system.

Currently, Anam's customers in the United States are served through its offices in Santa Clara, Chandler (Arizona), and Dallas. There are also business offices in France, Japan, the Philippines, Singapore, and Taiwan.

Anam's business strategy is "customer first," so Anam will meet with its clients any time, any place around the world to better serve their needs.

 ©1998 Dataquest

Financial Performance

Each year since 1968, Anam has proved progressively positive, and it has become one of the most stable companies in the industry, with profit margins of 3 percent in 1995 and 18 percent in 1997 (see Table 1). Anam's steady growth resulted from stable prices in packaging semiconductors.

Table 1
Anam's Consolidated Balance Sheet (Billions of Korean Won)

	1995	1996	1997
Net Sales	970.2	1,125.9	1,428.4
Cost of Sales	880.3	962.9	1,216.3
Gross Profit	33.1	29.2	252.2
Net Income	21.6	17.1	251.7
Cash and Deposits	70.5	291.6	190.5
Inventory	70.6	90.9	116.2
Current Assets	244.3	502.6	583.4
Assets	878.0	1,550.5	3,022.6
Current Liabilities	443.2	699.6	1,307.3
Liabilities	648.9	1,264.1	2,889.3

Source: Anam S&T Company Ltd.'s Financial Report

Semiconductor Business

Anam's overall revenue growth in worldwide sales is steadily increasing. Anam experienced outstanding growth of semiconductor revenue because of its orientation mainly toward package and test business in the semiconductor industry. Anam is a world leader in the packaging market. Dataquest expects Anam's 1998 revenue to increase by 54 percent over last year year's revenue because of the rapid demand expansion for BGA and quad flat packaging from mobile communications industry. Anam has begun operating fabrication lines since the fourth quarter of 1997. This product fabrication business will contribute to Anam's revenue expansion in 1998 (see Figure 2).

Anam's Activities in 1998

Anam to Introduce 0.18-Micron Semiconductor Lines

Anam plans to introduce the most advanced semiconductor processing technology with a circuit width of 0.18 micron in its nonmemory production lines.

Anam, a foundry service company, said it plans to introduce 0.18-micron wafer fabrication technologies from Texas Instruments Inc., its technological partner in the United States, for its 8-inch wafers.

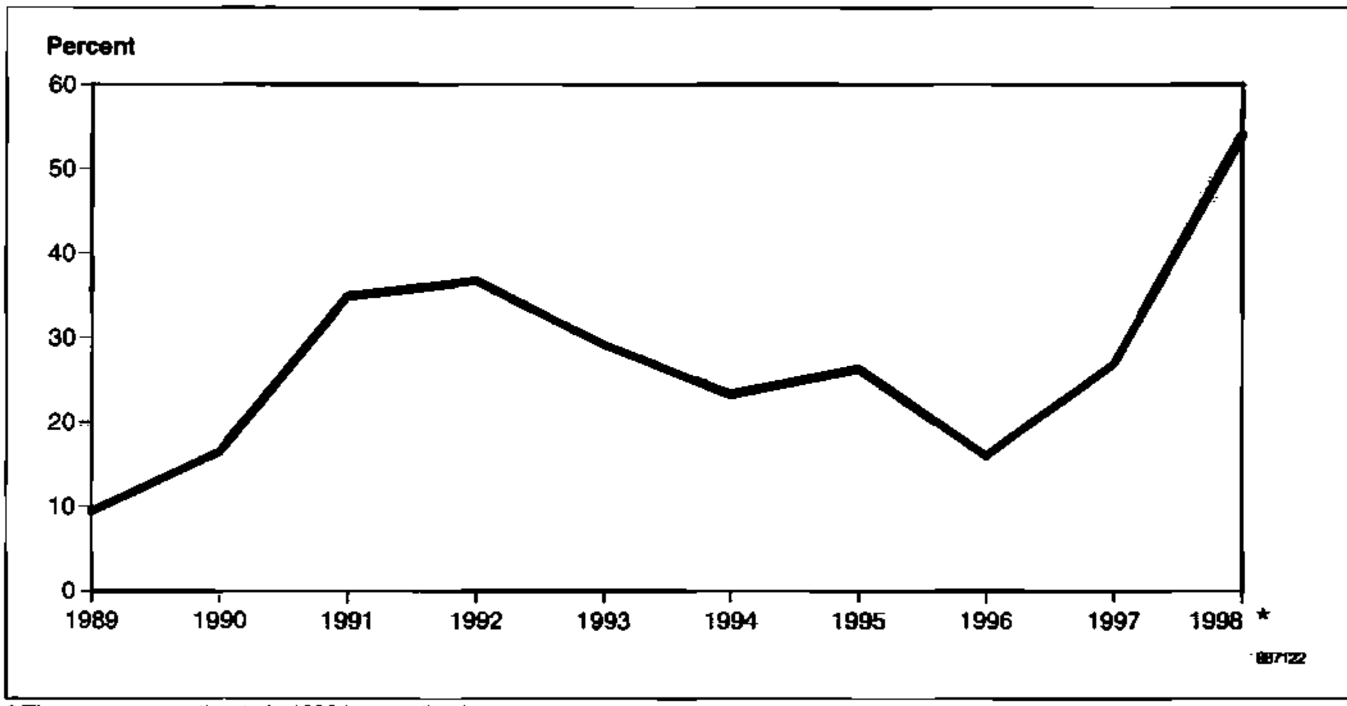
Fine 0.18-micron precision technologies, which are mainly used for manufacturing digital signal processors (DSPs) and application-specific integrated circuits (ASICs), can integrate 125 million circuits on a chip. With

 ©1998 Dataquest

TI's technological support, Anam will install the state-of-the-art facilities at its own expense by early 1999 and supply from a minimum of 40 percent to maximum of 70 percent of its products to TI.

Since the fourth quarter of 1997, Anam, using TI's 0.25-micron and 0.35-micron technologies, has been producing DSPs from 15,000 wafers a month and supplying them to TI.

Figure 2
Anam's Revenue Growth Rates, 1989 to 1998*



* The revenue growth rate in 1998 is an estimate.
Source: Dataquest (October 1998)

When the 0.18-micron processing lines are installed, Anam expects that its wafer fabrication capacity will increase from 15,000 units to 100,000 units a month.

Anam to Sell Chip Plant for U.S.$600 Million

The Anam Group has agreed with a consortium of Salomon Smith Barney Securities Inc. and Boston Bank of the United States to sell facilities operated by its semiconductor subsidiary, Anam Semiconductor Inc., for U.S.$600 million.

The two parties, however, decided not to disclose the target of the deal before a final agreement is reached, in consideration of the remaining sensitive issues (such as managerial rights and employee transfers).

A source at Anam hinted that the sell-off target might be one of its semiconductor packaging plants located in the Seoul metropolitan area or in Kwangju, South Cholla Province, or the nonmemory semiconductor plant in Puchon, Kyonggi Province.

In fact, Anam has been trying to attract foreign investment in the range of U.S.$2.2 billion to U.S.$2.5 billion since early this year with no results.

Anam Group said the proceeds from the sell-off will be used for canceling the guarantee on mutual payment for its subsidiaries and improving its financial standing by repaying debts.

Anam to Automate Semiconductor Packaging and Testing

In an attempt to reduce production costs, Anam, the largest semiconductor packaging company, is planning to automate the processing lines for packaging and testing at its semiconductor plants.

Anam said that it will install pilot automation of semiconductor packaging and testing at its assembly plants for plastic BGAs in the Philippines, in conjunction with Amkor, its subsidiary in the United States.

The company said the new processes will comprise an automatic monorail system, data management systems, and computer integrated manufacturing (CIM) systems.

Anam expects to reduce plant space by half and shorten production time drastically if the automation project is implemented as planned. In the semiconductor industry, most wafer processing is automated, but automation of packaging and testing has lagged because of its technological complexity.

Anam Produces Micro BGA Packages

Anam has begun commercial production of micro BGA packages, the next-generation semiconductor packages.

Anam has installed production lines for micro BGA packages with a weekly capacity of 750,000 units, anticipating a rapid demand expansion. Ball pitches of its micro BGA packages are 0.50mm, 0.75mm, 0.80mm, and 1.0mm in size.

So far, micro BGA packaging technology has been applied to flash memory chips and SRAMs, but recently, it has been used for DRAMs such as direct rambus DRAMs.

Micro BGA-based packaging is a new technology, which can drastically reduce the sizes of chips. For example, when assembling a 15mm x 15mm chip, it allows reduction of the package size to 1.2 times of the chip itself. The package size is typically three times larger than the chip when conventional rod-type lead packaging technology is employed.

Product Lineup

Anam will lead the semiconductor packaging industry through customer-oriented management, competitive technology, and diversification of packaging. Anam is strengthening its business in packaging, as well as foundry, to lead the world semiconductor industry. Table 2 shows Anam's product lineup by package.

	UBGA	40, 46, 48

Source: Dataquest (October 1998)

Dataquest Perspective

Anam will continue its efforts to lead various high-technology industries in semiconductors. Furthermore, to keep its competitive edge in the 21st century, Anam is reinforcing its nonmemory technology, especially the DSP business, to keep its competitive power in the semiconductor industry.

To become a pioneer of new technology in the nonmemory semiconductor specialized industry, Anam's fab division will engage in intensive research to come up with 0.25-micron and 0.18-micron technology development and transfer. At the same time, the entire Anam Group will utilize the expertise it gained from the domestic production to maintain the leading edge in the industry. Anam is actively pursuing its long-range goal of expanding production facilities abroad and maximizing its existing business areas.

Perspective

Semiconductors Asia/Pacific

Vendor Analysis

United Microelectronics Corporation

Abstract: *Despite the sluggish market conditions that characterized the semiconductor industry in 1997, United Microelectronics Corporation not only completed the transformation of its business model but also managed to achieve U.S.$896 million in revenue, an 8.7 percent increase over the previous year, 1996. To meet strong demand growth, UMC will invest NT$500 billion to build new fabs at the Tainan Science-Based Industrial Park in the next 10 years. This Perspective profiles the Taiwan-based semiconductor company UMC and its affiliate companies.*
By Jerry C. J. Yeh

Company Statistics

Company statistics include the following:

- Chairman—Robert H.C. Tsao
- CEO—John Hsuan
- CEO—Donald W. Brooks
- President—H. J. Wu
- Number of Employees—2,751 (as of March 1998)
- Fiscal 1997 Company Revenue—U.S.$896 million
- Fiscal 1997 Net Income—U.S.$338 million
- Total 1997 Assets—U.S.$3,035 million
- Fiscal Year-End—December 31

UMC Beliefs

United Microelectronics Corporation (UMC) states the following:

- UMC believes that by fully utilizing its employees' talents, it can outperform all competition and maintain an outstanding corporation.
- UMC believes that its employees, despite the outside factors, can determine the company's continued success based on their individual efforts.
- UMC believes that by working to benefit others, it will, in turn, benefit itself and the employees.

UMC's Long-Term Managerial Guidelines

UMC expresses the following long-term managerial guidelines:

- UMC respects the company as a public instrument, whose image, reputation, and credibility, all employees are committed to preserve.
- By increasing productivity constantly, UMC will maximize profits and thus maintain its ability to contribute to the economic growth and well-being of its community.
- Through endless innovation and a relentless pursuit of quality, UMC will become a world leader in its field.
- UMC will take every opportunity to form beneficial alliances and always treat its partners with honesty and friendship.
- UMC will actively encourage its employees to take initiative and make every effort to cultivate their talents. Furthermore, UMC will turn leadership into service rather than authority.
- UMC strives for vitality (endurance and productivity), harmony (mutual respect and cooperation), contentment (the right positions for the right people), and cheerfulness (positive attitudes), thus creating a lively, stimulating, and creative work environment.

Company Overview

The year 1997 was a key year in laying the foundations for UMC Group's turn-of-the-century expansion investment plan. During the year, UMC successfully completed the full transition of the UMC business model, continuing the process started in 1996 with the spin-off of the UMC design departments and the establishment of two independent IC design houses, Integrated Technology Express Inc. and Davicom Semiconductor Inc., in the United States. In 1997, UMC put the final touches on its restructuring program with the spin-off of its commercial product, memory, and multimedia divisions to create three new and independent design houses, Novatek Inc., AMIC Technology (Taiwan) Inc., and Mediatek Inc. With these actions, UMC committed itself fully to the dedicated foundry concept. In other accomplishments, UMC technology and process development departments further advanced UMC's process technology, entering the

©1998 Dataquest

0.25-micron arena, and succeeded in developing independent advanced mask-making technology. In addition, the turnkey services of the test and packaging engineering division and design support division have made it possible for foundry customers to enjoy even faster and more complete service.

Financial Accomplishments

Table 1 shows the exchange rates for U.S. dollars and the new Taiwan dollar between 1993 and 1997. Despite the slow conditions that characterized the semiconductor industry in 1997, UMC not only completed the transformation of its business model, but also managed to achieve a U.S.$896 million revenue, an 8.7 percent increase over the previous year, 1996 (see Table 2). Net income for 1997 was U.S.$338 million, surpassing the previous year by 21.6 percent.

Table 1
Exchange Rates, 1993 to 1997

Year	New Taiwan Dollar per U.S. Dollar
1993	26.16
1994	26.45
1995	26.48
1996	27.46
1997	28.79
U.S. Dollar Appreciation (%) 1996 to 1997	4.81

UMC's Status on the Bond Issue

Table 3 shows UMC's status on the bond issue. To fund fab expansion, a resolution was passed to issue several bonds from 1994 to 1998. The 1996 domestic convertible bonds were used to help finance the expansion of Fab III and for reinvestment in other companies. The investment project will ultimately require a total of NT$17 billion. There are three following funding sources for this project:

- Domestic convertible bonds (NT$6 billion)
- The company's own resources
- Other financial instruments (the two latter sources must provide NT$11 billion)

According to the original schedule, UMC is expected to complete 100 percent of the expenditure by the end of 1997. However, only 91.78 percent of the expenditure was actually executed. The company is running behind schedule because of its efforts to maximize efficiency in the plant construction and capacity expansion processes. UMC plans to return to the original financing schedule in the first quarter of 1998.

The 1997 Euro-convertible bonds were used to help finance the expansion of Fab III, for operating capital, and for investment in other companies. The investment project will ultimately require a total of NT$10.8 billion. The following represent three funding resources for this project:

- Euro-convertible bonds (U.S.$300 million or about NT$8.3 billion)
- The company's own resources
- Other financial instruments (the latter two sources must provide NT$2.5 billion)

According to the original schedule, UMC expected to complete all of the expenditure by the end of 1998.

Table 3
UMC's Status on the Bond Issue

	Euro-Convertible Bonds	Unsecured Convertible Bonds	Euro-Convertible Bonds	Domestic Convertible Bonds
Total Amount	U.S.$160,000,000	NT$6,000,000,000	U.S.$300,000,000	NT$15,000,000,000
Issue Price/Each	U.S.$1,000	NT$100,000	U.S.$5,000	NT$100,000
Annual Interest Payment (%)	1.25	2.5	0.25	0
Issue Period	6/1994 to 6/2004	5/1996 to 5/2006	5/1997 to 5/2004	1/1998 to 1/2008

Sources: UMC and Dataquest (October 1998)

Intercompany Holdings

UMC is like a tree that has its root extended to the various areas, including a wafer fab joint venture, IC design house, packaging, LCD, telecommunications, venture capital, and even banking. Table 4 shows UMC's major affiliated companies and its investment shares. Basically, this information is based on UMC's financial reports, but there are many semiconductor companies' owners that invested in the related companies from their own pocket or other channel.

 ©1998 Dataquest

UMC's Management Structure—Worldwide Operations

Figure 1 illustrates UMC's management personnel. Although UMC Group Chairman Robert Tsao's position and title remain unchanged, five new executive director positions were created. John Hsuan took the position of CEO of domestic operations; Don Brooks was named the CEO of international operations; I.D. Liu became the COO of expansion projects; Gary Tseng was appointed CFO of UMC Group; and J.S. Aur was installed as the CAO of the UMC Group. In other major changes, H. J. Wu became president of UMC; and Chris Chi, formerly a senior manager at Singapore's Chartered Semiconductor Manufacturing Pte. Ltd., joined the UMC family as senior vice president. Vice president Chi is currently in charge of operations at Fab III; and Fu Tai Liou, formerly a senior manager at STMicroelectronics, joined the UMC family as the senior vice president of the technology and process development division. With the addition of United Semiconductor Corporation (USC) President Peter Chang, United Integrated Circuits Corporation (UICC) President C. Y. Shu, and USIC President Frank Wen, UMC Group has put together the ideal team to launch its NT$500 billion investment plan and take it to the top of the semiconductor foundry industry.

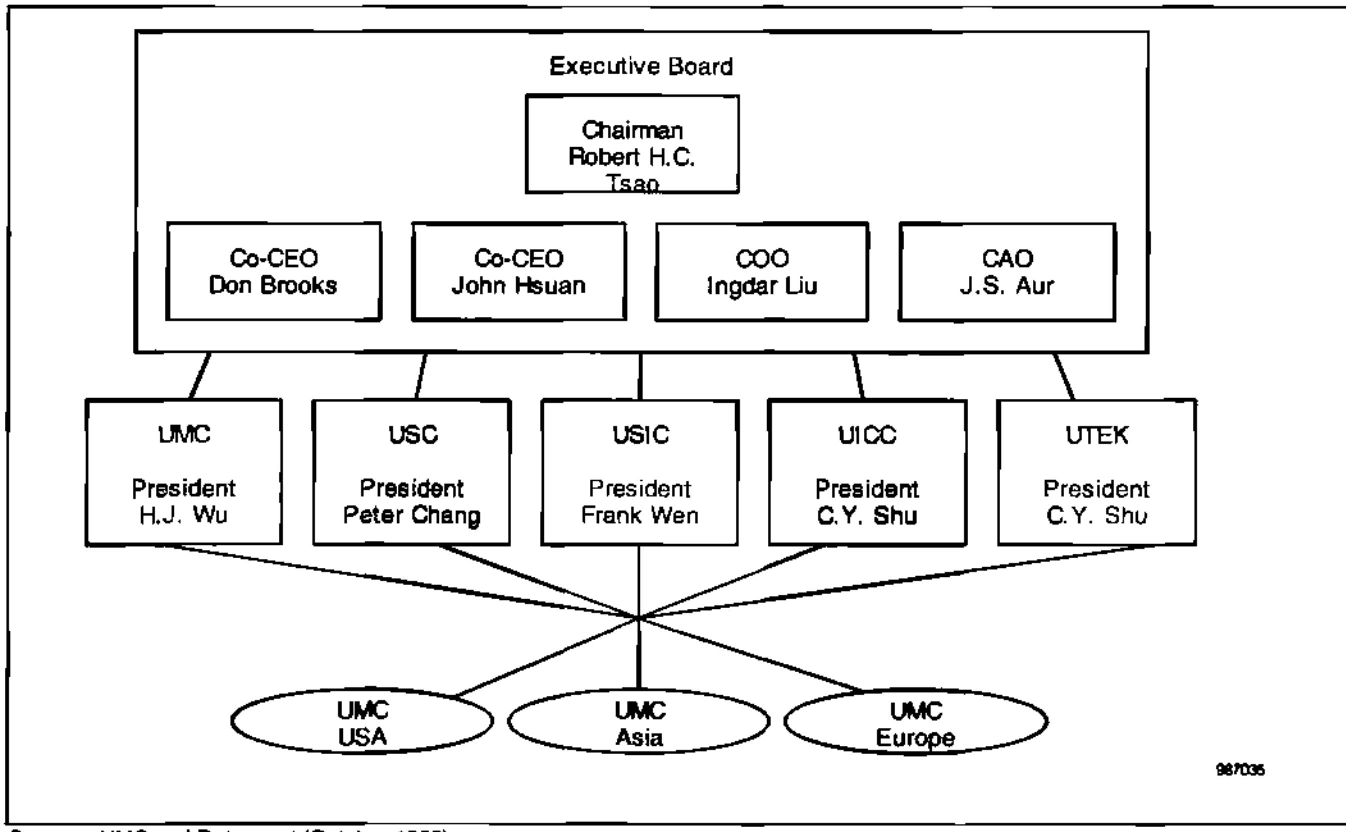
Figure 1
UMC's Management Organizational Structure



Sources: UMC and Dataquest (October 1998)

Research and Development Plans

In the area of process technology R&D in 1997, UMC's most outstanding accomplishment was the successful development of 0.25-micron logic technology and its successful qualification on a customer's product. In other area of cutting-edge manufacturing processes, UMC smoothly ramped 0.35-micron logic, 0.3-micron SRAM, and 0.35-micron DRAM products into mass production. The development of 0.25-micron logic and 0.3-micron DRAM processes was completed, and small-scale production will be launched in the first quarter of 1998. The 0.35-micron embedded DRAM process development was also completed in 1997, and UMC is working on customer products that utilize this technology. Plans for 0.18-micron process technology and device qualification were completed. At the same time, the 6-inch fab pushed EPROM and Flash EPROM processes into mass production, and it also developed a 16V process and color filter process technology. The R&D department's mask-making technology was successfully qualified, and small-scale, 0.35-micron and 0.25-micron mask making are under way. On January 13, 1998, UMC held a technology symposium in California's Silicon Valley with 400 representatives from more than 50 companies attending. The outstanding results of UMC's R&D program caused quite a sensation in the U.S. semiconductor industry.

In the next 10 years, UMC has investment plans for NT$500 billion at its Tainan Science-Based Industrial Park site. UMC intends to focus on the development of 0.18-micron and 0.13-micron logic, DRAM, and SRAM manufacturing process technologies. UMC also plans to develop E-DRAM, E-FLASH, and multivoltage process technologies to satisfy the varied demands of foundry customers. Meanwhile, UMC will develop standard cells and intellectual property, either in cooperation with other companies or on its own, thus strengthening its customers' competitive edge by offering even more comprehensive services.

Wafer Fabrication Status and Plan

In October 1997, UMC Group was dealt a shocking blow with the fire that struck the UICC fab. Following in the footsteps of the successful first UMC Group joint-venture company, USC, UICC, in the short year and a half after its birth, managed to complete fab construction and enter test production, breaking various industry speed records along the way. Tragically, just as test production had ramped up to 10,000 wafers per month and the fab was ready to enter mass production ahead of schedule, fire broke out at the fab. Fortunately, because of the unique structure and position of the UMC Group, UICC was able to guarantee capacity to its joint-venture partners and customers through cooperation with other UMC Group fabs and IC manufacturing allies in Taiwan.

Although UICC lost a year and a half of time and efforts, the fire enabled partners and customers alike to see UMC's crisis management skills in action, convincing them of UMC Group's ability to overcome whatever obstacles may lie in the future. The settlement of UICC insurance claims has also proceeded smoothly. The first payment for a sum of NT$500 million was made at the end of 1997. Total settlement should be completed by the end of 1998. To profit from this costly and tragic incident, the UMC Group has decided to invest NT$1 billion to set up a high-tech-industry-oriented fire-fighting department and has redoubled its efforts to improve every aspect of its industrial safety measures. The UMC Group also invited a leading risk management specialist from the Singapore insurance industry, K. W. Kong, to join its forces at the end of 1997. Table 5 shows UMC's wafer fabrication status and plan.

Dataquest Perspective

UMC was the first Taiwanese domestic IC manufacturing to offer wafer foundry services. With nearly two decades of design and manufacturing experience, UMC has carved out an important niche on the world stage, providing comprehensive services, such as design, mask tooling, fabrication, testing, analysis, and IC packaging. In the past few years, revenue generated by foundry services has grown exponentially. In July 1997, UMC Group announced its goal of becoming a leading name in the semiconductor foundry industry. Despite the serious setback caused by the UICC fire, UMC will accomplish this goal.

Table 5
UMC's Wafer Fabrication Status and Plan

Fab Name	Production Start	Wafer (Inches)	CMOS Process (Microns)	Capacity, Wafer/Month (as of 9/1998)	Forecast Capacity Wafer/Month (by end of 1998)
UMC Fab 2	6/1989	6	0.8 to 0.45	48K	48K
UMC Fab 3	9/1995	8	0.5 to 0.25	28K	28K
USC	4/1996	8	0.5 to 0.25	32K	33K
USIC	5/1998	8	0.35 to 0.25	12K	15K
UTEK Fab 1	4/1991	5	1.2 to 0.7	35K	35K
UTEK Fab 2	5/1998	8	0.5 to 0.25	4K	8K
UICC	Q2/1999	8	0.25 to 0.18	-	-
UMC Fab 5	Q4/1999	8	0.18 to 0.15	-	-

Source: UMC and Dataquest (October 1998)

To meet strong demand growth, UMC will invest NT$500 billion to build new fabs at the Tainan Science-Based Industrial Park in the next 10 years. Fab 5, which held its groundbreaking ceremony at the end of 1997, will start mass production in 1999. Future goals will focus on the establishment of the new fabs in the Tainan Science-Based Industrial Park, specifically on its construction, ramping up, the development of unparalleled services, and the aggressive development of leading-edge process technologies with the aim of becoming the world leader in the dedicated foundry business.

Perspective

Semiconductors Asia/Pacific
Market Analysis

South Korean Semiconductor Industry Trends

Abstract: *This Perspective analyzes South Korea's economic status, the major electronic equipment industries, and semiconductor manufacturers' activities this year. This Perspective also examines South Korea's 1997 semiconductor market share. It reviews the top 20 semiconductor companies' market share in South Korea.*
By C.S. Kim

South Korea's Economic Review and Outlook

South Korea's Economic Downturn and Its Impact on First Quarter Industry Performance

The Korean won had strengthened slightly by the end of the first quarter of 1998, but exports remain the key to survival for most domestic companies. Companies without any export revenue have been shown to be vulnerable to the negative effects of the economic crisis.

According to a report released by Korea's National Statistical Office in April 1998, industrial production in March plunged 10.1 percent from a year ago—despite relatively robust exports—which was severely affected by depressed consumer demand. The growth declines for two months in a row translated into negative 10.8 percent in January and another negative 1.7 percent in February. In the first three months of the year, industrial output showed a 7.8 percent year-on-year decline. Dataquest expects that fiscal retrenchment, high interest rates, and high exchange rates are pushing the real economy into stagflation, or economic downturn amid soaring inflation. The Korean economy is not expected to return to normal growth for some time.

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

South Korea's Economic Sluggishness and Its Impact on Second Quarter Industry Performance

The currency exchange rate strengthened from an average of W 1,655 to the U.S.$1 dollar in the first quarter of 1998, to W 1,397 to the U.S.$1 in the second quarter of 1998. The stronger won, which actually dipped below the W 1,300 level at the end of July 1998 for the first time in seven months, put the national economy on alert. The rise of the local currency was highly undesirable in view of two consecutive months of export declines, which may further deepen the economic recession and aggravate the unemployment problem.

According to a recent Bank of Korea report, the declining household spending trend is likely to bring about serious results and may cause a vicious cycle of dwindling production, falling household income, and a further slowdown in domestic consumption. The three characteristics of the spending decline trend cited by the central bank are as follows:

- An excessive consumption reduction (with spending decreases outpacing income reduction)
- The collapse of the middle class
- The consumption decrease mainly attributed to perceived uncertainty about the future

The spending decline outpaced by a wide margin the negative 3.85 percent gross domestic product (GDP) growth reported in the first quarter of 1998. In the 1990s, household consumption has accounted for as much as 52.6 percent of Korea's GDP growth. The falling expenditures among households may fuel a continued slowdown in Korea's economic growth potential.

Sales Slump Continues through the Second Half of 1998 for Major Industries

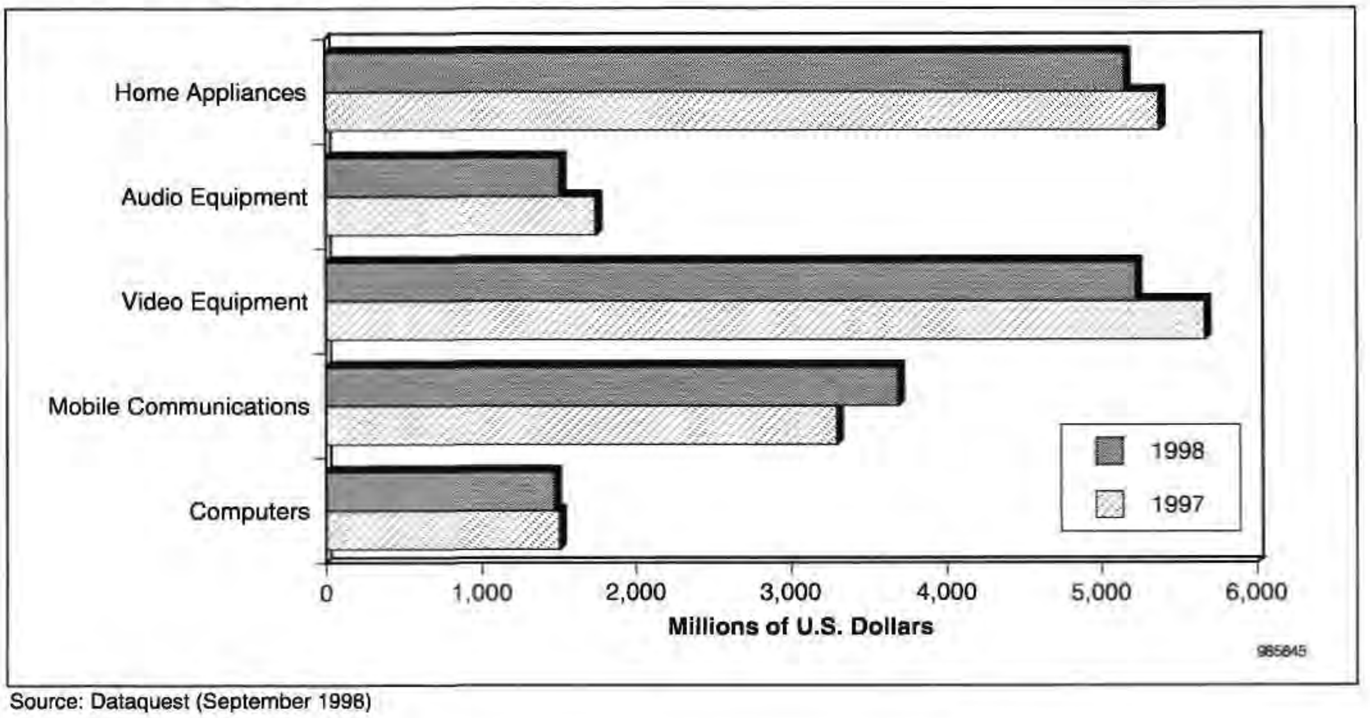
The current domestic business slump is expected to stretch through the second half of 1998 because of poor domestic sales, high inventories, and sluggish facility investments, according to the Bank of Korea. Major domestic industries are likely to undergo another six months of dismal sales—especially because markets show few signs of picking up at home or abroad. In its latest industrial forecast for the second half of 1998, the Korea Development Institute (KDI) expects that domestic consumer spending will shrink further, hit by reduced household income and mounting concerns over unemployment. The Institute forecasts the unemployment rate at 8.5 percent, with the number of unemployed reaching 1.76 million. As a result, sluggish consumer demand is unlikely to recover in the near future, despite a spate of economy-boosting measures, including the reduction of the special excise tax on durable goods and expanded construction investment. According to industry experts, domestic exporters will also suffer from a setback largely attributed to weakened price competitiveness that has arisen from the soaring Korean won and the weak Japanese yen. Instead of expanding exports, industries will try to defend their corporate profitability, which is also worsening rapidly.

South Korea's Major Electronic Equipment Production

Computer Production Expected to Decline by 1.9 Percent in 1998

Dataquest expects Korea's total computer production in 1998 to reach $1.47 billion, a 1.9 percent decline from last year (see Figure 1).

Figure 1
Major Electronic Equipment Production Comparison in South Korea, 1997 and 1998 (Millions of U.S. Dollars)



Source: Dataquest (September 1998)

As for PCs, including desktop and notebook PCs, domestic shipments in the first half of 1998 declined by 52.4 percent to $387 million, and exports increased by 78.7 percent to $120 million. The PC export increase is attributed to a 139 percent rise in exports of notebook PCs, which accounted for nearly 98 percent of the total overseas shipments.

Dataquest predicts that the total PC production this year will reach $1.28 billion, a 2.1 percent decline from last year because of the local demand slump.

Mobile Communications Equipment Production This Year Expected to Not Follow Last Year's Expansion Because of the Sluggish Local Demand of Mobile Phones in the Second Half of 1998

The domestic market for digital cellular phones is expected to fall to about 3.3 million units in the second half of 1998, spurring competition among vendors. In the first half of 1998, the three largest vendors, Samsung Electronics Company Ltd., LG Information and Communications Co. Ltd., and Hyundai Electronics Company Ltd., took more than 95 percent of the market in which 4.3 million digital cellular phones were sold. Dataquest

 ©1998 Dataquest

expects that Korea's total mobile communications equipment production in 1998 will reach $3.7 billion, an 11.7 percent increase from last year. Such growth results in production growth of digital cellular phones.

Consumer Electronics

The following trends in Korea's consumer electronics production have been observed by Dataquest:

- Video Electronics Production Expected to Decline by 7.8 Percent in 1998
  - Korea's video production will decrease this year, falling 7.8 percent to $5.2 billion, compared with the same period last year. Such a decline results in slumping exports and freezes local demand. Domestic consumer electronics companies are strengthening their marketing strategies in the United States, with high-priced, advanced products to solve the depressed export and domestic sales. These manufacturers are shipping high-value, advanced products—such as digital video disc (DVD) players, set-top boxes, 40-inch-or-larger projection TVs, and high-definition (HD) TVs this year—to the North American market, thereby reducing OEM supplies of low-end products.
- Domestic Home Appliance Production to Decline by 4.1 Percent in 1998
  - Because of the projected sales decline both at home and overseas in the second half of 1998, domestic home appliance manufacturers are struggling to stay afloat. They are suspending or postponing the development of new products and are cutting production. Dataquest expects that the total production of home appliances in 1998 will reach $5.1 billion, a 4.1 percent decline from last year.
  - Dataquest predicts that exports of Korean companies' products to China, the Middle East, and Latin America are also dropping sharply because of economic recession in these regions. Particularly, exports to Russia, which had reached more than $500 million annually, have been nearly suspended because of that country's economic troubles. Under these circumstances, Samsung Electronics, LG Electronics, and Daewoo Electronics Corporation recently cut back appliance production at their domestic and overseas plants and canceled or postponed new-product development. These manufacturers are facing troubles, and a collapse of the domestic consumer electronics industry is not unimaginable.
- Production of Audio Equipment Sharply Decreased by 13.4 Percent
  - Domestic audio manufacturers are confronting a crisis in exports and domestic sales. Exports of their products to Southeast Asia, Russia, China, the Middle East, and Latin America have drastically declined in recent months. Furthermore, Japanese audio system vendors are lowering prices of their products in these regions.
  - To reduce production costs and increase exports, LG Electronics relocated its production lines for low-end audio systems to China early this year, while expanding shipments of its products to China,

©1998 Dataquest

the Commonwealth of Independent States (CIS), Latin America, and Europe. However, the operation rate of its production lines recently dropped by 15 percent.

- Exports of audio products by Lotte Electronics Corp. and Anam Electronics Co. Ltd. have nearly ceased since May of 1998, whereas Haitai Electronics Co. Ltd. is filling only 70 percent of orders because of difficulties in procuring materials. As a result, Korea's audio equipment production this year will reach $1.5 billion, a 13.4 percent decline from last year.

South Korea's Semiconductor Industry

South Korea's Semiconductor Market Share in 1997

Dataquest estimates that in 1997, Korea's total semiconductor market revenue increased to about $5.5 billion. The top 20 suppliers dominated 69.2 percent of Korea's total semiconductor market in 1997 (see Table 1).

Samsung Electronics retained its No. 1 ranking in terms of Korea's 1997 semiconductor revenue. However, Samsung's regional revenue increased by only 2.8 percent to $620 million. Intel Corporation's revenue increased in Korea by 23.1 percent and reached $559 million in 1997. Dataquest expects Intel to surpass Samsung this year according to the semiconductor market flow. Note that most of the top 20 semiconductor suppliers in Korea also appear among the top 20 semiconductor suppliers in Asia/Pacific, with the exception of Sharp Electronics Corporation, Korean Electronics Co., Sanken Electronic Company Ltd., and Sony Corporation.

Philips Electronics NV's regional revenue grew 17.1 percent and totaled $404 million. Motorola Incorporated's revenue increased by 5.9 percent to $199 million. Toshiba Corporation's regional revenue was reduced by 16.6 percent to $196 million. Motorola and Toshiba also switched ranking positions in South Korean market in 1997, with Motorola in fifth place and Toshiba in sixth place. LG Semicon Co. Ltd. and Texas Instruments Inc. retained their positions in the top 10 semiconductor supplies in the South Korean market for 1997; however, their revenue declined by 9.1 percent and 4.2 percent, respectively. Sharp and Sanken were ranked as No. 12 and No. 15, respectively, in Korea because of Sharp's excellent supply of MOS logic devices and Sanken's discrete devices. Korean companies accounted for about 20 percent of their local market. Lucent Technologies jumped to No. 17 in South Korea in 1997 from No. 21 in 1996. Lucent and Sanken entered the top 20 group in 1997. Table 1 shows South Korea's top 20 semiconductor suppliers in 1997.

Source: Dataquest (September 1998)

Won Revenue of South Korean Semiconductor Companies Soared in First Half of 1998

Despite a continuous drop in chip prices, sales revenue (based on the Korean won) for South Korea's three major semiconductor manufacturers increased sharply in the first half of this year, climbing 22.5 percent to 46.4 percent over the same period last year. Profits in this sector, however, were lower, according to their estimates.

In the first half of 1998, sales revenue at Samsung Electronics reached W 10.9 trillion, a 22.5 percent increase over the same period last year. Hyundai Electronics posted W 2.1 trillion in sales, up by 42 percent, and LG Semicon's sales revenue increased by 46.4 percent to W 1.24 trillion. Samsung posted U.S.$105 million in profits during this period, whereas Hyundai Electronics and LG Semicon have reportedly posted deficits of several hundred million dollars each.

Samsung's favorable profits are attributed to its improvements in manufacturing technologies and the shipping of 64Mb DRAMs ahead of competitors. In addition, Hyundai Electronics and LG Semicon were affected by higher payments for leased equipment because of the weaker Korean currency, which contributed to their losses.

What Is Happening to South Korean Semiconductor Companies in 1998?

LG Semicon and Hyundai Electronics to Merge

Recent announcements state that progress is being made on Korea's "Big Deal," a scheme to move divisions between conglomerates. Among the many trades between *chaebols* (Korean conglomerates) is a merger between LG Semicon and Hyundai Electronics.

However, there appears to be some bickering about the fate of the proposed merger between Hyundai Electronics and LG Semicon. Despite their agreements on some portions of the "Big Deal," LG Semicon and Hyundai Electronics still have some strong disagreements about how the two companies should merge. Hyundai Electronics, arguing that it has the larger market share, has taken the position that it should manage the new company. LG Semicon, which actually produces more semiconductors than Hyundai Electronics but sells a large portion of them through Hitachi Ltd., has taken the position that it is a stronger manufacturer and should be in control of the merged semiconductor business.

U.S. Department of Commerce Finds LG Semicon and Hyundai Guilty of DRAM Dumping

Recently, the U.S. Department of Commerce (DOC) found LG Semicon and Hyundai Electronics—in addition to three resellers—guilty of dumping DRAMs into the U.S. market from May 1, 1996 to April 30, 1997. As a result of the finding, LG Semicon will be required to pay a tariff of 9.28 percent and Hyundai Electronics will have to pay a tariff of 3.95 percent on DRAMs imported to the United States. These tariffs compare more favorably with the preliminary tariffs of LG Semicon's 7.61 percent and Hyundai Electronics' 12.64 percent in March. Products manufactured inside the United States are not eligible for tariffs. The final ruling on this issue is to be made within the 60 days of the initial ruling. Tariffs will be imposed retroactively, starting with the period under review.

Both companies have announced their intention of appealing the ruling in the U.S. Court of International Trade in New York and are quoted as having accused the DOC of making "serious errors" in its analysis. In a statement issued after the finding, LG Semicon was quoted as saying that the DOC based its finding on DRAMs "unlawfully diverted to the U.S. market by third parties." The company also said, "We will not stand idly by while our reputation as a fair and competitive supplier of DRAMs is impugned." Hyundai Electronics simply called the ruling "unacceptable."

Although the preliminary tariffs were set based on incomplete information, a computational error made by the DOC was the reason given for the difference between Hyundai Electronics' preliminary tariff and the final ruling, while the difference for LG Semicon was attributed to the discovery of additional evidence to support the higher tariff. The companies will be

 ©1998 Dataquest

forced to post a cash bond for shipments during the period under examination (from May 1, 1996 to April 30, 1997). Although Dataquest does not survey shipments into the United States and does not have the companies' revenue figures that correspond exactly with the dates used by the DOC, Dataquest believes that its 1996 market share figures for shipments into the United States from January 1, 1996 to December 30, 1996 are sufficiently close to giving an estimate of the penalties facing the two companies.

LG Semicon shipped $417 million worth of DRAMs into the United States, which would result in tariffs of about $39 million. Hyundai sold the United States about $819 million worth of DRAMs in 1996, a number that would saddle the company with a tariff of $32 million. In addition to those bonds, the companies will need to accrue tariffs on all 1997 and 1998 (past and future) DRAM shipments, even while their appeals are pending. The companies estimate that their current sales into the United States are about 10 percent of LG Semicon's total DRAM revenue and 40 percent of Hyundai Electronics.

The period from May 1, 1996 to April 30, 1997 is the fourth review period under the current antidumping suit, originally filed by Micron Technology Inc. in 1993, which accused these two Korean companies of dumping in 1991. Each of the prior three review periods occurred during profitable markets, and the companies were not found to be dumping—thus, no tariffs were levied. The fourth cycle was added after a request made by Micron in 1997, extending the normal three-year review used by the U.S. DOC. For a while, the Korean government was protesting that it would take this matter to the World Court because the DOC appeared to be changing its own rules midgame. However, after the Asian financial crisis bloomed, this talk subsided, perhaps because of Korea's dependence on International Monetary Fund (IMF) bailout money, a large portion of which was to come from exports to the United States.

Hyundai Electronics believes that its DRAM shipments to the United States will not be seriously affected by the new tariffs, because the company claims that 90 percent of the chips it sells in the United States are manufactured in its new $1.3 billion wafer fab in Eugene, Oregon. Of the three Korean DRAM manufacturers, Hyundai Electronics has been a pioneer in fab construction outside of South Korea in an effort to thwart this kind of threat.

Another difficulty was thrust upon the two companies in September, when Micron successfully lobbied the U.S. Congress to attach a provision onto a bill that would allow U.S. participation in the IMF bailout. The bill, currently in the U.S. Senate for approval, would provide $18 billion to the IMF to be used to bail out ailing Asian economies. The added provision would disallow the use of any IMF funds from the United States to support foreign semiconductor companies.

It will be interesting to see whether the DRAM dumping finding will cause the same sort of price stabilization that happened in 1992, when the first Micron antidumping suit was filed against Korean manufacturers. At that time, prices suddenly stopped their fall and stabilized at a level that was to

 ©1998 Dataquest

last for an unprecedented three and a half years. Although we do not expect such an extended profitability period to occur again in our lifetimes, there is reason to believe that the current variable-cost model will give way to a more rational burdened-cost model, at least until demand catches up with capacity in 2000. This shift will most likely come about through price stabilization at current levels until burdened costs drop to current pricing.

Korean Manufacturers to Limit 64Mb DRAM Production

In an effort to bolster sagging prices, all three Korean DRAM manufacturers, Samsung, Hyundai Electronics, and LG Semicon, have announced plans to cut 64Mb DRAM production by closing their plants for one week. Korean suppliers shipped about 45 percent of the world's 64Mb DRAMs last quarter, according to Dataquest's latest DRAM Supply and Demand Quarterly Market Statistics report.

Following a one-week production suspension of 64Mb DRAMs by one of Hyundai Electronics' fabs in South Korea, Samsung planned to shut down operations of all its memory processing and assembly lines for one week starting June 14, 1998. LG Semicon said, "LG will decide its course of action after observing the policies of other companies." However, LG Semicon also reportedly planned to suspend its production operations for seven days either during the last week of June or the first week in July 1998.

This action is to be repeated periodically until the oversupply problems are resolved and prices stabilize. This idea reportedly came from a request for the Korean government's help to ease the companies' financial burdens, including high interest rates in the IMF system. The companies' representatives met with government officials and agreed to limit production and look for ways to achieve price stability.

Samsung Ships 256Mb SDRAM

Samsung claims to be the first company in the world to enter production of the 256Mb synchronous DRAM (SDRAM), having shipped samples of its second-generation device to seven of the world's largest PC makers. Samsung estimates that it is one to two years ahead of the device's anticipated production date. The company claims to have proven that the device can be mass-produced using 8-inch wafers, so that investment in 12-inch wafer fabrication lines is not necessary. The device is produced using 0.18-micron processing technology. Samsung claims to have been the first to move from 64Mb to 256Mb DRAM production without having to invest in new facilities.

Samsung's 256Mb SDRAM is designed to be compatible in both size and functionality with its current 64Mb SDRAM, allowing any computer system using 64Mb or 128Mb SDRAM to use the new 256Mb DRAM without modification. A standard dual in-line memory module (DIMM) can hold a total of eight 256Mb SDRAMs on both sides, so a single slot can expand the memory up to 1GB. Power consumption of the new 256Mb SDRAM is 70mA, 30 percent less than that available with 128Mb DRAMs, and the chip can operate at clock speeds as high as 167 MHz. The device is targeted at desktop PCs, workstations, and high-end PCs.

©1998 Dataquest

Samsung plans to use its new 0.18-micron technology to manufacture a fifth-generation 64Mb DRAM, which will greatly boost the competitiveness of these chips as well.

Samsung Electronics Samples 64Mb DDR SDRAM

Samsung has developed a beta version of a 64Mb double data rate (DDR) SDRAM that fully supports Joint Electron Device Engineering Council (JEDEC) standards.

Samsung expects that it will initially supply the beta product to manufacturers of servers, workstations, and data communications equipment. It plans to produce engineering samples in late September 1998 and commercial DIMMs in October.

Samsung's new 64Mb DDR SDRAM, which has a clock frequency of 133 MHz, supports PC-100 standards. Its DIMM can be extended to a maximum of 288MB, the company said. According to Samsung, the DDR SDRAMs can be manufactured using production lines for SDRAMs, and computer platforms require only minor changes for its use.

Samsung claims that Hewlett-Packard Company has expressed its willingness to support DDR SDRAM as a next-generation, high-speed memory.

Hyundai Electronics Starts Initial Production in Eugene, Oregon

Hyundai Electronics has started its test production at its Eugene, Oregon, 64Mb DRAM fab and began making 25 sample silicon wafers on December 31, 1997, barely meeting its deadline to launch production at the $1.4 billion plant in 1997. The company is borrowing about $1.2 billion to build and equip the factory. At full production, the plant's capacity is 30,000 200mm wafers per month. Hyundai Electronics said market conditions will determine how quickly the Eugene plant will ramp up production.

Hyundai Electronics expected to run test trials through March 1998 and to be able to reach full production by fall. The plant's wafers will be shipped to Korea for final processing and assembly.

The company plans to upgrade equipment at the end of 1998 to produce 128Mb devices in 1999 and to perform upgrades in 1999 to enable 256Mb DRAM production in 2000. The cost of that additional equipment is included in Phase One's $1.4 billion price tag.

Hyundai Electronics initially hoped to break ground in July 1995 and finish construction by December 1996, but the project took a year longer because of construction delays and environmental concerns.

LG Semicon Begins Mass Production of 64Mb SDRAM

LG Semicon has started the mass production of advanced 64Mb SDRAM chips. The chip, called the fourth-generation DRAM chip, has a data processing rate of 100 MHz, which is two times faster than conventional 64Mb DRAMs. This chip is faster than any other 64Mb DRAM chip in the world and will enable the company to be competitive in the global 64Mb DRAM market.

©1998 Dataquest

The company developed the new chip early this year by applying a 0.23-micron circuit-width technology, with which LG Semicon can produce 435 chips from a single 8-inch wafer, compared to 340 chips by Hitachi and 400 by Micron. LG Semicon launched its independent development of the new chip after a joint-development program with Hitachi early last year.

LG Semicon Strengthens Its High-Speed SDRAM in Global Market

LG Semicon is one of major suppliers of high-speed, SDRAMs. The company shipped a total of 13 million units of 64Mb SDRAMs for PC-100 in July and August 1998, accounting for 35 percent of the global high-speed DRAM market. LG Semicon's phenomenal record in the semiconductor market is seen as unprecedented.

The demand for SDRAMs with data processing speeds faster than 100 MHz has recently soared because of the introduction of Microsoft's Windows 98 and Intel's Pentium II processors, replacing extended data out (EDO)-based chips and 66-MHz 64Mb SDRAMs. Anticipating a rapid demand increase, LG Semicon has raised the production share of 64Mb SDRAMs for PC-100 to 92 percent of its total output. The company intends to ship 63 million 64Mb SDRAM chips for PC100 this year to strengthen its position in the high-speed SDRAM market.

South Korean Manufacturers Ramp Up SRAM Exports

Korea's static RAM (SRAM) exports are increasing rapidly. Korean SRAM vendors announced that exports of high-valued SRAMs, particularly synchronous SRAMs, increased sharply during the first quarter of 1998. The increase is attributed to the expansion of their use for computer cache memories and other information technology (IT) appliances—such as mobile phones, personal digital assistants (PDAs), and handheld PCs.

The South Korean semiconductor companies predicted that this year's export revenue will increase to between $800 million and $900 million. Samsung exported $200 million worth of SRAMs in the first quarter of 1998, a 50 percent increase over the same period in 1997. In particular, Samsung's synchronous SRAM exports during the first three months of 1998 tripled the amount of the same period last year. SRAM exports at both LG Semicon and Hyundai Electronics during the first quarter of 1998 reached nearly $40 million, twice the amount each company exported during the same period last year.

Samsung Electronics' 128Mb Flash Memory

Samsung Electronics announced that it is shipping samples of a 128Mb flash memory chip and that mass production would begin in the third quarter of 1998. Sampling of the new device comes just one year after Samsung began shipping its 64Mb flash memory chip. The Samsung chip can store and erase data at least 1 million times. The device is aimed at battery-operated consumer products, as well as mobile communications devices that require low-voltage operation. The chip is produced using the 0.27-micron process technology, enabling it to operate at 2.7 volts.

 ©1998 Dataquest

South Korean Semiconductor Companies' Nonmemory Semiconductor Businesses Take Off

The South Korean semiconductor manufacturers' exports of nonmemory products, including media processors, merged memories with logic (MMLs), Alpha chips, and quadrature phase-shift keying (QPSK), are increasing.

LG Semicon, which developed a media processor, MPACT chip, with Chromatic Research Inc. of the United States, produces 200,000 chips. LG Semicon plans to ship its Java chip next month, which can be used for a variety of network-based IT appliances, including network computers, Internet TVs, and Internet set-top boxes.

Samsung Electronics' exports of merged DRAMs with logic (MDLs) have increased from $200,000 in January 1998 to $5 million in September. Samsung plans to expand logic-merged chips to SRAMs and flash memories. The company also said that its revenue from Alpha chips will increase substantially in the future.

Despite recently selling Symbios, its nonmemory subsidiary in the United States, Hyundai Electronics intends to enter the market for CMOS image sensors this year and ship QPSK modules for satellite-broadcast receivers. Hyundai Electronics' revenue targets in these nonmemory products are $5 million in 1998 and $20 million in 1999.

Domestic liquid crystal display (LCD) manufacturers are concentrating on the development of driver integrated circuits (ICs) and the expansion of their utility. The following LCD manufacturers were noted by Dataquest:

- LG Semicon has recently developed a gate driver IC with 150 channels that can be used for super video graphics array (SVGA) and extended graphics array (XGA) thin film transistor (TFT) LCDs. Currently, LG Semicon is producing source driver ICs that can support 384 channels in conjunction with Vivid, a U.S. venture company. LG Semicon is planning to adopt these driver ICs in its TFT LCD products next year.
- Samsung Electronics is also strengthening its LCD driver IC business by expanding production. Following the development of source driver ICs with 300 channels and 309 channels for 12.1-inch SVGA and XGA TFT LCDs, and gate driver ICs with 120 and 128 channels, Samsung plans to develop a source driver IC with 384 channels and gate driver ICs with 256 channels for larger LCDs. Samsung said the ratio of use of its own driver ICs for LCDs increased to 60 percent in 1998 from 30 percent in 1997.

Dataquest Perspective

South Korea's electronics industry may be heading for its worst economic difficulties and sluggish domestic demand this year, according to the current situation. Such a status has forced industrial companies to cut equipment investment by 40 percent. As a result, data processing equipment production is expected to decline by 2.1 percent this year, and consumer electronics production is expected to shrink by 7.0 percent. However, communications

 ©1998 Dataquest

equipment production will grow at a 7.8 percent, owing to expanding digital cellular phone and mobile communications infrastructure equipment.

South Korea's financial crisis has resulted in Korean electronics vendors not being able to sustain the sales volume necessary to maintain their competitiveness and justify continued investment in the electronics industry. As a result, the Korean electronics vendors are experiencing massive core business restructuring, corporate mergers, acquisitions, and downsizing this year.

Semiconductor market growth depends on electronic equipment production. Regarding South Korea's electronic equipment production and falling prices—especially of memories and microcomponents—South Korea's semiconductor consumption will be entering a foggy tunnel this year. Although the South Korean electronics industry faces difficulty in increasing production because of this year's sluggish economy, its electronics industry is increasing in importance as the advanced electronic equipment manufacturing base. South Korean companies manufacturing electronic equipment are strengthening their resources in LCD, digital cellular phone, DVD player, and digital set-top box segments. As a result, semiconductor consumption for these applications will continue to grow. Therefore, semiconductor manufacturers that produce semiconductors for these applications have many opportunities in South Korea.

South Korean semiconductor manufacturers are also striving to diversify their product line-up of nonmemory to prevent them from fluctuating wildly in the memories market. Dataquest estimates that this is a part of their strategy to make up for declining revenue from memory chips sales overseas and to enhance the market competitiveness of their nonmemory products.

Perspective

Semiconductors Asia/Pacific

Market Analysis

Singapore's Semiconductor Industry Trends

Abstract: *Singapore leads the race in the number of wafer fabrication plants in Southeast Asia. However, all three semiconductor manufacturing companies registered revenue declines in 1997. This Perspective reviews the operations and the outlook of these companies. The dynamics of Singapore's active semiconductor market are also examined. By Ken Ng*

Industry Facing Downturn

Singapore's electronics industry, which accounted for almost a 51 percent share of total manufacturing output last year, is a key component of the city-state's export-driven economy. The semiconductor sector plays an important part in Singapore's economy.

Singapore's government had earlier this year forecast a gross domestic product (GDP) growth rate of between 2.5 percent and 4.5 percent for 1998. However, with the regional economic outlook deteriorating, the government has revised the official growth rate, forecasting downward to the 0.5 percent to 1.5 percent range. In the first half of this year, GDP growth slowed to 3.8 percent, a result of the Asian financial crisis and a weaker-than-expected demand for electronics products. Electronics exports (representing 70 percent of nonoil domestic exports) decreased by 3 percent in the first half of this year. Electronics exports have fallen more significantly in U.S. dollar terms, after taking into account the Singapore depreciation.

Dataquest

Program: Semiconductors Asia/Pacific
Product Code: SEMI-AP-DP-9809
Publication Date: September 14, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Oversupply and increased competition have hit Singapore's major export earners. Rigid disk drives (RDDs), the single-largest export item, have shown weak growth this year. Major RDD manufacturers, such as Seagate Technology Inc. and Western Digital Corporation, have reacted to the slowdown by cutting their workforce. PCs have also registered consistent declines in export value because of declining prices and inventory corrections.

Even the high-growth semiconductor industry has succumbed to the trend despite new investments in capacity and equipment. According to Dataquest, the Asia/Pacific market is expected to be adversely impacted by the regional economic turmoil and a persisting oversupply in the commodity chip markets. The regional semiconductor market is expected to record a revenue decline in 1998.

Singapore's Semiconductor Manufacturers

In the past few years, Singapore's semiconductor industry has witnessed large investments being made, particularly in wafer fabrication plants. Four companies already operating in Singapore are as follows:

- Chartered Semiconductor Manufacturing Ltd.
- Hitachi Nippon Steel Semiconductor Singapore Pte. Ltd.
- STMicroelectronics NV
- TECH Semiconductor Pte. Ltd.

These companies are involved in diverse manufacturing activities, such as dedicated foundry, DRAM fabrication, and integrated brand-name manufacturing. The companies also produce a wide range of products. Another characteristic of the local semiconductor manufacturing industry is the nature of government participation.

There are now 10 wafer fabrication plants—Chartered's five (including Silicon Manufacturing Partners), Hitachi Nippon Steel Semiconductor's one, STMicroelectronics' two (one building housing Fabs 1 to 4 and one housing Fab 5), and TECH's two—either in operation or under construction in Singapore at the moment. The principal products manufactured at these fabs range from MOS memory and MOS logic to analog devices. This section reviews the operations and plans of the four companies that have already committed to manufacturing in Singapore. Table 1 presents a summary of the current and planned wafer fabs in Singapore.

 ©1998 Dataquest

Table 1
Current and Planned Wafer Fabrication Plants in Singapore

Company	Fab Name	Location	Operations Start	Wafer Size (Inches)	Current Process (Microns)	Maximum Available Capacity/Month	Products
Chartered	Fab 1	Science Park	1989	6	0.60	26,000	Foundry
Chartered	Fab 2	Woodlands	1995	8	0.35	45,000	Foundry

The 1997 Review

The year 1997 was a reality check for Singapore's semiconductor manufacturing companies. Table 2 presents the ranking and revenue of the three manufacturers last year. All of the companies experienced revenue declines—with TECH suffering the largest plunge of 29.7 percent. Last year's downturn was attributed to a global DRAM product oversupply, coupled by pricing pressures across commodity chip markets, and lower-than-predicted growth for foundry services. Overall, the revenue of the top three manufacturers declined 9.8 percent last year.

Table 2
Estimated 1997 Revenue of Top Three Semiconductor Manufacturing Companies in Singapore, Including Contract Manufacturing (Millions of U.S. Dollars)

1997 Rank	1996 Rank	Company	1996 Revenue	1997 Revenue	Percentage Change
1	1	STMicroelectronics	1,173	1,133	-3.4
2	3	Chartered	407	374	-8.1
3	2	TECH	408	287	-29.7

Source: Dataquest (August 1998)

STMicroelectronics remained Singapore's largest manufacturer in 1997. Its position is attributed to having the highest number of wafer starts and producing its own brand-name products. The company experienced the lowest revenue decline of 3.4 percent. Chartered climbed into the second spot despite registering reduced revenue last year. The foundry nosed ahead of TECH as additional capacity came onstream.

Chartered Semiconductor Manufacturing

Chartered, a subsidiary of the government-linked Singapore Technologies Group, is a dedicated foundry currently operating three wafer fabrication plants. Fab 1 in Science Park is Chartered's oldest plant; operations started there more than eight years ago. Fabs 2 and 3 are located in Woodlands, both offering mainstream 0.35-micron process technologies. These two fabs have a combined maximum capacity of 65,000 8-inch wafers per month. Chartered Silicon Partners (CSP) was the fourth fab set up to manufacture ASICs—mainly for Hewlett-Packard Company—with additional capacity available to other fabless customers. Chartered holds the majority stake in CSP, with HP and the Singapore Economic Development Board each taking up minority stakes. Initial plans to begin production by early next year have been pushed out. The decision to delay the start of production by one year was resulted from the Asian economic downturn and a worldwide foundry capacity oversupply. By the year 2000, CSP should be able to produce more than 30,000 8-inch wafers using 0.25-or-deeper submicron process technologies.

Earlier this year, Chartered and Lucent Technologies Microelectronics Group entered into a joint venture to invest $1 billion in another wafer fabrication facility. The new joint venture company, SMP, is scheduled to begin commercial operations by 1999. At full capacity, the fab will produce 26,000 8-inch wafers per month using 0.25-micron process technology. The facility is expected to migrate to 0.18-micron process technology by 2000. Lucent holds the majority 51 percent share, with Chartered taking up a 49 percent stake. Production in this facility is planned ahead of CSP. SMP should start operations earlier as it is located in an existing plant area next to Fab 3. The equity structure allows Lucent the choice of technologies that will go into SMP to ensure that the technologies in the new fab are fully compatible with the company's Orlando, Florida, fab. This would provide Lucent with a virtual fab in Singapore to supply its customers in the Asia/ Pacific region. The agreement also enables Chartered and Lucent to share some technologies and to improve on them for the benefit of both companies.

Hitachi Nippon Steel Semiconductor

The newest entrant in Singapore's front-end semiconductor manufacturing industry is Hitachi Nippon Steel Semiconductor, a joint venture set up to produce DRAM devices. Hitachi Ltd. and Nippon Steel Semiconductor jointly hold a 35 percent equity, with the EDB taking the remaining 30 percent. The venture plans to ramp up 64Mb DRAM production to full capacity by April 1999. This $900 million plant has an estimated output of 20,000 8-inch wafers per month.

In light of the current market conditions, Hitachi Nippon Steel Semiconductor is taking a cautious approach in its ramp-up plan. The company has already started production, manufacturing both 64Mb extended data out (EDO) and synchronous DRAMs. It is expected that the plant will be manufacturing more SDRAMs, consistent with other large DRAM vendors. The wafers produced in Singapore will be sent to Hitachi's back-end plant in Penang, Malaysia, for packaging and testing. Hitachi has also outlined plans to relocate its 256Mb DRAM production from Japan to this facility by 2000.

STMicroelectronics

STMicroelectronics opened its first wholly owned wafer fab in Singapore in 1984. The company now operates four fabs in Ang Mo Kio, producing standard linear, standard logic, MOS microcomponents and logic, and semicustom products. Fabs 1 to 4 are housed in one building, with a combined capacity of more than 130,000 wafers per month. Producing 5-inch wafers, these fabs employ process technologies ranging from 1.5 microns to 2.5 microns. The Ang Mo Kio campus also serves as STMicroelectronics' Asia/Pacific regional headquarters.

STMicroelectronics has announced plans to construct another building for a new submicron fab. This wafer fab is expected to produce 8-inch wafers with geometries starting at 0.5 microns and a monthly capacity of 32,000 wafers. STMicroelectronics has subsequently postponed the new wafer fab construction. Plans for the plant to begin operation in early 1999 have now been delayed until 2000. The $700 million facility is planned to be located next to its existing facility in Ang Mo Kio.

 ©1998 Dataquest

STMicroelectronics' decision to delay the construction of this Singapore fab reflects caution in its outlook for the semiconductor industry. The company is estimated to have sufficient capacity to meet current demand levels. The company's latest 8-inch fab in Catania, Italy, has already started full production.

TECH Semiconductor

TECH has two wafer fabs that manufacture DRAM devices exclusively. TECH was originally joint-owned by four parties—Texas Instruments Inc. and EDB each with 27.25 percent equity, HP holding a 25 percent share, and Canon Inc. controlling a 20.5 percent stake. However, a reshuffle of equity holders is expected as a result of Micron Technology Inc.'s acquisition of TI's worldwide memory business. TI's holding in TECH should be assumed by Micron when the legalities of the deal are completed.

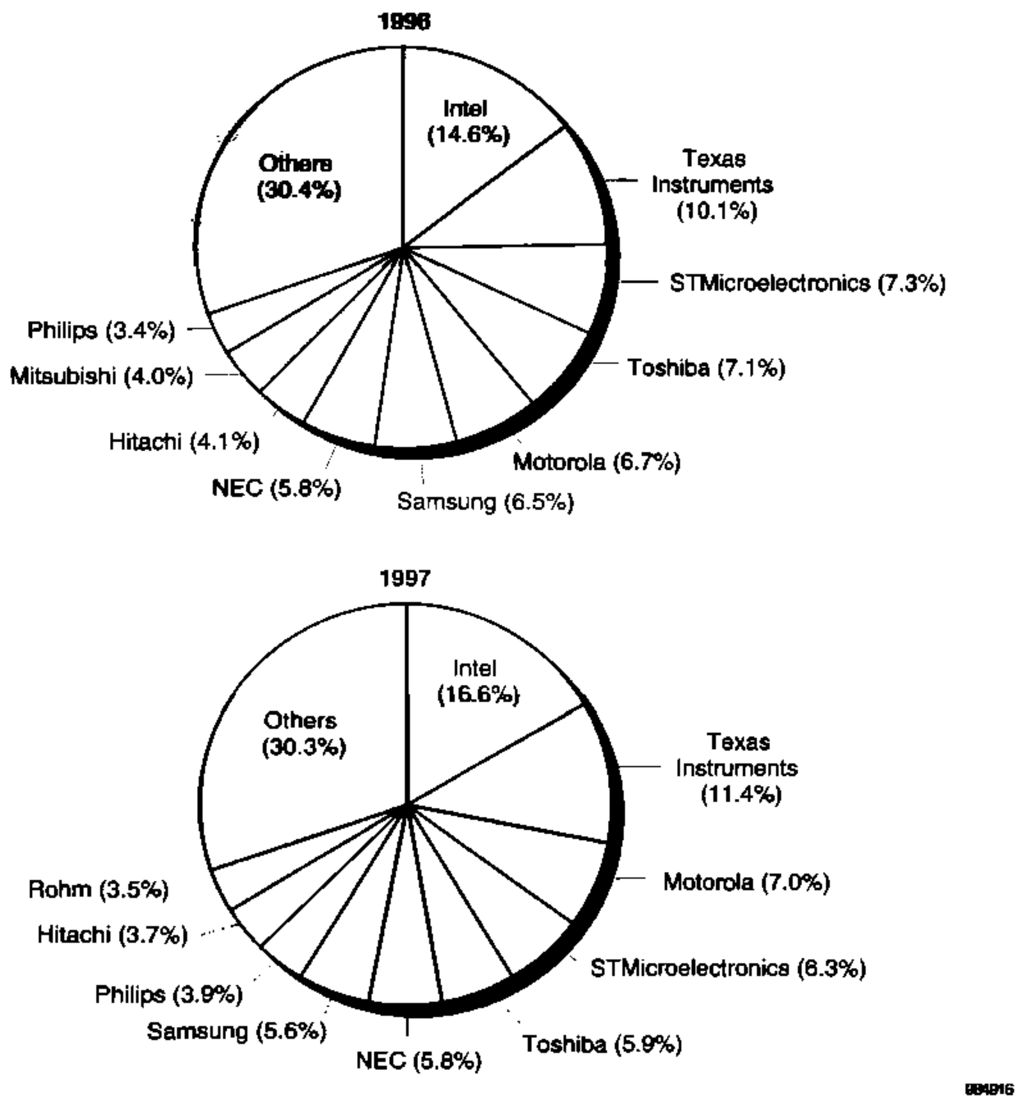
TECH's first fab was manufacturing 16Mb DRAM in 1993. In the wake of the acquisition, 16Mb wafer starts in Fab 1 will be gradually reduced in the preparation of equipment retooling. Fab 2 started operating earlier last year, producing 16Mb DRAM devices. TECH has since converted the second fab to manufacture 64Mb DRAM devices this year. As a foundry, TECH should stand to gain from Micron's technology in lowering production costs and its position as the second largest DRAM vendor worldwide.

Semiconductor Vendors in Singapore

Revenue from shipments to Singapore in 1997 by the top 32 worldwide semiconductor vendors (ranked as such by Dataquest) reached $8,656 million, an 11.7 percent increase over 1996 (for more details, please refer to SEMI-AP-MS-9803). Figure 1 illustrates the market share of the top 10 ranked companies in the Singapore semiconductor market. Intel Corporation, TI, and Motorola Incorporated occupied the top three positions in 1997, and at the same time, increased their market share among the surveyed companies last year. However, the company recording the most impressive gain in 1997 was Rohm Company Ltd. Its revenue surged by 97.4 percent on the back of rising discrete and analog sales.

Revenue from semiconductor shipments into Singapore has exceeded the actual value of semiconductors consumed in the city-state. According to Dataquest, Singapore's chip market is the largest in the Asia/Pacific region from a shipment perspective. Semiconductor sales in the local market would be typically made up of sales to end-equipment manufacturers (including contract equipment manufacturing companies), international procurement offices, and distributors. In each of these sales channels, a significant proportion of the products are then re-exported to the region for intermediate or final equipment production.

Figure 1
Top 10 Worldwide Vendors' Market Share from Shipments of Total Semiconductors to Singapore



Note: The total includes only the top 32 companies by shipment into Asia/Pacific; it does not equal the total Asia/Pacific market. This figure includes semiconductors used in Singapore and re-exported via Singapore.
Source: Dataquest (August 1998)

Singapore is established as the financial, communications, and logistic center in the Southeast Asian region. Dataquest believes that total shipment revenue attributed to the Singapore market by the top 10 ranked companies includes shipments of semiconductors to Malaysia, the Philippines, and Thailand, as well as other ASEAN countries. In certain cases, the products are also shipped and consumed in other Asia/Pacific countries. This means that the amount of semiconductors consumed locally is actually lower than total shipment revenue. The percentage of local semiconductor consumption is expected to decline, a result of the trend to relocate lower-value-added production activities to other cost-competitive countries. However, most equipment manufacturing companies should continue to procure semiconductors from Singapore, given the city-state's position as a regional business hub.

Dataquest Perspective

Trade data for the first half of 1998 has shown a slowing down of electronic exports. This trend reflects the negative impact on demand and increased pricing pressure for electronic products, brought on by excess capacity and the Asian financial crisis. Even the high-growth semiconductor manufacturing industry has succumbed to this trend, despite new investments made in plants and equipment. Singapore's electronics export growth is expected to remain weak as a result of lower output from the electronics manufacturing sector.

Singapore remains the leader in the number of wafer fabrication plants in Southeast Asia. The expansion of wafer fabs in other ASEAN countries has been impacted by the Asian economic downturn and the ensuing liquidity crunch. The year 1997 saw declining revenue for the three semiconductor manufacturing companies in Singapore. Although the number of manufacturers has risen to four in 1998, two of the companies have delayed the initial start-up schedules of their fabs as a result of the weak semiconductor market. Chartered has postponed its fourth fab, CSP, by one year. However, Chartered and Lucent are proceeding with the plan to begin production in SMP by next year. STMicroelectronics has also decided to hold back the construction of its second building to house Fab 5. The company is expected to evaluate its plan to determine an appropriate production schedule for its latest fab.

HNS, the latest entrant, is also exercising caution by adopting a gradual ramp-up approach in its 64Mb DRAM fab—a result of the global excess supply. It is expected to achieve full production by the second quarter of 1999. Another DRAM producer, TECH, is in a transition phase as it retools its fabs to Micron's manufacturing processes, following Micron's acquisition of TI's memory operations. With the upgrades undertaken at existing wafer plants, signs point to sustained semiconductor manufacturing growth in the coming years.

 ©1998 Dataquest

In the semiconductor market, total revenue from shipments to Singapore registered an increase last year. However, the percentage of actual chip consumption in Singapore should trend lower because end-equipment companies are shifting their factories to other countries in the region. The city-state's role as the eminent business hub in Southeast Asia should lead to a higher number of manufacturing companies maintaining and expanding their purchasing functions there. Moreover, Singapore authorities continue to make improvements in the public infrastructure, enabling procurement offices of OEM/CEM companies in Singapore to source for products to supply their regional manufacturing operations.

Semiconductors Asia/Pacific

Market Analysis

Semiconductor Capital Spending in Asia/Pacific

Abstract: *This Perspective presents a review and outlook of Asia/Pacific's semiconductor capital spending. Dataquest examines the region's capital spending using two methodologies: Asia/Pacific companies' capital spending around the world and worldwide companies' capital spending in Asia/Pacific. The outlook for worldwide companies' capital spending in Asia/Pacific will be dynamic because of the Asian financial crisis that has affected the region's major spenders. In addition to the semiconductor market, the economic crisis will become a decisive factor in Asia/Pacific's capital spending.*
By Jerry Yeh

An Overview

FILE COPY:
MARIA VALENZUELA

From 1992 to 1997, the compound annual growth rate (CAGR) of Asia/Pacific's capital spending by multinational companies in Asia/Pacific reached 43.8 percent, while the worldwide capital spending CAGR during the same period was 28.4 percent. According to Dataquest's midyear semiconductor capital spending forecast, worldwide capital spending for 1998 calls for a 22 percent decline. Capital spending by worldwide companies in Asia/Pacific is expected to decline by 11.7 percent in 1997, with another 26.7 percent decline in 1998.

The Asian financial crisis, which started in July of 1997, landed in Thailand first. After that, it traveled to Indonesia, and then to Korea. It destroyed these countries' economies and will become a decisive factor in semiconductor companies' capital spending by 2002. In the near future, Asia/Pacific's semiconductor capital spending is expected to decline. Although a dedicated foundry growth is anticipated, Dataquest expects a shrinkage in capital spending. It seems that crisis has not yet finished with the Asia/Pacific region.

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Notes on Asia/Pacific's Capital Spending Data

In the process of conducting data collection and preparing capital spending statistics information, Dataquest will sometimes consolidate or revise a particular company's data and differentiated data according to the region in which the investment was made. Two different methodologies have been used in this report to observe the region's reality. This section will explain any such changes contained in this Perspective for reference.

- **Statistical information of Asia/Pacific companies' capital spending in the worldwide market**—In 1997, Asia/Pacific companies spent U.S.$12.6 billion in the world. This total includes all spending to all regions, including those spending in Asia/Pacific. This methodology measures the capability of capital spending of Asia/Pacific countries or companies.
- **Statistical information of worldwide companies' capital spending in Asia/Pacific**—In 1997, worldwide companies spent $14.3 billion in Asia/Pacific. This total includes back-end manufacturing and wholly owned companies by non-Asia/Pacific companies in the region. This methodology presents the companies' activity from non-Asia/Pacific regions in Asia/Pacific.
- **Statistical information of capital spending by joint ventures**—Before joint-venture (JV) companies start operation and are included in Dataquest's survey list, their capital spending will be counted according to each investor and stake.

Asia/Pacific Companies' Capital Spending Worldwide

Companies' Semiconductor Capital Spending Ranking

The worldwide capital spending growth by Asia/Pacific semiconductor companies shrank to 51.1 percent in 1996, down from a sky-high 138.8 percent increase in 1995. In 1997, the capital spending dropped sharply to negative 10.6 percent, which was caused by the Asian financial crisis and the semiconductor market's downturn. The top 10 Asia/Pacific companies in terms of capital spending represented 76.1 percent of the 1997 semiconductor spending (see Table 1).

Korea's currency devaluation, the International Monetary Fund (IMF) bailout that shook investors' confidence, and a critical foreign currency shortage have all combined to cause Korean industrial giants to suffer from the first-ever, capital-spending cutback in 1997. LG Semicon Co. Ltd. and Samsung Electronics Company Ltd. spend almost the same amount of capital, U.S.$1.57 billion, in 1997. Despite this cutback in spending, the giant chaebols still managed to invest the largest amount of capital among Asia/Pacific companies. Totaling about U.S.$4.5 billion in 1997, the three Korean industrial giants won the top-three-spender positions, the same as in 1996.

With a tight budget and a postponed global investment, however, there is a shift in the pattern of capital spending: The capital will be invested in the state-of-the-art technology to continue Korea's lead in DRAM manufacturing. Korea's capacity may not expand as expected, but with the technology still in

 ©1998 Dataquest

hand, Korea has the potential to continue its market dominance. Anam S&T Company Ltd. started investing in capital spending in 1997. This new fab drew more capital to the foundry in the region. Anam ranked No. 16 in 1996, and jumped to No. 6 in 1997. The total spending for 1997 was U.S.$1.1 billion.

Although the Asian financial crisis hasn't hurt Taiwan critically in 1997, many Taiwanese companies' capital spending plans had been revised. The resulting 1997 capital spending does not surprise Dataquest because all planned investment set up in the previous year cannot be changed dramatically. This result is the same as predicted by Dataquest last year.

Taiwan Semiconductor Manufacturing Co. and its joint venture Wafer Tech (TSMC Group) was the fourth-largest spender. The company's strategy and dedicated foundry goal are clear to its investors. The TSMC Group won the No. 4 place in 1997 with a U.S.$1.2 billion capital spending.

The UMC Group, consisting of United Microelectronics Corporation (UMC) and its three joint ventures—United Silicon Inc. (USI), United Semiconductor Corporation (USC), and United Integrated Circuits Corporation (UICC)—trailed closely behind TSMC. The company's three joint ventures began to consume capital in 1997. Except for UICC's fire accident, the UMC Group successfully set up two other joint ventures. This quick action allowed the company to maintain its No. 2 position in dedicated foundry worldwide. The UMC Group won the No. 5 position with a U.S.$1.2 billion capital spending in 1997.

In 1997, under Winbond Electronics Corporation's support on capital investment, World Semiconductor Mfg. Co. Ltd. (WSMC) started its new fab construction. Dataquest counted WSMC as a part of Winbond's spending in 1997. In 1997, Winbond Group won the No. 8 spot on capital spending, with U.S.$875 million.

Dataquest counts ProMOS Technologies' spending as part of Mosel Vitelic Inc. in 1997. Mosel Vitelic Group won the No. 9 position, with U.S.$564 million in 1997. Chartered Semiconductor Manufacturing Pte. Ltd. dropped from No. 4 to No. 7 in 1997 with a capital spending of U.S.$940 million. In 1997, the company's major spending focused on its new fab (Fab 3). Macronix International Company Ltd. won the No. 10 place in capital spending with U.S.$359 million in 1997 for its new fab (Fab 2).

Country-Level Spenders' Comparison: Korea, Taiwan, and Singapore

In this section, Dataquest excludes other countries in the analysis because their combined capital spending is relatively small.

Korean companies have always been the largest investors in facilities in this region since the 1980s. The second-largest spender, Taiwan, has followed a certain distance from the Korean semiconductor giants for years. However, the gap is closing. As noted in Figure 1, Dataquest compares the three countries to illustrate the picture of country-level competition, which is always an interesting topic in the industry.

Table 1
Worldwide Capital Spending by Asia/Pacific Company: A Comparison of Top 10 Spenders, 1996 and 1997 (Millions of U.S. Dollars)

1996 Rank	1997 Rank	Company	1996	1997	Change (%) 1996 to 1997	1997 Share (%)
1	1	LG Semicon	2,732	1,572	-42	12.5
2	2	Samsung	2,236	1,572	-30	12.5
3	3	Hyundai	2,111	1,345	-36	10.7

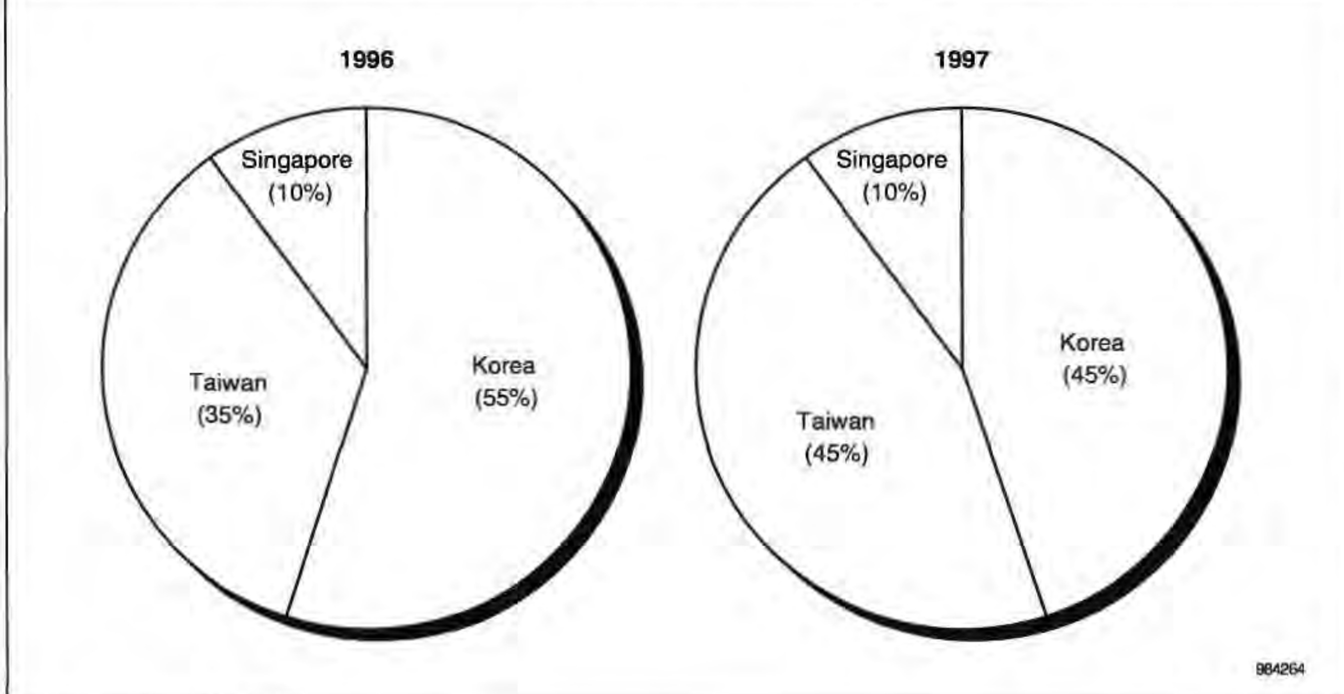
Source: Dataquest (July 1998)

Figure 1
A Comparison of Capital Spending in Korea, Taiwan, and Singapore, 1996 and 1997



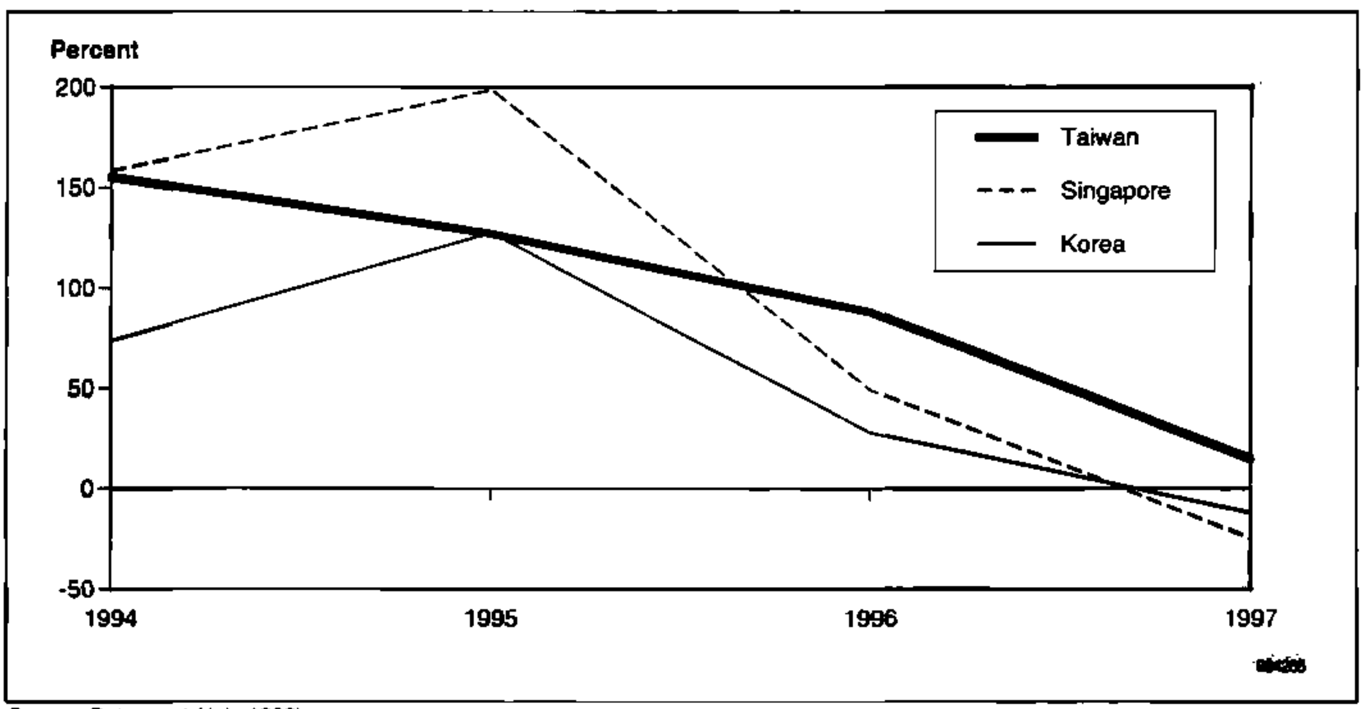
Source: Dataquest (July 1998)

In 1996, Korean companies captured the lion's share, 55 percent, of the three countries' capital spending. Taiwan's share was 35 percent, and Singapore's was 10 percent. In 1997, Korea dropped 10 percent to hold a 45 percent share, with a U.S.$5.58 billion capital spending, while Taiwan gained a 45 percent share with a U.S.$5.47 billion investment. Singapore retained the same percentage to hold a 10 percent share with a U.S.$1.16 billion. Figure 2 illustrates another comparison, the capital spending growth rate by the same countries. Taiwan continued its steady path of capital spending in the past few years. However, it shrank from an 87.9 percent growth rate in 1996 to a 14.9 percent growth rate in 1997. This growth surpassed the growth rate of total Asia/Pacific and other countries in 1997. Korea also faced declines, dropping from a 28 percent growth to a 24.5 percent decline. Singapore's spending also declined from a high of 49.2 percent to negative 11.9 percent. Benefiting from the booming DRAM market, Korea has succeeded in capital accumulation and strongly increased spending in 1996 to expand its global manufacturing. However, all those projects have been postponed in 1997.

In 1997, although a few of the originally planned Taiwanese new fabs were delayed or canceled because of the semiconductor market downturn, capital spending did not shrink at a large scale. What kept capital spending from plummeting was the new start-up companies that geared up new fab capacity and continued investment in dedicated foundry and DRAM.

After the past few years' effort, Singapore has built a semiconductor manufacturing base in the center of Southeast Asia—at the time of the Asian financial crisis and Thailand's failure to develop its semiconductor industry. Singapore now plays an important role as a regional and worldwide foundry provider.

Figure 2
Worldwide Capital Spending by Major Asia/Pacific Country, 1994 to 1997 (Rate of Change)

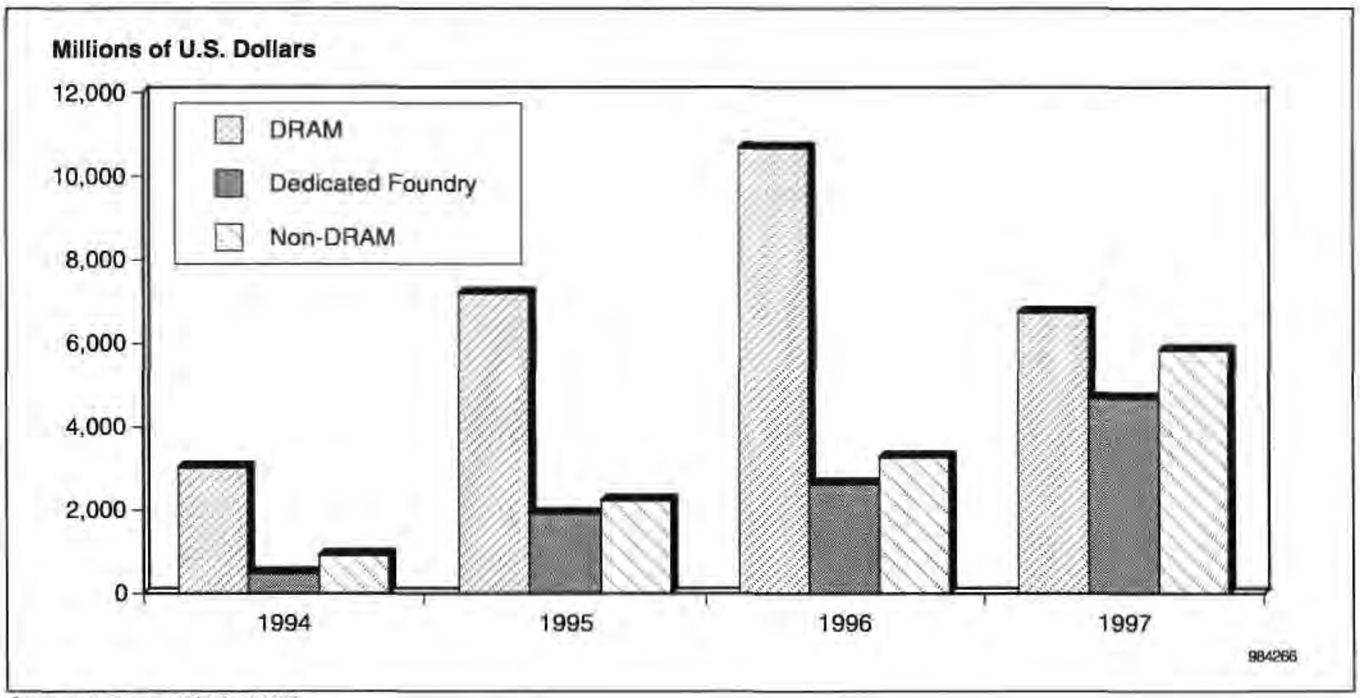


Source: Dataquest (July 1998)

Capital Moves toward Dedicated Foundry

Figure 3 illustrates worldwide capital spending by Asia/Pacific companies. DRAM has driven the Asia/Pacific capital spending growth during the past 10 years, since Korean companies first purchased the manufacturing facility for DRAM production. In 1997, Korean companies' large-scale cutback on capital spending resulted in a 36.8 percent decline on the region's DRAM segment's capital spending. In the dedicated foundry segment, a 78 percent growth in 1997 showed a capital shifting from DRAM to dedicated foundry. As non-DRAM wafer fab capacity increased—particularly the dedicated foundries—the percentage of capital spending for DRAM declined sharply. In 1996, DRAM took a 74.8 percent share of total spending, dropping to 53.6 percent in 1997. Dedicated foundry has become the second-largest segment after DRAM. In 1996, dedicated foundry reached 37.3 percent and took an 18.4 percent share of total capital spending. This segment showed a 78 percent growth in 1997, with a 37.2 percent share of the total.

Figure 3
Worldwide Capital Spending by Asia/Pacific Company, DRAM, Foundry, and Non-DRAM Comparison, 1994 to 1997



Source: Dataquest (July 1998)

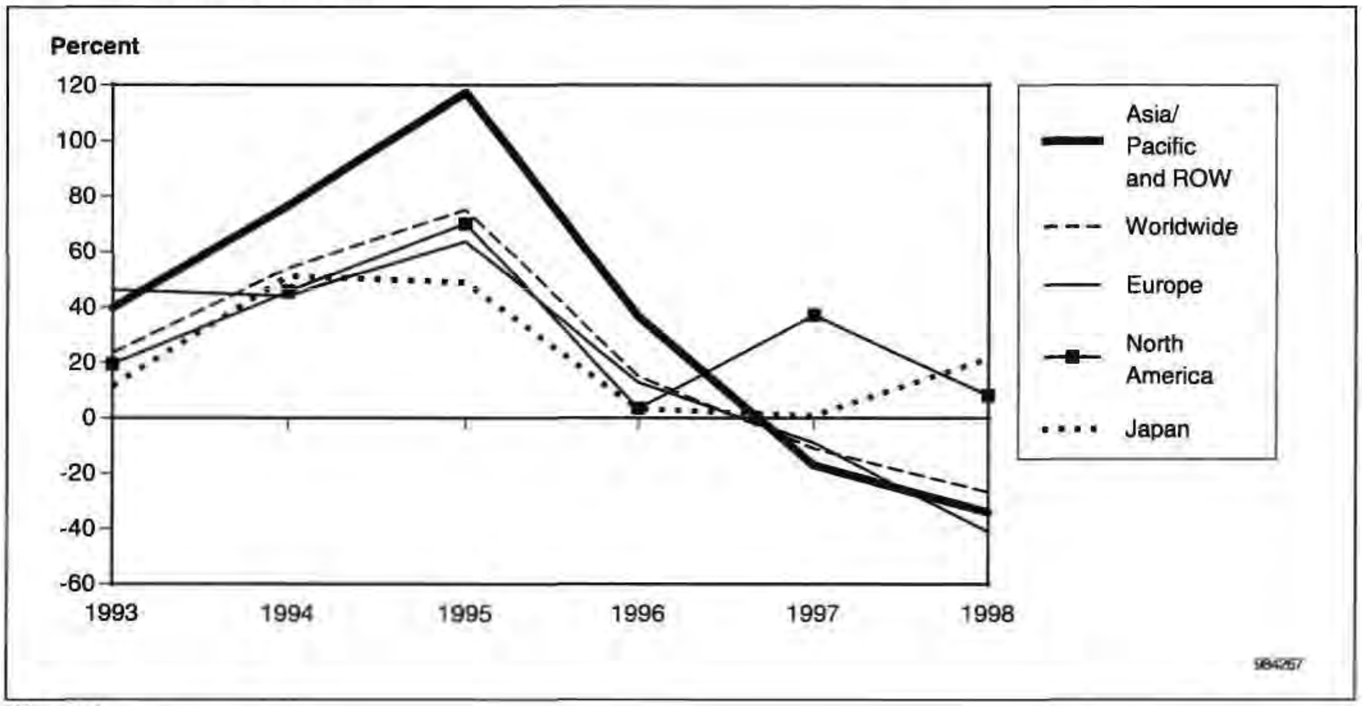
Worldwide Companies' Capital Spending in Asia/Pacific

Dataquest expects worldwide companies' capital spending in Asia/Pacific to reach a negative 0.2 percent CAGR from 1993 to 1998. Excluding the spending from Asia/Pacific companies, the actual spending from non-Asia/Pacific companies suffered a 24.7 percent decline. Figure 4 illustrates the regional growth rate of worldwide capital spending from 1993 to 1998. Figure 5 depicts worldwide companies' capital spending in Asia/Pacific in

1997 and 1998. While Asia/Pacific spenders decreased their own regional spending in 1997, the share of non-Asia/Pacific's spenders that invested in Asia/Pacific increased from 18.7 percent to 21 percent in 1997. Moreover, as Asia/Pacific continues to decrease its own regional spending in 1998, non-Asia/Pacific spenders expect to take 29 percent of the total share. Table 2 shows preliminary Asia/Pacific companies' capital spending around the world in 1997 and 1998.

For many years, Asia/Pacific companies have had the ability to invest in new wafer fabs mostly using their own capital. However, since the onset of the Asian financial crisis, non-Asia/Pacific companies have not shrank their investment in a larger scale in the region because foreign companies generally play the role of technology support and marketing in the region. For foreign companies, a small amount of investment can generate substantial benefits from their technology share with a joint venture, which encourages them to continue evaluating the region's future potential. Although the semiconductor market downturn and the Asian financial crisis caused a worldwide capital spending shrinkage, non-Asia/Pacific will not withdraw from this bargain land.

Figure 4
Regional Historical Growth Rate of Worldwide Companies' Capital Spending in Asia/Pacific, 1993 to 1998*



*Forecast
Source: Dataquest (July 1998)

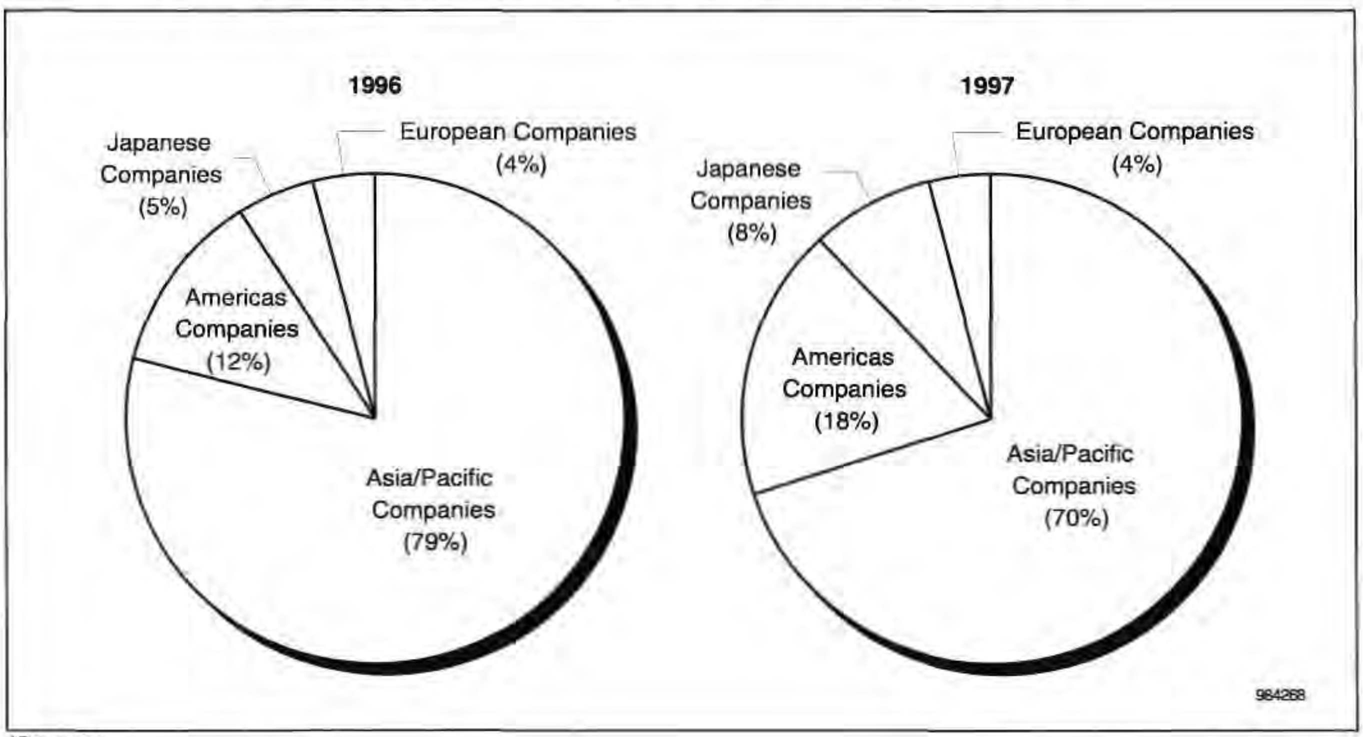
Dataquest Perspective

The picture of Asia/Pacific companies' capital spending in 1998 appears gray. Korea has cut capital spending in large scale. In the past few years, Korean companies have started investing around the world, but they face a new challenge since the economic crisis in 1997. Fortunately, it isn't too late to withdraw from the worldwide investment; otherwise, Korean companies' loss will become unpredictable. Some Taiwan companies are retaining a certain spending in 1998, but the overall spending is expected to decline. Since Thailand's currency fall and financial institutions' bankruptcies in July of 1997, there is no sign that the country will build a semiconductor industry in the near future. Singapore became a dedicated foundry center in Southeast Asia, but it still trails behind its Taiwanese foundry competitors.

While Dataquest examines the semiconductor industry in this gloomy economy, there is always a factor that is difficult to measure: What is a company's view of its future? Sometimes, a company's bottom line is mostly dependent upon the national culture (such as the national pride) and the company leaders' character.

Non-Asian companies tend to focus on a fast return on capital such as in three to five years. For example, when a U.S. or Europe-based multinational company invests in a new fab, it expects this fab to earn back its investment within three to five years. If these companies find out that their return isn't forthcoming in a few years, most of them will decide to withdraw from the business and find another way out.

Figure 5
Worldwide Companies' Capital Spending in Asia/Pacific, 1997 and 1998*



*Forecast

However, the Asia/Pacific company will decide to retain its business operation, even if it doesn't generate profits for several years during semiconductor downturn market. There are many reasons. In the past decades, most Asian countries were poor. Now, with their rapid industrialization and modernization, some of them have a chance to become a leading high-tech country and compete with the world's strong industrial leaders such as the United States and some European countries. So these Asia/Pacific countries and companies will invest as much resources as possible into their companies and never give up, while neglecting or relegating the financial danger that non-Asian companies often manage to avoid.

Following the national high-technology industrial policies, different Asia/Pacific countries are fully supported by their respective local governments. Most of these countries' resources—such as capital and human resources—have been invested in these high-tech industries. It is why most of Asia/Pacific electronics industries' pioneering companies have spent more than a decade investing in their companies while continuing to lose profits every year within that decade! With the darkness in the semiconductor market to last indefinitely, only the company with the technology, capital, and a resourceful management and design team can survive until the time of recovery.

Semiconductors Asia/Pacific

Market Analysis

1998 Asia/Pacific Microcomponent Market Trends

Abstract: *The Asia/Pacific MOS microcomponent market grew by an impressive 23.7 percent in 1997. Microprocessor products constituted the most influential segment in determining the overall trend of the microcomponent revenue. Dataquest estimates that digital signal processing (DSP) devices should record the highest growth rate among all the product segments. With the onset of the Asian financial crisis in the second half of 1997, the market is expected to experience lower growth rates this year.*

By Ken Ng

Introduction

FILE COPY:
MARIA VALENZUELA

The microcomponent market in Asia/Pacific recorded robust growth in 1997 driven by microprocessor (MPU) revenue expansion. All of the microcomponent product segments achieved healthy increases. Digital signal processor (DSP) products emerged as the fast-rising device category. Dataquest's five-year compound annual growth rate (CAGR) forecast of 18.4 percent for the regional microcomponent market indicates that revenue should continue to rise from 1998 to 2002.

The Asian financial crisis will have an adverse impact on the semiconductor market this year. With demand for electronic equipment remaining weak and prices of end products declining, regional semiconductor revenue growth is predicted to moderate. Although the MOS memory category is expected to bear the brunt of the market slowdown, microcomponent devices should also be affected by excess capacity and pricing pressure.

This Perspective examines the 1997 Asia/Pacific regional market trends, as well as forecasting the microcomponent market up to 2002. A downside forecast scenario is presented to assess the impact of the regional economic

turmoil. The first section reviews the competitive position of major microcomponent vendors in Asia/Pacific by analyzing market share rankings for total microcomponent revenue and in the four product segments. In addition to the Asia/Pacific view, estimates of each product category and a country-level breakdown will be provided in the later sections.

Asia/Pacific Microcomponents Revenue Ranking

Table 1 shows that the Asia/Pacific microcomponent market reached $10,796 million in 1997, representing a 23.7 percent revenue increase over 1996 (For more information, please refer to "1997 Regional Microcomponent Market Share," MCRO-WW-MS-9803). Intel Corporation, once again, topped the Asia/Pacific rankings with a 26.3 percent revenue surge, to record $3,901 million. The company accounted for a whopping 36.1 percent of total microcomponent revenue in the Asia/Pacific market. The second- and third-placed companies, Motorola Incorporated and Toshiba Corporation, also recorded revenue gains. However, Intel's revenue was almost six times the size of second-ranked Motorola—indicating that the leader is likely to remain in the first position for some years to come.

Table 1
Top 10 Worldwide Companies' Revenue from Shipments of MOS Microcomponents to Asia/Pacific (Millions of U.S. Dollars)

1996 Rank	1997 Rank	Company	1996 Revenue	1997 Revenue	Change (%) 1996 to 1997	1997 Market Share
1	1	Intel	3,088	3,901	26.3	36.1
2	2	Motorola	563	685	21.7	6.3
4	3	Toshiba	301	395	31.1	3.7
5	4	Texas Instruments	291	382	31.3	3.5

Source: Dataquest (July 1998)

Advanced Micro Devices Inc. (AMD) experienced a revenue doubling as a result of its increased competitiveness in the microprocessor market. The company enjoyed gains as its products were adopted by PC manufacturers. AMD experienced the fastest ascent in the rankings, advancing by 10 places.

Asia/Pacific Companies Are Emerging

United Microelectronics (UMC) was the only Asia/Pacific company represented in the top 10 ranking, based mainly on the company's microperipheral business. However, the Korean chaebols are beginning to make their presence felt in the Asia/Pacific microcomponent market. Korea's semiconductor manufacturers are placing increased emphasis on marketing their products in the Korean domestic market. Dataquest estimates that this is part of their strategy to make up for declining revenue from export sales of memory chips and enhance the competitiveness of their nonmemory products in the domestic market, which up to now, has been dominated by imports. These products are gaining acceptance among domestic electronic appliance manufacturers because of their improved price competitiveness. Equipment manufacturers will increasingly target export markets as a result of the Korean economic downturn that lowers consumer demand in the country.

Samsung Electronics Company Ltd. expects revenue from Alpha chips to increase substantially in the future. This is predicted to further add to the company's fast-increasing microcomponent business. The main applications for Alpha processors should come from servers manufactured in North America. LG Semicon Co. Ltd., which developed a media processor (MPACT chip) with Chromatic Research Inc. of the United States, is targeting to produce 200,000 units in 1998. LG also plans to deliver its Java chip in the second half of this year. This product can be used for a variety of network-based information technology appliances, including network computers, Internet TVs, and Internet set-top boxes. Although most of these new microcomponent devices will be consumed in the Korean domestic market, exports are likely to contribute a significant percentage of revenue as local equipment manufacturing is in the midst of a slowdown.

The Asia/Pacific MPU Market

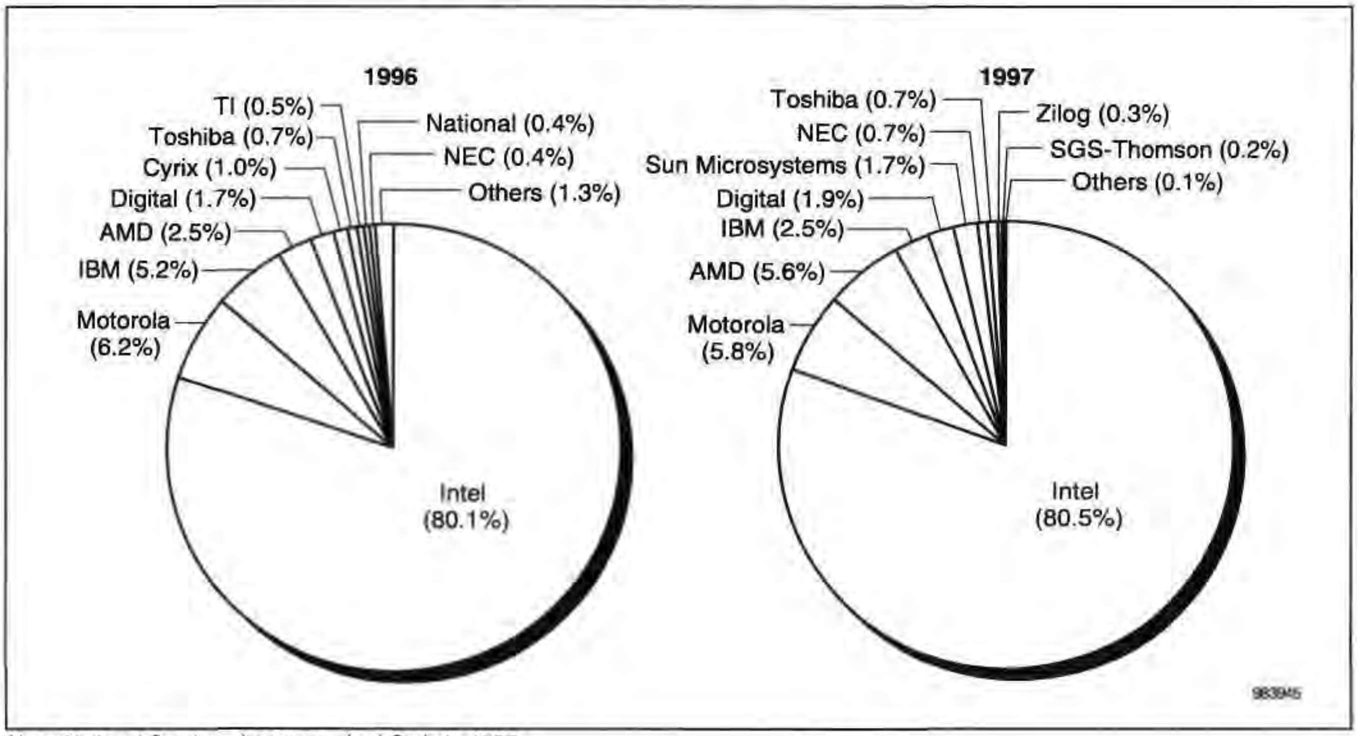
In 1997, total Asia/Pacific MPU revenue expanded by 28.2 percent to reach $4,380 million. Figure 1 presents the MPU market share of the top-10-ranked companies. Intel took 80.5 percent of the MPU market in 1997. Its dominance in the MPU device category has propelled the company toward the top of the overall Asia/Pacific microcomponent rankings. Motorola and AMD also made revenue increases last year. Motorola's Power PC revenue was tied to a recovery in Apple's PC production. AMD's MPU products gained wide acceptance from PC manufacturers, including first-tier companies such as Hewlett-Packard Company and Compaq Computer Corporation. Its range of MPUs also proved to be popular with other PC makers, particularly in the sub-$1,000 PC segment. After acquiring Cyrix, National Semiconductor Corporation (NS) has established a foothold in the Asia/Pacific MPU market. Looking forward, NS with its range of MPU products targeted at lower-end PCs, should emerge as another important vendor in Asia/Pacific.

The MPU category was the largest single product segment of the microcomponent market in 1997. MPUs accounted for nearly 41 percent of total microcomponent revenue. Dataquest estimates that Asia/Pacific's PC

©1998 Dataquest

production will grow at a 22.3 percent CAGR between 1997 and 2002. With the PC output expected to rise, the MPU market and Intel's position in this space should remain on top and unchanged.

Figure 1
Asia/Pacific Microprocessor Market Share, 1996 and 1997 (Percent)



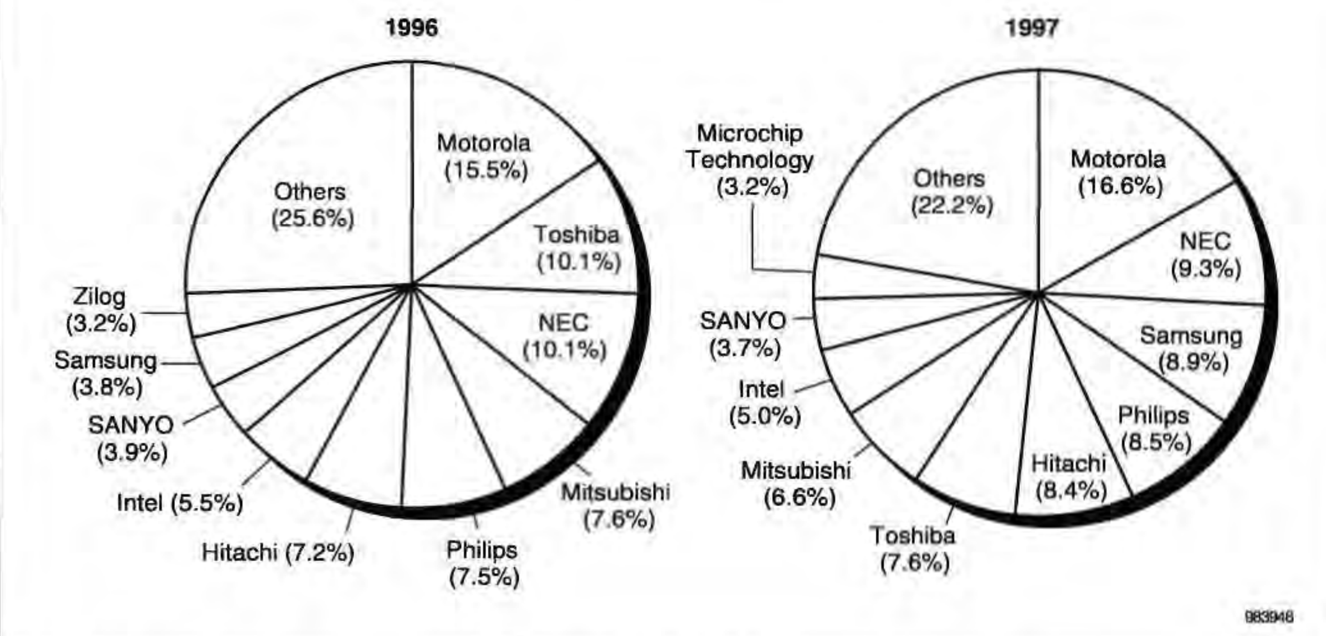
Note: National Semiconductor acquired Cyrix in 1997.
Source: Dataquest (July 1998)

The Asia/Pacific MCU Market

Total microcontroller (MCU) revenue in Asia/Pacific rose 15.2 percent to reach $2,309 million in 1997. Figure 2 provides the MCU market share of the top-10-ranked companies. Motorola occupied the top spot with 16.6 percent of the market, followed by NEC Corporation and Samsung with 9.3 percent and 8.9 percent share, respectively. Motorola's increasing share of 8-bit MCU devices has kept the company on top of the Asia/Pacific MCU rankings. A diverse mix of products, ranging from 4-bit to 16-bit MCUs, pushed NEC up a slot into second. Riding on the success of 4-bit MCUs, Samsung was the largest mover last year, gaining six positions to finish 1997 ranked third. The company's MCU sales grew as a result of revenue from consumer applications, including electronic toys.

The MCU category was the third-largest product segment of the microcomponent market. Last year, MCUs accounted for more than 21 percent of total Asia/Pacific microcomponent revenue. Dataquest projects that 16-bit and higher MCUs will find increasing usage in many types of high-volume end-electronic equipment. Vendors with an established market in these products, including Hitachi Ltd. and Motorola, should benefit from this trend.

Figure 2
Asia/Pacific Microcontroller Market Share, 1996 and 1997 (Percent)



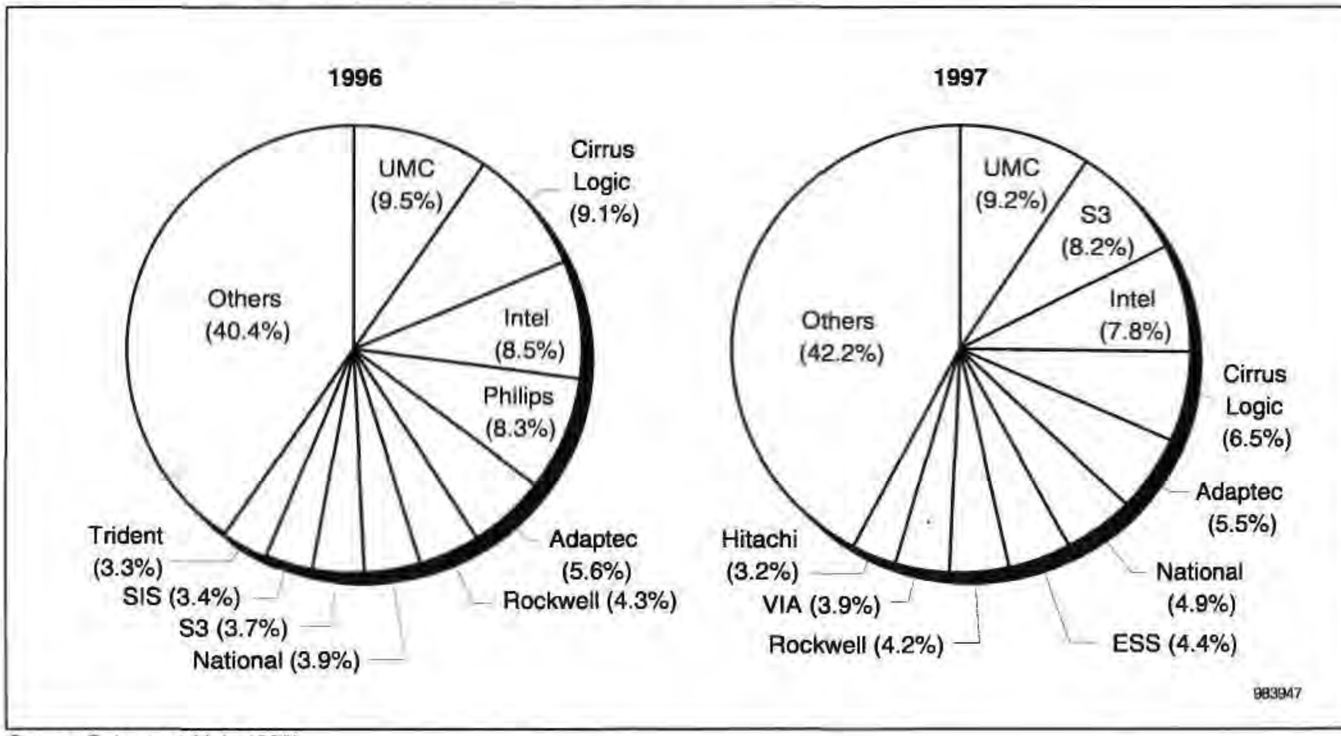
Source: Dataquest (July 1998)

The Asia/Pacific MPR Market

Total microperipheral (MPR) revenue in Asia/Pacific recorded a 17.0 percent growth to reach $3,315 million in 1997. Figure 3 charts the MPR market share of the top-10-ranked companies. UMC maintained its No. 1 position with 9.2 percent of the total market. Graphics chip manufacturer S3 Incorporated registered an impressive 161 percent revenue increase to move into the second place, followed closely behind by the Intel juggernaut. S3 and Intel had 8.2 percent and 7.8 percent of Asia/Pacific MPR market share respectively. The leading positions of UMC and Intel are attributed to their core logic chipset revenue. Another top-ranked Asia/Pacific vendor with a significant market in this segment is a fabless Taiwan company, VIA Technologies Inc. Dataquest estimates that Asia/Pacific motherboard production will register a five-year CAGR of 17.7 percent. This represents an increase from 60 million units in 1997 to nearly 136 million units by 2002. The graphics chip segment is expected to become increasingly competitive for the leader, S3. Intel's entry into this segment with the i740 chip should establish the company as a key vendor.

The MPR category was the second-largest product group of the microcomponent market. This PC-centric range of products constituted more than 30 percent of total microcomponent revenue in 1997. Besides the two largest segments of core logic and graphics chips, other major segments include communications, mass storage, and audio controllers. The major vendors in the communications segment were Rockwell International Corporation, NS, and UMC. Adaptec Inc. and Cirrus Logic Inc. dominated in the mass storage space, while ESS Technology Inc. remained as an important supplier of audio controller chips in Asia/Pacific.

Figure 3
Asia/Pacific Microperipheral Market Share (Percent)



Source: Dataquest (July 1998)

The Asia/Pacific DSP Market

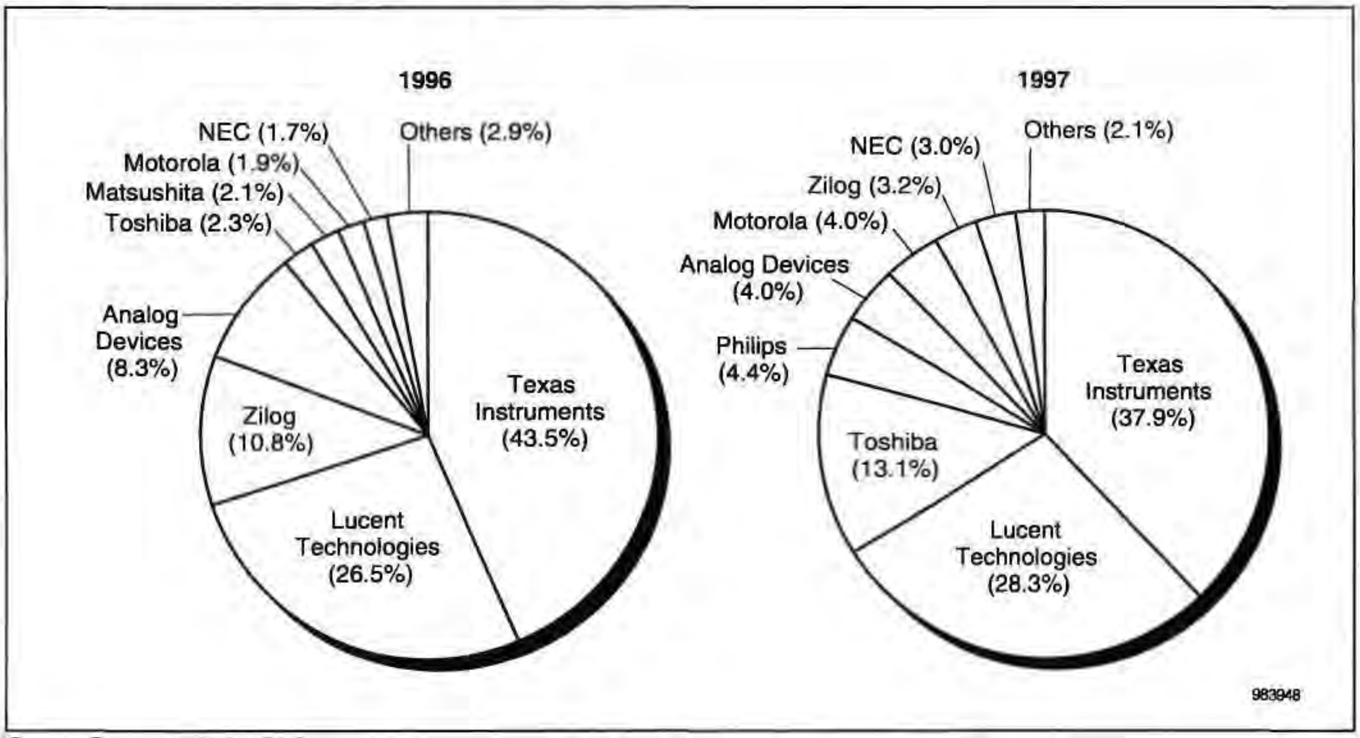
DSP devices were the most promising segment of the Asia/Pacific microcomponent market. In 1997, the total DSP revenue in Asia/Pacific recorded a stunning 68.2 percent growth to reach $792 million. Figure 4 illustrates the DSP market share of the top-8-ranked companies. Texas Instruments Inc. held on to the No. 1 position with 37.9 percent of the market. Second-ranked Lucent Technologies consolidated its place, expanding revenue by a massive 79.2 percent. Toshiba catapulted into the third spot with a $93 million rise in revenue last year. These top three vendors combined commanded 79 percent of the Asia/Pacific DSP market share. Their massive gains reflect the rapid emergence of DSP products as a high-growth device category.

The DSP category was the smallest, but the fastest-growing product group of the Asia/Pacific microcomponent market. Programmable DSP products represented more than 7 percent of total microcomponent revenue in 1997. DSP products have shown rapid growth as a result of higher demand from

 ©1998 Dataquest

data processing, consumer and communications applications. Examples of high-volume equipment adopting DSPs include digital cellular phones and rigid disk drives (RDDs). Between 1997 to 2002, Dataquest forecasts that Asia/Pacific's digital cellular phone and RDD unit production will grow at a 50.3 percent and 22.1 percent CAGR, respectively. Modems are another application projected to show a robust growth of 22.2 percent. These applications present attractive opportunities for vendors to participate in the burgeoning DSP market.

Figure 4
Asia/Pacific DSP Market Share (Percent)



Source: Dataquest (July 1998)

Asia/Pacific MOS Microcomponent Forecast

Dataquest estimates that the Asia/Pacific MOS microcomponent market will range from $12,651 million to $11,371 million this year, and $25,170 million to $22,600 million in 2002. Table 2 presents the most likely forecast of the Asia/Pacific microcomponent market. As a result of excess capacity and the Asian financial crisis, Dataquest's most likely forecast scenario is also the optimistic forecast. The market is likely to encounter downside potential from increased pricing pressure and weaker-than-expected growth of electronic equipment production this year.

The Asia/Pacific MOS microcomponent market is predicted to register an 18.4 percent CAGR in Dataquest's most likely forecast. MPU products should remain as the largest segment, accounting for 43.3 percent of the total microcomponent revenue in 2002 (see Figure 5). However, DSP products are estimated to record the highest CAGR of 24.7 percent, with 9.5 percent share of the total microcomponent market by 2002. MCU and MPR devices are projected to post healthy CAGRs of 17.1 percent and 15.5 percent, respectively.

Table 2
Asia/Pacific MOS Microcomponent Forecast, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002
MOS Microcomponent	**10,796**	**12,651**	**15,360**	**18,260**	**21,710**	**25,170**	**18.4**
Microprocessor	4,380	5,349	6,570	7,890	9,370	10,900	20.0
Microcontroller	2,303	2,630	3,060	3,710	4,430	5,080	17.1
Microperipheral	3,315	3,662	4,520	5,200	6,010	6,800	15.5
Digital Signal Processor	792	1,010	1,210	1,460	1,900	2,390	24.7

Source: Dataquest (June 1998)

In Dataquest's downside forecast scenario, the total Asia/Pacific microcomponent revenue in 1998 is estimated to be $1,280 million lower than in the original forecast. By 2002, the downside forecast estimates that revenue will decline $2,570 million, compared to the most likely scenario. This represents the potential loss in microcomponent revenue brought on by the adverse impact of the Asian economic crisis. The highlights of the downside forecast scenario are as follows:

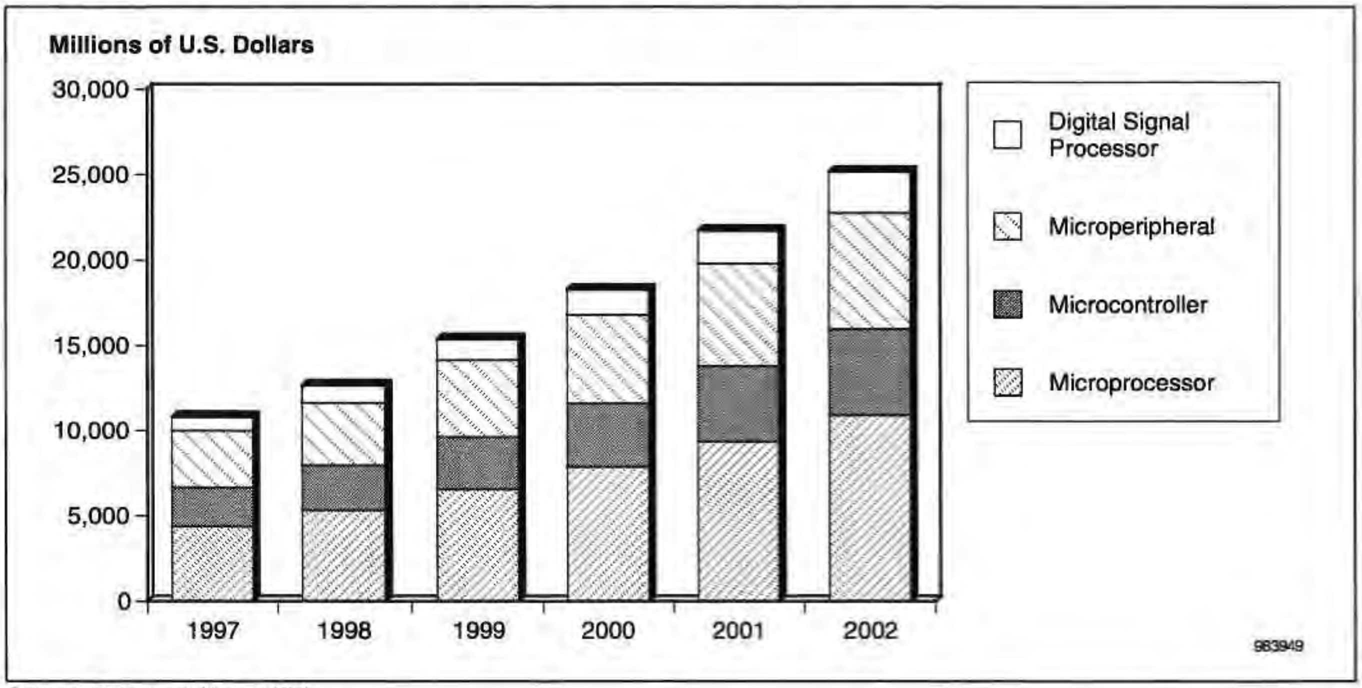
- The 1998 downside forecast revenue is $11,371 million. The Asia/Pacific microcomponent market should grow at 5.4 percent in this scenario, as a result of lower growth from MPU and MPR products. DSP devices are also projected to record lower growth rates compared to the most likely forecast scenario. However, MCUs are estimated to record a revenue decline this year.
- The regional microcomponent market is expected to stage a strong rebound in 1999, with growth predicted to exceed 20 percent. This should be followed by two years of solid growth averaging slightly under 19 percent in 2000 and 2001.
- The 2002 downside forecast revenue is $22,600 million. The Asia/Pacific microcomponent market should grow at a 15.9 percent CAGR, driven by a recovery in the MPU, MCU, and MPR device segments. DSP devices are projected to retain similar growth rates as in the most likely forecast scenario.

The Asia/Pacific MOS Microcomponent Forecast by Country

From the most likely forecast scenario of the regional microcomponent market, China/Hong Kong should emerge as the fastest-growing single country market in Asia/Pacific. Rising electronic equipment production, especially data processing applications, will drive the country to record a 24.4 percent CAGR in the forecast cycle. Figure 7 presents the Asia/Pacific country-level breakdown forecast.

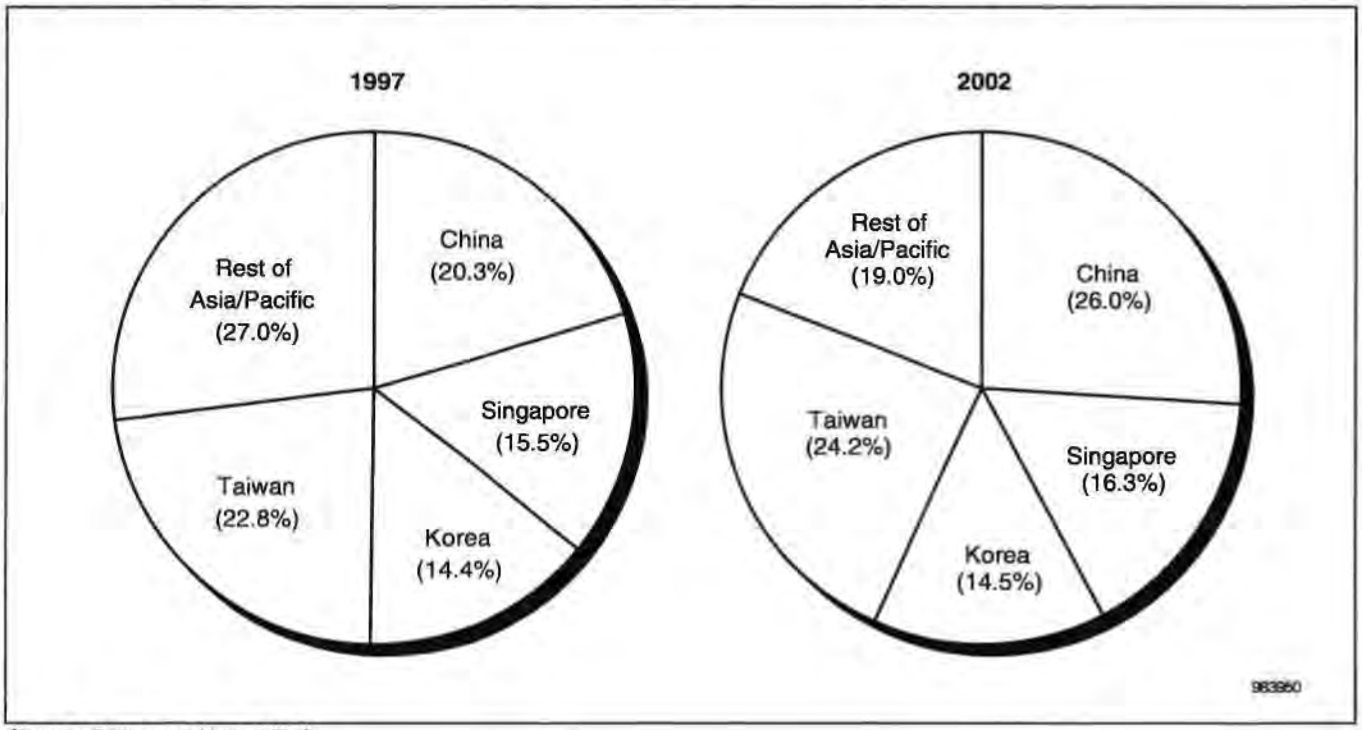
 ©1998 Dataquest

Figure 5
Asia/Pacific MOS Microcomponent Forecast, 1997 to 2002



Source: Dataquest (June 1998)

Figure 6
Asia/Pacific MOS Microcomponent Forecast by Country, 1997 and 2002 (Percent)



Source: Dataquest (June 1998)

 ©1998 Dataquest

China/Hong Kong's position as the second-largest microcomponent market in 1997 is attributed to it leading the regional consumption for MCUs. The demand for microcomponents is estimated to be driven by rising production of electronic equipment and expanding domestic consumption. With increasing production of PCs, digital cellular phones, and a wide range of consumer electronic equipment, China/Hong Kong is expected to become the largest microcomponent device market in Asia/Pacific by 2002.

Last year, Taiwan was the largest market for microcomponent devices with a 22.8 percent share. The island's data-processing and export intensive industries made Taiwan the main country in Asia/Pacific for MPU and MPR consumption. Although Taiwan is estimated to remain as the largest market for these products up to 2002, the nation will slip into the second place overall. By 2002, Taiwan, with a 24.2 percent share of the regional microcomponent revenue, should become No. 2 to its giant neighbor's 26.0 percent share. Singapore and Korea are likely to remain as the third and fourth largest consumption markets for microcomponent products in the forecast period.

Dataquest Perspective

The Asia/Pacific MOS microcomponent market grew by an impressive 23.7 percent in 1997. With the onset of the Asian financial crisis in the second half of 1997, the market this year is expected to experience lower growth rates. Dataquest forecasts that the regional microcomponent market should reach $25,170 million in 2002. The downside forecast scenario would reduce the market potential by $1.28 billion in 1998 and nearly $2.57 billion in 2002, as a result of the adverse impacts from excess capacity and the regional economic downturn. Among the product segments, MPU devices are predicted to remain as the most influential category in determining the overall microcomponent market trend. Over the forecast horizon, DSP products are likely to become the fastest-expanding segment, driven by rising demand from a wide range of electronic equipment. With 8-bit MCUs already established as the mainstream product in the region, 16-bit-and-higher MCUs should emerge to launch MCU product growth in coming years.

Intel has secured the No. 1 microcomponent supplier position in the region with its supremacy in the MPU device revenue. Competition is emerging from AMD and NS, particularly in the lower-priced MPU market segment. In the MPR space, Intel is a key player in core logic, as well as recently setting up a presence in the graphics chip market. Among the Asia/Pacific companies, Taiwan-based UMC and VIA are regional leaders in the core logic chipset market. Korean chaebols have initiated strategies to diversify into nonmemory products. Dataquest expects Korean companies to establish a foothold in the regional microcomponent market, especially in consumer and data processing applications.

Semiconductors Asia/Pacific

Market Analysis

1997 Semiconductor Market Share by Country in Asia/Pacific

Abstract: *This Perspective analyzes the 1997 semiconductor market share by country in Asia/Pacific. It reviews the top 20 companies' market share in China/Hong Kong, Singapore, South Korea, and Taiwan. Detailed product information will be published as a Market Statistics report in July.*

By C.S. Kim

The Asia/Pacific Semiconductor Market Share

The Asia/Pacific region is expected to command more market attention because of its recent economic and financial crises. Table 1 shows that Intel Corporation and Samsung Electronics Company Ltd. retained their respective first- and second-place rankings in terms of 1997 semiconductor revenue in the Asia/Pacific market. A host of other companies switched positions in this market. Texas Instruments Inc. now holds the No. 3 place in Asia/Pacific, while Toshiba Corporation ranks fourth. Motorola Incorporated and Philips Electronics NV also switched positions, with Motorola now fifth in Asia/Pacific and Philips in the sixth place. NEC Corporation, Hitachi Ltd., and SANYO Electric Company Ltd. retained the same rankings for both 1996 and 1997. STMicroelectronics NV (formerly SGS-Thomson Microelectronics NV) advanced to the eighth place during 1997 from 10th in 1996. Rohm Company Ltd. also advanced, to the No. 12 place in Asia/Pacific from No. 17 in 1996. Lucent Technologies and Advanced Micro Devices Inc. (AMD) entered the top 20 group in 1997.

FILE COPY:
MARIA VALENZUELA

Intel increased its revenue in Asia/Pacific by 25 percent, reaching the U.S.$4 billion mark in 1997. Samsung's revenue in this region increased 5 percent to $1.9 billion. TI increased its regional revenue 6.7 percent to $1.85 billion. Toshiba's revenue grew 0.2 percent to $1.8 billion. Motorola's revenue

jumped by 18 percent to $1.68 billion. Philips' revenue in this region grew by 7.4 percent and totaled $1.58 billion. NEC increased its revenue in Asia/Pacific by 3.4 percent, which totaled $1.3 billion. STMicroelectronics' revenue saw a 5.4 percent decline to total $1.08 billion in Asia/Pacific. Hitachi's revenue declined 14.2 percent to $1 billion. LG Semicon Co. Ltd. also experienced a 15.7 percent decline, with revenue falling just under $1 billion in Asia/Pacific. Rohm's revenue grew 75.4 percent in Asia/Pacific to $826 million. Lucent Technologies increased its revenue by 78 percent to a total of $632 million in the region. AMD increased its revenue by 75 percent, reaching a total of $470 million.

China/Hong Kong's Semiconductor Market Share

According to Dataquest's final market share statistics, China/Hong Kong's semiconductor market totaled about $6.8 billion in 1997, representing a 19.5 percent growth from 1996. In the same period, the Asia/Pacific market increased only 9.6 percent to a total of $32.5 billion.

The top 20 semiconductor suppliers' revenue in China/Hong Kong's semiconductor market in 1997 are listed by rank in Table 2. The top 20 suppliers accounted for about 77.6 percent of the total China/Hong Kong semiconductor market. Note that all top 20 companies in China/Hong Kong also appear among the top 20 semiconductor suppliers to Asia/Pacific, with the exception of Sony Corporation, which was ranked No. 19 in China/Hong Kong in 1997.

Intel's semiconductor sales to China/Hong Kong grew 22.6 percent in 1997. NEC and LG Semicon are the only ones of top 10 companies to show declines. In the top 10 group, Toshiba, Motorola, and Philips retained their No. 2, No. 3, and No. 5 position in 1997, respectively. Samsung, TI, and Rohm grew robustly in 1997 and moved up their positions, compared to 1996. Although Samsung experienced a 14.7 percent decline in DRAM revenue, its non-DRAM revenue grew 48.3 percent—owing to its expansion in microcontroller devices, analog IC devices, and discrete products in 1997. As a result, Samsung jumped from the No. 7 place to No. 4. LG Semicon and Hyundai Electronics Company Ltd. lost their positions and dropped to No. 8 and No. 11, respectively, because of the DRAM revenue decline. A notable change was Lucent Technologies, which moved into the top 20 group in 1997. The company's revenue reached $135 million with 128.8 percent growth for 1997. Rohm's revenue grew by 42.9 percent in the China/Hong Kong region to $230 million. AMD's revenue increased by 98.4 percent and totaled $121 million.

Singapore's Semiconductor Market Share

Dataquest estimates that in 1997, Singapore's total semiconductor market increased to about $9 billion. The top 20 suppliers took 86.6 percent of the total Singapore semiconductor market in 1997 (see Table 3).

Note that most of the top 20 suppliers in Singapore are also among the top 20 semiconductor suppliers in Asia/Pacific, with the exception of IBM and Sharp Electronics Corporation. Korean DRAM vendors experienced revenue declines in 1997. Their position in Singapore dropped to No. 7 in the case of Samsung, No. 12 for Hyundai, and No. 17 for LG Semicon in 1997.

Intel ranked No. 1 in the Singapore market in 1997, accounting for 15.7 percent of Singapore's market. Intel achieved significantly higher revenue in 1997 than in 1996. Dataquest estimates that Intel sold about $1.2 billion worth of microprocessors in Singapore. In addition to microprocessors, Intel also had a leading presence in Singapore's microperipheral market. According to Dataquest, Intel recorded a $104 million revenue from microperipheral devices in Singapore in 1997.

Table 2
1997 Rankings and Market Share for the Top 20 Semiconductor Suppliers in China/Hong Kong (Millions of U.S. Dollars)

Source: Dataquest (June 1998)

Trailing behind Intel, the second-largest supplier in Singapore was TI with 10.8 percent of the total market share. TI ranked No. 2 owing to a 27 percent growth, at $989 million in 1997. TI's strength was built on its strategy of semiconductor device diversification. TI consistently ranked in the top 10 in all the semiconductor device categories, except for discrete/optoelectronic devices.

Motorola was the third-largest supplier, capturing a 6.6 percent market share in 1997. Motorola's position was attributed to its semiconductor device diversification, since it ended up in the top 10 suppliers list for all devices except MOS memory.

Riding on its dominant position as the leading analog supplier, STMicroelectronics came in fourth in the semiconductor market share rankings with a 5.9 percent share of the Singapore market in 1997.

Toshiba was the only Japanese company among the top five suppliers in Singapore in 1997. Although Toshiba took a beating in the memory market, it was among the top five suppliers in the MOS memory, MOS logic, analog, and discrete/optoelectronic markets.

Rohm's revenue grew by 97.4 percent in Singapore to $302 million. As a result, Rohm advanced from No. 17 to the No. 10 place in Singapore in 1997.

South Korea's Semiconductor Market Share

Dataquest estimates that in 1997, Korea's total semiconductor market increased to about $5.5 billion. The top 20 suppliers took 69.2 percent of the total Korea semiconductor market in 1997 (see Table 4).

Samsung retained its first-place ranking in 1997 semiconductor revenue in the Korean market. However, Samsung's revenue in this region increased by only 2.8 percent to $620 million. Intel's revenue increased in Korea by 23.1 percent and reached $559 million in 1997. Dataquest expects Intel to surpass Samsung this year according to the semiconductor market flow. Note that most of the top 20 semiconductor suppliers in Korea also appear among the top 20 semiconductor suppliers in Asia/Pacific, with the exception of Sharp, Korean Electronics Co., Sanken Electronic Company Ltd., and Sony.

Philips' revenue in this region grew 17.1 percent and totaled $404 million. Motorola's revenue increased by 5.9 percent to $199 million. Toshiba's revenue was reduced by 16.6 percent in this region to $196 million. Motorola and Toshiba also switched ranking positions in 1997, with Motorola fifth in Korea and Toshiba in the sixth place. LG Semicon and TI in top 10 companies retained their positions in the Korean market for 1997; however, their revenue declined 9.1 percent and 4.2 percent, respectively. Sharp and Sanken were ranked as No. 12 and No. 15, respectively, in Korea because of their excellent supply of MOS logic devices in the case of Sharp, and discrete devices for Sanken. Korean companies accounted for about 20 percent of their local market. Lucent Technologies jumped to No. 17 in Korea from No. 21 position in 1996. Lucent Technologies and Sanken entered the top 20 group in 1997. Table 4 shows the top 20 suppliers of semiconductors in South Korea in 1997.

Table 4
1997 Rankings and Market Share for the Top 20 Semiconductor Suppliers in South Korea (Millions of U.S. Dollars)

Taiwan's Semiconductor Market Share

Taiwan's semiconductor market increased 12.8 percent in 1997. The total semiconductor market reached nearly $6.8 billion. The top 20 semiconductor suppliers in Taiwan's semiconductor market in 1997 are listed by rank in Table 5. The top 20 suppliers accounted for nearly 76.4 percent of the total Taiwan semiconductor market.

Intel and Toshiba retained their respective first- and second-place rankings in Taiwan's semiconductor market in 1997. A host of other companies switched positions in this market. NEC now holds the No. 3 place in Taiwan, while TI lost its ranking in 1997 because of a 22.5 percent revenue decline. AMD increased its revenue 74 percent and generated $221 million. As a result of such high growth, AMD jumped to the No. 9 place in Taiwan's market in 1997 from No. 17 position in 1996. Lucent Technologies increased its revenue 86.4 percent to $192 million in 1997. As a result, the company jumped to No. 12 in 1997 from No. 22 in 1996.

Dataquest Perspective

Although Dataquest does not indulge in market share forecasts, it does maintain extensive visibility of the products, applications, and regional markets in which all the vendors compete. The mood of the current market is cautious optimism. From 1992 to the end of 1995, the DRAM industry experienced its longest-ever period of profitability. The PC, cellular handset, automotive, and consumer electronic markets provided good price/performance competition as well as profit centers for all semiconductor vendors, but especially for the top 20. As a result, many DRAM suppliers reinvested their profits into new plants and equipment. Multiple companies poured more capital into the market than was needed. An overcapacity developed, and vendors saw their profits turn to ashes as the value of their DRAM products continued to decline.

Despite 1996's downturn in the semiconductor market, the Asia/Pacific region was still able to sustain a relatively healthy growth in 1997. This growth was attributed to a strong demand for semiconductors, which has been driven by the local electronic equipment production increase.

The Asia/Pacific semiconductor market is moving toward more difficult times as the negative impact of the Asian financial crisis takes hold. The Asia/Pacific region's GDP growth this year is expected to be depressed according to Dataquest. However, economic forecasts indicate that the Asia/Pacific region will start on the path toward economic recovery next year. When the countries regain their economic potential, we can expect the region to gain from increased competitiveness. As a result of economic recovery, Asia/Pacific's electronic equipment industry should enter into a growth stage again. Asia/Pacific's semiconductor market will continue to show healthy growth in the long term. Dataquest expects such growth in this region to be driven by data processing in Taiwan and Singapore and by communications and consumer electronics in China and Korea.

Perspective

Semiconductors Asia/Pacific

Market Analysis

Asia/Pacific Final 1997 Semiconductor Market Share

Abstract: *This Perspective provides the final 1997 Asia/Pacific top 20 semiconductor supplier rankings. Intel Corporation remains the first-ranked Asia/Pacific supplier. This Perspective also provides further analyses. Detailed product information will be published in May.*
By C.S. Kim

Regional Vendors' Worldwide Semiconductor Market Share

Dataquest's recently completed market share analysis for worldwide semiconductors in 1997 shows that the market grew only 3.5 percent to reach U.S.$147.2 billion. Intel Corporation, at $21.7 billion in semiconductor revenue, still holds the No. 1 position and continues to outdistance the other top vendors by a fairly large margin.

Regionally, the Americas region's vendor total semiconductor revenue grew 12.9 percent, reaching $72.3 billion, while European vendors' revenue grew 8.2 percent to $14.8 billion. Japanese vendors' revenue declined 6 percent to $47.8 billion, and Asia/Pacific vendors' revenue declined 9.7 percent to $12.2 billion. Japanese and Asia/Pacific vendors suffered significant declines in DRAM revenue.

As a result, the Americas companies and European companies secured 49.1 percent and 10.1 percent, respectively, of the worldwide semiconductor market, up from 45.1 percent and 9.6 percent, respectively, recorded in 1996. Japanese companies and Asia/Pacific companies accounted for 32.5 percent and 8.3 percent, respectively, of the 1997 global market, down from 35.8 percent and 9.5 percent, respectively, in 1996 (see Figure 1).

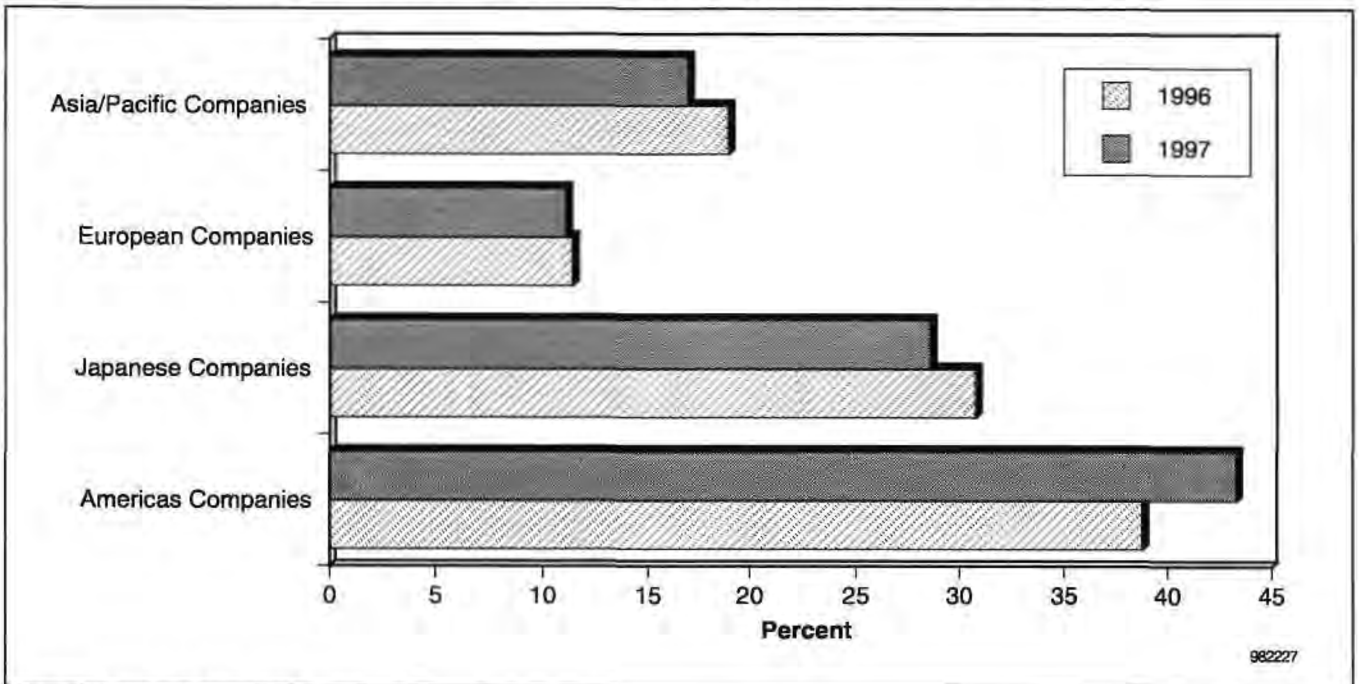
Regional Vendors' Market Share in the Asia/Pacific Region

The Asia/Pacific semiconductor market grew only 9.6 percent to reach $32.5 billion in 1997. Asia/Pacific and Japan, having many DRAM manufacturers, lost market share as regions, while the Americas region expanded its market share. Asia/Pacific companies' revenue decreased by 2.3 percent, primarily because of South Korean DRAM vendors' revenue losses. Japanese companies' revenue grew only 1.8 percent to $9.3 billion in 1997. American and European companies' revenue increased 22.3 percent and 7.2 percent, respectively. As a result, American companies accounted for 43.3 percent of Asia/Pacific market in 1997, up from 38.8 percent in 1996, while Japanese companies and Asia/Pacific companies accounted for 28.7 percent and 17 percent, respectively, of the 1997 Asia/Pacific market, down from 30.9 percent and 19 percent, respectively, in 1996 (see Figure 2).

Product Growth Trends in the Asia/Pacific Region

Dataquest's compilation of the 1997 MOS memory market shows almost 19 percent revenue decline compared to 1996 revenue; the result is a $1.5 billion revenue drop to a total market of $6.5 billion. DRAM continues to be the largest component of the memory market and the biggest influence on the market's contraction. DRAM revenue declined in 1997 by 21 percent, with average selling prices (ASPs) dropping by 36 percent. The SRAM market also remains in a severe oversupply, with revenue declining by 35.3 percent to below $600 million.

Figure 2
Regional Vendors' Semiconductor Market Share in Asia/Pacific, 1996 and 1997



Source: Dataquest (April 1998)

The product with the highest growth rate in 1997 was microcomponents, helped by increasing PC demand and the rapid acceptance of digital signal processing (DSP) devices in the mobile communications sector. Also making a significant contribution to the category's growth was the accelerating demand for graphics and imaging controllers, communications controllers, and mass storage controllers in computers, computer peripherals, and communications applications.

The Asia/Pacific MOS logic market grew 17.2 percent to $3.9 billion in 1997. The strong growth in 1997 came from cell-based ICs (CBICs), standard logic devices, and application-specific standard products (ASSPs). CBICs (37.4 percent), standard logic devices (30.5 percent), and other MOS logic products (45.1 percent) represented growth in the MOS logic market.

Asia/Pacific analog IC revenue grew a healthy 24.1 percent and reached $6.3 billion in 1997. The analog IC market picked up momentum in 1997 after modest growth in 1996. The remarkable wireless communications market growth and the continuing demand for well-conditioned power were among the key factors contributing to this momentum.

Table 1 shows growth by product category for Asia/Pacific semiconductor production.

Top 20 Ranking in the Asia/Pacific Region

The Asia/Pacific region will command tremendous market attention because of its recent economic and financial crisis. Table 2 shows that Intel and Samsung Electronics Company Ltd. retained their respective first and second place rankings in 1997 semiconductor revenue in the Asia/Pacific market. A host of other companies switched positions in this market. Texas Instruments Inc. now holds the third place in Asia/Pacific, while Toshiba Corporation ranks fourth. Motorola Incorporated and Philips Electronics NV also switched positions, with Motorola now fifth in Asia/Pacific and Philips in sixth place. NEC Corporation, Hitachi Ltd., and Sanyo Electric Company Ltd. retained their rankings in 1997 as in 1996. SGS-Thomson Microelectronics B.V. advanced to eighth place during 1997 from 10th in 1996. Rohm Company Ltd. also advanced, to No. 12 place in Asia/Pacific from No. 17 in

 ©1998 Dataquest

1996. Lucent Technologies and Advanced Micro Devices Inc. entered the top 20 group in 1997.

Source: Dataquest (April 1998)

In Asia/Pacific, while some companies experienced phenomenal growth, others saw their revenue decline. Intel's revenue grew by 25 percent and reached $4 billion in 1997. Samsung's revenue increased by 5 percent to $1.9 billion. Texas Instruments increased its regional revenue by 6.7 percent to total $1.85 billion. Toshiba's revenue grew by 0.2 percent to $1.8 billion.

 ©1998 Dataquest

Motorola's revenue jumped by 18 percent to $1.68 billion. Philips' revenue in this region grew by 7.4 percent and totaled $1.58 billion. NEC boosted its revenue by 3.4 percent and captured a total of $1.3 billion. In contrast to these companies' soaring growth, SGS-Thomson experienced a 5.4 percent decline to settle with a total of $1.08 billion. Hitachi's revenue dropped by 14.2 percent to $1 billion. LG Semicon Co. Ltd. suffered a 15.7 percent decline, with its revenue dropping below $1 billion. Rohm's revenue grew by 75.4 percent to $826 million. Lucent Technologies' revenue grew 78 percent to total $632 million. AMD increased its revenue by 75 percent to $470 million.

Worldwide Market Shrinkage of Asia/Pacific Suppliers

As shown in Table 3, the Asia/Pacific companies' market share dropped from 9.5 percent in 1996 to 8.3 percent in 1997, as the dominant Korean DRAM vendors saw big revenue losses. Macronix International Company Ltd., Vanguard Cellular Systems, Korean Electronic Co., and VIA Technologies Inc. were the only companies within the top 10 to show growth, with 3.1 percent, 48.4 percent, 11.9 percent, and 37.3 percent, respectively. Korean companies' share dropped from 7.9 percent in 1996 to 6.8 percent in 1997, while Taiwan companies' share declined only 0.1 percent from 1.6 percent in 1996 to 1.5 percent in 1997.

Dataquest Perspective

Although Dataquest does not indulge in market share forecasts, it does monitor extensively the products, applications, and regional markets in which all vendors compete. The mood of the current market is cautious optimism. From 1992 to the end of 1995, the DRAM industry experienced its longest-ever profitability period. The PC, cellular handset, automotive, and consumer markets provided good price/performance competition as well as profit centers for all semiconductor vendors—but especially for the top 20. As a result, many DRAM suppliers reinvested their profits into new plants and equipment. Numerous companies poured more capital into the market than was needed. An overcapacity developed, and vendors saw their profits turn to ashes as DRAM product value continued to decline.

The decline of the Asia/Pacific companies' share in 1997 came from Korean companies that were mainly oriented toward memory, especially DRAM products. In 1997, the Korean companies' shrinking semiconductor market share resulted from DRAM ASPs dropping by 36 percent.

Table 3
Worldwide Market Share Rankings of Asia/Pacific Semiconductor Suppliers, 1996 and 1997 (Millions of U.S. Dollars)

1996 Rank	1997 Rank	Company	1996 Revenue	1997 Revenue	Percentage Change	1997 Market Share (%)

Perspective

Semiconductors Asia/Pacific

Market Analysis

Taiwan's Semiconductor Industry Trends

Abstract: *This Perspective presents the 1997 Taiwanese semiconductor companies' overall performance, including a financial analysis, local alliances, vertical integration, revenue ranking, sector performance, and a snapshot of capital spending and a wafer fab database. In the past, Dataquest has provided a microview of Taiwan's semiconductor industry because there were fewer companies then. Starting in 1998, Dataquest will provide a macroview of the industry.*

By Jerry C. J. Yeh

Introduction

Dataquest's review of the 1997 Taiwanese semiconductor manufacturing revenue—including the semiconductor contract manufacturing (SCM) and original equipment manufacturers (OEM)—shows a healthy 18.6 percent revenue growth when compared to the 1996 revenue. This growth resulted in a U.S.$841 million revenue increase to reach a total of $5.4 billion. In sector performance, SCM/OEM revenue expanded from $2.6 billion in 1996 to $3.2 billion in 1997, which indicates more than 26.6 percent growth. Brand-name revenue rose from $2 billion to $2.1 billion in 1997, a 7.7 percent increase. Fabless revenue grew from $705 million to $910 million in 1997, a 29.1 percent increase.

Four Taiwanese semiconductor companies—Taiwan Semiconductor Mfg. Co. (TSMC), United Microelectronics Corporation (UMC), Winbond Electronics Corporation, and Macronix International Company Ltd.—have been selected as a financial-analysis resource. After-tax-profit-to-net-sales ratio reached almost 50 percent in 1995, later dropping to below 30 percent in 1997. Only dedicated foundries have generated more outstanding profits

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

than the nonfoundry companies. However, the foundries' price cut and capacity expansion did affect the profit since 1997. Return on total assets affected the continued investment in new wafer fabs. In 1995, the ratio reached the highest point, at 37. Dataquest expects the ratio to approximate 20 percent in 1998. In contrast to the other Asia/Pacific semiconductor companies, Taiwanese companies' financial structure and performance are healthy.

After the semiconductor market downturn, some Taiwanese semiconductor and electronics companies—such as TSMC, UMC, Nan Ya Plastics (NYP)/ Formosa Plastics Co. (FPC), Acer Inc., Winbond Electronics Co., Mosel Vitelic Inc., Powerchip Semiconductor Co.—have started an alliance (this alliance will be discussed in the next section). Although the semiconductor/electronic magnates are emerging, it doesn't mean that some companies will disappear.

An Overview of Taiwan's Semiconductor Industry Trends

Taiwan's semiconductor industry has changed dramatically in 1997. In the past, Dataquest has provided a microview of Taiwan's semiconductor industry because there were fewer companies then. Now, there are more than 15 independent semiconductor companies and more than 60 sizable design houses that produce a wide variety of products. On the other hand, Taiwan is the world's largest dedicated-foundry manufacturing base. In fact, Taiwan has become such an important SCM manufacturing base that Dataquest plans to create an internal cross service between Semiconductor Asia/Pacific (SEMI-AP) and Semiconductor Contract Manufacturing Worldwide Service (SCMS) programs especially for Taiwan.

Moreover, Taiwanese semiconductor companies have started a local alliance and vertical integration that was supported by the government's long-term target dubbed "Silicon Island." The Taiwanese companies' movement to form a local alliance and vertical integration is what motivates Dataquest to cover the analysis beyond revenue, fab capacity, and capital spending. Starting in 1998, Dataquest will provide an industry macroview. In this Perspective, financial and semiconductor group analyses are the first input. Revenue ranking, sector performance, capital spending, and wafer fabs information still remain in last year's report, but a more detailed capital spending and wafer fabs information will be presented in both SEMI-AP and SCMS-WW, which is scheduled for publication in the second half of 1998.

Actual exchange rates for Taiwan are shown in Table 1. The exchange rates are applied to all historical figures. In looking at Dataquest's historical numbers, it is important to note fluctuations in currencies in the New Taiwan dollar (NT). Dataquest uses constant exchange rates across technologies and regions. The 1998 projected exchange rates were used for forecasting all data in this report.

A Financial Analysis of the Taiwanese Semiconductor Companies

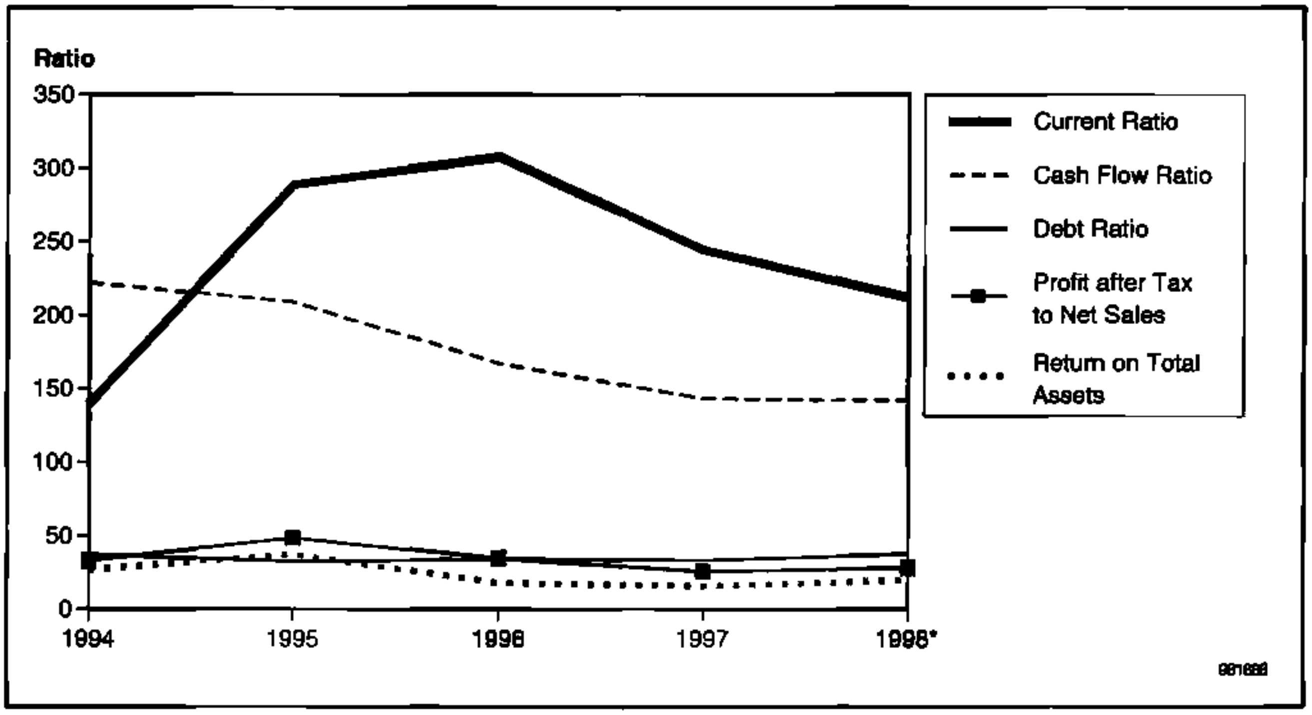
Since the second quarter of 1997, Dataquest is aware that its clients have become interested in their competitors' financial status. Financial report became one of top inquiries to Dataquest's inquiry system. Asia/Pacific companies, especially, had submitted more requests for competitors' internal financial information than other companies from other regions. This trend indicates a warning signal and a persistent question: As the market downturn market is prolonged, how long can a semiconductor company stay in business? Although almost all Asia/Pacific companies have some government support, the Asian financial crisis has shaken the legend of the Asian Tigers.

In this section, Dataquest provides a financial analysis for Taiwan. Four Taiwanese semiconductor companies, TSMC, UMC, Winbond, and Macronix, have been selected. Dataquest knows that these companies each performed differently in the past few years. This selection illustrates a more comprehensive picture of Taiwan's semiconductor financial status. Dataquest neglects the detailed information for all companies because it must protect these companies' confidential information— especially their internal forecasts.

Figure 1 presents these selected four companies' financial analysis from 1994 to 1998. Current ratio is a liquidity analysis, which shows a company's ability to repay its debts. In 1996, this ratio reached its highest ever, more than 300. Last year, the ratio suffered a 20 percent decline because of the companies' need for short-term debt to leverage their financial operation. The liquidity ratio also affects the debt ratio. The debt ratio is one of the capital-structure analysis that shows a company's fundamental financial structure. Although both current ratio and debt ratio will be affected by the increasing loans in 1998, those will still hover above 200 and below 40, respectively.

Cash-flow ratio dropped from 170 to 140 from 1996 to 1997 because of the semiconductor market downturn and revenue growth slowdown. Profit-after-tax-to-net-sales ratio reached almost 50 in 1995, dropping below 30 in 1997. Only dedicated foundries have generated more outstanding profits than the nonfoundry companies. However, the foundry price cut and capacity expansion did affect the profit since 1997. Return on total assets was affected by continued investment in new wafer fabs. In 1995, the ratio reached its highest at 37. Dataquest expects the ratio to hover at about 20 in 1998.

Figure 1
A Financial Analysis of Four Taiwanese Semiconductor Companies, 1994 to 1998*



* Forecast
Note: This ratio is the average of TSMC, UMC, Winbond, and Macronix.
Source: Dataquest (April 1998)

Compared with other Asia/Pacific semiconductor companies, Taiwanese companies' financial structure and performance are healthy. Taiwan has a lot of capital that could be used on the island's semiconductor or electronic development need. While the semiconductor market hasn't recovered, most of semiconductor capital has gone to the backend facility since 1997. Although Dataquest's financial analysis shows that a critical time is happening now, all ratios are still under control. Recently, Dataquest has heard of some local Taiwanese financial magnates who plan to join foundry manufacturing. Although this news isn't welcomed by the industry when there is still foundry overcapacity, it shows that existing semiconductor companies can still collect as much capital as they need.

Alliances and Vertical Integration: The Emerging Semiconductor/Electronics Magnates

Table 2 illustrates Taiwanese semiconductor companies' long-term investment in 1998. Basically, this information is based on companies' financial reports, but there are many semiconductor companies' owners who invested in the related companies from their own pocket. Moreover, Dataquest doesn't want to make advanced analysis, because it would make this analysis much too complicated.

Taiwan Semiconductor Mfg. Co.

TSMC has been ranked No. 1 in market capitalization in Taiwan in 1997, with a total value of U.S.$19.1 billion. In 1998, TSMC will have two joint ventures with the Acer Group—packaging and venture capital. Most of TSMC's investment is still within the semiconductor-related area. To concentrate on dedicated foundry, the company cannot be involved heavily in the IC design house. Hence, TSMC invests in Vanguard International Semiconductor Co.; the two companies have a very close relationship. As Taiwanese companies start forming alliances, Dataquest regards the TSMC and Vanguard team as a partnership in the same group.

United Microelectronics Corporation

UMC is ranked No. 3 in market capitalization in Taiwan in 1997, with a total value of U.S.$10.7 billion. UMC is an interesting company. The company is like a tree that has its root extended to the various areas, including a wafer fab joint venture, IC design house, packaging, LCD, telecommunications, venture capital, and, even banking. In 1998, Holtek Microelectronics Inc. promised to provide capacity to UICC. Currently, UMC holds 15 percent of Holtek, but this share can be increased in the near term. Dataquest regards all UMC's joint venture—United Semiconductor Corporation (USC), United Silicon Inc. (USI), United Integrated Circuits Corporation (UICC), and its new partner, Holtek Semiconductor Inc. (Holtek)—as the UMC group.

Nan Ya Plastics (NYP)/Formosa Plastics Co. (FPC)

Nan Ya Technology Corporation is a subsidiary of Nan Ya Plastics (NYP)/ Formosa Plastics Co. (FPC). NYP/FPC is a rising giant in Taiwan's electronics industry. It isn't an ordinary plastics company. One may not be familiar with NYP/FPC, but one must have heard of the following companies—Nan Ya Technology Co., First International Computer Inc. (FIC), VIA Technologies Inc., and Formosa Komatsu Silicon Co. These companies are related to NYP/FPC. NYP/FPC's total assets is U.S.$7.5 billion, plus a U.S.$4.7 billion revenue that was gained along with the petrochemical products in 1997.

Formosa Komatsu Silicon Co. (FKS), the 20,000-units-per-month, 8-inch silicon wafer plant, is a joint venture with NYP/FPC, Komatsu Electronics, and the Asia-Pacific Investment Co. It plans to start production in April 1998. FIC is one of the top 30 PC manufacturers. VIA Technologies Inc. is a semiconductor design house that ranked among the top three as the chipset vendor in the world in 1997. Nan Ya Plastics Co. is a manufacturer of PCB that ranked as the top 10 PCB makers in the world. NYP/FPC will be one of the largest and completely vertically integrated electronic group in Taiwan.

 ©1998 Dataquest

The Acer Group

One of the most important semiconductor news in Taiwan during the first quarter of 1998 is that the Acer Group bought TI-Acer Inc. Acer is the world's seventh-largest PC manufacturers. This news was followed by another merger between Acer and Texas Instruments. In 1997, the company announced that it bought TI's notebook division. Now, Acer is not only a computer giant, but also a semiconductor player. In the Acer Group, Acer Peripheral Inc. (API) is one of the most well-known and profitable companies. API is one of the world's largest CD-ROM, monitor, and scanner manufacturers. The company has designed its own digital cellar phone in 1998. Acer Laboratory Inc. (ALI) also belongs to Acer. ALI is one of the world's top five chipset vendors.

Other Companies

Winbond and World Semiconductor Mfg. Co. Ltd. (WSMC) belong to the same group. Winbond's capital investment and technology helped WSMC start its new fab setup smoothly in 1997.

Mosel Vitelic has its own alliance strategy: The company has a joint venture with Siemens AG—ProMOS Technologies that started 64M DRAM production in 1997. Mosel Vitelic also gained from Siemens' 16M DRAM foundry. Mosel Vitelic invests in ChipMOS Technologies Inc., a joint venture between Mosel Vitelic and Siliconware Precision Industries Ltd. This new assembly and testing company is design for 64Mb and 1Gb DRAM. ChipMOS plans to start production in 1999.

Powerchip Semiconductor Co. is owned by UMAX Data Systems Inc. UMAX is one of the world's top three scanner manufacturers. Powerchip, a joint venture between UMAX/Elite Group and Japan's Mitsubishi Electronics America Inc., started commercial DRAM production in October 1996.

Hualon Microelectronics Corporation (HMC) may be alone for a long time. The company belongs to Hualon Co., one of the largest fiber manufacturers in Taiwan. Currently, Hualon shows no signs of forming advanced alliance with other companies.

The semiconductor/electronic magnates have been formed, but it doesn't mean that some companies will disappear. Smaller companies will persist even in a tough market because it is an old Chinese tradition that men must have their own business that will give all family glory—men are supposed to be the boss. This is why there are so many start-up companies in Taiwan, and many young people want to start their own businesses. If large wafer investments can't be achieved, IC design house will be the best choice. Actually, a compact-size company is the best fit for the fast-changing IC industry. Although having many compact-size companies can bring intense competition among them, it also provides opportunities for those companies worldwide, which want to invest or purchase in Taiwan. Taiwanese companies have suffered this long market downturn, but, finally, they have begun to learn how to unite together.

©1998 Dataquest

Taiwanese Semiconductor Manufacturers' Revenue Ranking

Table 3 lists Taiwanese semiconductor manufacturers' 1997 revenue by company ranking. Taiwan Semiconductor Mfg. Co. continued its steady pace as the industry leader in Taiwan, maintaining its No. 1 position. TSMC reached $1.5 billion, representing a 7.54 percent growth. UMC remained in the same position as 1996; however, the company showed an 8.7 percent growth to reach $896 million because of its successful transfer to the foundry business. Winbond took over the third position from TI/Acer with a slight 5.25 percent decline. Winbond's two 8-inch wafer fabs were not ready in 1997. TI-Acer dropped to the No. 4 position, showing a 26.64 percent decline, impacted by the sluggish DRAM price and loss of other niche products support. Macronix is in the No. 5 position and had the slight revenue increase in Taiwan with a 5.4 percent to reach $390 million.

Trailing closely behind is Vanguard, in the No. 6 position. Vanguard has the largest growth because it is a start-up company and gained a foundry business from the TSMC. Its $348 million revenue, with a 39.2 percent growth, represented the better year enjoyed by the Taiwanese semiconductor companies.

Mosel Vitelic dropped to the No. 7 position. The company doesn't have its own 8-inch fab, but it will have investnent income from ProMOS. This is the first time that both USC and Powerchip showed up on Dataquest's top 10 ranking in 1997, winning the No. 8 and 9 positions. USC succeeded in foundry, reaching $277 million. Powerchip started DRAM mass production, which offset the sluggish DRAM price in 1997, reaching $265 million. Holtek's 27.18 percent growth helped the company to maintain its No. 10 position.

Sector Performance: SCM and System OEM, Brand Name, and Fabless

This section characterizes semiconductor industry revenue by the following three general categories

- Semiconductor contract manufacturing and system OEM, which included dedicated foundry and integrated device manufacturers (IDMs)
- Manufacturers' alliances with other brand-name products and brand-name production (by branding a company's product under its own name)
- Fabless vendors (pure design houses)

Figure 2 summarizes the results of Dataquest's recent Taiwanese industry survey and provides a split among SCM/OEM, brand name, and fabless revenue. Dataquest readers should note the overlap in the SCM and fabless. This comparison shows the fabless companies' growth in Taiwan.

SCM/OEM revenue expanded from $2.6 billion in 1996 to $3.2 billion in 1997, indicating a 26.6 percent growth. Brand-name revenue rose from $2 billion to $2.1 billion in 1997, a 7.7 percent increase. Fabless revenue grew from $705 million to $910 million in 1997, showing a 29.1 percent increase.

The total semiconductor manufacturing growth was driven by foundry, or IC design house, which is one of its main engines. Compared to worldwide IC design house, Taiwanese IC design house did not provide as much contribution to the local foundry. However, starting with UMC's dedicated foundry strategy that spun off all its design teams since 1996, Holtek also decided to spinoff its design team and transfer the company to become another dedicated foundry. In 1998, Dataquest expects the IC design house revenue to grow strongly to reach $1.3 billion, with a 31 percent growth.

Capital Spending by Taiwanese Companies Worldwide

After a 72.6 percent growth of Taiwanese semiconductor capital spending in 1996, Taiwanese companies experienced a "slight" growth of 13.6 percent, reaching $5.3 billion in 1997 (see Figure 3)—compared to Asia/Pacific's 23.9 percent decline and the worldwide 8.5 percent decline. Taiwanese foundry companies have maintained the spending plans set early in 1996 and 1997. However, the DRAM capacity expansion slowed down. The major spending for DRAM companies was in process technology migration. Dataquest expects Taiwanese companies to generate a 15 percent growth in 1998. Figure 3 illustrates a comparison of the Taiwanese, Asia/Pacific, and worldwide companies' capital spending from 1994 to 1997, with a 1998 forecast. Figure 4 shows top 10 Taiwanese semiconductor companies' capital spending for 1997, with a forecast for 1998.

Table 4 presents details about the current and planned wafer fabs in Taiwan, including starting date, capacities, and products. More detail on capital spending and wafer fabs will be available in SEMI-AP-DP-9808, "Asia/Pacific Companies' Capital Spending," and SCMS-WW-DP-9812, "Asia/Pacific Fab Capacity Review."

Dataquest Perspective

By Dataquest's market share definition, SCM and OEM are excluded from the companies' revenue. This definition prevents the overlap of revenue and reveals the actual market size. In 1997, Dataquest's *Taiwanese Semiconductor Industry Trends Report* included those sections for each company. After the Asian financial crisis and the worse-than-expected market, this methodology provides one answer to Taiwanese companies' overall performance in 1997. Since 1995, new companies that have emerged and the huge capital that was spent in Taiwanese semiconductor industry were dubbed "fab fever." In the past two years, there were endless arguments between brand and nonbrand (foundry or OEM) when the companies had to decide their strategy for future development. Dataquest believes that both will exist. Foundries will be expanded, but the brand name may not be the same as we have heard for years.

The most important event in 1997 wasn't the continuing, sluggish DRAM price, but Asia/Pacific's financial crisis, which is expected to cause poor market performance. Suddenly, the financial structure has been in the spotlight in the region. At the time of the booming semiconductor market, semiconductor companies look like they are on their way to prosperity. Although history tells us that semiconductor market cycles happen in a certain period, more announcements of Taiwan's newly constructed fabs seemed to ignore the risk. However, the downturn did come, with the winter lasting longer than expected. In the first quarter of 1998, Taiwan and its semiconductor companies are still standing after the storm.

However, the recent, drastic DRAM price decline is causing extreme uncertainties for Taiwan's semiconductor companies. During the writing of this Perspective, DRAM prices dropped from $14 to $9. It is uncertain whether they will be able to weather this latest storm. The Asian financial crisis hasn't ended, and Korean semiconductor companies are selling DRAM in the world market at spectacularly low prices because of their need for hard currency. Hence, if DRAM prices do not stop decreasing, multinational and Taiwanese DRAM vendors are likely to face another turbulent storm. DRAM oversupply is here. As history tells us, if market recovery cannot rely on increasing demand, vendors will withdraw from the market as the last solution. The question of how long a semiconductor company can stay in business is still relevant.

Perspective

Semiconductors Asia/Pacific

Market Analysis

1998 Asia/Pacific Regional Outlook

Abstract: *Asia/Pacific has seen strong economic growth and rapid development of its electronics industries during the last decade. Growth was led by the Four Tigers—Hong Kong, Singapore, South Korea, and Taiwan—followed by Indonesia, Malaysia, and Thailand. However, Asia/Pacific's economy will be depressed in 1998 because of the financial crisis. This Perspective provides an outlook and implications of the current financial crisis in Asia/Pacific.*

By C.S. Kim

Introduction

Much has been heard about the current financial crisis in South Korea and Southeast Asia. However, the implications of the crisis for all industrial sectors are much less clear. Dataquest has been following the events during the past few months and analyzing their implications for Asia/Pacific's semiconductor industry.

Where Did the Financial Crisis Come From?

Simply stated, the financial crisis stemmed from South Korean companies' inability to repay their short-term debts. The expansion that has given South Korea an average annual gross domestic product (GDP) growth rate of 8.6 percent during the past 30 years has been achieved largely on the back of massive, politically backed, short-term borrowings, which were rolled over regularly and renewed by the country's top companies—family-run conglomerates commonly known as *chaebols*. Problems have occurred with this short-term-borrowing strategy because many investments made were long term and not suited to short-term returns. More importantly, the primarily South Korean banks, which in turn borrowed mainly U.S. dollars

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

from Japanese banks, are now unable to continue rolling over the debts and granting extensions. Inevitably, the huge debts are now due for repayment. There are several factors that have caused this debt situation.

Until mid-1997, several Southeast Asian currencies, including the South Korean won, were pegged to the U.S. dollar. With the growing strength of the dollar since mid-1995, caused by the improving performance of the American economy, the won and the other Southeast Asian currencies also grew in strength. This growth made Southeast Asian exports more expensive and less competitive in a worldwide market that was already showing signs of slowing down and overcapacity because of overinvestment. In an attempt to revive South Korea's failing export-led economy, the dollar pegging was abandoned and the won devalued to make South Korean goods cheaper in the world market. This devaluation, however, increased the won value of debts borrowed in foreign currencies, massively increasing the amount of won required by banks and *chaebols* to repay their debts. In May 1997, the won/dollar rate was approximately U.S.$1:W 900. As of January 8, 1998, the rate was $1:W 1,800, meaning that South Korean companies now have to pay twice as much won for their dollar-based debts as they did in May 1997.

The second factor concerns primarily the Japanese banks that, by lending to South Korean banks, financed South Korea's growth. Japanese banks were unable to renegotiate their South Korean debts because of their own liquidity problems. Much of the security upon which Japanese banks based their value was property-based investments. However, in the early 1990s, the Japanese property market collapsed, taking with it much of the equity that Japanese banks relied upon. The equity loss impaired these banks' ability to borrow money in the international money markets, thus, less new money was available to renegotiate South Korean debts. South Korean loans, therefore, became due for repayment.

The debt problem is now so severe that the South Korea's Ministry of Finance and Economy estimates that approximately $21.5 billion of external debt will be due for repayment in the first three months of 1998. In the first six months of 1998, approximately $70 billion of external liabilities will be payable—this amount represents about 70 percent of the nation's total external debt.

Behind these statistics lies a myriad of companies with liabilities unheard of in the Western economies. Halla Group, South Korea's twelfth-largest conglomerate, declared bankruptcy on December 6, 1997, with a debt-to-equity ratio of almost 20:1 (its debts were 20 times greater than its net worth). Halla Group is not alone. The 1996 financial statements of South Korean *chaebols* reported that of the top 25 *chaebols*, 22 have debt-to-equity ratios greater than 3:1, and 10 have ratios greater than 5:1. In 1996, the top 25 companies had a combined total assets of $192 billion and debts totaling $149.5 billion.

South Korea as a Competitor

With the stringent management and restructuring requirements of the IMF bailout, the Korean semiconductor industry is planning to cut 1998's capital investment by 30 percent to 50 percent, compared to 1997. Korean DRAM manufacturers fear that their cutbacks could result in a drastically dwindling share of the world market, with market share lost particularly to Japanese and Taiwanese companies. The threat of shrinking market share is something that Korean DRAM manufacturers haven't been accustomed to; they have enjoyed a steady market share growth since 1990.

Samsung Electronics Company Ltd., currently the world's leading DRAM producer, is expected to implement a 30 percent cut in overall investment and is considering further cuts. Samsung's plans are to earmark W 800 billion to W 900 billion for semiconductor and LCD investment next year and W 400 billion to W 500 billion on research and development. LG Semicon Co. Ltd. and Hyundai Electronics Company Ltd. are also cutting back investment. LG Semicon plans to lower investment by 30 percent, or W 1.05 trillion to W 1.10 trillion for next year, while Hyundai is considering a 40 percent cut. As with Samsung, both LG Semicon and Hyundai have yet to make their investment plans final.

What impacts will these cutbacks have on projects already under consideration? LG Semicon is expected to delay the construction of its second LCD plant in southern Korea. LG Semicon and Hyundai are re-examining their plans to construct DRAM fabs in the United Kingdom, although both expect to go ahead with plans as scheduled. Most expansion plans for DRAM fabs in the United States by Samsung, LG Semicon, and Hyundai are expected to be suspended.

As explained in Dataquest's Tactical Memories Newsletter (Volume II, Number 26), much of South Korea's DRAM manufacturing costs are based on won. As the value of the won slides against international currencies, so too do the costs of South Korea's DRAM manufacturers. Given that the won has devalued by 50 percent against the dollar in the past eight months, this cost gives South Korean DRAM manufacturers a significant opportunity to cut dollar-based prices while maintaining won-based margins. In the short term, this move means that in an already-deflated DRAM market, further price pressure can be brought to bear by South Korean and other Southeast Asian DRAM manufacturers. This move will enable them to achieve greater market share and generate much-needed revenue and profit-making dollars, while putting pressure on the non-Southeast Asian competitors to such an extent that antidumping inquiries, so recently resolved, may be put back on the political agenda.

Similarly, however, many non-Southeast Asian semiconductor companies have packaging and test plants throughout the Southeast Asia region. Where these companies have fixed and variable costs based in local currencies, marginal savings will be realized because of the depreciation of those local currencies. These savings will provide those non-Southeast Asian semiconductor companies with some extra leeway to respond to competitive pricing from Southeast Asian semiconductor companies.

©1998 Dataquest

South Korea as a Consumer

Perhaps the financial crisis' greater significance may be the exposure of those outside of Southeast Asia to the loss of Southeast Asia's purchasing power. In the United States, Atmel Corporation, the nonvolatile memory and ASIC supplier, has announced a fourth fiscal quarter charge of $160 million, citing credit problems with specific Asian customers. While this statement may be open to further scrutiny, it does raise the point that companies may be exposed to risks regarding the occurrence of potential bad debts and future loss of custom as a result of the inability of Southeast Asian OEMs and contract equipment manufacturers (CEMs) to obtain letters of guarantee from their banks, which are essential when they wish to trade on credit.

In 1996, non-Asia/Pacific semiconductor companies achieved sales of $24 billion (81 percent of their total revenue) through sales into the Asia/Pacific region; the percentage is likely to be similar for 1997. South Korea represents 17 percent of Asia/Pacific's semiconductor consumption. Using this percentage of non-Asia/Pacific revenue total means that South Korea represents approximately $3.1 billion of non-Asia/Pacific semiconductor companies' revenue. Most manufacturing locations within South Korea are owned locally, and this represents a problem for non-Asia/Pacific semiconductor manufacturers. With IMF restrictions in place, South Korean companies will find it difficult to obtain letters of guarantee. Without these letters, their only option is to pay cash for purchases of semiconductors. Cash has become twice as expensive to buy as it was eight months ago, and cash is even difficult to obtain. The credit and cash problems potentially put at risk a substantial proportion of the $3.1 billion revenue realized by non-Asia/Pacific semiconductor companies, both in the current and future financial years, because of a loss of the South Korean purchasing power.

Other Southeast Asian Countries

Within the rest of the Southeast Asian region, the severity of the financial crisis is varied. The Philippines, Thailand, Indonesia, and Malaysia all have problems similar to South Korea, and all have experienced IMF intervention in their economies to some degree. In total, the four countries have received more than $30 billion in IMF-led relief. The constrictions associated with IMF intervention and the currency crises being experienced in these countries will affect indigenous producers in these countries as they have affected South Korean manufacturers. A significant proportion of OEMs and CEMs in these countries are, however, not based in Southeast Asia. These companies will, therefore, experience a cost, which may encourage them to ramp up production while costs are low. Therefore, the position of semiconductor demand in these countries is unclear. Any potential demand loss from indigenous manufacturers because of the purchasing power loss may well be countered by increasing demand from nonindigenous manufacturers benefiting from cost.

Taiwan, Singapore, and China/Hong Kong are in a different position from the four countries discussed above, because their economies are financially

 ©1998 Dataquest

more advanced. External debts within these countries are minimal in comparison to those of the above countries, and government reserves are more than adequate to cover these debts and protect the currency when necessary, although Hong Kong is coming under increasing pressure. With the exception of a general loss of confidence because of their geographical proximity, these countries have been much less severely affected, although all have experienced a weakening of their currencies and stock markets.

The Potential Effects of Lost GDP

In December 1997, the Organisation for Economic Cooperation and Development (OECD) projected that the Asian financial crisis would reduce the GDPs of Asia/Pacific countries, including Japan, by 1.4 percent in 1998, and that the knock-on effect would reduce the GDPs of Europe and the United States by 0.4 percent. Dataquest estimates that approximately 4.5 percent of GDP is spent each year on electronic equipment consumption in Southeast Asia. Dataquest estimates that in Japan, this percentage is approximately 3.0 percent. Given a 1.4 percent reduction in GDP across the Asia/Pacific region, this situation would lead to a fall in electronics equipment consumption of $2.5 billion, which would equate to semiconductor revenue of approximately $500 million. In terms of Asia/Pacific revenue, given Asia/Pacific's current market share of the worldwide total available market, this situation would mean a revenue loss of approximately $47.5 million. However, since the OECD made its December forecast, much has come to light that would indicate a worsening situation. For each additional 1 percent fall in Asia/Pacific's GDP, worldwide semiconductor revenue would fall by approximately $360 million, equating to Asia/Pacific's revenue of roughly $34.2 million.

A major assumption in this calculation is that with decreasing GDP, the marginal propensity to consume would also decrease at a uniform rate. In reality, however, the loss of confidence in the market and consumers' worry over job security and desire to save would almost certainly make the marginal propensity to consume decrease at a faster rate than the reducing GDP. Thus, electronics equipment consumption would fall more sharply, leading to a larger fall in semiconductor revenue. In addition, for each 0.5 percent fall in the rest of the world's GDP, $600 million would be lost from worldwide semiconductor revenue, equating to approximately $57 million of Asia/Pacific semiconductor revenue.

Dataquest Perspective

Dataquest believes that the currency devaluation in some countries within Asia/Pacific will have varying positive and negative effects on the region's semiconductor consumption. The countries primarily affected and discussed here are South Korea, Taiwan, Singapore, Thailand, Malaysia, Indonesia, and the Philippines. Note that the Hong Kong dollar remains the least vulnerable currency, and it was seriously attacked by speculators only after the Southeast Asian devaluation—but then to no avail. Dataquest also believes that Taiwan's electronics industry will fare well in this crisis, primarily

 ©1998 Dataquest

because a larger percentage of components is supplied locally and because its financial sector is stronger than in the other countries.

In the short term, numerous companies selling equipment or semiconductor components to these countries report difficulty in getting payment from their channels. Consumption of end equipment such as PCs, cellular phones, and color televisions will be affected, but these are small, developing markets relative to worldwide consumption. Since 1997, Dataquest has observed a growth deceleration in Southeast Asia and an acceleration in China. China's electronics equipment production will grow at nearly 20 percent this year and is now the largest semiconductor market in Asia/Pacific. China now represents a huge consumer of communications and computer equipment, with 25 percent of all PCs purchased in Asia/Pacific and growth exceeding 40 percent. Although electronics consumption may be lower than previously expected in the selected countries, the region as a whole will continue to enjoy the fastest growth rates in the world.

The long-term impact on overall semiconductor consumption in Asia/Pacific is better understood from a company-level view. Companies in the affected Asian countries, which rely primarily on imported components, are experiencing increased costs because of their weaker local currency. However, if their finished products are exported, then this cost increase can be reversed because more local currency is received for the same U.S. dollar price.

Although recent trends show increased shipments to Southeast Asia from manufacturers based there, this output represents less than 15 percent of total production. Exports have and will continue to drive electronics production in Asia/Pacific and, therefore, strong semiconductor demand. Weaker currency means more expensive parts for some, but all will have more competitive exports. Although certain companies may be hurt, the aggregate demand will not be reduced and could well be helped in the long run.

It will take one to two years for cutbacks in Korean investment to make a significant impact on company market share and DRAM industry capacity. There is more than enough capacity already to support current demand, and as all manufacturers continue to shrink their 16Mb and 64Mb devices, industry overcapacity will continue through most of 1998 and possibly into 1999. To put device die size into perspective, the average die size of 16Mb DRAM at the end of 1998 will be 60 percent of the average die size of 4Mb DRAM at the end of 1995.

Taiwanese DRAM manufacturers will have a significant impact on when the market comes into balance. If Taiwanese companies continue with their aggressive expansion, the equilibrium point may be pushed out from three to six months well into 1999. Before the IMF actions, the Taiwanese companies planned to increase capital spending in local currency (NT$) by 10 percent. In U.S. dollar terms, this may actually represent declining capital spending because of currency devaluation. The Korean cutback in spending may encourage Taiwanese DRAM vendors to accelerate investment in an effort to take market share away from the Koreans. If Korean companies cut their

 ©1998 Dataquest

capital spending as indicated and if Taiwanese companies continue with their capital spending plans for foundry, memory, and joint ventures, Taiwan may surpass Korea in capital spending in 1998. However, not all Taiwanese DRAM vendors are expected to increase capital spending—at this time, Mosel Vitelic Inc. and Powerchip Corporation are expected to decrease their capital spending in 1998, and others may follow.

Dataquest believes that there is a good possibility that Taiwanese manufacturers will not implement their aggressive capital spending plans. The Taiwanese companies are newcomers to the DRAM industry with no experience prior to the industry downturn. As they gain experience in the current downturn, they may decide to stop DRAM spending abruptly. This move will come with the realization that, while aggressive expansion will buy market share, it will also lengthen the DRAM industry downturn.

Semiconductors Asia/Pacific

Market Analysis

1997 Regional Review: Semiconductor Industry in Asia/Pacific

Abstract: *This Perspective provides a summary of the Asia/Pacific semiconductor industry news in 1997 and provides insight to the financial turmoil happening in the Asia/Pacific region.*

By C.S. Kim

Asian Currency Crisis

Dataquest believes the currency devaluation in some of the countries within the Asia/Pacific region will have varying positive and negative effects on semiconductor consumption in the region. The countries primarily affected and discussed here are Korea, Taiwan, Singapore, Thailand, Malaysia, Indonesia, and the Philippines. Note that the Hong Kong dollar remains the least vulnerable currency and it was seriously attacked by speculators only after the Southeast Asian devaluation, but then to no avail. Dataquest also believes Taiwan's electronics industry will fare well in this crisis, primarily because a larger percentage of components is supplied locally and because its financial sector is stronger than in these other countries.

In the short run, numerous companies selling equipment or semiconductor components to these countries report difficulty in getting payment from their channels. Consumption of end equipment such as PCs, cellular phones, and color televisions will be affected, but these are small, developing markets relative to worldwide consumption. Since last year, Dataquest has observed a deceleration of growth in Southeast Asia and an acceleration in China. China's electronics equipment production will grow at nearly 20 percent this year and is now the largest semiconductor market in Asia/Pacific. China now represents a huge consumer of communications and computer equipment, with 25 percent of all personal computers

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

purchased in Asia/Pacific and growth exceeding 40 percent. Although electronics consumption may be lower than previously expected in selected countries, the region as a whole will continue to enjoy the fastest growth rates in the world.

The long-term impact on overall semiconductor consumption in Asia/Pacific is better understood from a company-level view. Companies in the affected Asian countries, which rely primarily on imported components, are experiencing increased costs because of their weaker local currency. However, if their finished products are exported, then this cost increase can be reversed because more local currency is received for the same U.S. dollar price.

If an electronics manufacturer receives components through internal transfer or global sourcing agreements (billed out of headquarters) and exports its finished product, then it benefits significantly—it has no cost increase, yet does have increased revenue (in local currency). So which situation is more common in Southeast Asia? The majority of production in these countries is exported rather than shipped locally. However, most components are imported from Europe, Japan, or North America, and the lion's share of these semiconductors is imported by multinationals that either have global procurement agreements or receive large amounts of transshipments from other subsidiaries.

Although recent trends show increased shipments to Southeast Asia from manufacturers based there, this output represents less than 15 percent of total production. Exports have and will continue to drive electronics production in Asia/Pacific and, therefore, strong semiconductor demand. Weaker currency means more expensive parts for some, but all will have more competitive exports. Although certain companies may be hurt, aggregate demand will not be damaged and could well be helped in the long run.

First Quarter: Semiconductor Companies' Activities

TSMC and SST Sign Licensing Agreement for Embedded Flash

Silicon Storage Technology (SST) and Taiwan Semiconductor Mfg. Co. (TSMC) have signed a technology licensing agreement covering the design, manufacture, and distribution of embedded flash memory products based on SST's SuperFlash technology. Under the licensing agreement, SST has granted TSMC a license to use SST's SuperFlash technology to provide customers access to embedded flash applications.

More and more electronic applications are memory hungry. The need to drive down chip count to reduce costs, save space, and limit weight couples with benefits such as reduced power consumption and improved system quality and reliability. The fundamental markets driving embedded applications actually remain strong. From an applications point of view, embedded flash can naturally be integrated with the microcontroller, digital signal processor (DSP), or ASIC for use in such applications as analog

 ©1998 Dataquest

storage devices, smart card ICs, and programmable logic devices. Chips with embedded flash memory can be incorporated into a wide range of computer, communications, and consumer products.

SST's SuperFlash technology uses a thick-oxide process with fewer manufacturing steps that results in higher yields and offers significant cost benefits for embedded applications. The two companies are developing a proprietary process to allow significant amounts of embedded flash to be used without the die size penalty of traditional two-transistor thin-oxide cell embedded EEPROM flash technology. The licensing agreement covers process technologies with 0.5-micron, 0.35-micron, and smaller geometries. TSMC is planning the launch of 0.25-micron logic, embedded DRAM, SRAM, and flash processes in the fourth quarter of 1997. TSMC has affirmed its commitment to providing its customers with early access to advanced technology.

The licensing agreement has granted TSMC a license to use SST's SuperFlash technology to make embedded flash applications available to its customers. This embedded flash process will enable the customers to design application-specific standard products that integrate the appropriate amount of memory at the speed required. Dataquest expects that TSMC will provide a final solution to volume production in the vast array of applications with embedded SuperFlash technology.

Korean 16Mb DRAM Production: Slowdown or Excess Inventory?

Two months ago, three Korean DRAM vendors, Samsung Electronics Company Ltd., LG Semicon Co. Ltd., and Hyundai Electronics Industries Co. Ltd., announced a 30 percent reduction of their 16Mb DRAM output. At the time, the 16Mb DRAM production of the three Korean vendors constituted about 30 percent of the total worldwide 16Mb DRAM market. If production cuts actually reached 30 percent as announced, the three companies' 16Mb DRAM market share should have declined to about 25 percent. In January 1997, the contract price of 16Mb DRAM was $6.50 to $7.00 in Japan, and currently the price has risen to above $9.00 because of production slowdowns. The DRAM makers hope to raise the price to between $11.00 and $12.00.

Dataquest believes that the reduction has occurred in the shipment numbers of the three companies and not in their unit production. Dataquest has observed that their materials purchasing patterns have not changed. Although the volume of their silicon wafer purchases has occasionally dipped, this is probably because the shrink versions of their chips consume fewer wafers. An 8-inch wafer with 0.35-micron technology usually produces 200 to 220 16Mb DRAM dice, but the number increases to 430 to 450 when the shrink chip design is applied. The production rate for the three companies might have decreased by 10 to 20 percent, but not by 30 percent.

The Korean companies are carefully monitoring the spot market prices and have controlled their shipments. Last year, they had retained a huge inventory of 16Mb DRAM parts and had begun releasing the inventory at very low prices in May 1996. By the end of January 1997, the three

 ©1998 Dataquest

companies had reduced their inventory to a reasonable level; however, because of the recent cutbacks, inventory has again accumulated to between one and a half and two months' worth of production. All DRAM vendors and users are very much interested in when the three Korean vendors will choose to release this inventory. If they release their inventory all at once, the flood will likely cause prices to go down rapidly. Thus, Dataquest believes the companies will release their inventory in measured amounts in order to keep prices relatively high.

The bottom line on price might also depend on the dumping issues raised by the Europeans. The Korean vendors will try to maintain a minimum price that is as high as possible when they finally release the inventory. Dataquest estimates that the minimum price might be $8.50 to $9.00. The timing for the release of their inventory could be around the end of April and the beginning of May, when Japanese DRAM manufacturers enter into a holiday season, known as Golden Week. This happened last year at about the same time, and 16Mb DRAM prices dropped dramatically. It may happen again this year.

Second Quarter: Semiconductor Companies' Activities

Singapore's Ninth Wafer Fab

Chartered Semiconductor Manufacturing (CSM) entered into a joint venture with Hewlett-Packard Company and the Economic Development Board (EDB) to build Singapore's ninth wafer fabrication plant. The new company, Chartered Silicon Partners, will cost over $1 billion. CSM, a subsidiary of government-owned Singapore Technologies, will be a majority shareholder, while HP and EDB will each take minority stakes. CSM plans to make ASICs for HP, besides serving as a chip foundry for other customers. The plant is expected to be completed by early to mid-1999. It will manufacture 30,000 eight-inch wafers per month using process technology of 0.35 micron and below.

This announcement is in line with Singapore's strategic intent to have 25 wafer fabs by the next decade. CSM is building its fourth plant, in addition to two existing fabs in operation and a third expected to begin production by the end of 1997. These fabs offer a range of processes in logic, analog, volatile and nonvolatile memories, and embedded logic/memory.

In 1995, CSM held the fifth-largest SCM worldwide market share with revenue of $285 million. CSM's Fab No. 2 is capable of making up to 40,000 eight-inch wafers, utilizing a 0.35-micron process. Dataquest predicts a 25 to 30 percent oversupply in overall semiconductor contract manufacturing capacity by 1999, with the exception of 0.25-micron process technology.

Worldwide ASIC consumption is estimated to grow 60 percent from 1996 to 1999, with ASIC designs of less than 0.3-micron expected to hit the mainstream by then. Because CSM has planned a process technology road map down to 0.18 micron, CSP will be capable of moving to more advanced process technologies later. By the time CSP begins operations in 1999, it may

 ©1998 Dataquest

be well positioned to capitalize on a demand rise for ASICs and shortages in the 0.25-micron process.

TSMC's Big Project Starts: Promise for a New Park's Success

President Donald Brooks of TSMC led several vice presidents and top managers to Tainan County (120 miles south of Hsin Chu Science-Based Industrial Park) to visit with Mayor Chen and his staff last week. The parties discussed Tainan county government support for the Tainan Science-Based Industrial Park (TSIP). Details of the infrastructure plans and other TSMC requirements for its new wafer fabs to be built in the industrial park have been addressed.

TSIP Manufacturing Center, TSMC's U.S.$15 billion, 10-year project is now officially underway. The company has completed the procedures to acquire a 100-acre parcel of land in Tainan Science-Based Industrial Park. The next TSMC 8-inch fab (Fab 6) will be built in TSIP. Fab 6 will require investment of U.S.$145 million and is scheduled to break ground by the end of this year. In the next 10 years, TSMC will build six more advanced wafer fabs (12 inches) in TSIP.

There are two Taiwanese semiconductor companies acquiring land in TSIP after TSMC. United Microelectronics Corporation has more than 85 acres of land for a new fab and for the company's subsidiaries, including LCD panel and printed circuit board (PCB) manufacturing. Mosel Vitelic Inc. has a 64-acre parcel for the company's new 12-inch fab and testing and assembly facilities. More investments will be clarified by the end of this year.

TSIP is being offered with tax incentives and research and development grants for companies by the Taiwanese government. The branch office of the Industrial Technology Research Institute and National Cheng-Kung University and Chung-Shan Universities in the Tainan area will provide technological support and human resources for companies locating in the park, following the same model as ITRI and Tsing-Hwa and Chio-Tung Universities in the Hsin Chu area. Tainan County will also provide several alternative projects to satisfy investors' needs. Dataquest expects that other Taiwanese semiconductor companies, and foreign companies, will invest in TSIP.

After two strong expansion years in Taiwanese semiconductor capital spending (1994 to 1995), followed by an essentially flat 1996, Taiwanese semiconductor companies will see another surge of "fab fever" in next 10 years. Taiwan is clearly the new major production growth area. As Dr. Michael E. Porter of Harvard University pointed out in his address in Taiwan two weeks ago, Taiwan has the development potential to become the Asia/Pacific technology center.

The Taiwanese semiconductor companies' investments show their long-term development commitment and will make a significant contribution to their homeland rather than to others. The investments also promise that TSIP will become another semiconductor manufacturing center in Taiwan and win the same reputation that Hsin Chu Science-Based Park has in the industry.

These new science-based parks illustrate the future of the Taiwanese semiconductor industry—"Silicon Island."

Hyundai Announced 1Gb Synchronous DRAM

Hyundai officially announced the successful development of a fully working die 1Gb synchronous DRAM chip using the new silicon-on-insulator (SOI) technology. The actual chip can store an amount of information equivalent to over 8,000 newspaper pages, 160 books (320,000 two-hundred-word pages), 400 still pictures, or 16 hours of audio data.

Hyundai is the world's second chip producer to develop a fully working die, following Samsung, which demonstrated its sample last year. The Hyundai chip, however, is the world's first 1Gb DRAM developed on the SOI technology. Simply put, in this new technology, circuits are designed on a silicon layer superimposed on an insulator, which in turn is put on the ordinary bulk wafer.

The main merit of the SOI wafer is low power consumption, a key requirement for high-performance chips. The new chip consumes less power than Samsung's because the insulator placed between the two silicon layers minimizes electrical leakage. The Hyundai chip can operate on power of 1.8V, while Samsung's bulk wafer-based chip operates on 2.5V. Lower power consumption will be increasingly important because the trend in the electronics industry is toward portable equipment, such as notebook PCs. The new technology also enhances a chip's data processing speed. The maximum data processing speed of the Hyundai chip is 15ns, about 20 percent faster than Samsung's. Hyundai invested W 55 billion in the 1Gb DRAM project, employing 170 key researchers for two years.

Dataquest estimates that Hyundai's new chip has shown to the world chip industry that SOI technology, which has thus far been used for nonmemory chips, can also be used for memory-chip production. The SOI-based chip may emerge as the dominant chip structure in the future because it lends itself to development of what is called merged memory logic (MML) chips, logic chips embedded with memory chips. MML chips are increasingly used in building electronics devices because they can reduce equipment size.

Dataquest forecasts that Hyundai's 1Gb DRAM will first be used on future-generation PCs and workstations. It will also find its way to other products that require the ability to process vast amounts of data rapidly, such as videoconferencing systems with interpretation ability, medical systems, satellite telecommunications, personal digital assistants, high-definition TV, 3-D graphics, and other future digital multimedia products. The new chips will be commercially available around the turn of the century, with full-scale production forecast for around 2005.

CSM and Toshiba Enter Embedded DRAM Agreement

Chartered Semiconductor Manufacturing Pte. Ltd. and Toshiba Corporation entered into a five-year agreement that calls for technology and manufacturing cooperation on embedded DRAM. Toshiba will license its embedded DRAM technology, beginning with a 0.35-micron process and later migrating to a 0.25-micron process. After process qualification, CSM will manufacture embedded DRAM products for Toshiba by early 1998 in CSM's new Fab 3. Embedded DRAM is targeted at graphics and portable applications that require low power consumption.

CSM is among the first wafer foundries to obtain access to embedded DRAM technology from a major application-specific IC (ASIC) vendor. Embedded DRAM is a key component of system-level integration (SLI), the fastest growth area for ASIC products. Dataquest expects embedded DRAM to make up more than a quarter of the total market for SLI ASIC products by the year 2000. The SLI ASIC market is expected to exceed $15 billion in that year.

Products manufactured by CSM will use Toshiba's 1T DRAM ASIC technology. This technology is based on a one-transistor DRAM cell structure. The 0.35-micron 1T family can incorporate up to 32Mb, and the 0.25-micron 1T family offers memory capacity up to 128Mb. This partnership allows CSM to enter the fast-growing embedded DRAM market and at the same time enables Toshiba to secure a reliable second source. In the longer term, it is expected to provide CSM with additional capabilities to manufacture SLI ASIC products.

Third Quarter: Semiconductor Companies' Activities

UMC Signs Former TSMC President Don Brooks

United Microelectronics (UMC), Hsinchu, has hired the former president of Taiwan Semiconductor Manufacturing Company (TSMC), Donald Brooks. Mr. Brooks will become a member of the UMC board and president of the newly formed international operations unit, based in Sunnyvale, California, and will report to UMC president John Hsuan. Also, he will be responsible for United Foundry Services, another new operation supporting UMC's U.S. business. His extensive role in the company will include serving as vice chairman of the three foundry joint ventures (United Semiconductor, United IC Corporation, and United Silicon), and management of UMC's venture capital operation.

Mr. Brooks resigned from TSMC two months ago, saying he wanted to return to the United States to spend more time with his family. He explained his decision to join UMC in an open letter to the employees of TSMC, stating that the move provides an opportunity "to live in the United States, to be involved in the semiconductor industry with a dynamic company, and to continue to develop my relationships with the Taiwan people."

Don Brooks is a fine catch for UMC. During his six-year tenure at TSMC, he led a small, unprofitable company struggling for success with a newly conceived business model to worldwide preeminence as a dedicated foundry. He brings this experience and a long career in the semiconductor industry to UMC at a time when the company has shifted its strategy to a greater focus on the wafer foundry business. The addition of Mr. Brooks to the executive management team complements UMC's strategy quite nicely and makes it a force to be reckoned with in the foundry market.

Mr. Brooks has a well-established network of contacts in the U.S. semiconductor community, among fabless IC design companies and IDMs alike, and this will prove to be a valuable asset for UMC in its efforts to penetrate the U.S. semiconductor contract manufacturing market. His thorough understanding of business practices in Taiwan, coupled with these personal relationships, will give UMC an excellent facilitator between the factory and its U.S.-based customers. The foundry supplier/customer relationship is a strategic one, and it is fundamentally built on trust at a personal level. This is where the addition of Don Brooks is sure to make a difference, especially in the U.S. market.

TSMC has dominated the wafer foundry game in recent history, with UMC and Chartered never really mounting a serious challenge. With the signing of this star player, UMC might have a real shot at the championship, or at least an undisputed second place.

Samsung Semiconductor Opens European ASIC Design Center

Samsung Semiconductor has opened a ASIC design center in Schwalbach near Frankfurt, Germany. The center will serve both the German and wider European markets. A major focus will be the integration of Alpha and ARM processors, DSP, and memory into system-level ASICs.

This opening follows nine days after Cypress Semiconductor opened a major design center in the United Kingdom. These are only two examples of a stream of multinational semiconductor and electronic systems companies establishing design centers in Europe—mostly in Germany and the United Kingdom. Looking to the future, the problem beneath the surface is the continued availability of design engineers and the rate at which engineers are produced by the university system. At least these high-profile design centers have served to trigger much productive debate here among companies, governments, and the academic community.

The opening of the Samsung design center marks the real start of that company's ASIC operations in Europe. At first sight, ASIC may appear to be a strange market for a memory company to enter, with little synergy with existing operations. However, as the concept of system-on-a-chip (system-level integration) moves closer to reality, the ability to integrate processor cores, logic, and memory (especially DRAM) becomes critical. Furthermore, few vendors have embedded DRAM capabilities.

Samsung is clearly pushing forward with its nonmemory products with an emphasis on Alpha processor and ASIC solutions. Recognizing the need for a substantial library of system-level macros, SLMs, also known as intellectual property (IP) cores, the company has already forged links with Digital Equipment Corporation, Advanced Risk Machines, and the DSP Group, and has developed compatible macros for its cell-based process.

Armed with this library of SLMs and a proven high-density one-transistor DRAM technology, Samsung is well placed to enter such major European applications markets as GSM cellular handsets, LAN hubs/switches, and automotive.

Dataquest believes Samsung has and can acquire the technology needed for these markets but this is far from guaranteeing market success. The organization and culture of an ASIC supplier is radically different to a commodity memory vendor. Interfaces and communication channels need to be developed with customers' design groups rather than primarily with purchasing functions. Support and logistics requirements are very different. A dedicated salesforce may be needed. Samsung has the capability to make major gains in the emerging system-level ASIC market, but it must be prepared to give its ASIC specialists and marketers the flexibility they will certainly need to guarantee that success.

Three Korean Semiconductor Companies Increased 16Mb Synchronous DRAM

Three Korean semiconductor manufacturers—Samsung, Hyundai, and LG Semicon—produced synchronous DRAM totaling about 10 percent to 15 percent of their 16Mb DRAM at the end of 1996; they have currently increased their synchronous DRAM by 30 percent to 40 percent and hoped to increase synchronous DRAM production by 50 percent to 60 percent in the fourth quarter of 1997.

These three Korean semiconductor manufacturers depended heavily on memory semiconductor manufacturing. They considered a few plans to escape the difficult situation with DRAM, whose price is not stable because of the entrance of Taiwanese companies into the market and the increase in Micron's 16Mb DRAM. First, they wanted to try to balance their semiconductor production between memory and nonmemory products. Second, they wanted to strengthen their synchronous DRAM coming up to the surface of the 16Mb DRAM market.

Dataquest estimates that the three companies needed far more time to balance their production between memory and nonmemory because of their nonmemory technology. But they may be successful in keeping their DRAM market share as an expansion of synchronous DRAMs because DRAM lines for the fast page mode and extended data out devices can switch to synchronous DRAMs by process additions and changes.

Fourth Quarter: Semiconductor Companies' Activities

What Will the UICC Fire Mean for Equipment Companies?

The fire a week ago at UMC's second joint venture, United Integrated Circuits Corporation, essentially rendered unusable some wafer fab equipment. The total damage was estimated by UMC to be about $421 million. Given the severe structural damage to the building, Dataquest's guess is that some $200 million to $250 million worth of equipment was included. Dataquest has been asked recently if the equipment suppliers will benefit.

On the surface, the immediate impulse would be to point out that the equipment has to be replaced, and this means some added revenue eventually to the equipment companies. Putting this into perspective, however, reveals that it is not that big an issue: $250 million is only a little over 1 percent of the annual shipments of wafer fab equipment today, so it is not going to make anybody rich.

Furthermore, in the near term, it may actually be more disruptive than otherwise. UICC was clearly a fab in a ramping mode, with equipment deliveries scheduled continually over the next months. There is now no fab to ship to, however, so there is a level of uncertainty in the market. It is likely that much of the equipment planned for UICC will be redirected to UMC's other joint ventures, and there are indications that plans are already changing for acceleration of the expansions at both United Semiconductor (JV1) and United Silicon (JV3).

Dataquest's bottom-line assessment is that some names will change on the equipment, and the near-term impact will be minimal. The positive benefit will not likely be seen for nine to 12 months, and then be quite diffused and not noticeable. This is not a conclusion that favors those looking for sensationalism in this event, but it will probably be close to reality.

ProMOS Technologies Opens Chip Plant in Taiwan; Starts High-Volume 64Mb DRAM Production

ProMOS Technologies Inc., a joint venture of Mosel Vitelic and Siemens AG, celebrated the formal opening of its new wafer fab in Hsinchu, Taiwan. The 8-inch wafer facility enables both partners to begin high-volume 64Mb DRAM production.

The joint venture, formed only 11 months ago, represents a total capital investment of around $1.7 billion over three years. ProMOS employs 1,100 people and should have been running at full capacity by the end of 1996, beginning with 20,000 8-inch wafer starts per month of its initial product, the 64Mb DRAM chip on 0.35-micron technology. The 64Mb DRAMs are based on a technology that Siemens developed with IBM and Toshiba. Within the next three months, Mosel Vitelic and Siemens will expand their 64Mb portfolio with the release of configurations of 64Mb synchronous DRAMs (SDRAMs).

In September, Mosel Vitelic signed a contract under which Siemens will deliver to Mosel Vitelic 50 percent of the output of 16Mb DRAM and SDRAM from Siemens's new plant in North Tyneside, England. However, with the current unsteady price of 16Mb DRAM, this addition may not actually increase Mosel Vitelic's earnings. With the ProMOS joint venture, Mosel is preparing for 64Mb DRAM. Initially, the agreement calls for both Mosel Vitelic and Siemens to purchase ProMOS products for resale. Sixty-two percent of ProMOS's 64Mb DRAM will be labeled with Mosel Vitelic's brand name.

 ©1998 Dataquest

Mosel Vitelic has also licensed 256Mb manufacturing technology from Siemens and may participate in IBM, Toshiba, and Siemens' DRAM joint development project, but an agreement has not yet been reached. If its participation is granted, Mosel Vitelic is expected to become the first Taiwanese company to acquire 1Gb DRAM technology. The cooperation in both original technology and joint-venture manufacturing between Mosel Vitelic and Siemens is significant. Other partnerships involving Taiwanese companies include Texas Instruments Inc./TI-Acer, Toshiba/Winbond Electronics Corporation, and Mitsubishi Corporation/Powerchip Semiconductor Corporation.

Mosel Vitelic was the first Taiwanese company to license Japanese technology when it opened its 6-inch-capable wafer fab with transferred and licensed DRAM technology from Oki Electric Industries Company Ltd., in 1994. Today, Mosel Vitelic is the first Taiwanese semiconductor company to set up a joint-venture company with a European semiconductor company. The result is the first Taiwanese facility to produce 64Mb DRAM.

Korean Companies Intensify Efforts for Next-Generation DRAM

Searching for the right path for next-generation DRAM, Korean DRAM manufacturers are intensifying their efforts to develop high-speed DRAM that can improve PC performance. Samsung announced that it has developed the world's first 64Mb double data rate (DDR) SDRAM, while LG Semicon announced it has begun mass production of the world's fastest 18Mb Rambus DRAM (RDRAM).

Samsung's DDR SDRAM, as its name indicates, has a data rate double that of synchronous DRAM (SDRAM), the current high-end DRAM for PCs. DDR was proposed by a group of DRAM companies, including Samsung, as an alternative to Direct RDRAM and was standardized by the Joint Electronic Device Engineering Council (JEDEC) last summer. Samsung played a leading role in the standardization process and is the first company to develop DDR SDRAM based on the standard.

While Samsung is focusing on DDR SDRAM, LG Semicon is putting more weight on Direct RDRAM. Direct RDRAM, although capable of offering higher data rates than DDR SDRAM, is expected to be more expensive to produce because of its larger die size and an associated licensing fee. According to some DRAM manufacturers, Direct RDRAM will be about 20 percent more expensive than SDRAM, a large cost penalty. This characteristic has made Samsung and other DRAM makers stop short of fully committing themselves to Direct Rambus, even though the technology has been endorsed by Intel Corporation.

The Direct RDRAM specification has only just been announced, and there has not been enough time since the development effort was started for manufacturers to produce working Direct Rambus parts. How then can LG Semicon demonstrate its commitment to the Rambus technology? LG Semicon has begun mass production of the predecessor to the Direct Rambus, the 18Mb RDRAM, which is already being used for graphics memory in PCs. LG Semicon expects RDRAM to rapidly take market share from synchronous graphics DRAM (SGDRAM) in the graphics memory market. Although LG Semicon is making a push for its RDRAM in the graphics market, the company's main concern lies in introducing Direct RDRAM to the main memory market as early as possible. RDRAM is the technology base that is being used by Rambus Inc. to develop Direct RDRAM.

Samsung and Hyundai also support Direct RDRAM and are working to develop it, but LG Semicon appears to be much more strongly committed to this technology. Direct RDRAM is generally expected to debut in 1999, but LG Semicon is determined to develop it in the first half of 1998 and establish leadership in the development and production of the new chip. One of the first companies to license RDRAM technology from Rambus, LG Semicon hopes its long development experience with RDRAM will help it attain this goal.

Another Taiwanese Company Licenses DRAM Technology

Macronix International Company Ltd. entered the DRAM market through a technology alliance with Matsushita Electric Industrial Co. Ltd. Matsushita licensed its 16Mb and 64Mb DRAM technology to Macronix, which will manufacture 16Mb DRAM on a foundry basis and then sell the output to Matsushita. Macronix expects to begin manufacturing of 64Mb DRAM in 1998. Macronix's long-term goal is not to be a commodity DRAM manufacturer, but to use its own logic process with Matsushita's DRAM technology to develop and sell a line of embedded memory devices under Macronix's brand name.

Macronix's agreement with Matsushita will help in two ways. The immediate benefit is that adding standard 16Mb DRAM to Macronix's product mix will help increase the utilization rate for its new 8-inch fab. The long-term benefit is that it adds strategically to Macronix's intellectual property portfolio. Companies with the most reusable intellectual property should have an advantage in the embedded memory market. Macronix already has experience with mask ROM, EPROM, and flash memory technologies, and it is adding DRAM capability with this agreement. It should be possible for Macronix to use its logic capability to add SRAM technology. When combined, this gives Macronix the building blocks needed for embedded memory.

Having the building blocks, however, doesn't ensure success. Many DRAM, SRAM, and nonvolatile memory companies are looking at ways to improve their own revenue stream and fab utilization with embedded memory products. From the logic side, ASIC and ASSP vendors are adding memory technology to their product portfolios. The embedded memory market promises to be very crowded. Success will depend not only on having all memory technologies and a process that optimizes for both logic and memory, but an ability to get design-wins. The design-win mentality may ultimately be the hardest addition for most memory companies because of their experience selling standard, commodity products.

Dataquest Perspective

South Korea and the International Monetary Fund (IMF) have agreed to a rescue package totaling $57 billion. South Korea agreed to implement IMF-recommended measures to revitalize its faltering economy in return for accepting the bailout fund. Even with the agreement, there are fears that the bailout may not succeed and that Korea's links to other Asia/Pacific countries may endanger those countries as well.

With the stringent management and restructuring requirements of the IMF bailout, the Korean semiconductor industry is planning to cut 1998's capital investment by 30 percent to 50 percent, compared to 1997. Korean DRAM manufacturers fear that their cutbacks could result in a drastically dwindling share of the world market, with market share lost particularly to Japanese and Taiwanese companies. The threat of shrinking market share is something Korean DRAM manufacturers haven't been accustomed to; they have enjoyed steady market share growth since 1990.

Samsung, currently the world's leading DRAM producer, is expected to implement a 30 percent cut in overall investment and is considering further cuts. Samsung's plans are to earmark W 800 billion to W 900 billion for semiconductor and LCD investment next year and W 400 billion to W 500 billion on research and development. LG Semicon and Hyundai are also cutting back investment. LG Semicon plans to lower investment by 30 percent, or W 1.05 trillion to W 1.10 trillion for next year, while Hyundai is considering a 40 percent cut. As with Samsung, both LG Semicon and Hyundai have yet to make their investment plans final.

What impact will these cutbacks have on projects already under consideration? LG Semicon is expected to delay the construction of its second LCD plant in southern Korea. LG Semicon and Hyundai are re-examining their plans to construct DRAM fabs in the United Kingdom, although both expect to go ahead with plans as scheduled. Most expansion plans for DRAM fabs in the United States by Samsung, LG Semicon, and Hyundai are expected to be suspended. Dongbu, which earlier this year announced plans to enter the semiconductor industry, decided to postpone this indefinitely, citing difficulties in borrowing money.

It will take one to two years for cutbacks in Korean investment to make a significant impact on company market share and DRAM industry capacity. There is more than enough capacity already to support current demand, and as all manufacturers continue to shrink their 16Mb and 64Mb devices, industry overcapacity will continue through most of 1998 and possibly into 1999. To put device die size into perspective, the average die size of 16Mb DRAM at the end of 1998 will be 60 percent of the average die size of 4Mb DRAM at the end of 1995.

Taiwanese DRAM manufacturers will have a significant impact on when the market comes into balance. If Taiwanese companies continue with their aggressive expansion, the equilibrium point may be pushed out three to six months, well into 1999. Before the IMF actions, the Taiwanese companies

 ©1998 Dataquest

planned to increase capital spending in local currency (NT$) by 10 percent. In U.S. dollar terms, this may actually represent declining capital spending because of currency devaluation. The Korean cutback in spending may encourage Taiwanese DRAM vendors to accelerate investment in an effort to take market share away from the Koreans. If Korean companies cut their capital spending as indicated and if Taiwanese companies continue with their capital spending plans for foundry, memory, and joint ventures, Taiwan may surpass Korea in capital spending in 1998. However, not all Taiwanese DRAM vendors are expected to increase capital spending—at this time, Mosel Vitelic, and Powerchip are expected to decrease their capital spending in 1998, and others may follow.

Dataquest believes there is a good possibility that Taiwanese manufacturers will not implement their aggressive capital spending plans. The Taiwanese companies are newcomers to the DRAM industry and haven't experienced prior industry downturns. As they gain experience in the current downturn, they may decide to stop DRAM spending abruptly. This will come with the realization that, while aggressive expansion will buy market share, it will also lengthen the DRAM industry downturn.

Dataquest believes that the currency and financial market problems in Asia/Pacific have a lot to do with speculative investment "bubbles" in property, construction, semiconductors, and other industries, rather than to fundamental manufacturing efficiencies. Asia/Pacific will continue to be a high-growth, efficient exporter of electronic equipment. But it is clear what happens when rapid economic growth goes unchecked by a transparent financial system and clean government regulation: overcapacity and irrational loans.

These bubbles can become so serious as to bring down entire financial systems and impair international confidence, and hence, future economic growth. This situation is what is being witnessed in Korea and Thailand. The impact of electronics production will be weakened by local consumption of information technology products. But electronics exports, the mainstay of semiconductor consumption in Asia/Pacific, will be less affected—a good news for semiconductor suppliers.

Semiconductors Asia/Pacific

Market Analysis

Asia/Pacific Semiconductor Market Forecast, Spring 1998

Abstract: *Dataquest forecasts that the Asia/Pacific semiconductor market will grow 10.3 percent in 1998, totaling U.S.$35.9 billion. By 2002, the Asia/Pacific semiconductor market will total nearly $67.6 billion, which marks a 15.7 percent-plus CAGR for the five-year period from 1997 to 2002. This Perspective details Dataquest's forecast of the Asia/Pacific and worldwide semiconductor market by product.*
By C.S. Kim

Worldwide Semiconductor Forecast Highlights and Assumptions

The following are the key assumptions and highlights of Dataquest's forecast:

- The worldwide semiconductor market will increase by just 8 percent in 1998, totaling U.S.$159 billion. This modest recovery, which is slower than the 1998 growth rate originally expected, follows the slight 3.5 percent growth in 1997. The industry faces its third year of lackluster performance. The Asian financial crisis and the low DRAM pricing will hamper semiconductor revenue growth this year, although some product segments will achieve robust, double-digit growth rates. For 1999, the market should grow by 18 percent to total $188 billion. The long-term growth will be somewhat slower than the prior forecast. By 2002, the worldwide semiconductor market will total nearly $290 billion, which marks a 14.4 percent compound annual growth rate (CAGR) for the five-year period from 1997 to 2002 (see Table 1).
- Worldwide PC unit shipments will increase by just 15 percent in 1998 and exceed 90 million units. PC revenue will grow by just 6.4 percent this year—however, in part, attributed to the emergence of the sub-U.S.$1,000 PCs. For the long term, the semiconductor forecast assumes that

FILE COPY:
MARIA VALENZUELA

Dataquest
Program: Semiconductors Asia/Pacific
Product Code: SEMI-AP-DP-9805
Publication Date: June 1, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

worldwide PC unit shipments will grow at a 16 percent CAGR for the five-year period and total nearly 170 million units for 2002. PC revenue, however, will grow at a slower 9 percent CAGR because of the declining PC prices.

- The semiconductor industry should retain a long-term vitality. PCs, communications, and consumer electronics will continue to rank as the most important semiconductor application markets. The trend toward system-level integration (SLI) bodes well for the industry. The impact of information technology (IT) market challenges, such as the year 2000 problem and European Monetary Union, remain uncertain. Their effects on the semiconductor market will, however, likely "filter" through their impacts on the PC, communications, and related equipment sectors.
- The Asian financial crisis means somewhat-lower near-term and long-term expectations for Japan and Asia/Pacific. Japan will remain behind the Americas as the world's second-largest semiconductor consumption market until 2000, when Asia/Pacific should surpass Japan.
- As the central processor in the PC, the x86 architecture serves as the major driving force of the PC and microprocessor (MPU) markets. As expected, the MPU market growth will start to moderate following the extremely high-growth 1992-to-1997 period. For 1998, the worldwide MPU market will increase by just 15 percent, with a 16 percent CAGR from 1997 to 2002.
- Microprocessors in embedded applications will continue to fuel MPU growth for a wider array of vendors. For example, growth in video games, communications, and Internet appliances continues to drive the embedded RISC market.
- Digital signal processors (DSPs) rank among the highest-growing semiconductor products. These devices are the centerpiece of communications electronics (such as cell phones), modems, and the emerging consumer digital electronics. The worldwide DSP market should grow at a 25 percent CAGR from 1997 to 2002.
- Memory IC trends, especially DRAM pricing, serve as a key swing factor in both the near-term and long-term forecasts. In 1998, the worldwide memory market should grow by a scant 1.4 percent; the DRAM market will decrease by just 1 percent in 1998.
- There will be a continuing DRAM capacity oversupply through most of 1999. The long-term forecast, however, explicitly assumes a DRAM capacity shortage by 2000 and a DRAM market surge for 2001. Associated assumptions are excess DRAM capacity by 2002 and a cyclical DRAM market downturn that year.
- Cell-based ICs (CBICs) will continue to be a fast-growing logic product market and the product of choice for SLI. By contrast, gate arrays are entering the declining phase of the product life cycle.

Asia/Pacific Semiconductor Forecast Highlights and Assumptions

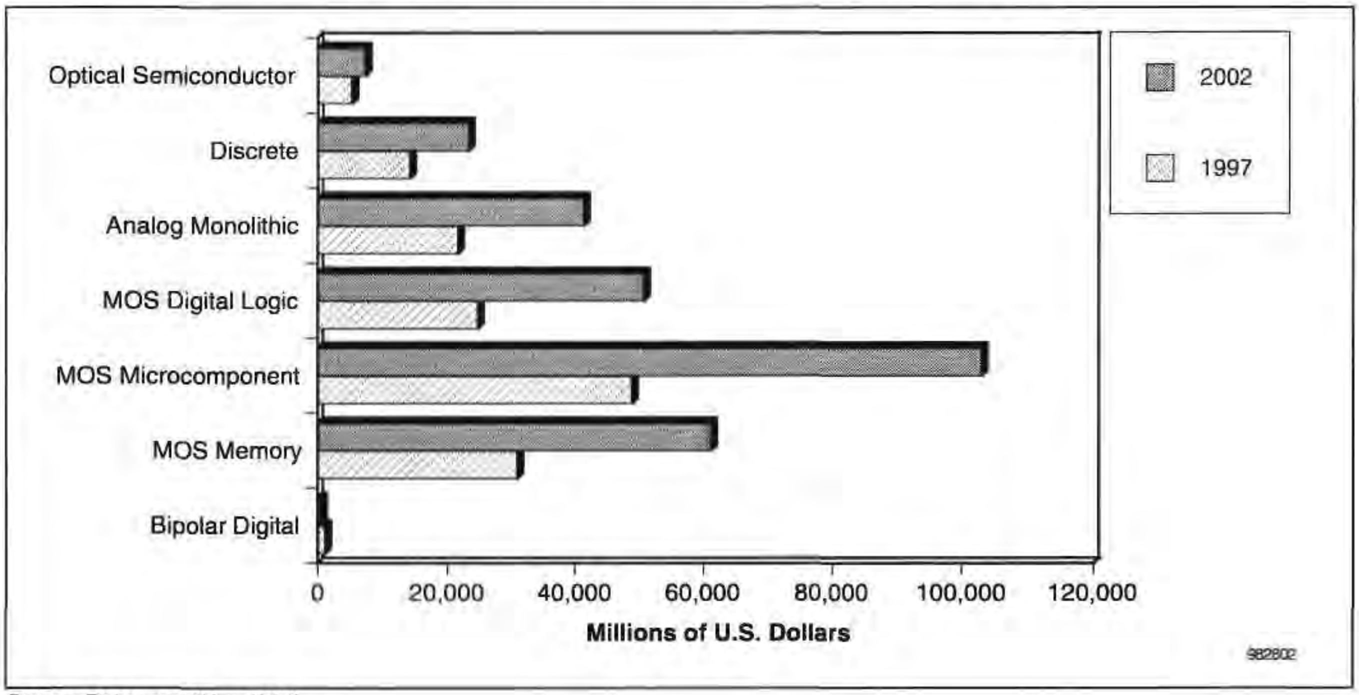
The forecast calls for the Asia/Pacific semiconductor market to grow at a 15.7 percent CAGR for 1997 through 2002, which is slower than prior expectations. The market should grow by 10.3 percent this year to total $35.9 billion and $67.6 billion by 2002. The following assumptions guide this forecast.

The Asian financial crisis will have varying effects on semiconductor consumption in the region—many are negative, but some are positive. In addition, the effects differ markedly on a country-by-country basis. For example, growth in countries such as Indonesia, Thailand, and the Philippines has decelerated, while it has accelerated in China and Taiwan. Taiwan's electronics industry will fare well in this crisis, primarily because of its large percentage of locally supplied components and its strong financial

 ©1998 Dataquest

sector. Figure 1 illustrates the worldwide semiconductor market by product from 1997 to 2002.

Figure 1
Product Comparison, Worldwide Semiconductor Market, 1997 and 2002



Source: Dataquest (May 1998)

All semiconductor vendors are watching China. China's electronics equipment production will grow nearly 20 percent this year. China now stands as the Asia/Pacific's largest semiconductor market. China represents a huge communications and computer equipment consumer, accounting for 25 percent of all PCs purchased in Asia/Pacific. China's PC unit growth exceeds a 40 percent annual rate.

Although electronics consumption may be lower than previously expected in selected countries, the region as a whole will continue to enjoy the fastest growth rates in the world.

The semiconductor market for PC applications represents more than one-third of all semiconductor consumption and will continue as the key for semiconductor growth. The Asia/Pacific PC production will continue to maintain a steady growth over the forecast period. The Asia/Pacific PC production should total 23 million units in 1998. The region's PC production growth will be attributed to Pentium II, DVD, 3-D graphics, Windows NT, and Windows 98. Although much of the production gets shipped elsewhere worldwide, PC unit consumption in the region should increase by more than 20 percent this year to reach 12 million units.

In the long term, Dataquest expects the region's most important semiconductor demand driver, the PC, to sustain a solid growth in Asia/Pacific's production unit, with a CAGR of 23 percent in the five-year

 ©1998 Dataquest

forecast period. As a result, the Asia/Pacific PC production will exceed 45 million units in 2002. The motherboard production will also continue its pace in the region.

In regional consumption, the Asia/Pacific PC unit consumption will grow at a 25 percent CAGR in the period and total 30 million units in 2002. PC revenue will grow at a slower, but still impressive, 20 percent CAGR.

The communications equipment manufacturing will also generate outstanding semiconductor growth in Asia/Pacific in the forecast period, which will support the demand growth for ASICs, DSPs, ASSPs, and analog ICs. In the near term, most of the Asia/Pacific semiconductor market for communications equipment in 1998 will be driven by mobile and wireless communications. Digital consumer electronics products, such as digital set-top boxes, will also begin to contribute significantly to overall semiconductor demand.

The demand for discrete and optical semiconductors should be lower in 1998 than originally expected because of sluggish consumer equipment production, especially digital consumer application. However, these markets will continue to achieve steady growth because of post-1998 recovery in Asia/Pacific production of digital consumer equipment (see Figure 2).

Table 2 shows the Asia/Pacific semiconductor market forecast by product from 1997 to 2002.

Dataquest Perspective

The DRAM market is expected to remain volatile. The DRAM revenue forecast could swing widely for the near term and the long term because of DRAM price fluctuations. DRAM bit consumption continues in line with Dataquest's prior projections, which means that unit demand should be strong, although pricing might remain weak. As indicated, the semiconductor forecast assumes a cyclical upturn in 2001. The DRAM market peak in 2001, however, has been moderated to match similar historical peaks.

The SRAM market is still oversubscribed; however, the analog-to-digital conversion of cellular phones has increased SRAM usage in these phones dramatically. There is a big difference between this market and the PC market, the last big SRAM stronghold. Cell phone manufacturers are much more selective about their supplier base, as they use parts from top-tier suppliers and shy away from small, fabless companies. Dataquest still expects to see attrition in this market because many companies that thrived on an open market for PC cache chips will be excluded shortly from this previously highly penetrable market and will not be able to participate in the cellular telephone market.

The microprocessor market forecast remains largely consistent with prior expectations. As expected, the MPU market will increase this year and over the long term, but at a slower rate versus the 1992-to-1997 period. The x86 architecture will continue its PC market domination. Business PC demand continues to drive MPU demand. The x86 MPU technology advances still stimulate PC demand from the key, early-adopter, repeat buyers.

Non-PC applications, such as digital cellular, digital consumer electronics, and communications, will drive demand for MCUs and DSPs, including embedded versions.

The MOS digital logic market is forecast to reach a 6.7 percent growth in 1998. This is a slower growth than originally expected. Other MOS logic product forecasts have also been lowered. Supply exceeds demand for these products, which means a downward pricing pressure. ASIC product forecasts have been lowered only slightly. CBICs, the SLI product of choice, will continue as the fastest-growing logic product. Gate arrays, however, are under serious pricing pressure and are entering the decline phase of the life cycle. CBICs are displacing gate arrays from high-end applications as PLDs displace gate arrays on low-end applications. This translates into higher long-term growth in the CBIC and PLD segments and lower growth in gate arrays.

The Asia/Pacific analog IC market should grow at a CAGR of 17.5 percent for the 1997-to-2002 period and reach $14 billion by 2002. Looking at the long-term trends to 2002, mixed-signal ICs will experience solid growth, driven by applications such as digital cellular. In addition, new emerging applications in the consumer and communications market will contribute to the growth of mixed-signal ICs. In the more traditional standard linear product area, voltage-regulator products will continue to enjoy strong growth as the demand for smart power continues to grow, especially in the portable electronics markets.

Chapter 1
Executive Summary

The Asia/Pacific semiconductor market will grow by 14.6 percent and total U.S.$36 billion in 1999. The economic crisis in Asia (including Japan) remains a major concern. The Asia/Pacific semiconductor market is expected to grow at a 13.3 percent compound average growth rate (CAGR) for 1997 to 2002, reaching $61 billion in 2002.

Forecast Outlook

Asia/Pacific's semiconductor revenue will grow by 14.6 percent in 1999, totaling $36 billion. This forecast follows an unexpected revenue decline of at least 3.5 percent for 1998. By 2002, Asia/Pacific's semiconductor revenue will total $61 billion, marking a 13.3 percent-plus CAGR for the five-year period from 1997 to 2002.

The semiconductor industry now moves toward the end of its third straight year of lackluster performance. Market watchers previously expected the semiconductor product market to rebound in 1998. The Asian financial crisis and low device prices (such as those for DRAMs, CBICs, and analog ICs) are hindering Asia/Pacific's semiconductor revenue growth this year. Few product segments will achieve more than marginal revenue growth for 1998, and year-end revenue results remain a concern for vendors.

Dataquest's 1999 forecast assumes sluggish demand in Asia/Pacific at best and also stable DRAM pricing. Most product markets will not strengthen until mid-1999, so next year's growth will concentrate in the second half of 1999. In addition, the long-term growth rate is slower than that of the prior forecast.

China/Hong Kong's semiconductor market will grow another 13.6 percent in 1999 and total nearly $7.9 billion. By 2002, China/Hong Kong's semiconductor market will total $15 billion, which marks a 17.5 percent CAGR from 1997 to 2002.

Singapore's semiconductor market will grow by 13.7 percent in 1999 and total $5.4 billion. In the long term, Singapore's semiconductor market will total $9 billion in 2002, which means a 13 percent CAGR for the 1997-to-2002 period.

South Korea's semiconductor market should increase by 13.7 percent in 1999 and reach the $5.7 billion level. By 2002, South Korea's semiconductor market will total $9.7 billion, which is a 12.1 percent CAGR from 1997 to 2002.

Taiwan's semiconductor market will increase by 15 percent in 1999 and reach about the $7.9 billion mark. By 2002, Taiwan's semiconductor market will be about $12 billion, for about 12.3 percent CAGR for the 1997-to-2002 period.

Chapter 2
Introduction and Forecast Assumptions

This Market Trends report contains detailed information on Dataquest's view of the Asia/Pacific semiconductor market, including China/Hong Kong, Singapore, South Korea, and Taiwan.

Exchange Rates

Dataquest's research of electronic equipment markets and semiconductor consumption within those markets combines data from many countries. Most countries use currencies other than the U.S. dollar, and these have fluctuating exchange rates relative to the dollar. Because Dataquest researches electronic equipment production and semiconductor consumption in several regions of the world with the goal of reporting comparable regional values and worldwide market trends, Dataquest uses the U.S. dollar as a common currency for comparisons and aggregation. As a general rule, Dataquest collects data and formulates forecasts in local currencies, and then convert them to U.S. dollars using applicable exchange rates in Table 2-1. Dataquest maintains a database of historical exchange rates, which is updated monthly. Dataquest does not forecast future exchange rates. Instead, Dataquest assumes that future exchange rates will reflect current exchange rates.

Table 2-1
Asia/Pacific Exchange Rates against the U.S. Dollar, 1997 to 1999

	Annual Average 1997	Estimated Annual Average 1998	Forecast Annual Rate 1999 and Beyond
Australia (Dollar)	1.35	1.58	1.62

Asia/Pacific Macroeconomic Outlook

By all indications, Asia's circumstances have worsened. Economic activities have slowed across Asia, and most of the region's economies now find themselves cornered and battered by a flurry of economic ills that defy easy, unilateral solutions. Meanwhile, Asia's troubles are imposing punishing economic strains on emerging economies elsewhere. From Russia and Africa to the Middle East and Latin America, emerging economies outside Asia find themselves struggling with the depressed commodity prices and general wariness of international investors toward emerging markets that have followed in the wake of Asia's turmoil. The 1998 outlook for the world's developing economies has dimmed. Naturally, much of this change reflects the significant downward revision of forecasts for Asia/Pacific's economies. Dataquest estimates that growth among Asia/Pacific's emerging economies, including China, will average just 1.8 percent in 1998. Just when and how Asia will recover remains an open question.

Macroeconomic conditions among the individual economies of Asia/Pacific region range from shaky to disastrous. In many countries, domestic spending has been crushed by high interest rates, and export growth curtailed for want of scarce credit. More importantly, foreign capital inflows have all but ceased, and trade among Asian economies has virtually collapsed. A number of forecasters now believe that resolving matters requires altogether new policies that concentrate on the region as whole, including Japan, rather than individual countries. Such policies would give top priority to reviving intraregional trade and reducing the threat of competitive currency devaluations. Dataquest expects that there will be gradual improvement in emerging Asia beginning next year. Dataquest expects growth among Asian economies to jump to 4.3 percent next year and average upward of 6.0 percent through 2002. Still, these results can hardly be considered a sure bet. Between Japan's distressed state and the apparent antipathy of foreign capital toward the region, Asia's economic future faces significant downside risks. Table 2-2 shows Asia/Pacific countries' gross domestic product (GDP) and consumer price index (CPI).

Asia/Pacific Country Analysis

The Asian financial crisis has cut the GDP growth rates in many countries, especially in Indonesia, Malaysia, South Korea, and Thailand. The monetary depreciation makes the debt counting in U.S. dollars more severe. Foreign-investment withdrawals exacerbated the debt situation. The debt crisis drags on in Southeast Asian and South Korea, and the contagion effect keeps Asia/Pacific's financial markets unsettled. For some of these countries, the governments' foreign-exchange reserves have been depleted, and they cannot afford to pay their short-term foreign debts. Meanwhile, the sluggish Japanese economy is causing a decline in exports for South Asian countries.

China

As a result of sluggish domestic consumption and export demand, China's GDP growth was slowing down to 7 percent in the first half of 1998. The central government raised the value-added tax (VAT) rebates for the exports of seven categories of machinery and electronic products and five categories of manufactured light goods effective from July 1, 1998 to meet its growth target of external trade. The 1998 GDP, as a whole, is forecast at about 7.5 percent, down from 1997's 8.8 percent.

Source: Dataquest (July 1998)

Due to deflation of the Chinese currency, China's renminbi and Hong Kong's dollar remain stable for the short term. Nonetheless, the Chinese renminbi and the Hong Kong dollar are projected to depreciate in the long term to maintain competitiveness with the Southeast Asian countries, which is the same reason as that behind China's 1994 renminbi depreciation.

Singapore

The U.S. dollar appreciation to the Singapore dollar from 1996 to 1997 has affected the balance of payment that is relevant to intraregional trade. The Singapore economy is being adversely impacted by the sharp downturns experienced by its neighboring countries. Economic growth in 1998 has become more dependent on "pump-priming," as the manufacturing sector output remains weak.

Electronics manufacturing growth has been affected by lower demand, overcapacity, and intense price competition. Trade volume is forecast to be negative, as regional demand remains weak and key markets (such as United States and the European Union) maintain only a moderate growth. Although Singapore recorded a 3.8 percent GDP growth in the first half 1998, the regional economic outlook has deteriorated. In July, the government revised the official growth rate downward to 0.5 percent from 1.5 percent for 1998, from its earlier forecast range of 2.5 percent to 4.5 percent.

South Korea

The South Korean economy is running into serious trouble amid rapidly cooling domestic demand and dwindling exports. The South Korean economy is suffering a vicious cycle of production drops and deepening domestic demand. Economic uncertainties and credit squeezes taking place in the course of restructuring have placed immense pressure on domestic demand, and the economy is liable to plunge deeper into recession.

South Korea's 1998 GDP is expected to contract 4.8 percent before turning around at an annual rate of 0.6 percent in 1999, although the government will have to take strong macroeconomic measures. The 4.8 percent contraction, if realized, will be a steep downturn from the negative 4 percent forecast jointly made by the government and the International Monetary Fund (IMF) in July.

Some economists are warning that South Korea could face a second financial crisis, depending on the seriousness of the international economic turmoil. There has been no restoration of international confidence in emerging markets. Troubles could return at any time according to these institutes.

The South Korean domestic economy is in the doldrums. The businesses are too centralized in conglomerates with high indebtedness. The Korean won has depreciated, and investment spending is dropping. Besides the consumer price inflation jump, the growing unemployment results in a steep decline in consumer spending.

Taiwan

Although Taiwan has been sheltered from the Asian economic turmoil, owing to its healthy economic fundamentals, the local Taiwanese currency has dropped more than 15 percent since October 1997. But Taiwan should be able to cope with the turmoil and continue its robust economic performance in the long term.

While Taiwan's economic growth may slow slightly in the next two years, its private-investment outlook during the period is expected to brighten. With the opening of new international air transport routes, increased investment is expected in cargo-carrying aircraft. Ongoing, large-scale construction projects will bring in further investment as well.

Taiwan's government is expected to continue removing investment obstacles and promoting the build-operate-transfer model being followed in the construction of its high-speed rail project. The establishment of the Tainan Science-Based Industrial Park is also expected to induce more domestic and foreign direct investment in electronics.

Based on these factors, private investment is expect to grow about 14 percent in the 1998/1999 fiscal year, Taiwan's highest growth rate in the past seven years. The continuing privatization of state-owned enterprises, however, means investment in publicly owned enterprises will register a decline. Taiwan's government expects a 5.2 percent GDP growth in 1998.

Semiconductor Forecast Assumptions

Table 2-3 shows that semiconductor revenue in Asia/Pacific will increase by 14.6 percent in 1999 and total $36 billion. This follows a 3.5 percent decline for 1998. Long-term, regional revenue will grow at a 13.3 percent CAGR and reach $61 billion by 2002.

The following summarizes Asia/Pacific regional semiconductor market outlooks:

- China/Hong Kong's semiconductor market will grow by 13.6 percent in 1999 and total $7.9 billion. By 2002, China/Hong Kong's market will total $15 billion, which marks a 17.5 percent CAGR for 1997 to 2002.
- Singapore's semiconductor market will grow by 13.7 percent in 1999 and total $5.4 billion. In the long term, Singapore's semiconductor market will total $9 billion, a 13 percent CAGR for 1997-to-2002 period.
- South Korea's semiconductor market will increase by 13.7 percent in 1999 and reach about the $5.7 billion level. By 2002, South Korea's semiconductor market will total $9.7 billion, which is a 12.1 percent CAGR from 1997 to 2002.
- Taiwan's semiconductor market will increase by 15 percent in 1999 and reach the $7.9 billion mark. By 2002, Taiwan's semiconductor market will approach $12 billion, with a 12.3 percent CAGR for the 1997-to-2002 period.

Source: Dataquest (October 1998)

Assumptions for the Asia/Pacific Semiconductor Forecast

The following assumptions guide the Asia/Pacific forecast shown in Table 2-3:

- The Asian economic crisis has seriously affected Asia's semiconductor demand and pricing in 1998. Asia/Pacific economies should start to recover in 1999, with a 1 percent GDP growth.
- China's economy will grow at about 7.5 percent in 1999.
- The Asia/Pacific semiconductor market is expected to post positive growth in 1999 because of increased electronic equipment production.
- Asia/Pacific's semiconductor consumption will gradually recover during the second half of 1999.
- The highest growth rates are expected to come from microcomponents and memory products, as a result of fast-expanding data processing and communications applications.
- Asia/Pacific's semiconductor consumption growth will increase rapidly in 2000 and 2001, driven by higher revenue from the memory market. However, the balanced supply-demand situation is expected to tend toward oversupply by 2002.

Accelerators to the Asia/Pacific Forecast

The following assumptions, if they occurred, would accelerate the Asia/Pacific forecast shown in Table 2-3, which would mean higher growth rates and revenue levels than shown in the table.

- Communications equipment could generate stronger demand in the region, especially for ASICs, DSPs, ASSPs, and analog ICs.
- In the near future, mobile and wireless communications, plus digital consumer products (such as digital set-top boxes), could become quite strong.
- The region's strong production growth is likely to be driven by Pentium II, digital video disc (DVD), 3-D graphics, Windows NT, and Windows 98.
- In the long term, the most important semiconductor demand driver in the region will be PCs.

 ©1998 Dataquest

- Electronic equipment manufacturers in Asia/Pacific gain competitiveness, winning more contract business from PC manufacturers.
- There will be rising electronic equipment production from new manufacturing investments, especially in data processing and communications applications.
- The memory market recovers earlier than expected. Average selling prices (ASPs) are likely to strengthen because of industry consolidation.

Inhibitors to the Asia/Pacific Forecast

The following factors, if they occurred, would inhibit the Asia/Pacific forecast shown in Table 2-3. This would mean lower growth rates and revenue levels than shown in the table:

- Failure of Asian economic crisis to turn economies upward in 1999. For example, Japan's economy remains in a deep slump, and Americas/European export markets exhibit reduced demand.
- Continuing overcapacity in consumer electronics.
- Related to an export slump would be concomitant slowing of local Asia consumption as a result of high unemployment.
- The lack of internal semiconductor consumption would then probably bring down Asia's economy and, ultimately, the consumption of semiconductor chips.
- Semiconductor vendors are affected even more by steeply lower prices in response to intense competition in the high-growth devices.
- Oversupply in commodity chip markets occurs earlier than 2002.

The Scope of This Market Trends Report

This Market Trends report investigates the dynamics behind consumption growth in the four countries' semiconductor markets. This report includes the following chapters:

- Chapter 1, executive summary—The executive summary includes the major conclusions of the Asia/Pacific semiconductor market trends.
- Chapter 2, introduction and forecast assumptions—Dataquest's market forecasting assumptions in macroeconomics and the semiconductor forecast are explained.
- Chapter 3, Asia/Pacific semiconductor forecast by product—Dataquest discusses semiconductor market by product and provides an analysis of each product's trends.
- Chapter 4, semiconductor market forecast by country—Dataquest analyzes semiconductor market trends in these four countries (China/Hong Kong, Singapore, South Korea, and Taiwan) and presents detailed device forecasts for them.

Chapter 3
Asia/Pacific Semiconductor Forecast by Product

This chapter's tables and figures provide the complete five-year forecast by product type in the Asia/Pacific semiconductor market.

Asia/Pacific Electronic Equipment Production Forecast

The Asia/Pacific electronic equipment production forecast serves as a basis for the semiconductor product forecast.

PCs, mobile communications, and consumer electronics account for about 40 percent of semiconductor consumption. Trends in these application markets will determine near-term results and generate long-term growth in semiconductor revenue. For the long term, the PC remains the paramount application for computer microprocessors (MPUs) and DRAMs. Servers will eventually emerge as a key application for computer MPUs. Mobile communications, data communications, and digital consumer electronics, among other applications, should drive the growth of digital signal processors (DSPs), microcontrollers (MCUs), embedded MPUs, and digital application-specific ICs (ASICs). Flash memory and EEPROM should also benefit from these trends.

The following sections summarize the assumptions for the key semiconductor applications.

Assumptions for Electronic Equipment Production Forecast

This report's forecasts cover a product or region. Each forecast includes a set of assumptions that serve as the basis for the forecast. Table 3-1 and Figure 3-1 provide the five-year forecast to 2002 by application type and comparison for the Asia/Pacific electronic equipment production.

Table 3-1
Asia/Pacific Electronic Equipment Production Forecast by Application, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002

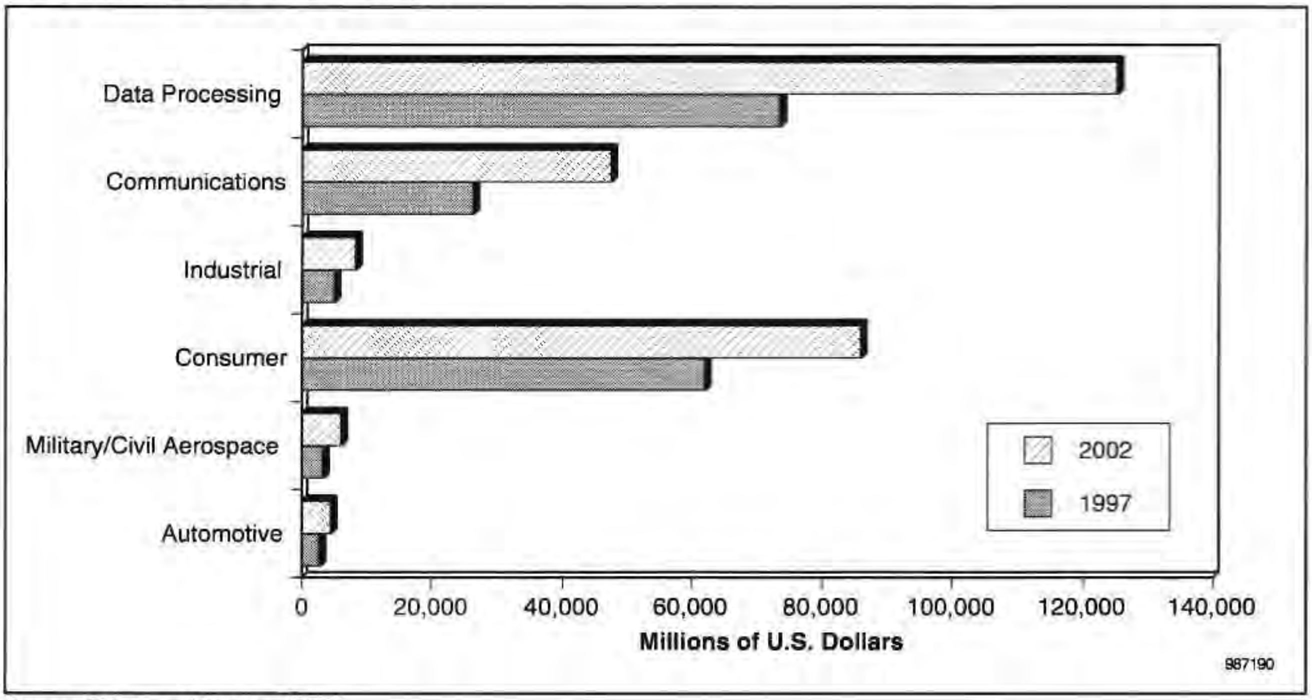
Figure 3-1
Asia/Pacific Electronic Equipment Production Comparison by Application, 1997 and 2002 (Millions of U.S. Dollars)



Source: Dataquest (October 1998)

Assumptions for Data Processing Equipment Applications

- Data processing equipment will continue to be the mainstay of Asia/Pacific's electronics production. PCs and PC-related components (such as motherboards, rigid disk drives, CD-ROM drives, and application boards) will continue to represent the backbone of the Asia/Pacific regional data processing electronics.
- The graphics chip market will face pricing pressure even as manufacturers continue to add features. The corporate computing market will continue to be slow to demand 3-D graphics features. While it is difficult to buy non-3-D products today, the issue is one of corporate users' buying down on the value scale rather than buying up.
- The audio equipment market will face increasing competition from integrated designs with sound chips on the motherboard. Price pressure is extreme and will continue for at least one more year.
- A cyclical upturn in DRAM revenue in 2000 and 2001 will be the primary driver of overall PC semiconductor market growth. PCs' main memory sizes will track historic trends and grow in the range of 40 percent to 45 percent per year.

Assumptions for Communications Equipment Applications

- Communications equipment production is expected to grow at average annual rates in excess of 10 percent. Strong growth in mobile communications and public telecommunications equipment will provide the spark for this growth. Asia/Pacific will continue to remain the world's fastest-growing and most economically active region through the end of the decade.

 ©1998 Dataquest

- The region's developing economies are expected to generate a huge demand for communications equipment of all types, but most especially for premise and mobile equipment. Dataquest expects this surging local demand to stimulate the region's communications industry, generating high growth rates for premise telecom and mobile communications equipment.
- Digital cordless telephones will retain continued popularity beyond 1999. The third-generation cellular technology is not expected to have a significant impact on semiconductor consumption during the 1997-to-2002 forecast horizon.
- Driven by Internet bandwidth upgrades, semiconductor consumption by the public infrastructure equipment market will remain strong. Cable modems and xDSL modems are on track for deployment in the 2001/2002 time frame.

Assumptions for Consumer Electronics Applications

- Consumer electronics will remain the second-largest segment of the region's electronics industry. Despite the recent retreat of the yen against the dollar, Dataquest expects that Asia/Pacific will continue to benefit from Japan's production shift. In fact, Dataquest now expects the Asia/Pacific region to become the world's dominant producer of consumer electronics by 2002. Overall, consumer electronics equipment is anticipated to average about 7 percent growth in the forecast period. Video and audio equipment will remain the mainstays of Asia/Pacific's consumer production.
- Chinese demand for Asia/Pacific-produced consumer electronics could well rival export demand by 2002 if economic development in China continues at its current dizzying pace.
- The need to maintain low manufacturing costs for low value-added products is likely to diffuse production of low-end consumer electronics into other parts of Asia/Pacific, especially Southeast Asia, in the forecast period. At the same time, rising labor costs in established manufacturing centers (that is, the "Four Tigers") are likely to induce a shift in these centers toward higher value-added, higher-end consumer electronics.

Asia/Pacific Semiconductor Forecast by Product

The following sections identify the assumptions that serve as the basis for each semiconductor product forecast in Table 3-2. Table 3-2 and Figure 3-2 provide the five-year forecast through 2002 by product type for the Asia/Pacific semiconductor market. Table 3-2 shows that the Asia/Pacific semiconductor market should grow at a 13.3 percent CAGR during the five-year forecast period from 1997 to 2002.

Source: Dataquest (October 1998)

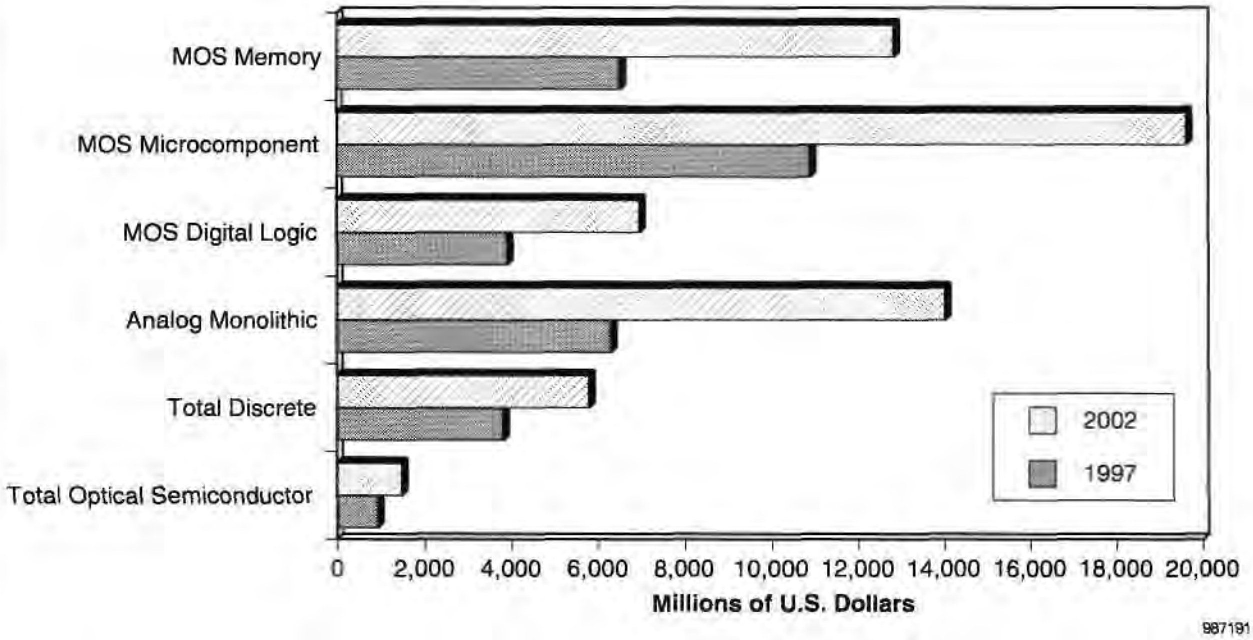
MOS Memory Forecast

Table 3-2 shows that the Asia/Pacific memory market will increase by 23.7 percent in 1999 and total $6.2 billion. This follows a steep 23.6 percent decline for 1998. In the long term, the Asia/Pacific memory market will grow at a 14.5 percent CAGR and reach $12.8 billion by 2002.

The following summarizes Asia/Pacific memory IC product outlooks:

- DRAM revenue will increase by 28 percent in 1999 and total $4 billion. This follows a 33.6 percent decline for 1998. In the long term, Asia/Pacific DRAM revenue will grow at a 14.2 percent CAGR and reach $9 billion by 2002.
- SRAM revenue will increase by 20.1 percent in 1999 and total $792 million. This follows a 10.1 percent increase for 1998. In the long term, Asia/Pacific SRAM revenue will grow at a 19.8 percent CAGR and reach $1.5 billion by 2002.
- Nonvolatile revenue will increase by 14.6 percent in 1999 and total $1.4 billion. This follows a 3.4 percent decline for 1998. In the long term, Asia/Pacific's nonvolatile memory revenue will grow at a 13.1 percent CAGR and reach $2.3 billion by 2002. Flash memory and EEPROM will drive nonvolatile market growth.

Figure 3-2
Asia/Pacific Semiconductor Market Comparison by Product, 1997 and 2002
(Millions of U.S. Dollars)



Source: Dataquest (October 1998)

Assumptions for MOS Memory Forecast

- Nearly all memory prices will continue to suffer because of industry overcapacity.
- No near-term changes are anticipated in already-existing bit or unit consumption trends.
- The effects of embedded memory on existing markets will be negligible.
- DRAM consumption will catch up with capacity in 2000, and an undercapacity will occur in 2001, which will be corrected in 2002.
- Flash memory will displace EPROM, but other memory markets will continue along their current paths: Strong growth for EEPROM, and modest growth for mask ROM and SRAM.

Assumptions for DRAM Forecast

- Bit growth in the near term will average at about 66 percent.
- Prices during late 1998 and 1999 will commence leveling off, driven partly by the conversion to PC100 and partly by antidumping findings against Hyundai Electronics Company Ltd. and LG Semicon Co. Ltd.
- The current overcapacity will not resolve itself in the near term. DRAM overcapacity will continue until demand meets capacity in 2000.
- The year 2001 will be an undercapacity year, and the resultant profit cycle will be similar to those of 1980, 1984, and 1989. A repeat of the 1995 cycle will not occur within our lifetime.

 ©1998 Dataquest

Assumptions for SRAM Forecast

- Depressed pricing continues, despite consolidation of the PC cache market.
- Other end markets move in a relatively predictable direction. However, the current oversupply will keep prices low.
- A foundry overcapacity situation will keep prices from recovering.
- Bit growth, density migration, and speed improvement will continue along trends that have been in place for the past three years.

Assumptions for Nonvolatile Memory Forecast

- The flash memory market will continue to be oversupplied in the near term, and competitive pricing of both flash and EPROM will reflect this situation. EEPROM and mask ROM will enjoy stable pricing.
- Flash and EEPROM bit consumption will continue to grow dramatically. Mask ROM will continue to grow modestly, and EPROM will continue to be displaced by cheap flash memory.
- Flash will displace EPROM now that more attractive prices are available.
- The flash market will grow more from increased usage in new applications. However, it will also displace EPROM to a great extent over the forecast term.
- Mask ROM will continue to grow at a rate established before the great video game boom.
- EEPROM will continue to grow substantially, driven by its use in smart cards, DRAM modules, and microcontroller-based equipment.

MOS Microcomponent Forecast

Table 3-2 shows that Asia/Pacific's MOS microcomponent market will increase by 10.5 percent in 1999 and total $12.2 billion, following a 1.5 percent growth for 1998. In the long term, Asia/Pacific's microcomponent market will grow at a 12.5 percent CAGR and reach $19.6 billion by 2002.

The following summarizes the Asia/Pacific MOS microcomponent IC product outlook:

- The MPU revenue will increase by 14.4 percent in 1999 and total $5.3 billion, following a 3 percent increase for 1998. In the long term, the Asia/Pacific MPU revenue will grow at a 12.5 percent CAGR and reach $8 billion by 2002.
- The MCU revenue will increase by 10.9 percent in 1999 and total $2.5 billion, following a 4.5 percent decline for 1998. In the long term, Asia/Pacific's MCU revenue will grow at a 12.6 percent CAGR and reach $4.2 billion by 2002.
- The microperipheral (MPR) revenue will increase by 1.5 percent in 1999 and total $3.3 billion, following a 0.8 percent decline for 1998. In the long term, the Asia/Pacific MPR revenue will grow at a 8.9 percent CAGR and reach $5.1 billion by 2002.

 ©1998 Dataquest

- The DSP revenue will increase by 21.9 percent in 1999 and total $1.2 billion, following a 19.9 percent increase for 1998. In the long term, the Asia/Pacific DSP revenue will grow at a 23.7 percent CAGR and reach $2.3 billion by 2002.

Assumptions for Microprocessor Forecast

- Intel Corporation's high-end Xeon processors will begin to offset desktop MPUs' average selling price erosion in the second half of 1998, but they will not be able to offset such a decline completely until 1999, when Intel offers support for four- and eight-way server configurations.
- Throughout the forecast period, general-purpose, "PC-like" devices will continue as the dominant mechanism for users to access the Internet and to perform other data-processing functions in the home and office.
- PCs' average selling price will continue a downward trend, as users see little reason to buy high-performance (and expensive) systems to use with current applications software that places few demands on CPU performance.
- In the later years of the forecast period, new software applications and usage paradigms will evolve, which will tax the processing power of the much faster processors then available and motivate users to replace older systems. Some of these new applications will expand the market by making computers relevant to users who previously had no need for such devices. Vast increases in communications bandwidth to homes and small-office environments will enable many of these applications.
- Demand remains suitably strong for proven embedded applications, such as office equipment, routers and hubs, video games, satellite receivers, and set-top boxes.
- The attraction of building an ASIC with a deeply embedded MPU core will take away some embedded MPU business.

Assumptions for MCU Forecast

- MCU prices eroded rapidly during 1998, indicating low 1999 price levels.
- Growth for 16- and 32-bit MCUs will increase more quickly than previously expected.
- More exotic features (such as flash memory) will be offered at low prices.

Assumptions for DSP Forecast

- Demand for cellular phones, modems, and risk drives is no longer increasing as fast as that for DSPs.
- New architectures of high-performance DSPs reduce the cost per function in high-density DSP arrays.
- DSPs can open a host of new applications for mobile and Internet communications and consumer interactivity.

 ©1998 Dataquest

MOS Logic Forecast

Table 3-2 shows that Asia/Pacific's logic revenue will increase by 9.2 percent in 1999 and total $4.3 billion, following a 0.5 percent decline for 1998. In 1998, the ASIC market experienced the worst percentage revenue change in history. Gate array revenue declined by 13 percent, while revenue from cell-based ICs (CBICs) increased marginally. In the long term, Asia/Pacific's ASIC revenue will grow at a 15.8 percent CAGR and reach $3.5 billion by 2002. This growth will be fueled, in part, by the trend toward system-level integration (SLI).

Assumptions for ASIC Forecast

- ASIC and logic market growth stalled during 1998 for the following three main reasons:
  - General industry slowdown
  - Asian financial crisis
  - An associated accelerated rate of average selling price declines
- Logic markets will remain flat into 1999. There will be no significant increase in ASIC/logic quarterly revenue until the second or third quarter of 1999.
- Other logic devices, which include application-specific products (ASSPs), should show strong unit growth, but with average price declines.
- Custom ICs are rapidly being replaced by ASICs because they offer shorter time to market.
- Standard logic has a small number of suppliers, and the market remains relatively flat.
- ASIC growth will be driven by CBICs and PLDs at the expense of gate arrays.
- SLI will fuel the growth of the CBIC market, as microprocessors, DRAM, and other intellectual property (IP) blocks get integrated on-chip.
- Key ASIC/ASSP application market drivers include the following: disk drives, workstations, servers, digital cellular, LAN/WAN, premise and central office switching systems, set-top boxes, video games, digital camcorders, still cameras, and digital TV.
- ASICs will be converted to ASSPs as each application market matures.

Analog Forecast

The Asia/Pacific analog IC revenue will increase by 22 percent in 1999 and total $7.9 billion, following disappointing marginal growth for 1998. In the long term, Asia/Pacific's analog revenue will grow at a 17.3 percent CAGR and reach $14 billion by 2002.

Assumptions for Analog IC Forecast

- Demand has slowed PC, communications, consumer, and industrial markets, among others.
- The Asian economic downturn and its rippling effects on the rest of the world are the main reasons for the demand slowdown.

 ©1998 Dataquest

- A recovering Asian economy and continued growth in Americas and Europe in 1999, combined with the inventory reduction at analog IC suppliers in 1998, should bring strong growth back to analog ICs in 1999.
- A semiconductor boom cycle starting in 1999 will continue to result in strong growth for analog ICs in 2000 and 2001.
- The year 2002 could see a slowdown in analog IC growth, as the semiconductor market enters its next cyclical downturn.

Discrete Product Forecast

Table 3-2 shows that the Asia/Pacific discrete semiconductor revenue will increase by 10.3 percent in 1999 and total $4.3 billion, following a marginal 2.2 percent increase for 1998. In the long term, Asia/Pacific's discrete revenue will grow at an 8.7 percent CAGR and reach $5.8 billion by 2002.

Assumptions for Discrete Forecast

- Product price instability across all discrete devices, which was prevalent through the first half 1998, has subsided. All discrete product groups are still in a state of ready availability. However, prices are returning to a state of stability.
- Continued instability in consumer, data processing, industrial, and automotive equipment sectors indicates a slower-than-normal growth path for discrete devices through the second quarter of 1999.
- The delayed recovery in the semiconductor market may delay some competitor and user decisions to shift to the slowly evolving power discrete (MOSFET and IGBT) products. While large suppliers in the Americas, such as Motorola Incorporated, have lost product share to some of the European competitors, consolidation of vendor activities and new market entrants may change the balance of supplier share and product activity in the next two years.
- The long-term growth prospect appears moderate, as competitors and users switch to power-management devices. Consolidation or acquisition of competitors' products appear as developments, along with even more price instability for developing product areas.

Optoelectronics Product Forecast

Table 3-2 shows that the Asia/Pacific optoelectronic semiconductor revenue will increase by 8 percent in 1999 and total $1 billion, following a 3.5 percent growth for 1998. In the long term, Asia/Pacific's optoelectronic semiconductor revenue will grow at a 10.2 percent CAGR and reach $1.5 billion by 2002.

Assumptions for Optoelectronics Forecast

- LEDs and laser diodes are key market drivers.
- LED growth has been moderated from the previous forecast because of a general industry slowdown caused by the Asian financial crisis.
- The laser diode market has been affected negatively by the slow consumer markets and positively by the demand for bandwidth in the Internet-driven telecommunications market.
- PC and wireless handset demand growth will return to higher levels in 1999.

Chapter 4
Asia/Pacific Semiconductor Forecast by Region

This chapter presents the semiconductor market and major electronic equipment production forecast during the five-year period from 1997 to 2002 in China/Hong Kong, Singapore, South Korea, and Taiwan. This chapter's tables and the figures provide the complete five-year forecast by region in the Asia/Pacific semiconductor market and major electronic equipment production.

China/Hong Kong's Semiconductor Forecast

While most Asia/Pacific countries will experience a decline in 1998, Dataquest predicts that China/Hong Kong's semiconductor market will grow by 2.8 percent to reach U.S.$7 billion. Dataquest expects that the growth will be sustained in China/Hong Kong's semiconductor market, despite the current Asian financial crisis because China has relatively better economic health than other Asian nations, particularly steady growth with low inflation. By 2002, China/Hong Kong's semiconductor market will total $15 billion, which marks a 17.5 percent CAGR from 1997 to 2002.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- China's economy is expected to grow by an estimated 7.5 percent, while Hong Kong will face a 1.2 percent decline in 1998. The Asia/Pacific region should begin to recover from the economic turmoil next year.
- China's electronics equipment production will grow 12.6 percent this year. China is now the largest semiconductor consumer in Asia/Pacific. It represents the largest consumer of computer equipment, accounting for a quarter of the region's PC shipments. China's PC unit shipments are expected to reach 3 million units, a 53 percent rise over the 1997 level.
- China/Hong Kong's semiconductor market will expand from $6.9 billion in 1997 to $15 billion in 2002, at a 17.5 percent CAGR, far higher than the region's 13.3 percent CAGR. In 1998, China/Hong Kong's semiconductor market is forecast to grow at 2.8 percent, reaching $7 billion.
- MOS memory devices are estimated to decline in 1998 because of the sluggish DRAM price in 1998. The DRAM market alone is expected to shrink by 27.5 percent in 1998, which is a result of vendors' cutthroat price competition.
- The MOS microcomponent market remains consistent with prior expectations. This product market is forecast to grow at an 18 percent CAGR from 1997 to 2002, reaching $5.1 billion in 2002. Among the fastest-growing MOS microcomponent product categories, digital signal processors and microprocessors are expected to achieve a 26.6 percent CAGR and a 20.8 percent CAGR, respectively, during the forecast period.

 ©1998 Dataquest

- The MOS digital logic market is estimated to increase from $0.9 billion in 1997 to $1.6 billion by 2002, with a healthy 12.6 percent CAGR, but its share of total semiconductor market will decrease from 13.2 percent in 1997 to just over 10 percent in 2002.
- The analog market will surge from $1.4 billion in 1997 to $3.5 billion by 2002, with a 19.8 percent CAGR.
- Dataquest expects the market for discrete and optoelectronic devices to expand from $1 billion in 1997 to $2.2 billion in five years, with a 15.1 percent CAGR. This growth is consistent with the electronic equipment production growth in China/Hong Kong.

Electronic Equipment Production in China/Hong Kong

China/Hong Kong's electronic equipment production is expected to continue growing at a 15.1 percent CAGR to 2002, reaching $92.2 billion. This growth is driven by emerging applications in the data processing, communications, and consumer electronics segments.

Electronic equipment production is forecast to grow 12.6 percent in 1998, contrasting with 18.6 percent in 1997. The dollar value is expected to reach $51.3 billion in 1998, compared to $45.6 billion in 1997. The slower growth in 1998 is attributed to the influences of the Asian financial crisis and the nationwide restructuring of state-owned enterprises, which suppress export growth and internal consumption.

However, given the encouraging macroeconomic developments and continued favorable government policy, China's equipment production will remain on an upward curve through the end of the decade at a 15.1 percent CAGR, to reach $92.2 billion by 2002.

Table 4-1 and Figure 4-1 show China/Hong Kong's electronic equipment production forecast and comparison in the five-year period. In 1997, PC and monitor equipment are projected to be the most significant contributors to production growth from 1997 to 2002. The communications equipment market is estimated to be outstanding, driven by increased production of mobile communications equipment.

Table 4-1
China/Hong Kong Electronic Equipment Production Forecast, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002
Total Electronic Equipment	**45,564**	**51,324**	**59,068**	**69,080**	**80,271**	**92,208**	**15.1**
Data Processing	12,454	15,781	19,495	24,310	29,591	35,343	23.2
Communications	7,433	8,116	9,055	10,587	12,278	13,946	13.4
Industrial	1,006	1,093	1,242	1,434	1,668	1,925	13.9

China/Hong Kong's Semiconductor Market Trends by Product

Table 4-2 and Figure 4-2 present detailed China/Hong Kong's semiconductor market forecast and comparison for China/Hong Kong in the five-year forecast period.

MOS Memory

China/Hong Kong's consumption of MOS memory products reached $1.1 billion in 1997. Because of the astonishing price decline as a combined result of competition and overcapacity, MOS memory product revenue is expected to experience an 18.3 percent decline this year. MOS memory products will exhibit the highest fluctuating annual percentage changes, as DRAM pricing movements become largely unpredictable by vendors. From 1999 to 2001, the MOS memory market is forecast to rise again, before diving in 2002 when a DRAM device glut resurfaces again.

The MOS memory market is estimated to increase to $2.8 billion by 2002. The CAGR is forecast at 19.7 percent from 1997 to 2002. The growth will be largely driven by the growing demand in PCs and emerging digital products.

DRAM devices constituted the largest segment of the MOS memory product category in 1997, reaching $800 million. Flash memory devices took the second place, while SRAM was the third largest.

Source: Dataquest (October 1998)

MOS Microcomponent

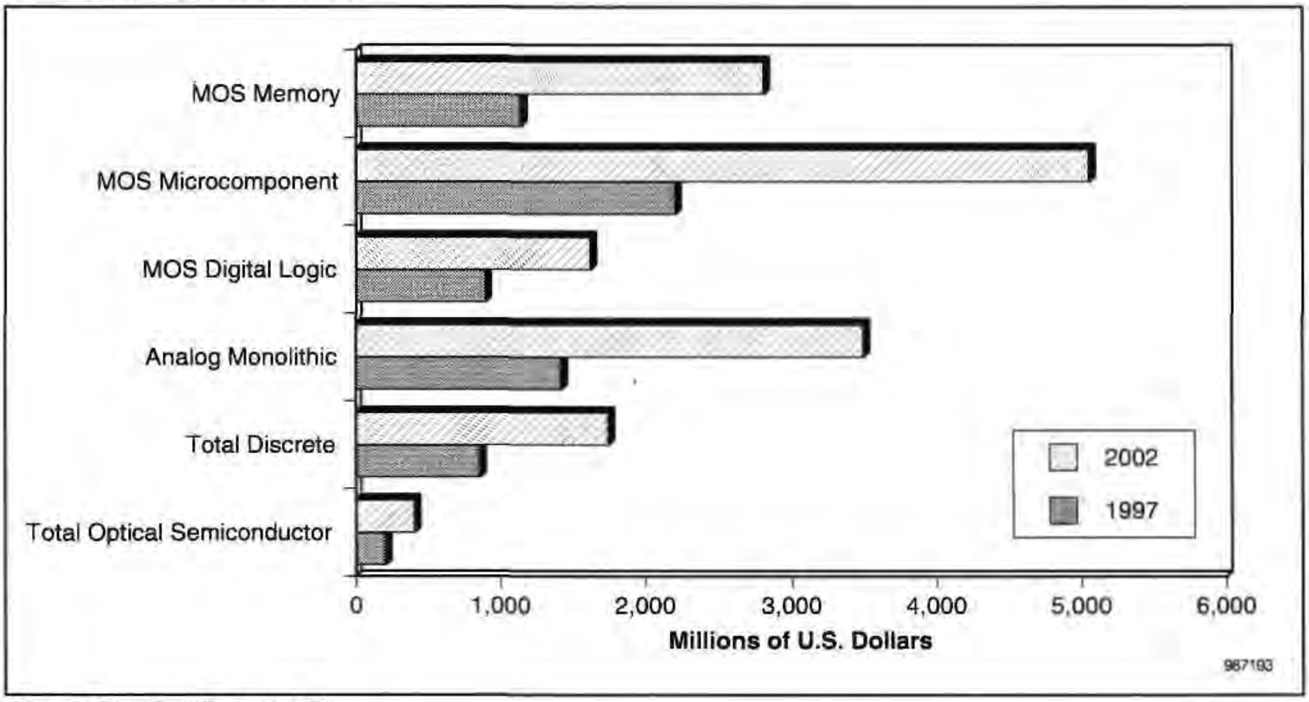
China/Hong Kong's consumption of MOS microcomponent products reached $2.2 billion in 1997. Revenue from MOS microcomponent products is expected to grow at 7.4 percent this year. Although there is a strong demand in PCs and cellular phones, this is offset by the price decline pressure in microcontroller devices.

The MOS microcomponent market is estimated to rise to $5.1 billion by 2002, with an 18 percent CAGR from 1997 to 2002. MOS microcomponent products will continue to represent the largest device category over the five-year forecast period because of their importance in electronic equipment.

Microprocessor devices represent the largest segment in the MOS microcomponent product categories, followed by microcontroller and microperipheral devices. Although these devices are expected to remain dominant until 2002, the increasing use of DSP devices in many high-volume applications is likely to contribute a significant revenue growth in the MOS microcomponent market. It is expected that DSP devices will increase from 7.5 percent of the total MOS microcomponent in 1997 to 10.6 percent in 2002.

 ©1998 Dataquest

Figure 4-2
China/Hong Kong Semiconductor Market Comparison by Product, 1997 and 2002 (Millions of U.S. Dollars)



Source: Dataquest (October 1998)

MOS Digital Logic

China/Hong Kong's use of MOS digital logic devices in electronic equipment manufacturing reached $0.9 billion in 1997. MOS digital logic devices are expected to show a flat growth this year. Such low growth results from the decline of custom IC devices and the decrease in MOS standard logic prices.

The MOS digital logic market is projected to reach about $1.6 billion by 2002, with a 12.6 percent CAGR from 1997 to 2002.

ASIC devices will show the fastest-growing revenue in the MOS digital logic product category. The ASIC segment will increasingly dominate the growth trend as CBICs present the most viable path toward integrating systems on a chip.

Analog Monolithic

China/Hong Kong's consumption of analog products reached $1.4 billion in 1997. Revenue from analog products is expected to show a moderate growth of 5.6 percent this year.

Analog product consumption is estimated to increase to $3.5 billion by 2002, with a 19.8 percent CAGR from 1997 to 2002. As a result, the analog market will represent the second-largest device category, following MOS microcomponent devices.

 ©1998 Dataquest

Discrete and Optical Semiconductor

The discrete market in China/Hong Kong is estimated to increase to $1.7 billion by 2002, with a projected 15.2 percent CAGR from 1997 to 2002. Discrete products, being a basic building block for most electronic equipment, will continue to contribute steady revenue over the five-year forecast period.

The optical semiconductor market is expected to increase from $0.2 billion to $0.4 billion by 2002 with a 14.7 percent CAGR.

Singapore's Semiconductor Forecast

The Asia/Pacific region is experiencing the pain from the Asian financial crisis that began in 1997. Asian economies continue to deteriorate as a result of consumption and investment downturns. Among the economies worst affected are the Southeast Asian nations, including Singapore. The city state's growth rate this year is projected to be 1.3 percent, according to Dataquest. This forecast is within the Singaporean government's revised GDP growth range of 0.5 percent to 1.5 percent.

Although the U.S. and European economies have shown signs of strength, the regional situation closer to Singapore continues a downward impact on the economy. Recent regional developments, including the deterioration in Southeast Asian and Japanese economies, have dampened demand for Singapore exports. Industrial production numbers shows that electronics output, which accounts for nearly half of manufacturing, contracted by 9 percent in local currency terms in August. The monthly decline reflected the lower sales of telecommunications equipment, semiconductors, and PCs.

Electronics output for the first eight months of 1998 has fallen 3.4 percent, compared to a year ago. Lower equipment production and a steep erosion in chip prices are forecast to lead to lower semiconductor consumption revenue in Singapore this year. The semiconductor market should fall by 4.0 percent in 1998 and reach about $4.8 billion. In the long term, Singapore's semiconductor market will total nearly $9.1 billion, which is a 13.0 percent CAGR from 1997 to 2002.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- Asia/Pacific's GDP growth rates are forecast to be depressed by the Asian financial crisis in 1998. According to Dataquest, Singapore's economy is estimated to grow by 1.3 percent, within the official forecast GDP growth range of 0.5 percent to 1.5 percent. Singapore is predicted to begin recovering from the regional economic turmoil next year.
- Singapore's semiconductor consumption is estimated to decline in 1998. This forecast represents a downgrade compared with prior expectations, as a result of lower electronic equipment output and declining chip prices. Revenue from the production of electronic equipment is predicted to fall by 4.8 percent in 1998, led by falls in data processing equipment and consumer electronic applications.

 ©1998 Dataquest

- Pricing pressure and lower demand for memory, ASIC, MPR, and MCU products are expected to present significant adverse impacts. Memory products should suffer the largest revenue decline this year.
- Electronic equipment production is estimated to register a 7.2 percent CAGR between 1997 and 2002, driven by increased manufacturing investments from companies taking advantage of the devalued currency and Singapore's position as the Southeast Asian regional business hub. The semiconductor market should experience a higher five-year CAGR than equipment production revenue because of rising semiconductor content in electronic equipment. Data processing and communications equipment are projected to drive growth of total electronic equipment production over the forecast cycle.
- The Singapore semiconductor market is expected to post positive growth rates on the back of recovering electronic equipment production from 1999. The MOS memory category is forecast to record the highest five-year CAGR, with the DRAM market projected to move closer to demand-supply balance by the end of this decade. DRAM prices should peak in 2001, before softening again by 2002.
- MOS microcomponent products will continue to represent the largest device category over the five-year forecast cycle, as data processing and communications equipment production is estimated to increase in the forecast period.
- MOS digital logic products should retain their position as the third-largest product category in Singapore. High-volume applications for ASIC devices and the industry trend toward system-level integration should spur growth in this category.

Electronic Equipment Production in Singapore

Singapore's electronic equipment production is forecast to grow at a 7.2 percent CAGR from 1997 to 2002. Although production growth in previous years was driven by investments from multinational companies, a lower growth rate is expected as the city state starts to transition toward higher-value-added manufacturing activities. In recent years, manufacturing of lower value-added equipment in Singapore has been relocated to cost-competitive locations in the Asia/Pacific region. This has resulted in equipment production of consumer electronics, in particular, and other products dwindling, as the shift in direction to other Southeast Asian countries and China/Hong Kong gains momentum. Besides higher-value-added products, Singapore's electronic equipment production should also be driven by multinational OEMs outsourcing their production functions. The continuation of this trend will lead to contract equipment manufacturers accounting for a higher percentage of local equipment output.

Table 4-3 and Figure 4-3 present Singapore's electronic equipment production forecast from 1997 to 2002. In 1998, manufacturing revenue is expected to decline by 4.8 percent as a result of intense pricing pressures and lower demand amid the regional economic turmoil. Data processing equipment is projected to be the most significant contributor of equipment production revenue up to 2002. Singapore is still host to the world's leading producers of data storage products. In 1997, Dataquest estimates that Singapore's production output of rigid disk drives accounted for nearly 39 percent of total worldwide units. Among the three largest equipment groups, communications equipment is projected to register an 8.2 percent

 ©1998 Dataquest

compound growth over the forecast cycle, which we expect to be driven by increased manufacturing of premise telecom and mobile communications equipment.

Figure 4-3 illustrates Singapore's electronic equipment production comparison for 1997 and 2002. As the aftereffect of the Asian financial crisis takes hold, Singapore's electronic equipment production growth is expected to remain in low gear this year. This will be compounded by the continuing trend of relocating production of lower-value-added equipment to cost-competitive countries. The shift has resulted in reduced consumer electronics production, evidenced by the declining output of VCRs and color television sets. On a positive note, the city is well on its way toward becoming a production base for higher-value-added equipment, particularly data processing and communications products. With this trend already evident, Singapore's consumption of semiconductors in manufacturing should rise as equipment with higher silicon content will make up a large majority of total production.

Singapore's major electronic equipment manufacturing is estimated to experience the highest annual growth rates in 2000 and 2001. The trend is determined by the output of data processing equipment. In 1997, revenue generated from data storage products constituted 45 percent of the total equipment revenue and is forecast to rise to exceed 48 percent by 2002.

Singapore's Semiconductor Market Trends by Product

Table 4-4 presents the Singapore semiconductor market forecast by product from 1997 to 2002.

Table 4-3
Singapore Electronic Equipment Production Forecast, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002

MOS Memory

Singapore's use of MOS memory products in electronics manufacturing reached $1.2 billion in 1997. Vendors' revenue generated from MOS memory products is expected to decline by 23.1 percent this year, as a result of oversupply and lower prices. MOS memory products should exhibit the highest fluctuating annual percentage changes because of volatility in the DRAM market. From 1999 to 2001, the MOS memory market is forecast to move toward a balanced supply-demand situation. However, a memory downturn is projected in 2002 when excess capacity returns in DRAM production.

The MOS memory market is estimated to increase to $2.4 billion by 2002. The 1997-to-2002 CAGR of 15.5 percent will result in MOS memory products representing the second-largest device category over the five-year period.

DRAM devices constituted the largest segment of the MOS memory product category in 1997. Nonvolatile memory devices take a second place, with SRAMs occupying the third spot. The positions of these three device segments are forecast to be unchanged until 2002.

MOS Microcomponent

Singapore's consumption of MOS microcomponent products in manufacturing reached $1.7 billion in 1997. Vendors' revenue generated from MOS microcomponent products is expected to register a modest 8.3 percent growth this year, as a result of declining revenue predicted for microcontroller and microperipheral devices. This year's growth should be driven by robust expansion in the microprocessor and DSP markets.

Table 4-4
Singapore Semiconductor Market Forecast by Device, 1997 to 2002
(Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002
Total Semiconductor	**4,962**	**4,761**	**5,416**	**6,727**	**8,473**	**9,139**	**13.0**

Total Discrete	435	419	431	506	534	551	4.8
Total Optical Semiconductor	102	106	115	134	149	170	10.8

Source: Dataquest (October 1998)

The MOS microcomponent market is estimated to rise to $3.3 billion by 2002. This segment should record the second-highest 1997-to-2002 CAGR of 14.3 percent. MOS microcomponent products is expected to remain the largest device category over the five-year forecast cycle.

Microprocessor devices accounted for the largest segment in the 1997 MOS microcomponent product category, followed by microcontroller and microperipheral devices. Although these devices are expected to remain dominant until 2002, the increasing use of DSP devices in many high-volume applications is likely to contribute significant revenue growth in the MOS microcomponent market.

MOS Digital Logic

MOS digital logic products emerged as the third-largest product category in Singapore's electronics manufacturing in 1997. The use of these products reached $0.8 billion, overtaking analog products for the first time. The MOS digital logic segment is expected to experience a 1.5 percent revenue decline in 1998.

 ©1998 Dataquest

The MOS digital logic market is projected to increase to $1.4 billion by 2002, with a 12.1 percent CAGR from 1997 to 2002. This market is predicted to be the third-fastest-growing segment as a result of the products' increased usage in high-volume applications and the industry trend toward SLI.

ASIC devices make up the largest portion of revenue in Singapore's MOS digital logic product category, following the other MOS logic category. The ASIC segment will continue to dominate the growth trend, as designers integrate single-chip systems.

Analog Monolithic

Singapore's use of analog products in electronics manufacturing reached $0.7 billion in 1997. In 1998, the revenue from analog products is expected to decline 6.4 percent as market conditions remain weak.

The analog market is estimated to rise to $1.3 billion by 2002. Singapore's analog product market will experience steady revenue expansion over the five-year period, with a projected 1997-to-2002 CAGR of 11.8 percent.

Discrete and Optical Semiconductor

Singapore's combined use of discrete and optical semiconductor products in manufacturing reached $0.5 billion in 1997. The revenue from this combined product category is forecast to fall 2.2 percent this year, as a result of lower demand and oversupply in the discrete market.

Singapore's discrete market is estimated to rise to $0.6 billion by 2002. With a projected 1997-to-2002 CAGR of 4.8 percent, discrete products will continue to represent mature revenue expansion over the five-year period.

Singapore's optical semiconductor market is expected to increase to $0.2 billion by 2002, with a 10.8 percent CAGR.

Figure 4-4 illustrates the Singapore semiconductor market comparison by product in 1997 and 2002.

South Korea's Semiconductor Forecast

The South Korean economy is running into serious trouble amid rapidly cooling domestic demand and dwindling exports. The Korean economy is suffering a vicious cycle of production drops and deepening domestic demand. Economic uncertainties and credit squeezes taking place in the course of restructuring have placed immense pressure on domestic demand, and the economy is liable to plunge deeper into recession.

The 1998 GDP is expected to contract 4.8 percent this year before turning around at an annual rate of 0.6 percent in 1999, although the government will have to take strong macroeconomic measures. The 4.8 percent contraction, if realized, will be a steep downturn from the negative 3.8 percent forecast jointly made by the government and the International Monetary Fund (IMF) in July 1998.

Some economists are warning that South Korea could face a second financial crisis, depending on the seriousness of the international economic turmoil. There has been no restoration of international confidence in emerging markets. Troubles could return at any time according to these institutes.

The South Korean domestic economy is in the doldrums. The businesses are too centralized in conglomerates with high indebtedness. The Korean won has depreciated, and investment spending is dropping. Besides the consumer price inflation jump, the growing unemployment results in a steep decline in consumer spending.

 ©1998 Dataquest

The South Korean semiconductor market will grow by 13.7 percent in 1999 and total $5.8 billion, following a steep 7.9 percent decline for 1998. In the long term, Dataquest predicts that the South Korean semiconductor market will show its steady growth from 1999, recovering from a financial crisis next year. As a result, South Korea's semiconductor market will grow at a 12.1 percent CAGR and reach $9.7 billion by 2002.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- South Korea's semiconductor market will increase by 13.7 percent in 1999 to a total of $5.8 billion. The South Korean financial crisis and a low DRAM pricing hindered this year's semiconductor revenue growth, although some product segments will achieve robust double-digit growth rates. In the long term, South Korea's semiconductor market will reach nearly $9.7 billion, which marks a 12.1 percent CAGR for the five-year period from 1997 to 2002.
- South Korea's PC unit production will grow by 1.4 percent in 1999 and total 1.7 million units, following a steep 17 percent decline for 1998. For the long term, Korea's PC unit production will grow at a 6.7 percent CAGR for the five-year period and total 2.8 million units by 2002.
- The semiconductor industry should retain a long-term vitality. PCs, communications equipment, and consumer electronics will continue to rank as the most important application markets in South Korea in the five-year forecast period from 1997 to 2002.
- MOS microcomponent products, especially DSPs, will continue to fuel South Korea's semiconductor market growth. DSPs rank among the highest-growth semiconductor products. This device is the centerpiece of communications electronics (such as cellular phones and modems) and the emerging consumer digital electronics. The South Korean DSP market should grow at a 25.5 percent CAGR for the 1997-to-2002 period and reach $289 million by 2002.
- The memory market will increase by 17.4 percent in 1999 and total $646 million, following a steep 29.5 percent decline for 1998. In the long term, the Korean memory market will grow at a 9.1 percent CAGR and reach $1.2 billion by 2002.
- The MOS logic revenue will increase by 10.8 percent in 1999 and total $802 million, following a 1 percent growth for 1998. In the long term, the South Korean logic market will grow at a 14.2 percent CAGR and reach $1.4 billion by 2002. This growth will be fueled by ASICs and other MOS logic devices.
- The South Korean analog IC market will increase by 20.7 percent in 1999 and total $1.8 billion, following a disappointing marginal growth for 1998. In the long term, South Korea's analog market will grow at a 17.5 percent CAGR for the 1997-to-2002 forecast period and reach $3.2 billion by 2002.

©1998 Dataquest

- South Korea's discrete semiconductor revenue will increase by 10.3 percent in 1999 and total $912 million, following a marginal 3.1 percent increase for 1998. In the long term, the South Korean discrete market will grow at a 9.4 percent CAGR and reach $1.3 billion by 2002. Optoelectronic semiconductor revenue will increase by 8.3 percent in 1999 and total $195 million, following a 2.9 percent growth for 1998. In the long term, South Korean optoelectronic semiconductor revenue will grow at an 11.4 percent CAGR and reach $300 million by 2002.

Electronic Equipment Production in South Korea

Dataquest predicts that the South Korean PC industry should experience a 17 percent decline for 1998 to about 1.7 million units. This growth will affect the memory market, especially DRAM, this year. However, Dataquest expects the PC production revenue to grow at a 6.7 percent CAGR during the five-year period from 1997 to 2002. Monitors, which represent the largest sector in South Korea's data processing industry, will increase by 14 percent in 1999 and reach 25.6 million units. Monitor production unit will grow at a 7.9 percent CAGR during the five-year period from 1997 to 2002. Monitors have been considered a major product of data processing in South Korea during the forecast period.

Unit production of digital cellular phones in South Korea is expected to enjoy a healthy growth, at 41.9 percent CAGR from 1997 to 2002. This product is expected to expand its share in electronic equipment continuously because of its healthy local demand and outstanding export growth.

Dataquest expects that the driver of consumer electronics in South Korea will come mainly from analog camcorders, DVD players, analog set-top boxes, and digital set-top boxes, which are expected to enjoy outstanding growth during the five-year forecast period from 1997 to 2002. In contrast, VCRs and personal/portable stereos will show a sluggish growth. Therefore, DVD players and digital set-top boxes, which are expected to enjoy healthy growth, will increase their share of total consumer electronics production in South Korea.

Table 4-5 shows the electronic equipment production forecast for South Korea from 1997 to 2002. Figure 4-5 illustrates the electronic equipment production comparison for 1997 and 2002.

Table 4-5
South Korea Electronic Equipment Production Forecast, 1997 to 2002
(Millions of U.S. Dollars)

South Korea's Semiconductor Market Trends by Product

Table 4-6 presents the South Korean semiconductor market forecast by device from 1997 to 2002.

MOS Memory

South Korea's consumption of MOS memory products in electronics manufacturing will increase by 17.4 percent in 1999 and total $646 million, following a sharp 29.5 percent decline for 1998. In the long term, South Korea's memory market will grow at a 9.1 percent CAGR and reach $1.2 billion by 2002. MOS memory products should exhibit the highest fluctuating annual percentage changes, as DRAM pricing movements take hold. From 1999 to 2001, the MOS memory market is forecast to rise rapidly, before nose diving in 2002 when a glut in DRAM devices resurfaces again. South Korea's MOS memory will be ranked the fourth-largest semiconductor market in the country in the five-year forecast period.

DRAM devices will be positioned in the largest segment of the MOS memory product category over the forecast period in South Korea. SRAM devices take the second place, with flash memory occupying the third spot. The positions of these three device segments are forecast to be unchanged by 2002.

Source: Dataquest (October 1998)

The following summarizes memory IC product outlooks:

- South Korea's DRAM market will increase by 21.4 percent in 1999 and total $340 million, following a 46.7 percent decline for 1998. By 2002, South Korea's DRAM revenue will total about $680 million, which marks a 5.3 percent CAGR from 1997 to 2002.
- The SRAM market in South Korea will grow by 12 percent in 1999 and total $106 million. In the long term, the country's SRAM revenue will total $198 million, or a 21.4 percent CAGR for the 1997-to-2002 forecast period.
- Nonvolatile revenue will increase by 13.1 percent in 1999 and total $190 million, following a 3.3 percent decline for 1998. In the long term, South Korea's nonvolatile memory market will grow at a 12.8 percent CAGR from 1997 to 2002 and reach $318 million by 2002.

MOS Microcomponent

South Korea's MOS microcomponent revenue will increase by 9.3 percent in 1999 and total $1.4 billion, following a 16.9 percent decline for 1998. The MOS microcomponent market is estimated to increase to $2.4 billion by 2002 with an 8.6 percent CAGR during the five-year period from 1997 to 2002.

 ©1998 Dataquest

For 1999, South Korea's MPU revenue will increase by 12.1 percent and reach $370 million. In the long term, the country's MPU revenue should reach $560 million, which represents a flat CAGR for the 1997-to-2002 period. This growth results in the slump in PC production and demand for 1998.

South Korea's DSP revenue will increase by 19.3 percent in 1999 and total $130 million, following a 17 percent increase for 1998. By 2002, South Korea's DSP revenue will reach $289 million, which translates into a stellar 25.5 percent CAGR from 1997 to 2002.

The MCU revenue will increase by 10.9 percent in 1999 and total $559 million, following a 5.3 percent decline for 1998. Sharp price erosion for MCU products hinders the growth of MCU market for 1998. In the long term, South Korea's MCU revenue will grow at a 12.8 percent CAGR for the 1997-to-2002 period and reach $971 million by 2002.

MOS Digital Logic

The MOS digital logic segment is expected to record a 10.8 percent revenue growth in 1999 and reach $802 million. The MOS digital logic market is projected to increase to $1.4 billion by 2002. A 14.2 percent CAGR for the 1997-to-2002 period is predicted as a result of the industry trend toward SLI.

South Korea's ASIC market will increase by 12.9 percent in 1999 and total $323 million, following a 1.4 percent growth for 1998. In the long term, South Korea's ASIC revenue will grow at a 17.8 percent CAGR for the 1997-to-2002 period and reach $639 million by 2002.

South Korean custom IC revenue will decline by 27.3 percent in 1999 and total $43 million. In the long term, it will total $11 million, or a 33.5 percent CAGR decline from 1997 to 2002.

The standard logic segment will increase by 4.2 percent in 1999 and reach the $78 million level, following an 11.3 percent decline for 1998. By 2002, South Korea's standard logic revenue will total $86 million, which is a 0.5 percent CAGR from 1997 to 2002.

The other MOS logic sector will increase by 17.8 percent in 1999 and reach the $358 million mark. By 2002, South Korea's other MOS logic revenue will reach $655 million, for a 19.9 percent CAGR from 1997 to 2002.

Analog Monolithic

In 1999, South Korea's analog IC revenue is expected to grow by 20.7 percent and total $1.8 billion, following a 1.7 percent increase for 1998. In the long term, it will grow at a 17.5 percent CAGR for the 1997-to-2002 period and reach $3.2 billion by 2002.

Looking at the long-term trends to 2002, mixed-signal ICs will experience a solid growth, driven by the application markets such as digital cellular. In addition, new emerging applications in the consumer and communications markets will contribute to the growth of mixed-signal ICs. In the more traditional standard linear product area, voltage-regulator products will continue to enjoy a strong growth, as the demand for smart power continues to grow, especially in the portable equipment markets.

 ©1998 Dataquest

Discrete and Optical Semiconductor

South Korea's discrete product revenue will increase by 10.3 percent in 1999 and total $912 million, following a marginal growth for 1998. In the long term, it will grow at a 9.4 percent CAGR for the 1997-to-2002 period and reach $1.3 billion by 2002.

South Korea's optical semiconductor revenue will grow by 8.3 percent in 1999 and total $195 million. By 2002, it will total $300 million, which represents a 11.4 percent CAGR from 1997 to 2002.

Figure 4-6 illustrates South Korea's semiconductor market comparison by product in 1997 and 2002.

Taiwan's Semiconductor Forecast

Although Taiwan has not suffered the Asian financial crisis turmoil like its neighbors because of its healthy economic fundamentals, the local currency has dropped more than 15 percent since October 1997. But Taiwan should be able to cope with the turmoil and continue its robust economic performance over the long term. Taiwan's semiconductor market will be expanding from $6.8 billion in 1997 to $12 billion in 2002, at a 12.3 percent CAGR. In 1998, Taiwan's semiconductor market is forecast to grow at 2 percent, reaching $6.9 billion.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- The Taiwanese government expects 5.2 percent GDP growth in 1998. The Asia/Pacific region should begin to recover from the economic turmoil next year.
- Taiwan's electronic equipment production was estimated to register a 10.6 percent CAGR between 1997 and 2002. Data processing and communications equipment segments are expected to drive the growth of total electronic equipment production by 2002. Taiwan's electronics equipment production will grow 12.8 percent in 1998.
- Taiwan's semiconductor market will expand from $6.8 billion in 1997 to $12 billion in 2002, at a 12.3 percent CAGR. In 1998, Taiwan's semiconductor market is forecast to grow 2 percent, reaching $6.9 billion.
- MOS memories were the fastest-growing segment before 1995. However, the market has dropped since 1996. MOS memory devices are estimated to decline 15.9 percent because of the sluggish DRAM price in 1998. The DRAM market alone is expected to shrink by 21.4 percent in 1998, which is caused by vendors' price competition and oversupply.
- The Taiwanese MOS microcomponent market is the largest semiconductor device segment. It is expected to reach $2.7 billion, for an 8 percent growth in 1998. The MOS microcomponent market represents 38.9 percent of all semiconductors shipped to Taiwan in 1998, and it is expected to expand by an 11.4 percent CAGR from 1997 to 2002.
- Taiwan's MOS digital logic market is estimated to increase from $0.7 billion in 1997 to $1.2 billion by 2002, with a healthy 14.2 percent CAGR. The analog market will surge from $0.8 billion in 1997 to $1.8 billion by 2002, with a 17.4 percent CAGR.
- Taiwan's discrete and optoelectronics segments shouldo expand from $0.8 billion in 1997 to $1.3 billion in five years, with a 9.6 percent CAGR. Dataquest expects this market to show a stable growth following the growth of the demand for the equipment.

Electronic Equipment Production in Taiwan

Taiwan's electronic equipment revenue is expected to continue its healthy growth at 10.5 percent CAGR from 1997 to 2002, reaching $38 billion. Data processing production will still be the mainstay for Taiwan by 2002, growing at a moderate pace.

 ©1998 Dataquest

Dataquest's long-term electronic equipment production forecast by sector projects data processing to sustain the lion's share of production in Taiwan from 1997 to 2002. Its CAGR is expected to be only 11.4 percent during this period. Data processing equipment accounts for more than 50 percent of total Taiwan electronic equipment production. Three niche markets—PCs, monitors, and motherboards—dominate this sector, accounting for 72 percent of total data processing equipment manufacturing.

Communications equipment production is the second-largest sector, with an 8.5 percent CAGR from 1997 to 2002, which will continue from 1997 to 2002. Revenue generated in this sector in recent years was created mainly by the modem and network card industries. Wireless communications equipment production is expected to be the most promising industry for the sector. Dataquest expects this segment to increase its revenue from $5.4 billion in 1997 to $8.2 billion in 2002.

Consumer electronics manufacturing will rank third in electronic equipment production, with a 9.7 percent CAGR from 1997 to 2002. Consumer electronics will continue to its slow growth sector, although most of Taiwan's consumer production has shifted to China and Southeast Asia. However, DVD players, digital still cameras, and set-top boxes are expected to be the major driving force of consumer growth.

Table 4-7 and Figure 4-7 show Taiwan's electronic equipment production and comparison from 1997 to 2002. In 1997, PCs and monitor equipment are projected to be the most significant contributors to production growth from 1997 to 2002. Communications equipment is estimated to be outstanding, driven by increased production of mobile communications equipment.

Taiwan's Semiconductor Market Trends by Product

Table 4-8 presents Taiwan's semiconductor market forecast by device from 1997 to 2002.

MOS Memory

The MOS memory market represented 29.2 percent of all semiconductors shipped to Taiwan in 1997, a 39.2 percent decrease from its 1996 levels. Since 1996, MOS memory had not been the largest device in the MOS digital segment. In 1997, memory products were affected by the DRAM price drop, a result of the DRAM oversupply.

Taiwan's MOS memory market reached $1.9 billion in 1997. The market is expected to face a 15.9 percent decline in 1998. The MOS memory market is estimated to increase to $3.4 billion by 2002, with an 11.8 percent CAGR from 1997 to 2002. Taiwan's developing data processing industries will lead a surge in MOS memory consumption in the next five years.

DRAM devices constituted the largest segment of the MOS memory product category in 1997, reaching $1.5 billion. DRAM devices are expected to peak in 2001 and reach $3.2 billion.

MOS Microcomponent

The Taiwanese MOS microcomponent market is the largest semiconductor device segment. PC production continues its relentless growth, driving the overall semiconductor market and, in particular, contributing to the growth of MOS microcomponent products.

Taiwan's MOS microcomponent device market is expected to reach $2.7 billion, for an 8 percent growth in 1998. The MOS microcomponent market represents 38.9 percent of all semiconductors shipped to Taiwan in 1998. The market is expected to expand by an 11.4 percent CAGR from 1997 to 2002.

Microprocessors remain the dominant revenue source in MOS microcomponents, although the other three constituent product types (microcontrollers, microperipherals, and DSPs) showed stronger growth in recent years. Although the microprocessor is expected to remain dominant until 2002, the increasing use of DSP devices in many high-volume applications is likely to contribute a significant revenue growth in the MOS microcomponent market. It is expected that DSP devices will expand by an 18.9 percent CAGR from 1997 to 2002.

©1998 Dataquest

The CPU and core logic devices are the main microprocessor markets. Intel will retain its dominance of the microprocessor market. Other companies with x86-type processors will be able to increase their business and grab shares from Intel.

MOS Digital Logic

The MOS digital logic market is estimated to increase from $0.7 billion in 1997 to $1.2 billion by 2002, with a healthy 14.2 percent CAGR. The analog market will surge from $0.8 billion in 1997 to $1.8 billion by 2002, with a 17.4 percent CAGR.

Taiwan's MOS logic market demand in 1997 mainly comprised ASICs, standard logic products, and other logic devices. ASIC devices will show the fastest revenue growth in the MOS digital logic product category.

Analog Monolithic

Taiwan's analog device market reached $786 million in 1997. Revenue from analog products is expected to show a healthy growth of 14.6 percent in 1998.

The Taiwanese analog device market is estimated to increase to $1.8 billion by 2002, with a 17.4 percent CAGR from 1997 to 2002. Consumer electronics manufacturing will still be the main application for this device.

Discrete and Optical Semiconductor

Taiwan's discrete and optoelectronic devices are expected to expand from $0.8 billion in 1997 to $1.3 billion in five years, with a 9.6 percent CAGR. Dataquest expects this market to show a stable growth.

Figure 4-8 illustrates the Taiwan semiconductor market comparison by product in 1997 and 2002.

Chapter 1
Executive Summary

This Executive Summary presents the following major conclusions of the Asia/Pacific semiconductor Market Trends report:

- Dataquest forecasts that the Asia/Pacific semiconductor market will grow 10.3 percent in 1998, reaching U.S.$35.9 billion. The Asia/Pacific semiconductor market should grow at a 15.7 percent compound annual growth rate (CAGR) from 1997 to 2002, reaching $67.6 billion in 2002.
- China/Hong Kong's semiconductor market will grow by 15.5 percent in 1998 to total nearly $7.8 billion. By 2002, the China/Hong Kong market is expected to total $17.6 billion, which marks a 21.1 percent CAGR for the 1997-to-2002 period.
- Singapore's semiconductor market will grow by 11.8 percent in 1998 to total $5.6 billion. In the long term, Singapore's semiconductor market will total $11 billion, which indicates a 17.2 percent CAGR for the 1997-to-2002 period.
- South Korea's semiconductor market should increase by 9.1 percent in 1998 to reach the $6 billion level. By 2002, South Korea's semiconductor market will total $11.6 billion, which generates a 16.2 percent CAGR between 1997 and 2002.
- Taiwan's semiconductor market will increase by 13.9 percent in 1998 to reach about $7.7 billion. By 2002, Taiwan's semiconductor market will approach nearly $15 billion, for a nearly 17.2 percent CAGR for the 1997-to-2002 period.

Chapter 2
Introduction and Forecast Assumptions

This Market Trends report presents Dataquest's market data and forecast analysis of Asia/Pacific's semiconductor market including China/Hong Kong, Taiwan, South Korea, and Singapore. The Asia/Pacific region has been the fastest-growing semiconductor market in the world since 1988. However, Asia/Pacific's semiconductor market grew at only 9.6 percent in 1997. The greatest impact on the 1997 semiconductor market growth in the region will be DRAM pricing. Overall, the nonmemory markets continued a healthy expansion because of Asia/Pacific's diverse manufacturing base.

The continuation of low-end and medium-range electronic equipment production transplantation from all regions of the world to Asia/Pacific will continue to be a factor in developing markets such as China and Malaysia. This production shift has enhanced the Asia/Pacific growth that comes with the growth of its own internal consumption markets.

Semiconductor Forecast Assumptions

Dataquest forecasts that the Asia/Pacific semiconductor market will grow at a five-year CAGR of 15.7 percent, reaching $67.6 billion by 2002.

These four regions—China/Hong Kong, Taiwan, South Korea, and Singapore—constitute the major semiconductor market in Asia/Pacific (more than two-thirds of the total Asia/Pacific semiconductor market in 1997). Dataquest believes that these four regions will continue to play the major role in Asia/Pacific's semiconductor market over the forecast period.

The Asian financial crisis will have varying effects on semiconductor consumption in the region—many negative but some positive. In addition, the effects differ markedly on an Asian country-by-country basis. For example, growth in countries such as Indonesia, Thailand, and the Philippines decelerated—but growth accelerated in China and Taiwan. Taiwan's electronics industry will fare well in this crisis, primarily because a larger percentage of components is supplied locally and because its financial sector is stronger than those of other Asian countries.

All semiconductor vendors are watching China. China's electronics equipment production will grow nearly 20 percent in 1998. China now stands as the largest semiconductor market in Asia/Pacific. China represents a large consumer of communications and computer equipment, accounting for 25 percent of all PCs purchased in Asia/Pacific. China's PC unit growth exceeds a 40 percent annual rate.

Although electronics consumption may be lower than previously expected in selected countries, the region as a whole will continue to enjoy the fastest growth rates in the world.

©1998 Dataquest

The semiconductor market for PC application represents more than one-third of all semiconductor consumption and will continue to play the key role for semiconductor growth. The Asia/Pacific PC production will continue to maintain a steady growth over the forecast period. Asia/Pacific's PC production should total 23 million units in 1998. The PC production growth in this region will be attributed to Pentium II, DVD, 3-D graphics, Windows NT, and Windows 98. Although much of the production gets shipped elsewhere worldwide, PC unit consumption in the region should increase by more than 20 percent this year and reach 12 million units.

In the long term, Dataquest expects the region's most important semiconductor demand driver, the PC, to sustain a solid growth in Asia/Pacific's production with a 23 percent CAGR over the five-year forecast period. As a result, PC production in Asia/Pacific will exceed 45 million units in 2002. PC motherboard production will also continue to maintain steady growth in the region.

Communications equipment will also generate outstanding semiconductor growth in Asia/Pacific over the forecast period. This application will support the demand growth for ASICs, DSPs, ASSPs, and analog ICs. In the near term, most of the Asia/Pacific semiconductor market for communications in 1998 will be driven by mobile and wireless communications. Digital consumer electronics products, such as digital set-top boxes, will also begin to make a significant contribution to overall semiconductor demand.

The markets of discrete and optical semiconductor should be lower in 1998 than originally expected because of sluggish consumer equipment production, especially digital consumer applications. However, these markets will continue to achieve steady growth to post a 1998 recovery in Asia/Pacific production of digital consumer equipment.

Economic Assumptions and Exchange Rates

Current exchange rates for the major Asia/Pacific countries are detailed in Table 2-1. Dataquest uses constant exchange rates across technologies and regions. The final and projected exchange rates from 1996 to 1999 were used for forecasting the four countries' markets in Asia/Pacific.

The Asian financial crisis cut gross domestic product (GDP) growth rates in many countries in 1997. According to Dataquest's growth rate projections (see Table 2-2), Asia/Pacific countries likely to experience depressed GDP growth include Southeast Asian countries and South Korea.

The Scope of This Market Trends Report

This Market Trends report investigates the dynamics behind consumption growth in the four countries' markets. This report includes the following chapters:

- Chapter 1, Executive Summary—The executive summary includes the major conclusions regarding the Asia/Pacific semiconductor market trends.
- Chapter 2, Introduction and Forecast Assumptions—Dataquest's market forecasting assumptions in macroeconomics and applications for semiconductor products are explained.

 ©1998 Dataquest

- Chapter 3, Asia/Pacific Semiconductor Forecast by Product—Dataquest provides semiconductor market by product and an analysis of each product's trends.
- Chapter 4, Semiconductor Market Forecast by Region—Dataquest analyzes semiconductor market trends in these four regions (China/Hong Kong, Singapore, South Korea, and Taiwan) and presents detailed device forecasts for these four regions.

Chapter 3
Asia/Pacific Semiconductor Forecast by Product

This chapter's tables and the figures provide the complete, five-year forecast by product type in the Asia/Pacific semiconductor market.

The Asia/Pacific Semiconductor Forecast

Dataquest forecasts that Asia/Pacific's semiconductor market will grow 10.3 percent in 1998, reaching $35.9 billion. The Asia/Pacific semiconductor market should grow at a 15.7 percent CAGR from 1997 to 2002, reaching $67.6 billion in 2002.

The following highlights summarize Asia/Pacific's regional semiconductor market outlooks:

- China/Hong Kong's semiconductor market will grow by 15.5 percent in 1998 and total nearly $7.8 billion. By 2002, China/Hong Kong's market will total $17.6 billion, which marks a 21.1 percent CAGR for the 1997-to-2002 period.
- Singapore's semiconductor market will grow by 11.8 percent in 1998 and total $5.6 billion. In the long term, Singapore's semiconductor market will total $11 billion, indicating a 17.2 percent CAGR for the 1997-to-2002 period.
- South Korea's semiconductor market will increase by 9.1 percent in 1998 and reach about the $6 billion level. By 2002, South Korea's semiconductor market will total $11.6 billion, a 16.2 percent CAGR for the five-year period from 1997 to 2002.
- Taiwan's semiconductor market will increase by 13.9 percent in 1998 and reach about the $7.7 billion mark. By 2002, Taiwan's semiconductor market will approach nearly $15 billion, with a nearly 17.2 percent CAGR from 1997 to 2002.

Table 3-1 and Figure 3-1 show total semiconductor market revenue and growth rates by region in Asia/Pacific during the next five-year period.

Table 3-1
Total Semiconductor Market Forecast by Region in Asia/Pacific, 1997 to 2002
(Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002
Asia/Pacific	32,535	35,899	42,755	51,751	64,483	67,562	15.7
China/Hong Kong	6,769	7,819	9,429	12,098	15,951	17,593	21.1
Singapore	4,972	5,560	6,790	8,472	10,798	11,012	17.2
South Korea	5,490	5,989	7,130	8,665	10,576	11,612	16.2
Taiwan	6,754	7,694	9,262	11,294	14,367	14,917	17.2
Rest of Asia	8,551	8,837	10,143	11,221	12,791	12,427	7.8

Source: Dataquest (June 1998)

The forecasts in Table 3-1 and Figure 3-1 call for modest semiconductor growth for Asia/Pacific in 1998 and stronger growth over the long term. Dataquest expects the Asia/Pacific semiconductor market as measured in revenue to grow at about 10 percent in 1998. Dataquest had expected a more robust 1998 growth rate.

DRAM and the Asian financial crisis explain much of this change. For example, the Asia/Pacific DRAM market will remain in decline in 1998, compared to the 1997 level. Dataquest previously expected a rebound in DRAM market growth for 1998. DRAM bit growth remains impressive, but excess capacity and low pricing, combined with the Asian financial crisis, mean scant DRAM revenue growth for 1998.

Figure 3-1
Total Semiconductor Market Growth Rates by Region in Asia/Pacific, 1997 to 2002

Product Forecasts

The following sections highlight trends that guide key product forecasts.

MOS Memory

The DRAM market will remain volatile. The DRAM revenue forecast could swing widely for both the near term and the long term because of DRAM price fluctuations. DRAM-bit consumption continues in line with Dataquest's prior projections. This means that unit demand should be strong, although pricing might remain weak. As indicated, the semiconductor forecast assumes a cyclical upturn in 2001. The DRAM market peak in 2001, however, has been moderated to match similar historical peaks.

DRAM prices continue to hug a cost-based price curve that means low pricing. This stifles the prospect for DRAM revenue growth. Dataquest expects this situation to remain the case through 1998 and into 1999. These prices are limited on the high side by DRAM oversupply, and on the low side, by antidumping regulations.

The current Asian crisis' effects on DRAM prices will be "self-regulating" in that a temporary 1998 price downturn should shift market share to lower-cost producers, after which these low-cost suppliers' capacity will be utilized and DRAM prices will recover slightly.

The current overcapacity will continue through 1999 and into 2000. Capital expenditure did not slow in 1997 as Dataquest had originally anticipated. To reflect the impact, the DRAM market revenue peak originally expected for 2000 has been pushed out by one year to 2001. (Some manufacturing capacity may eventually exit the DRAM market; however, this is not predicted in the current forecast.)

The SRAM market is still oversubscribed. However, the analog-to-digital conversion of cellular phones has increased SRAM usage in these phones dramatically. There is a large difference between this market and the PC market, the last big SRAM stronghold. Cell phone manufacturers are much more selective about their supplier base, as they use parts from top-tier suppliers and shy away from small fabless companies. Dataquest still expects to see attrition in this market because many companies that thrived on an open market for PC cache chips will shortly be excluded from this previously highly penetrable market and thus will not be able to participate in the cellular telephone market.

In the nonvolatile memory market, Dataquest sees a continuing slow conversion from EPROM to flash memory. Most of this conversion is happening in new designs and is, therefore, occurring at the higher densities. The flash memory market has moved from high profitability toward more competitive pricing as many competitors join the fold; however, unit growth remains strong. This new, lower pricing has enabled the use of flash memory in a diverse array of new applications. Mask ROM has moved away from the "growth hump" that was characteristic of the game cartridge boom and is back on the less dramatic, pregame growth trend.

 ©1998 Dataquest

There will continue to be substantial growth in the relatively small EEPROM market fueled by this technology's use in everything from electronic commerce to microcontroller-based systems including smart cards. New applications include universal serial bus (USB) interfaces for the PC. The conversion of DRAM modules from SIMMs to DIMMS will also help, as each new DIMM will contain one EEPROM to identify the attributes of the module.

Table 3-2 and Figure 3-2 show the MOS memory market forecast and growth rates by product in Asia/Pacific during the next five-year period.

The following summarizes Asia/Pacific's memory IC product outlooks:

- DRAM is expected to decline by 1 percent in 1998 and total $4.6 billion. By 2002, Asia/Pacific's DRAM market will total $8.5 billion, which marks a 12.9 percent CAGR for the 1997-to-2002 period.
- SRAM will grow by 4.4 percent in 1998 and total $626 million. In the long term, Asia/Pacific's SRAM market will total nearly $1.7 billion, which means a 22.9 percent CAGR for the five-year period from 1997 to 2002.
- Flash should increase by 21.2 percent in 1998 and reach the $731 million level. By 2002, Asia/Pacific's flash market will total nearly $1.6 billion, which is a 21 percent CAGR from 1997 to 2002.
- EEPROM will increase by 7.6 percent in 1998 and reach the $227 million mark. By 2002, Asia/Pacific's EEPROM market will approach $420 million, for a nearly 15 percent CAGR from 1997 to 2002.
- EPROM is expected to decrease by more than 25 percent in 1998, declining to just about $152 million. By 2002, Asia/Pacific's EPROM market will decline to just $92 million.
- Mask ROM will decrease by 14 percent in 1998, declining to $176 million. By 2002, Asia/Pacific's mask ROM market will edge upward, however, to the $188 million level.

MOS Microcomponent

The Asia/Pacific microprocessor market forecast remains largely consistent with prior expectations. As expected, the MPU market will increase this year and over the long term, but at a slower rate versus the 1992-to-1997 period. The x86 architecture will continue its domination of the PC market. Business PC demand continues to drive MPU demand. The x86 MPU technology advances still stimulate PC demand from the key "early-adopter" repeat buyers.

Key PC market dynamics, however, are changing as of first half 1998. For example, the "sub-U.S.$1,000" PC captured consumer market demand during late 1997. Business buyers now show growing interest in low-cost PCs, which means a long-term decline in the PC average selling price (ASP). A sharp fall in the x86 MPU ASP, however, is not expected. Intel Corporation's competitors, such as Advanced Micro Devices Inc. and National Semiconductor Corporation, are not expected to cause a x86 price war.

Although the MPU price for PC desktop applications will decline, the x86 ASP will rise somewhat as MPUs absorb other system functions. In addition, Intel is creating workstation- and server-specific versions of x86 products that generate a much higher ASP (more than $500 per unit) than devices geared for PC markets. Internet appliances, communications (for example, cellular), and video games will fuel growth in the embedded RISC MPU market.

 ©1998 Dataquest

For 1998, the Asia/Pacific MPU market should increase by 20.1 percent and reach $5.3 billion. Intel is expected to lead a strong second half 1998 rebound in the Asia/Pacific MPU market. In the long term, Asia/Pacific's MPU market should reach $10.9 billion, which represents a 19.6 percent CAGR for the 1997-to-2002 period. This is a slower, long-term MPU compound growth rate than the 24.5 percent-plus CAGR for the 1992-to-1997 period, mirroring the slower, long-term pace of PC revenue growth.

Dataquest's forecast continues to assume that non-PC applications—such as digital cellular, digital consumer electronics, and data communications, will drive demand for MCUs and DSPs, including embedded versions. The following summarizes these product forecasts:

- DSPs should increase by 26.1 percent in 1998, reaching $1 billion. By 2002, Asia/Pacific's DSP market will approach $2.4 billion, which translates into a stellar 24.4 percent CAGR for the 1997-to-2002 period.
- Sharp price erosion for microcontroller (MCU) products means lower 1998 revenue than originally expected. For 1998, Asia/Pacific's MCU market will increase by 13.7 percent and total $2.6 billion. In the long term, Asia/Pacific's MCU market will total $5.1 billion by 2002. The forecast of a 17 percent CAGR for the 1997-to-2002 period is lower than prior expectations.

Table 3-3 and Figure 3-3 show the MOS microcomponent market forecast and growth rates by product in Asia/Pacific during the next five-year period.

MOS Digital Logic

The Asia/Pacific MOS digital logic forecast calls for 6.7 percent growth in 1998. This growth is slower than originally anticipated.

The short-term forecasts on other MOS logic products have also been lowered. Supply exceeds demand for these products, which means downward pricing pressure. Standard logic remains relatively unchanged from Dataquest's prior forecasts. ASIC product forecasts have been lowered only slightly. Cell-based ICs (CBICs), the system-level integration (SLI) product of choice, will continue as the fastest-growing logic product. Gate arrays, however, are under serious pricing pressure and are entering the decline phase of the life cycle. CBICs are displacing gate arrays from high-end applications as programmable logic devices (PLDs) displace gate arrays on low-end applications. This trend translates into higher, long-term growth in the CBIC and PLD segments and lower growth in gate arrays.

For 1998, the Asia/Pacific CBIC market should grow at a 21.8 percent rate. PLDs are suffering from rapid price erosion and slow demand, so Dataquest is forecasting an 18.6 percent increase in 1998, the lowest growth rate in the market's history. Gate array revenue will continue to decline this year, by 5.5 percent. Full-custom ICs are on the most rapid decline because they are being replaced by CBICs and gate arrays to some degree. The standard logic market will increase by 8.7 percent. Other MOS logic products will grow 5.2 percent.

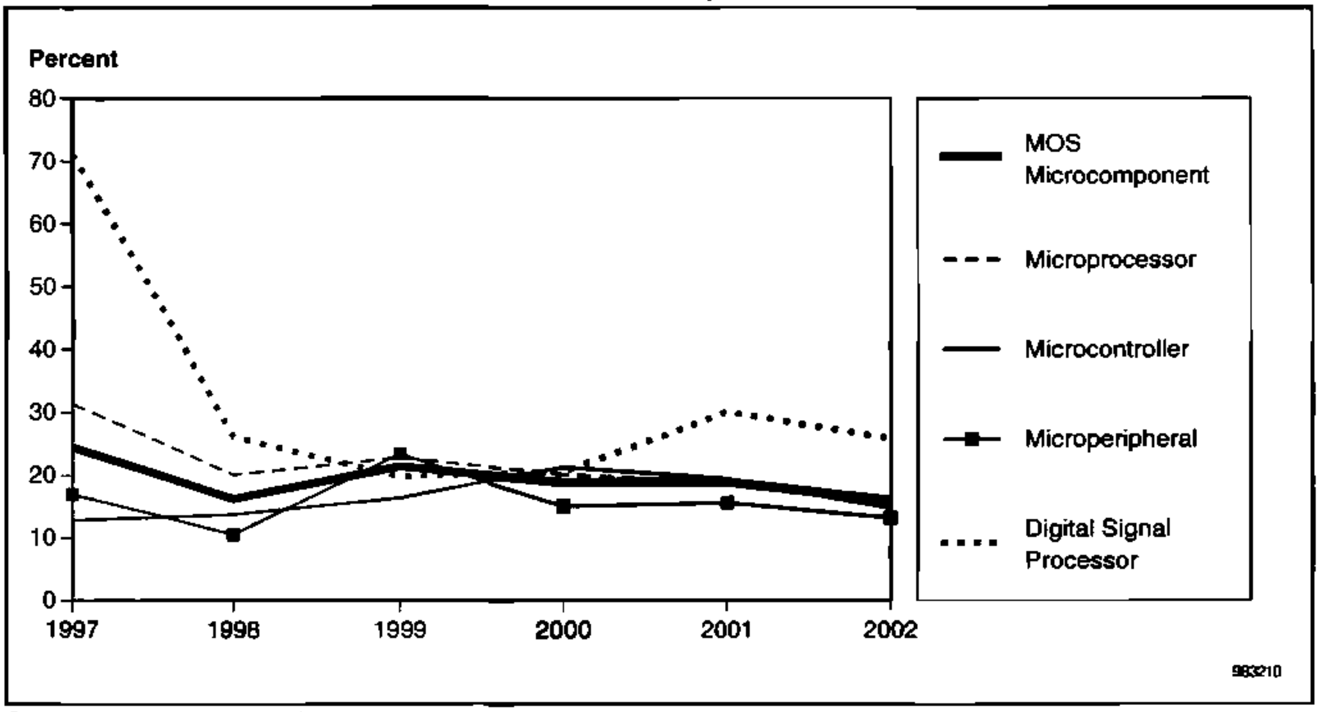
MOS Microcomponent Market Growth Rates by Product in Asia/Pacific, 1997 to 2002



Source: Dataquest (June 1998)

In the long term, the CBIC market will reach $3.6 billion by 2002, an impressive 28.1 percent-plus CAGR from 1997 to 2002. PLDs will expand at nearly a 23.8 percent CAGR and reach $422 million by 2002. Other MOS logic products will grow at a respectable 16.5 percent CAGR. Standard logic will grow slowly, while gate arrays will decline.

Table 3-4 and Figure 3-4 show the MOS digital logic consumption forecast and growth rates by product in Asia/Pacific during the next five-year period.

Analog Monolithic

The Asia/Pacific analog IC market in 1998 is forecast to grow 14.6 percent and total $7.2 billion. The Asian financial crisis should reduce consumer demand in Asia/Pacific and Japan, which will slow analog products' growth. In 1997, the analog market expanded by 24.1 percent.

The Asia/Pacific analog IC market should grow at a 17.5 percent CAGR for the 1997-to-2002 period to reach $14.2 billion by 2002. Looking at the long-term trends to 2002, mixed-signal ICs will experience a solid growth, driven by the application markets such as digital cellular. In addition, new, emerging applications in the consumer and communications market will contribute to the growth of mixed-signal ICs. In the more traditional standard linear product area, voltage-regulator products will continue to enjoy strong growth as the demand for smart power continues to grow, especially in the portable PC and electronics markets.

Discrete and Optical Semiconductor

Asia/Pacific's discrete market should increase in 1998 by 8.8 percent to $4.2 billion. The long-term forecast assumes a stable market. Dataquest forecasts a 10.2 percent CAGR in discrete products through 2002, totaling $6.2 billion.

Asia/Pacific's optoelectronic semiconductor market will grow only 3.5 percent in 1998 and total $0.9 billion. This market grew by 23.5 percent in 1997. By 2002, Asia/Pacific's optoelectronics semiconductor market will total $1.5 billion, which represents a 10.2 percent CAGR for the five-year period from 1997 to 2002.

Table 3-5 and Figure 3-5 show the analog/discrete/optical semiconductor market forecast and growth rates in Asia/Pacific during the next five-year period.

Table 3-5
Analog/Discrete/Optical Semiconductor Market Forecast in Asia/Pacific, 1997 to 2002 (Millions of U.S. Dollars)

Chapter 4
Asia/Pacific Semiconductor Forecast by Region

This chapter presents the semiconductor market and major electronic equipment production forecast during the five-year period from 1997 to 2002 in China/Hong Kong, Singapore, South Korea, and Taiwan. This chapter's tables and the figures provide the complete, five-year forecast by region in the Asia/Pacific semiconductor market and major electronic equipment production.

China/Hong Kong Semiconductor Forecast

China/Hong Kong's semiconductor market is forecast to grow by 15.5 percent in 1998 and total about $7.8 billion. By 2002, China/Hong Kong's market will total $17.6 billion, which marks a 21.1 percent CAGR for the 1997-to-2002 period.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- The China and Hong Kong economies should grow by an estimated 8 percent and 2.7 percent, respectively. The Asia/Pacific region should begin to recover from the regional economic turmoil next year.
- China's electronics equipment production will grow nearly 20 percent this year. China now stands as the largest semiconductor market in Asia/Pacific. China represents a huge consumer of communications and computer equipment, accounting for 25 percent of all personal computers purchased in Asia/Pacific. China's PC unit growth exceeds a 40 percent annual rate.
- The five-year forecast shows that the China/Hong Kong semiconductor market will be expanded from $6.8 billion in 1997 to $17.6 billion in 2002, at a 21.1 percent CAGR, far higher than the region's 15.7 percent CAGR. In 1998, China/Hong semiconductor market will grow 15.5 percent and total nearly $7.8 billion.
- MOS memory devices will be depressed in 1998 due to the sluggishness of DRAM prices in 1998.
- MOS microcomponent market remains largely consistent with prior expections. This product market should grow at a 24.3 percent CAGR for 1997 through 2002, reaching $6.5 billion in 2002.
- However, the MOS digital logic market will increase from $0.9 billion in 1997 to $1.8 billion by 2002, with an 15.5 percent CAGR. The MOS digital logic market share of the total semiconductor market will decrease from 13.2 percent in 1997 to 10.4 percent in 2002.
- Analog market will surge from $1.4 billion in 1997 to $4.3 billion by 2002, with a 25 percent CAGR. As a result, the analog market's proportion of total semiconductors will be expected to increase from 21 percent in 1997 to 24.7 percent in 2002.
- Dataquest expects the discretes and optoelectronics market to expand from $1 billion in 1997 to $2.2 billion by 2002, with a 14.7 percent CAGR.

China/Hong Kong Semiconductor Market Trends by Product

Table 4-1 presents the China/Hong Kong semiconductor market forecast by product from 1997 to 2002.

Figure 4-1 illustrates the China/Hong Kong semiconductor market comparison by product in 1997 and 2002.

Table 4-1
Total China/Hong Kong Semiconductor Market Forecast by Product, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997 to 2002

MOS Memory

The following highlights summarize China/Hong Kong's MOS memory market:

- The consumption of MOS memory products in China/Hong Kong reached $1.1 billion in 1997. Revenue from MOS memory products is expected to show only a 3.2 percent growth in 1998 as market conditions remain weak. MOS memory products should exhibit the highest fluctuating annual percentage changes as DRAM pricing movements take hold. From 1999 to 2001, the MOS memory market is forecast to rise rapidly, before nose-diving in 2002 when a glut in DRAM devices resurfaces again.
- The MOS memory market is estimated to increase to about $2.6 billion by 2002. The 1997-to-2002 CAGR of 17.8 percent will result in MOS memory products representing the third-largest device category over the five-year forecast period.
- DRAM devices constituted the largest segment of the MOS memory product category in 1997. Flash memory devices took second place instead of SRAM. The positions of these three device segments are forecast to be unchanged in 2002.

MOS Microcomponent

MOS microcomponent market highlights are as follows:

- The consumption of MOS microcomponent products reached $2.2 billion in 1997. Revenue from MOS microcomponent products is expected to register 21.3 percent growth in 1998, as a result of increased demand from PCs and cellular phones.
- The MOS microcomponent market is estimated to rise to $6.5 billion by 2002. With a 24.3 percent CAGR from 1997 to 2002, MOS microcomponent products will continue to represent the largest device category over the five-year forecast cycle.
- Microprocessor devices represent the largest segment in the MOS microcomponent product category, followed by microperipheral and microcontroller devices. Although these devices are expected to remain dominant until 2002, the increasing use of DSP devices in many high-volume applications is likely to contribute significant revenue growth in the MOS microcomponent market.

MOS Digital Logic

MOS digital logic market highlights include the following:

- The consumption of MOS digital logic products reached $0.9 billion, overtaking discrete products for the first time in 1997. MOS digital logic is expected to record a 9.2 percent growth in 1998. Such low growth results from the decline of custom IC devices.
- The MOS digital logic market is projected to reach about $1.8 billion by 2002 with a 15.5 percent CAGR from 1997 to 2002.
- ASIC devices will show the fastest revenue growth in the MOS digital logic product category. The ASIC segment will increasingly dominate the growth trend as CBICs present the most viable path toward integrating systems on a chip.

Analog Monolithic

Analog monolithic market highlights are as follows:

- The consumption of analog products in China/Hong Kong reached $1.4 billion in 1997. Revenue from analog products is expected to show a 22 percent growth in 1998, as market conditions are expected to improve.
- Analog product revenue is estimated to increase to $4.4 billion by 2002, with a 25 percent CAGR for the 1997-to-2002 period. As a result, the analog market represents the second-largest device category over the next five-year period.

Discrete and Optical Semiconductor

Discrete and optical semiconductor highlights include the following:

- The discrete market is estimated to increase to $1.9 billion by 2002. With a projected 16.8 percent CAGR for the 1997-to-2002 period, discrete products will continue to represent steady revenue expansion in this five-year period.
- The optical semiconductor market is expected to increase to $0.4 billion by 2002 with a 14.7 percent CAGR.

Singapore's Semiconductor Forecast

The Asia/Pacific region was hit by the Asian financial crisis in 1997. The region's countries are likely to see depressed economic growth as a result of consumption and investment downturn. Among the economies worst affected are the Southeast Asian nations, including Singapore. The city state's growth rate this year is projected to be 2.5 percent, according to Dataquest. This forecast is within the Singaporean government's estimated GDP growth range of 2.5 percent to 4.5 percent.

Although the U.S. and European economies continue to show signs of strength, the regional situation closer to Singapore is expected to have a downward impact on the economy's health. Recent regional developments, including Indonesia's social unrest and the weak Japanese economy, have further dampened the demand of Singapore exports in 1998. The latest trade figures released by the government show that domestic exports contracted by 2.1 percent in April. The decline reflected the lower sales of electronic equipment, rigid disk drives, and PCs, as regional demand remains weak.

Singapore's semiconductor market will grow by 11.8 percent in 1998 and reach about $5.6 billion. In the long term, Singapore's semiconductor market will total $11 billion, with a 17.2 percent CAGR for the period from 1997 to 2002.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- The Asia/Pacific GDP growth rates are likely to be negatively impacted by the Asian financial crisis in 1998. Singapore's economy is expected to grow by an estimated 2.5 percent. The Asia/Pacific region should begin to recover from the regional economic turmoil next year.
- By the end of this decade, Dataquest forecasts that Asia/Pacific is likely to become the world's second-largest production region of electronic equipment. Data processing and communications equipment are forecast to drive Singapore's total electronic equipment production growth. Semiconductor consumption is expected to rise as a result of increasing semiconductor content.
- Prices of memory products, especially DRAM devices, are expected to bottom out this year. The DRAM market is projected to move closer to demand-supply balance by the end of this decade. DRAM prices are expected to peak in 2001, before softening again in 2002.
- In 1997, the top six equipment categories manufactured in Singapore included rigid disk drive, serial printer, PC, pager, color television, and digital cellular telephone. Production revenue of these six major electronic equipment segments is expected to record a five-year CAGR of 12.6 percent.
- From 1999 to 2001, the MOS memory market is expected to rise rapidly, before nose-diving in 2002 when a glut in the DRAM market re-emerges.

 ©1998 Dataquest

- With the highest 1997-to-2002 CAGR of 19.5 percent, MOS microcomponent products will continue to represent the largest device category in this five-year forecast cycle.
- MOS digital logic products emerged as the third-largest product category in Singapore in 1997. A 16.8 percent CAGR from 1997 to 2002 is predicted as a result of these products finding increased applications and the industry trend toward system-level integration.

Singapore's Semiconductor Market Trends by Product

Table 4-2 shows Singapore's semiconductor market forecast by product from 1997 to 2002.

Figure 4-2 illustrates Singapore's semiconductor market comparison by product in 1997 and 2002. This year, Singapore's semiconductor consumption is projected to expand by 11.8 percent.

MOS Memory

MOS memory trends include the following:

- Singapore's consumption of MOS memory products reached $1.2 billion in 1997. Revenue from MOS memory products is expected to register a flat 1.5 percent growth this year as the market remains weak. MOS memory products should exhibit the highest fluctuating annual percentage changes as DRAM pricing movements take hold. From 1999 to 2001, the MOS memory market is forecast to rise rapidly, before nose-diving in 2002 when a glut in DRAM devices resurfaces again.
- The MOS memory market is estimated to increase to $2.5 billion by 2002. The 1997-to-2002 CAGR of 16.8 percent will result in MOS memory products representing the second-largest device category over this five-year period.
- DRAM devices constituted the largest segment of the MOS memory product category in 1997. Flash memory devices took second place with SRAMs occupying the No. 3 spot. The positions of these three device segments are forecast to be unchanged by 2002.

MOS Microcomponent

MOS microcomponent trends include the following:

- The consumption of MOS microcomponent products reached $1.7 billion in 1997. MOS microcomponent revenue is expected to register a 16 percent growth in 1998, as a result of increased demand from PCs, printers, and cellular phones.
- The MOS microcomponent market is estimated to rise to $4.1 billion by 2002. With the highest 1997-to-2002 CAGR of 19.5 percent, MOS microcomponent products will continue to represent the largest device category in this five-year forecast cycle.
- Microprocessor devices represent the largest segment in the MOS microcomponent product category, followed by microcontroller and microperipheral devices. Although these devices are expected to remain dominant until 2002, the increasing use of DSP devices in many high-volume applications is likely to contribute significant revenue growth in the MOS microcomponent market.

MOS Digital Logic

MOS digital logic trends include the following:

- MOS digital logic products emerged as the third-largest product category in Singapore in 1997. The product consumption reached $0.8 billion, overtaking analog products for the first time in 1997. MOS digital logic is expected to record an 8.8 percent revenue growth in 1998.
- The MOS digital logic market is projected to increase to $1.8 billion by 2002. A 16.8 percent CAGR from 1997 to 2002 is predicted as a result of these products finding increased applications and the industry trend toward system-level integration.
- ASIC devices dominate the largest portion of revenue in the MOS digital logic product category. The ASIC segment will increasingly dominate the growth trend as CBICs present the most viable path toward integrating systems on a chip.

Analog Monolithic

Analog monolithic trends include the following:

- Singapore's consumption of analog products reached $0.7 billion in 1997. Revenue from analog products is expected to show a 16.8 percent growth this year as market conditions are expected to improve.

Discrete and Optical Semiconductor

Discrete and optical semiconductor trends include the following:

- The combined consumption of discrete and optical semiconductor products reached $0.5 billion in 1997. Revenue from this combined product category is forecast to register 19.2 percent growth this year as a result of increased demand from a wide range of data processing, consumer, and communications equipment.
- The discrete market is estimated to increase to $0.8 billion by 2002. With a projected 1997-to-2002 CAGR of 13 percent, discrete products will continue to represent steady revenue expansion in the five-year period.
- The optical semiconductor market is expected to increase to $0.2 billion by 2002 with a 15 percent CAGR.

South Korea's Semiconductor Forecast

With sluggish domestic consumption and tight money supply, the South Korean GDP is expected to be at negative 1.8 percent in 1998. If Korea fails to reform its flagging economy and its industrial restructuring go awry, the GDP may shrink by as much as 2 percent year on year. GDP measures the value of a country's total output of goods and services, subtracting income from its foreign direct investments.

Dataquest estimates that a 15 percent drop in domestic consumption will wipe out any positive effect of the trade surpluses and drag down economic growth to about negative 1.8 percent from 1997's 5.5 percent. Assisted by a sharp fall in import demands, the current-account balance was expected to swing from a deficit of $23.5 billion in 1997 to a surplus of about $35 billion. The annual jobless rate will stop short of 7 percent, or 1.5 million unemployed workers. It also expected that the consumer price index will post a yearly gain over 10 percent.

Dataquest expects that, depending on the results of the ongoing restructuring of industrial and financial companies, the Korean economy may be able to regain its vitality gradually, starting in 1999. The yearly GDP growth will climb to 2.2 percent next year, 5.7 percent in 2000, 5.6 percent in 2001, and 5.6 percent in 2002.

As the won-dollar exchange rate become more stable and domestic demand expands, however, current-account surpluses will contract, declining to $16.4 billion in 1999, $10.2 billion in 2000, $8.5 billion in 2001, and $6.7 billion in 2002. The unemployment rate will also stabilize at 3 percent to 4 percent in 2000.

Although Korea represented 17 percent of Asia/Pacific's semiconductor consumption in historical forecast, this proportion of Asia/Pacific's semiconductor consumption will decline a little in 1998 because of IMF restrictions.

Korea's semiconductor market will grow by 9.1 percent in 1998 and reach about $6 billion. Dataquest predicts that Korea's semiconductor market will show its steady growth from 1999, recovering from the financial crisis in the fourth quarter of 1998. As a result, Korea's semiconductor market will total $11.6 billion, with a 16.2 percent CAGR from 1997 to 2002.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- Korea's semiconductor market will increase by about 9 percent in 1998 to a total of $6 billion. The Korean financial crisis and low DRAM pricing will hamper semiconductor revenue growth in 1998, although some product segments will achieve robust double-digit growth rates. For 1999, the market should grow by 19 percent and total about $7 billion. The long-term growth will be somewhat slower than the prior forecast. By 2002, Korean semiconductor market will total $11.6 billion, which marks a 16.2 percent CAGR for the five-year period from 1997 to 2002.

 ©1998 Dataquest

- Korea's PC unit production will decline by 14 percent in 1998 and total 1.6 million units. PC production revenue will decrease by 18 percent this year and reach about $1 billion. For the long term, the semiconductor forecast assumes that Korea's PC production will grow at a 10.4 percent CAGR for the five-year period and total just over 3 million units for 2002. PC production revenue, however, will grow at a slower 8.1 percent CAGR because of the declining PC prices.
- The semiconductor industry should retain long-term vitality. PCs, communications, and consumer electronics will continue to rank as Korea's most important application markets during the five-year forecast period from 1997 to 2002.
- MOS microcomponent products, especially digital signal processors (DSPs), will continue to fuel the growth of Korea's semiconductor market. DSPs rank among the highest-growth semiconductor products. This device is the centerpiece of communications electronics—such as cellular phones, modems, and the emerging consumer digital electronics. The Korean DSP market should grow at a 26.4 percent CAGR for the 1997-to-2002 period and approach $0.3 billion by 2002.
- Memory IC trends, especially DRAM pricing, serve as a key swing factor in both the near-term and long-term forecasts. In 1998, Korea's memory market should decline by 5.9 percent; the DRAM market is expected to decrease by 12.4 percent in 1998.
- MOS digital logic market will increase from $0.7 billion in 1997 to $1.5 billion by 2002, with a 16.5 percent CAGR.
- Analog market will grow at a 17.9 percent CAGR for the 1997-to-2002 period and approach $3.3 billion by 2002.
- Dataquest expects the combined market for discrete and optical semiconductors to expand from nearly $1 billion in 1997 to $1.6 billion by 2002, with a 10.9 percent CAGR.

South Korea's Semiconductor Market Trends by Product

Table 4-3 presents the South Korea semiconductor market forecast by product from 1997 to 2002.

Figure 4-3 depicts South Korea's semiconductor market comparison by product in 1997 and 2002.

Table 4-3
Total South Korea Semiconductor Market Forecast by Product, 1997 to 2002
(Millions of U.S. Dollars)

MOS Memory

MOS memory trends include the following:

- South Korea's MOS memory consumption reached $0.8 billion in 1997. Revenue from MOS memory products is expected to decline 5.9 percent this year as the market remains weak. MOS memory products should exhibit the highest fluctuating annual percentage changes as DRAM pricing movements take hold. From 1999 to 2001, the MOS memory market is forecast to rise rapidly, before nose-diving in 2002 when a glut in DRAM devices resurfaces again.
- The MOS memory market is estimated to increase to $1.5 billion by 2002. The 1997-to-2002 CAGR of 14.5 percent will result in MOS memory products representing the fourth-largest device category in the five-year period.
- DRAM devices constituted the largest segment of the MOS memory product category in 1997. SRAM devices takes second place with flash memory occupying the third spot. The positions of these three device segments are forecast to be unchanged in 2002.

The following summarizes memory IC product outlooks:

- DRAM should decrease by 12.4 percent in 1998 and total $460 million. By 2002, South Korea's DRAM revenue will total about $980 million, which marks a 13.3 percent CAGR from 1997 to 2002.
- SRAM will grow by 13.3 percent in 1998 and total $85 million. In the long term, South Korea's SRAM revenue will total $225 million, a 24.6 percent CAGR for the period from 1997 to 2002.
- Flash should increase by 23.5 percent in 1998 and reach the $84 million level. By 2002, South Korea's flash revenue will total $183 million, which is a 21.9 percent CAGR for the 1997-to-2002 period.
- EEPROM will increase by 9.5 percent in 1998 and reach the $46 million mark. By 2002, South Korea's EEPROM revenue will approach $86 million, for a 15.4 percent CAGR from 1997 to 2002.
- EPROM should decrease by more than 20 percent in 1998, declining to $22 million. By 2002, South Korea's EPROM revenue will decline to just $14 million.
- Mask ROM will decrease by more than 13 percent in 1998, declining to $31 million. By 2002, South Korea's mask ROM revenue will edge upward, however, to the $35 million level.

MOS Microcomponent

MOS microcomponent trends include the following:

- South Korea's MOS microcomponent revenue will increase this year and over the long term, but at a slower rate versus the 1992-to-1997 period. The MOS microcomponent market is estimated to increase to $3.6 billion by 2002, with an 18.4 percent CAGR during this five-year period from 1997 to 2002.
- For 1998, South Korea's MPU revenue should increase by 13.5 percent and reach $640 million. In the long term, South Korea's MPU revenue should reach $1,350 million, representing a 19.1 percent CAGR from 1997 to 2002. This is a slower, long-term MPU compound growth rate than the 1992-to-1997 period's CAGR. This mirrors the slower, long-term pace of PC revenue growth.
- Dataquest's forecast continues to assume that non-PC applications—such as digital cellular, digital consumer electronics, and data communications—will drive demand for MCUs and DSPs, including embedded versions.
- DSPs should increase by 29 percent in 1998, exceeding $100 million. By 2002, South Korea's DSP revenue will approach $300 million, which translates into a stellar 26.4 percent CAGR for the 1997-to-2002 period.
- Sharp price erosion for microcontroller (MCU) products means lower 1998 revenue. For 1998, South Korea's MCU revenue will increase by 12.8 percent and total $600 million. In the long term, South Korea's MCU revenue will total $1,180 million by 2002, with a 17.3 percent CAGR forecast for the 1997-to-2002 period.

MOS Digital Logic

MOS digital logic trends include the following:

- MOS digital logic is expected to record a 6.6 percent revenue growth this year and reach $763 million. The MOS digital logic market is projected to increase to $1,537 million by 2002. A 16.5 percent CAGR from 1997 to 2002 is predicted as a result of the industry trend toward system-level integration.
- ASIC market should increase by 17 percent in 1998 and total $330 million. By 2002, South Korea's ASIC revenue will total about $820 million, which marks a 23.8 percent CAGR for the 1997-to-2002 period.
- Custom IC revenue will decline by 24.4 percent in 1998 and total $65 million. In the long term, South Korea's custom IC revenue will total $13 million, which means a 31.5 percent CAGR decline from 1997 to 2002.
- Standard logic should increase by 7.1 percent in 1998 and reach the $90 million level. By 2002, South Korea's standard logic revenue will total $114 million, which is a 6.3 percent CAGR from 1997 to 2002.
- Other MOS logic will increase by 5.3 percent in 1998 and reach the $278 million mark. By 2002, South Korea's other MOS logic revenue will approach $590 million, for a 17.4 percent CAGR from 1997 to 2002.

Analog Monolithic

Analog monolithic trends include the following:

- South Korea's analog IC revenue during 1998 will grow by nearly 14.3 percent and total $1,630 million. The Korean financial crisis should reduce consumer demand in South Korea, which will slow the growth of analog products.
- Analog IC revenue should grow at a 17.9 percent CAGR for the 1997-to-2002 period and reach $3,250 million by 2002. Looking at the long-term trends to 2002, mixed-signal ICs will experience solid growth, driven by application markets such as digital cellular. In addition, new emerging applications in the consumer and communications market will contribute to the growth of mixed-signal ICs. In the more traditional standard linear product area, voltage-regulator products will continue to enjoy strong growth as the demand for smart power continues to grow, especially in the portable electronics markets.

Discrete and Optical Semiconductor

Discrete and optical semiconductor market trends include the following:

- Discrete product revenue should increase in 1998 by nearly 10 percent to $880 million. The long-term forecast assumes a stable market. Dataquest forecasts a 10.8 percent CAGR in discrete products through 2002, totaling $1,340 million.
- Optical semiconductor revenue will grow only 2.9 percent in 1998 and total $180 million. By 2002, South Korea's optical semiconductor revenue will total $300 million, representing an 11.4 percent CAGR from 1997 to 2002.

©1998 Dataquest

Taiwan's Semiconductor Forecast

Taiwan's semiconductor market will increase by 13.9 percent in 1998 and reach about the $7.7 billion mark. By 2002, Taiwan's semiconductor market will approach nearly $15 billion, for a nearly 17.2 percent CAGR from 1997 to 2002.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- The Asia/Pacific GDP growth rates are likely to be negatively impacted by the Asian financial crisis in 1998. Taiwan's economy is expected to grow by an estimated 5.2 percent. The Asia/Pacific region should begin to recover from the regional economic turmoil in 1999.
- PCs were still the largest items in Taiwan, with a $5.7 billion revenue in 1997, which represented a 49.2 percent share of total PC production in Asia/Pacific. Dataquest predicts that PCs will grow aggressively at an 11.2 percent CAGR in the next five years, to $9.6 billion by 2002.
- Monitors ranked second in 1997. Monitors, however, will show slow growth of 5.8 percent in the next five years. Motherboards were the third-largest product segment, which is expected to show a 10.8 percent CAGR growth for the next five years.
- The five-year forecast shows the Taiwanese semiconductor market expanding from $6.8 billion in 1997 to $14.9 billion in 2002, at a 17.2 percent CAGR, higher than the region's 15.7 percent growth. In 1997, Taiwan's semiconductor market showed a 12.8 percent growth, compared to 1996, resulting in a total market of $6.8 billion. Excluding DRAM, the 1997 Taiwanese semiconductor market actually grew by 30.6 percent, led by 32 percent MOS microcomponent growth.
- MOS memory devices lost their overall position to MOS microcomponents in 1997 as the largest semiconductor category. This drastic change was caused mostly by the sluggish DRAM price in 1997.
- Taiwan's MOS microcomponent emerged as the largest semiconductor market category in 1997, overtaking MOS memory for the first time. The MOS microcomponent market has grown from $958 million in 1993 to $2.5 billion in 1997.
- MOS digital logic market will surge from $629 million in 1997 to $1.5 billion by 2002, with a 19.1 percent CAGR. The MOS digital logic market share of total semiconductor market should increase from 9.3 percent in 1997 to 10 percent in 2002.
- Dataquest projects a moderate growth for discrete of 12.2 percent CAGR to $1.2 billion in 2002. Analog products' market share of the total semiconductor market should decrease from 11.6 percent in 1997 to 12.6 percent in 2002.
- Dataquest expects the market for discretes and optoelectronics to expand from $846 million in 1997 to $1.5 billion by 2002, with a 12.1 percent CAGR.

MOS Memory

MOS memory devices lost their overall position in 1997 as the largest semiconductor category to MOS microcomponents. This drastic change was caused mostly by the sluggish DRAM price in 1997. However, Taiwan's developing data processing industries will lead a demand for MOS memory consumption in the next five years. The MOS memory family continues to be the process driver for the semiconductor industry. Continued high demand for memory from the data processing segment and its pervasiveness in other applications will keep memory the important product family for the forecast period. Domestic demand for PCs is another driving force for the Taiwanese semiconductor market. Dataquest forecasts that the MOS memory market will surge from $2 billion in 1997 to $3.9 billion by 2002, with a 14.8 percent CAGR. MOS memory's market share of total semiconductor consumption should decrease from 29.2 percent in 1997 to 26.4 percent in 2002.

MOS Microcomponent

Taiwan's MOS microcomponent emerged as the largest semiconductor market category in 1997, overtaking MOS memory for the first time. The MOS microcomponent market has grown from $958 million in 1993 to $2.5 billion in 1997. Intel Corporation will maintain its dominance of the microprocessor market. Other companies with x86-type processors will be able to increase their business and take share from Intel. Strong demand for microcontrollers will continue. These products will continue to be designed into data processing and many other applications.

 ©1998 Dataquest

The PC-driven microcomponents segment will increase from 36.7 percent of the semiconductor market in 1997 to almost 40.7 percent in 2002. Dataquest forecasts that the MOS microcomponent market will surge from $2.5 billion in 1997 to $6.1 billion by 2002, with a 19.6 percent CAGR.

MOS Digital Logic

MOS digital logic market demand in 1997 mainly comprised ASICs, standard logic products, other logic devices, and custom ICs. Demand for MOS digital logic devices continued to be driven by data processing, consumer, and increasingly, communications applications. MOS digital logic was the smallest subsegment of the MOS digital category. MOS digital logic market will surge from $629 million in 1997 to $1.5 billion by 2002, with a 19.1 percent CAGR. MOS digital logic's market share of the total semiconductor market will increase from 9.3 percent in 1997 to 10 percent in 2002.

Analog Monolithic

Dataquest's forecast shows analog to be the third-largest semiconductor device by 2002. Demand for analog devices now is expected to come from a more diverse mix of applications, such as communications and consumer. Dataquest projects a steady growth to $1.9 billion in 2002 with a 19 percent CAGR. Analog's market share of the total semiconductor market will decrease from 11.6 percent in 1997 to 12.6 percent in 2002.

Discrete and Optical Semiconductor

Discrete and optical semiconductor devices have an even-wider diversity of product applications that requires many types of discrete device, such as consumer, communications, and data processing. Dataquest expects the market for discretes and optoelectronics to expand from $0.8 billion in 1997 to $1.5 billion by 2002, with a 12.1 percent CAGR. The discrete and optical semiconductor market share of the total semiconductor market is expected to decrease from 12.5 percent in 1997 to 10 percent in 2002.

Chapter 1
Executive Summary

Semiconductor production in Asia/Pacific has grown significantly in recent years. The semiconductor industry has witnessed the rise of South Korean companies as a manufacturing power, accompanied by their advancing worldwide rankings. Recently, the emergence of Taiwanese semiconductor contract manufacturing (SCM) companies has made a mark on the industry. Semiconductor production in these two countries will remain as the mainstay in the Asia/Pacific region.

Dataquest forecasts that the Asian financial crisis will reduce gross domestic product (GDP) growth of Asia/Pacific economies in 1998. South Korea (referred hereafter as Korea), one of the countries worst hit by the crisis, is predicted to stage a recovery by 1999. The impact of the Asian financial crisis on the region's semiconductor manufacturing companies is expected to cause delays in capacity expansion, according to Dataquest. As a result, growth is likely to become more moderate as companies freeze capital spending on plant and equipment.

Korea and Taiwan are the largest semiconductor production centers in the region. The next expansion wave in Asia/Pacific is predicted to come from Singapore, followed by China/Hong Kong. The benefits associated with semiconductor manufacturing—high value-added production, transfer of technology, and upskilling of the workforce—have sparked the interest of other countries in the region. Among the Southeast Asian nations, Malaysia is predicted to become a participant toward the end of this decade. By 2002, the Asia/Pacific semiconductor production revenue is predicted to grow 2.5 times its 1997 revenue.

This Market Trends report's objectives serve the following purposes:

- Review the 1997 Asia/Pacific semiconductor production—Estimate the 1997 revenue of the top manufacturers from the region's semiconductor production
- Forecast Asia/Pacific's semiconductor production trends from 1998 to 2002—Identify device segments driving the growth trends and provide breakdown of production by device segment
- Review the 1997 semiconductor production in China/Hong Kong, Korea, Singapore, and Taiwan—Estimate the 1997 revenue of the top manufacturers in each country
- Forecast semiconductor production trends in China/Hong Kong, Korea, Singapore, and Taiwan from 1998 to 2002—Identify device segments driving the growth trends in each country and provide the breakdown of production by device segment
- Provide insights into the defining characteristics for each country—Identify device segments driving the growth and break down production by device type

©1998 Dataquest

Asia/Pacific's semiconductor production is defined by the place where the wafers are fabricated. The Asia/Pacific regional semiconductor production includes all regional production and production by foreign (non-Asian) manufacturers. Dataquest follows a methodology that uses the market share revenue database, the Asia/Pacific fab database, and projecting the production revenue of the device segments separately. These devices include memory, microcomponents, logic, analog, discrete, optoelectronics, and bipolar digital components. The production revenue projections are also checked against Dataquest's semiconductor device forecasts.

The following highlights the summary of the key findings:

- In 1997, almost 47 percent of Asia/Pacific's total available capacity was equipped to produce semiconductors with design rules of 0.35-micron or lower. Most of these advanced process technologies were installed in foundries and DRAM fabs. About 26 percent of total available capacity was manufacturing wafers using process technologies of 0.8-micron or higher.
- Semiconductor production revenue in Asia/Pacific reached an estimated $18,139 million in 1997. Korean companies—Samsung Electronics Company Ltd., LG Semicon Co. Ltd., and Hyundai Electronics Company Ltd.—were ranked as the top three semiconductor manufacturers. Taiwanese companies accounted for half of the top 10 spots, reflecting Taiwanese companies' rapid emergence and Taiwan's position as a major production center.
- Asia/Pacific semiconductor companies' SCM revenue reached $4,777 million in 1997. Taiwanese companies captured 71 percent of total Asia/Pacific SCM revenue. Foundry manufacturing accounted for 27 percent of total semiconductor manufacturing output in the Asia/Pacific region.
- The 1998 semiconductor production forecast ranges from $20,450 million to $23,260 million (most likely, $22,120 million). By 2002, the production forecast is expected to range from $47.7 billion to $42.8 billion (most likely, $44.8 billion).
- MOS digital logic products are expected to record the highest device compound annual growth rate (CAGR) in Asia/Pacific of 26.9 percent up to 2002. MOS microcomponent production is likely to increase by a 21.8 percent CAGR. Memory products should see a return to healthy growth on expectations of market recovery by the turn of this century. Memory device production was projected to account for 63.5 percent of total production revenue in 1997. By 2002, MOS memory is expected to remain as the single-largest device segment with 65.1 percent share of total output.
- Korea was the largest semiconductor production center in Asia/Pacific. Almost 50 percent of Korea's total production capacity was geared to make products with design rules of 0.35-micron and below. The total 1997 revenue for Korean semiconductor manufacturing companies dropped 11.4 percent to $10,283 million, given the weak market conditions for memory devices. Production output was concentrated on mass-producing DRAMs. By 2002, Dataquest forecasts Korea's semiconductor production to reach $24,096 million.

 ©1998 Dataquest

- As a manufacturing base, Taiwan takes second place in the Asia/Pacific region. Nearly 50 percent of Taiwan's total production capacity is equipped to make products with design rules of 0.35-micron and below. Total 1997 revenue for Taiwanese semiconductor manufacturing companies grew 18.6 percent to reach $5,352 million. By 2002, Dataquest forecasts semiconductor production to achieve $13,390 million. With more companies on the island reorganizing to better target the foundry business, Taiwan is cementing its place as the world's foundry capital.
- An estimated 55 percent of Singapore's total production capacity was equipped to make products with design rules of 0.35-micron and below. The total 1997 revenue of Singapore semiconductor manufacturing companies decreased by 2.5 percent, to $1,937 million. This less-than-impressive growth can be attributed to pricing pressures on analog and DRAM devices. By 2002, Dataquest forecasts semiconductor production to reach $4,824 million. The general trend of semiconductor production in the city state will be driven by a diverse product portfolio.
- China/Hong Kong is the fastest-emerging country in the Asia/Pacific region, both as a production center and a semiconductor consumption market. Process technologies used in China/Hong Kong are less advanced, with almost 70 percent of total production capacity geared toward making products with design rules above 1-micron. In 1997, production revenue reached $490 million. By 2002, Dataquest forecasts semiconductor production to reach $1,444 million. The ownership structure is another defining characteristic of semiconductor companies operating in China/Hong Kong. A foreign majority-owned company tends to produce for export markets, while a company with local (usually Chinese government) majority ownership will tend manufacture semiconductors for the domestic consumption market.

Dataquest Perspective

The semiconductor production growth in Asia/Pacific is determined by capital investments made to build new wafer fabrication plants and to expand manufacturing capacities and the pricing level of memory products. Dataquest forecasts the worldwide memory market to record flat growth in 1998 and then register three straight years of accelerating growth, before being hit by a downturn again in 2002. Semiconductor production in the Asia/Pacific region is projected to record a five-year CAGR of 18.6 percent.

The region is likely to exhibit steady semiconductor production growth rates from 1998 to 2001. In 1998, growth is likely to be driven by new wafer plants' capacity addition in Korea, Taiwan, and Singapore. From 1999 to 2001, semiconductor production revenue is forecast to increase as a result of the recovering memory market and new companies starting commercial operations in the region.

 ©1998 Dataquest

Korea and Taiwan are expected to remain as the manufacturing powerhouse in Asia/Pacific for the next five-year period. Korea's production revenue is likely to surge when the memory cycle picks up, while Taiwan's semiconductor production revenue takes on a different nature. Although Taiwanese companies are influenced by memory pricing fluctuations, the product mix and the estimated increase in production capacity are predicted to reduce revenue volatility.

Chapter 2
Semiconductor Production in the Asia/Pacific Region

This chapter presents an overview of Asia/Pacific's semiconductor production. Asia/Pacific has been the fastest-growing semiconductor market since the beginning of this decade. As a production base, the region has experienced a rapid buildup of semiconductor manufacturing capacity, with Asia/Pacific and multinational semiconductor companies executing their expansion plans in the region. Semiconductor production has grown in the past few years, driven by increasing consumption within the region. It seemed that the region would continue on this growth trend as strong confidence in the economic outlook prevailed.

However, in the middle of 1997, these assumptions had to be re-examined when economic turmoil hit Asia/Pacific. The Asian financial crisis cut GDP growth rates in many countries in 1997. According to Dataquest's projections (see Table 2-1), Asia/Pacific countries likely to experience depressed GDP growth in 1998 include the Southeast Asian countries and South Korea.

Table 2-1
Asian GDP Growth Rates, 1995 to 1999 (Percent)

Country	1995	1996	1997	1998	1999
Indonesia	8.2	7.8	5.0	-2.1	0.5
Malaysia	9.5	8.2	6.8	2.0	3.0
Philippines	4.8	5.5	4.7	3.0	4.5
Singapore	8.8	7.0	7.6	2.5	4.0
Thailand	8.7	6.7	-0.5	-3.5	1.5
China	10.5	9.7	8.8	8.4	8.6
Hong Kong	4.5	4.9	5.4	3.4	4.6
Taiwan	6.0	5.7	6.4	5.1	5.5
South Korea	8.9	7.1	4.9	-2.0	2.0
Japan	1.4	4.1	0.9	0.8	1.8
India	7.1	6.8	4.6	5.3	8.6

Source: Dataquest (May 1998)

The Asian financial crisis caused many semiconductor companies to review their current operations, business portfolios, and expansion plans. According to Dataquest, Asia/Pacific's capital spending expansion comes primarily from two areas, DRAM and foundry capacity. DRAM investments made by Korean *chaebols* are likely to be cut drastically in 1998 because of the capital shortage. Foundry capacity investments, however, are projected to increase as Taiwanese companies continue to expand production cautiously. Overall, this is estimated to result in a capital-spending decline in Asia/Pacific for 1998. In the longer term, Dataquest expects Asia/Pacific to exhibit among the most aggressive capital-spending growth of any region, but it will match the worldwide growth rates much more closely than in the past.

Definitions

Semiconductor production in Asia/Pacific is defined by the place where the wafers are fabricated. The Asia/Pacific regional semiconductor production includes all production in the region and production by foreign (non-Asian) manufacturers. Dataquest follows a methodology that uses the market share revenue database, the Asia/Pacific fab database, and projecting the production revenue of the device segments separately. These devices include memory, microcomponents, logic, analog, discrete, optoelectronics, and bipolar digital components. The production revenue projections are checked against Dataquest's semiconductor device forecasts.

For example, Asia/Pacific's semiconductor production includes Samsung's and United Microelectronics Corporation's (UMC) fabs, as well as U.S., European, and Japanese companies' fabs. Semiconductor production revenue for integrated device manufacturers, such as SGS-Thomson Microelectronics B.V., counts the total value generated by all semiconductor manufacturing activities—including both front-end manufacturing and back-end operations. In the case of foundry manufacturers, all revenue gained from semiconductor contract manufacturing and related services are included. However, the value generated by packaging subcontractors and companies with only test and assembly plants in the region is not counted in the total Asia/Pacific semiconductor revenue. For instance, the revenue generated by Intel Corporation's Asia/Pacific assembly, testing, and packaging plants is not included in the total Asia/Pacific revenue. This approach provides insights into production trends for front-end manufacturing.

Semiconductor contract manufacturing is defined as a service in which a supplier performs some or all semiconductor manufacturing operations under contract to a customer. In its broadest sense, SCM can encompass wafer fabrication, packaging/assembly, and testing of semiconductor products.

An integrated device manufacturer (IDM) is a semiconductor supplier that manufactures its own products. The IDM's defining attribute is the exclusive ownership of one or more wafer fabrication facilities.

Yearly exchange rate variations can have a significant effect on data up to 1997. For more information about the exchange rates used, please refer to Table 2-2.

Asia/Pacific Semiconductor Production

This section analyzes Asia/Pacific's production capacities and manufacturing technologies.

The two largest semiconductor production bases in the Asia/Pacific are Korea and Taiwan. In 1997, there were more than 25 wafer fabrication plants operating in each of these countries. Singapore is an emerging production center, with manufacturing on the island dominated by three large companies. Although China/Hong Kong has a high number of semiconductor manufacturing companies, these companies run smaller wafer production volumes. Among the other Asia/Pacific countries, Malaysia stands out as the most promising location for semiconductor production expansion. The nation, with an established semiconductor back-end infrastructure, is likely to become the next growth country.

In 1997, maximum-available wafer production capacity in the Asia/Pacific region reached 711.4 million square inches (MSI). The maximum-available capacity, as measured in MSI, is likely to increase by another 19 percent as additional capacity comes on stream this year. The bulk of the increased capacity is likely to come from Korea, Taiwan, and Singapore.

Asia/Pacific's wafer production uses a wide range of process technologies. Figure 2-1 illustrates the MSI-per-year analysis by minimum line width. In 1997, almost 47 percent of the total available capacity in the region was equipped to produce semiconductors with design rules of 0.35-micron or lower. Many of these advanced process technologies were installed in foundries and DRAM fabs. The progression to production using more advanced design rules, such as 0.25 micron and lower, is predicted to receive more emphasis in 1998 with foundries and DRAM fabs, once again, expected to lead the way. About 26 percent of total available capacity was used to manufacture wafers using process technologies of 0.8-micron or higher.

Asia/Pacific Semiconductor Manufacturers' Revenue Ranking

Table 2-3 presents the 1997 ranking of the top 10 semiconductor manufacturers in Asia/Pacific by revenue. Korean companies occupied the top three places in the 1997 ranking. Samsung, LG Semicon, and Hyundai, which also ranked as the top three semiconductor manufacturers in 1996, held onto their ranking despite registering declining revenues last year as a result of the DRAM pricing pressures. Taiwanese companies accounted for half of the top 10 spots, reflecting Taiwanese companies' rapid emergence and Taiwan's position as a major production center.

Asia/Pacific's total semiconductor production revenue fell in 1997. All the major memory vendors suffered from the price decline and overcapacity situation in the market. Even the major analog manufacturer, SGS-Thomson, experienced a slowdown as a result of pricing pressures on its commodity products. The only group of companies to see overall revenue gains were the semiconductor contract manufacturers.

Among the foundry companies, Taiwan Semiconductor Manufacturing Company (TSMC) took the top spot in 1997. The UMC Group, another Taiwanese-owned manufacturer, locked in the largest revenue increase—a result of its successful entry into the foundry market. Another dedicated foundry that enjoyed healthy revenue growth in 1997 was Singapore's Chartered Semiconductor Manufacturing (CSM). In Asia/Pacific, the presence of the world's three largest dedicated foundries contributed a significant percentage of the total Asia/Pacific production base.

Semiconductor Contract Manufacturing Revenue

The SCM revenue is important both for dedicated foundries and IDMs. With overcapacity issues and capital shortage holding up many companies' efforts to expand and upgrade their existing facilities, IDMs are increasingly looking toward semiconductor contract manufacturing for additional revenue streams. Figure 2-2 illustrates that Asia/Pacific semiconductor companies' SCM revenue reached $4,777 million in 1997. Taiwanese companies, such as TSMC and UMC Group, captured 71 percent of total Asia/Pacific SCM revenue.

In terms of output by supplier type, foundry manufacturing accounts for 27 percent of total semiconductor manufacturing output in Asia/Pacific (see Figure 2-3). This percentage is likely to increase as more companies in the region are attracted to this industry segment. The percentage of IDM revenue is dominated by Korean companies and multinational companies producing brand-name semiconductors in the region.

Asia/Pacific Semiconductor Production Forecast

Table 2-4 shows that Asia/Pacific's semiconductor production reached $18,139 million in 1997. By 2002, Dataquest forecasts semiconductor production to register $44,764 million. This amount represents a five-year CAGR of 19.8 percent. The forecast is based on the following key assumptions:

- Semiconductor manufacturing capacity is forecast to increase in the next five-year period. Taiwanese manufacturers' capital spending will continue to grow as they seek out new business opportunities. Taiwanese semiconductor companies have strong balance sheets, which will enable them to further invest in wafer fab projects, especially in the foundry business. After recovering from the financial crisis, Korean companies are expected to increase their capital expenditure budgets quickly. The companies are likely to make investments in the upgrading equipment and building 300mm wafer fabrication plants. Foreign manufacturers will proceed with their new investments and planned expansion of existing facilities in Singapore, China/Hong Kong, and Malaysia.
- Production revenue of memory devices, especially DRAM products, is expected to rise steadily over the forecast cycle. After consolidation in 1998, DRAM revenue is expected to record rapid growth, reaching a peak in 2001. This peaking is expected to be followed by a decline in 2002, when the market is forecast to face the prospects of excess production capacity and plunging prices again. Memory devices' production sales are forecast to remain as the largest revenue earner for Asia/Pacific companies.
- Foundry manufacturing has emerged as a viable alternative to the traditional manufacturing model. SCM revenue is estimated to increase, with growing acceptance from IDMs, especially the Japanese companies, and the rapid expansion of fabless companies. Competition in dedicated foundries is forecast to become more intense. As a result, foundry wafer prices are predicted to decline in the forecast cycle. Increased competition will also mean that the foundries will have to upgrade equipment and expand production capacities continuously.

Taking the assumptions into consideration, the best-case semiconductor production forecast scenario for 1998 is $23,260 million. This amount represents an uptick of 5.2 percent over the most likely forecast. The worst-case scenario is estimated to cut production revenue back to $20,450 million. This amount represents a downside of 7.5 percent. By 2002, the production forecast is expected to range from $47.7 billion to $42.8 billion (the highest likelihood is $44.8 billion). Figure 2-4 illustrates Asia/Pacific's semiconductor production forecast from 1997 to 2002.

©1998 Dataquest

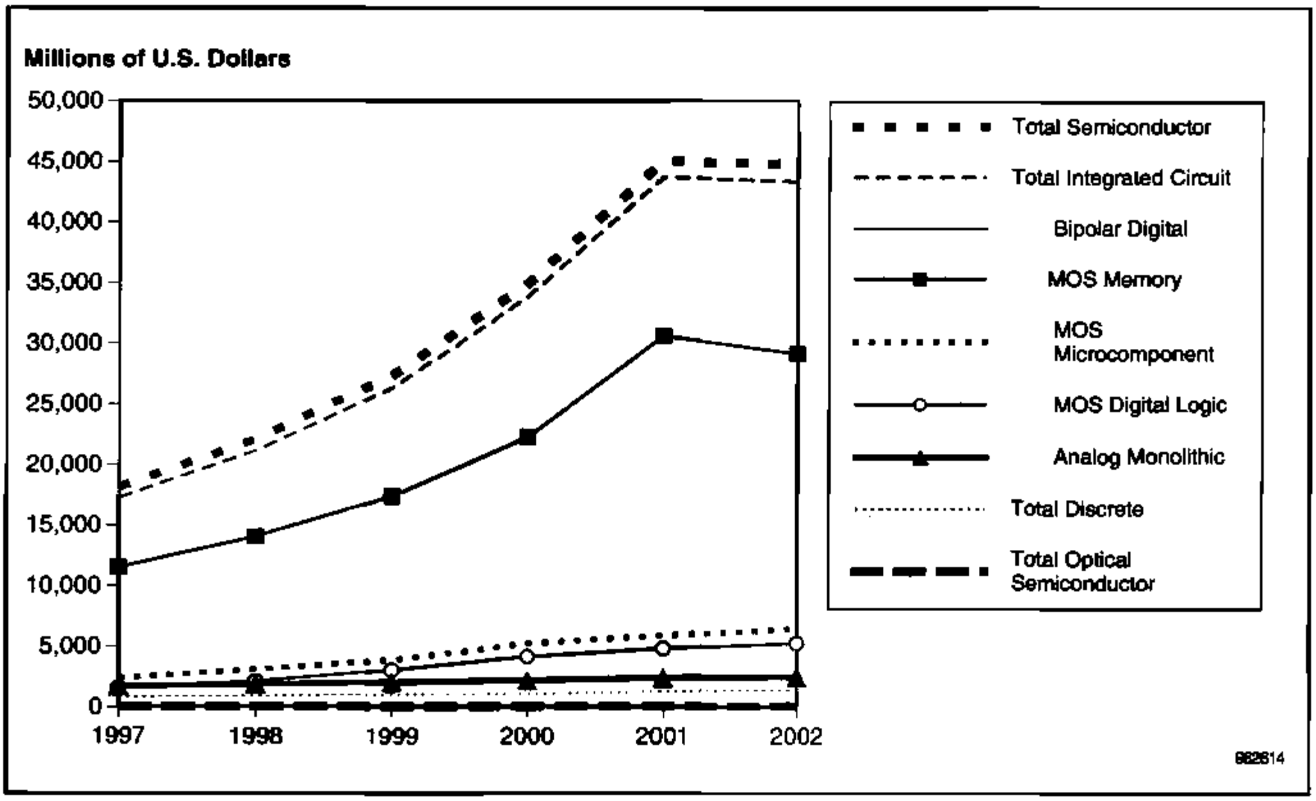
MOS digital logic products are expected to record the highest device CAGR of 26.9 percent up to 2002. Asia/Pacific companies are striving to diversify their product portfolio and reduce dependence on commodity devices, such as memory products. These companies have been intensifying efforts to diversify their product revenue base into logic and microcomponent devices. The execution of these product strategies is estimated to raise the ASIC/SLI device production, so that it will become one of the key product growth drivers as semiconductor manufacturers produce more system solutions on a single chip. MOS microcomponent production is also likely to grow at a 21.8 percent CAGR, a result of the strategy to build single-chip solutions.

Memory products should also see healthy growth on expectations that the market will recover by the turn of this century. Figure 2-5 illustrates that memory devices are likely to drive Asia/Pacific production revenue growth in the region up until 2001. With the memory market forecast to decline in 2002, logic and microcomponent products are predicted to take over as the main production revenue expansion engines. Steady growth rates, estimated for both these device segments, will tend to counteract the DRAM-cycle volatility. The highest annual growth rates are forecast to occur before 2002, when the memory market is expected to be near the supply-demand balance.

Figure 2-5
Asia/Pacific's Semiconductor Device Forecast Revenue, 1997 to 2002



Source: Dataquest (June 1998)

Memory device production was projected to account for 63.5 percent of total production revenue in 1997 (see Figure 2-6). By 2002, MOS memory is expected to remain as the single-largest device segment with a 65.1 percent share of total output. Besides memory products, the next two top device categories are forecast to be microcomponents and logic. This means that future investment dollars in Asia/Pacific will be allocated toward building advanced wafer fabrication facilities to produce these products. However, analog device production is forecast to make up a smaller percentage of the total Asia/Pacific semiconductor production in 2002.

The total semiconductor production by country (see Table 2-5) shows that Korea is the largest manufacturer in the region. Taiwan is the second-largest manufacturer, with Singapore and China/Hong Kong in third and fourth place, respectively.

Among the four countries, China/Hong Kong is expected to register the most dynamic five-year CAGR of 24.1 percent. As semiconductor production in Asia/Pacific is almost entirely located in these four countries, the following chapters examine separately each country's production.

Table 2-5
Asia/Pacific Semiconductor Production Forecast by Country, 1997 to 2002
(Millions of U.S. Dollars)

Country	1997	1998	1999	2000	2001	2002	CAGR (%) 1997-2002

Chapter 3

Semiconductor Production in Korea

This chapter presents semiconductor production in Korea. Korea is the home to the world's largest memory manufacturer. The three largest Korean companies are also positioned as the top three memory suppliers in Asia/Pacific. If Taiwan is on the fast track toward becoming the Silicon Island, then Korea is already the DRAM Peninsula.

In 1997, Korean companies accounted for 34 percent of total worldwide DRAM revenue. These companies experienced a slowdown because of the declining worldwide memory market. However, the top three Korean *chaebols* still occupied the first three places in the Asia/Pacific semiconductor production revenue rankings.

Korean companies have accumulated a wealth of know-how in process technology, a result of many years of experience in front-end wafer production. They have also built up a competitive cost structure from continuously striving to shrink chip size, improve production yields, and execute high-volume manufacturing. The country has a large skilled labor pool from its history of participation in the electronics and semiconductor industries. Furthermore, the won depreciation, brought on by the Asian financial crisis, has given Korean manufacturers an additional edge in cost. However, Korean companies are expected to face challenges in better utilizing excess production capacity. They would move toward further strengthening their foundry business. The companies are also making efforts to branch out into other nonmemory businesses, which should remove part of the volatility associated with the DRAM business cycle.

Korea's Semiconductor Manufacturing Capacity

Figure 3-1 illustrates Korea's maximum-available manufacturing capacity in 1997 by process technology. Almost 50 percent of Korea's total production capacity was geared to make products with design rules of 0.35-micron and below. As the country with most established wafer fabrication plants in Asia/Pacific, slightly more than 25 percent of fabs were manufacturing products using design rules of 0.8-micron and above. Many of the products made using these processes go into consumer electronics applications.

In 1998, the maximum-available manufacturing capacity, as measured in MSI, is forecast to increase by just 4 percent. The moderation in production capacity expansion comes as a result of the financial crisis that negatively impacted Korea in 1997. Capital spending cutbacks of up to 40 percent this year may cause some Korean manufacturers to fall behind as competitors with more stable financial structures continue to invest in new and advanced technologies. This situation could result in the *chaebols* not being able to increase their memory products' market share.

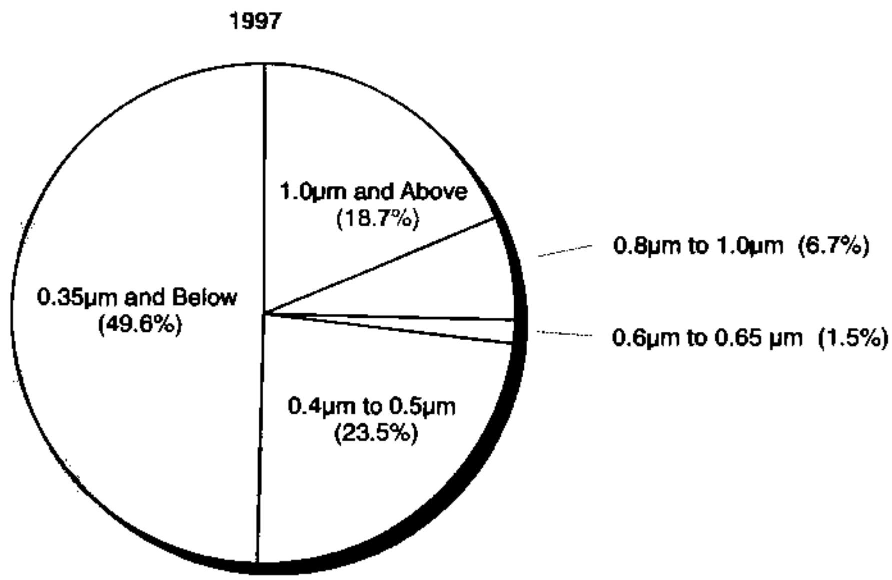
Figure 3-1
Korea's Maximum-Available Production Capacity by Process Technology, 1997 (Percent)



Source: Dataquest (June 1998)

Korean Semiconductor Manufacturers' Revenue Ranking

Table 3-1 lists the top five Korean semiconductor manufacturers' revenue in 1997. Samsung maintained its leadership as Korea's largest producer. Samsung is also ranked No. 1 in Asia/Pacific, and it was the largest MOS memory vendor worldwide for 1997—all this despite recording a declining revenue rate of 9 percent. LG Semicon's semiconductor manufacturing revenue was also negatively impacted by the overcapacity that beset the DRAM market. In third place was another large DRAM vendor, Hyundai. The company also experienced a revenue decline in 1997.

Korea Electronics Company Ltd. (KEC) recorded the highest revenue increase rate among the top-five-ranked manufacturers. The company's production output is mainly targeted at the consumer electronics market. Daewoo Electronics Corporation made the top five companies in Korea. Daewoo's revenue climbed 11 percent in 1997. This increase is not entirely surprising, given that the two companies manufacture products aimed at the less volatile analog, discrete, and microcomponent device markets.

The total 1997 revenue for Korean semiconductor manufacturing companies dropped 11.4 percent, given the weak market conditions for memory devices. Revenue gains made by KEC and Daewoo were not enough to turn this situation around. The combined revenue from both companies represented just 3 percent of the total semiconductor production revenue.

Table 3-1
Korea's Estimated Revenue of Semiconductor Manufacturing Companies, Including Contract Manufacturing, 1996 and 1997 (Millions of U.S. Dollars)

Rank	Company	1996 Revenue	1997 Revenue	Percent Change (%) 1996 to 1997
1	Samsung	6,464	5,881	-9.0
2	LG Semicon	2,580	2,112	-18.1
3	Hyundai	2,247	1,939	-13.7
4	KEC	268	300	11.9
5	Daewoo	45	50	11.1
	Others	0	1	NA
	Total	**11,604**	**10,283**	**-11.4**

NA = Not available
Source: Dataquest (June 1998)

Semiconductor Contract Manufacturing Revenue in Korea

In 1997, revenue generated by SCM business reached $346 million. SCM revenue represented a mere 3.4 percent of the total manufacturing revenue. However, the foundry business is expected to become of growing significance for Korean companies as one of the solutions to overcome the excess production capacity.

Analysis of individual companies' SCM revenue shows that LG Semicon captured the largest share of the foundry business in 1997 (see Figure 3-2). The company manufactures DRAMs for large Japanese customers such as Hitachi Ltd. Foundry revenue accounts for 15 percent of LG Semicon's total semiconductor production revenue. Emerging competition to the leader comes from Samsung and Anam S&T Company Ltd. In 1997, Samsung gained foundry revenue from manufacturing Digital Equipment Corporation's Alpha chip. Anam is expected to start high-volume production as a dedicated foundry making Texas Instrument Inc.'s digital signal processing (DSP) devices. With a capital shortage for new investments and the Asian financial crisis, Korean *chaebols* are expected to increase competition to the established foundry companies elsewhere in the world.

Korea's Semiconductor Production Forecast

Table 3-2 shows Korea's semiconductor production revenue forecast. In 1997, production revenue reached $10,283 million, the highest in Asia/Pacific. Production output was concentrated on mass producing DRAMs. By 2002, Dataquest forecasts semiconductor production to reach $24,096 million. Korea is expected to achieve a robust CAGR of 18.6 percent as a result of the DRAM market recovering by the turn of the century. The highest annual growth rates are estimated to be achieved in 2000 and 2001, with revenue projected to decline slightly by 2002 (see Figure 3-3).

MOS microcomponent devices are expected to record the highest CAGR of 24.6 percent for the five-year forecast cycle. MOS memory products should see the second-highest CAGR of 18.9 percent. This is estimated to be followed by analog and MOS logic devices. The device production growth trends are likely to be determined by the memory market recovery and the *chaebols'* efforts to diversify their product offerings.

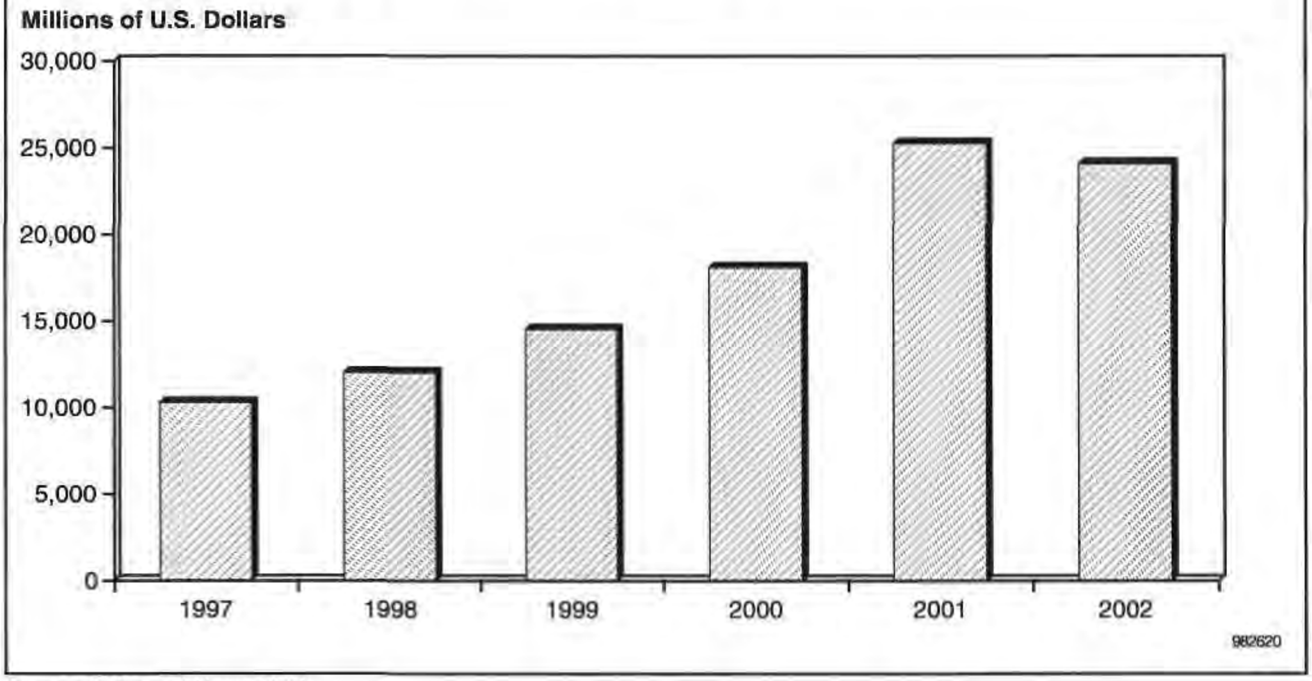
Figure 3-3
Korea's Semiconductor Production Forecast, 1997 to 2002



Source: Dataquest (June 1998)

Figure 3-4 depicts Korea's semiconductor production trend. Although microcomponent devices are predicted to be the most promising product category, total semiconductor production revenue should be driven by memory devices. Within the memory segment, DRAMs determines the general trend of semiconductor production.

Figure 3-5 illustrates the total semiconductor production by percentage share in Korea in 1997. Memory devices production represented a huge 81.3 percent share of the total revenue. Discrete products took the second-largest slice of the production value. By 2002, MOS memory devices are expected to widen the share of output to 82.4 percent. The other top device category is forecast to be microcomponents.

Korean companies' capital spending should resume after the country begins to recover from the economic slump, with Korea predicted to remain as the largest semiconductor producer in Asia/Pacific.

Chapter 4
Taiwan's Semiconductor Production

In this chapter, Taiwan's semiconductor production is examined. Taiwan is the home to the world's largest dedicated foundry manufacturers. The Silicon Island continues to be the host to an increasing number wafer fabrication plants, with investments expected to come from existing manufacturers and new companies that are poised to enter the dedicated foundry industry.

The number of Taiwanese semiconductor manufacturing companies is growing, driven by alliances made by local companies, as well as joint ventures between local and multinational companies. This development has led to the setting up of new local-foreign venture entities such as Powerchip Semiconductor Co. and ProMos Technologies.

In this decade, Taiwan has emerged as a major semiconductor production center. The country has a well-educated workforce, particularly from engineering backgrounds, who have been trained since the 1970s. This is a major factor that has enabled Taiwan to play an important role in semiconductor manufacturing. In the early years, these pioneers went to the United States and joined electronics and semiconductor companies. During the past 10 years, these well-trained engineers have returned to Taiwan and established new semiconductor businesses. At the same time, the Taiwanese government has also played an important role, including setting up research centers, such as the Industrial Technology Research Institute (ITRI). Many of the current leaders in Taiwan's semiconductor industry were former ITRI R&D researchers.

In addition, the Taiwanese government has improved infrastructure by building industrial parks for semiconductor companies. Despite the regional economic turmoil, Taiwan's economy is still looking robust. With the support of local banks and healthy company financials, Taiwanese companies' capital spending is expected to rise this year. Rising electronic equipment production is likely to drive higher semiconductor demand in Taiwan. Data processing applications such as PCs, monitors, and motherboards are expected to show healthy growth.

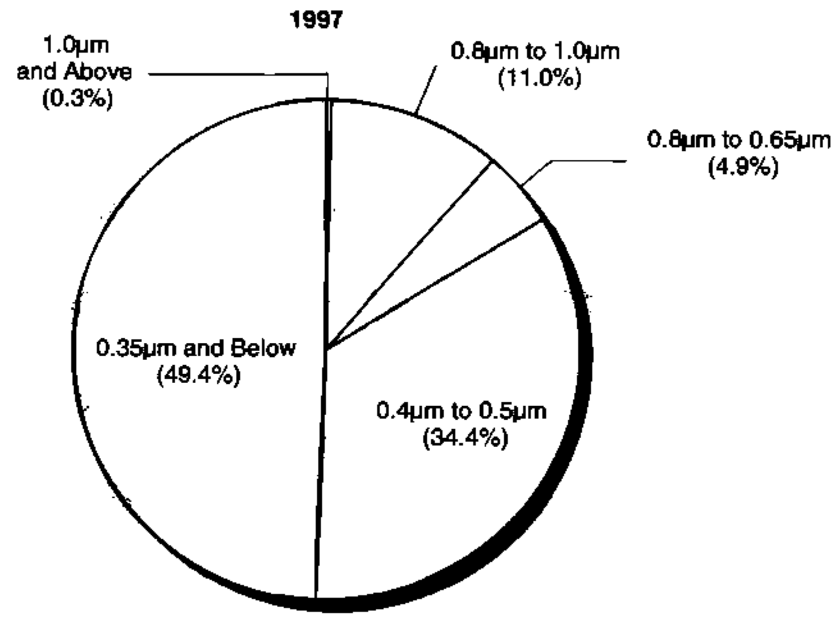
When the Taiwanese semiconductor industry was emerging, government support played an important role in the industry's success. However, as companies become better established, the government's role has subsided. In the past few years, Taiwan's investment environment and the semiconductor manufacturing base have been set up successfully.

Taiwan's Semiconductor Manufacturing Capacity

Figure 4-1 illustrates the 1997 maximum-available manufacturing capacity for Taiwan by process technology. As a manufacturing base, Taiwan takes second place in the Asia/Pacific region. Nearly 50 percent of Taiwan's total production capacity is equipped to make products with design rules of 0.35-micron and below. Slightly higher than 11 percent of fabs are installed with equipment to manufacture line widths of 0.8-micron and above. Taiwanese fabs, particularly the foundries, are continually investing in equipment that enables wafer production using leading-edge process technologies.

©1998 Dataquest

Figure 4-1
Taiwan's Maximum-Available Production Capacity by Process Technology, 1997 (Percent)



Source: Dataquest (June 1998)

In 1998, the maximum-available manufacturing capacity measured in MSI is forecast to expand by another 33 percent. The production capacity boost comes from the anticipated addition of new fabs by existing companies, such as Winbond Electronics Corporation and UMC Group, and the anticipated arrival of a new foundry company, Worldwide Semiconductor Manufacturing Corporation (WSMC).

Taiwanese Semiconductor Manufacturers' Revenue Ranking

Table 4-1 presents the top 10 Taiwanese semiconductor manufacturers' revenue in 1997. TSMC was ranked No. 1, recording an 8.3 percent growth rate. The UMC Group remained in the second position with revenue contribution coming from its new fabs, including USC and USI. Winbond climbed into the third place despite recording a drop in manufacturing revenue. TI-Acer fell one place to the fourth place, impacted by DRAM pricing pressures. This entity ceased to exist when Acer bought TI's stake in the venture this year. The new company, Acer Semiconductor Manufacturing Incorporated (ASMI), has been set up to replace TI-Acer.

Powerchip Semiconductor Co. enjoyed the highest revenue increase among the top 10 manufacturers in 1997, a result of the venture ramping up production volume. Jointly owned by UMAX Data Systems Inc. and Mitsubishi Corporation, the company started making DRAMs in October 1996. A new addition to the top 10 rankings is Nan Ya Technology Co. The company began commercial operations of its 0.35-micron fab in early 1997.

Production output is divided into making DRAMs and serving its foundry customers.

Table 4-1
Estimated 1997 Revenue of Semiconductor Manufacturing Companies in Taiwan, Including Contract Manufacturing (Millions of U.S. Dollars)

Rank	Company	1996 Revenue	1997 Revenue	Percent Change (%) 1996 to 1997
1	TSMC	1,422	1,540	8.3
2	UMC Group	824	1,173	42.4
3	Winbond	438	415	-5.3
4	TI-Acer	545	402	-26.2
5	Macronix	370	390	5.4
6	Vanguard	250	348	39.2
7	Mosel Vitelic	398	308	-22.6
8	Powerchip	10	265	2,550.0
9	Holtek	103	131	27.2
10	Nan Ya	-	110	NA
	Others	74	270	264.9
	Total	**4,511**	**5,352**	**18.6**

NA = Not available
Source: Dataquest (June 1998)

The total 1997 revenue for Taiwanese semiconductor manufacturing companies grew by 18.6 percent, despite the less-than-favorable market conditions. This growth can be attributed to revenue gained from increased output coming from new wafer fabs that started production in 1997 and design-related services. The revenue growth rate would have been even higher had not there been a fire that burnt down UMC Group's newest wafer fabrication plant, United Integrated Circuits Co. (UICC).

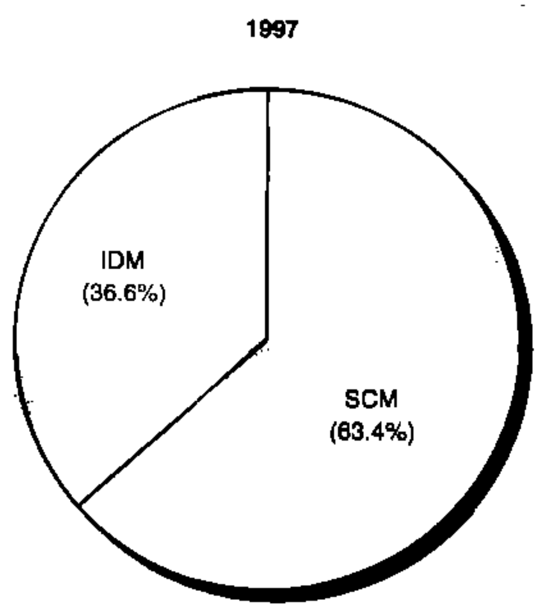
With the second-highest-maximum-available capacity, as measured in MSI, Taiwan achieved the second-highest total revenue from semiconductor production in Asia/Pacific in 1997. The product revenue and utilization of available capacity of top-ranked manufacturers, especially the foundries, depends on orders from their customers. Also, dedicated foundry companies have to produce a wide product range for IDMs and fabless customers, which also impacts capacity utilization.

Semiconductor Contract Manufacturing Revenue in Taiwan

In 1997, revenue generated by SCM business reached $3.4 billion. SCM revenue represented a 63 percent majority of the total manufacturing revenue (see Figure 4-2). Brand-name manufacturing represented a lower proportion of the total revenue as foundry business remained as the main growth driver of semiconductor production in Taiwan. Despite pressures on foundry wafer prices, the major players' total revenue was not negatively impacted because of their production capacity expansion.

 ©1998 Dataquest

Figure 4-2
Taiwan's Semiconductor Production by Supplier Type, 1997



Source: Dataquest (June 1998)

Analysis of individual companies' SCM revenue shows that TSMC is the largest production revenue contributor in Taiwan, and the largest foundry in the world, according to Dataquest. TSMC is also the leader in installing the latest process technologies. Competition to the leader comes from the UMC Group. UMC has embarked on a dedicated-foundry strategy that led to the decision to spin-off its design teams. With more companies on the island reorganizing to better target the foundry business, Taiwan is cementing its place as the world's foundry capital.

Taiwan's Semiconductor Production Forecast

Table 4-2 shows that Taiwan's semiconductor production revenue in 1997 was $5,352 million. By 2002, Dataquest forecasts semiconductor production to reach $13,390 million. Taiwan is expected to achieve a healthy CAGR of 20.1 percent as a result of the companies' continuing expansion of their production capacities. The Taiwanese companies' financial structure is sound, which will enable them to proceed with executing the planned expansion of the new facilities.

Figure 4-3 depicts Taiwan's estimated annual growth. High annual growth rates are expected for this year and 1999.

 ©1998 Dataquest

Table 4-2
Taiwan's Semiconductor Production Forecast, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997-2002
Total Semiconductor	**5,352**	**6,845**	**8,578**	**10,369**	**12,466**	**13,390**	**20.1**
Total Integrated Circuit	5,352	6,845	8,578	10,369	12,466	13,390	20.1
Bipolar Digital	-	-	-	-	-	-	-
MOS Memory	2,724	3,644	4,560	5,586	6,947	7,498	22.4

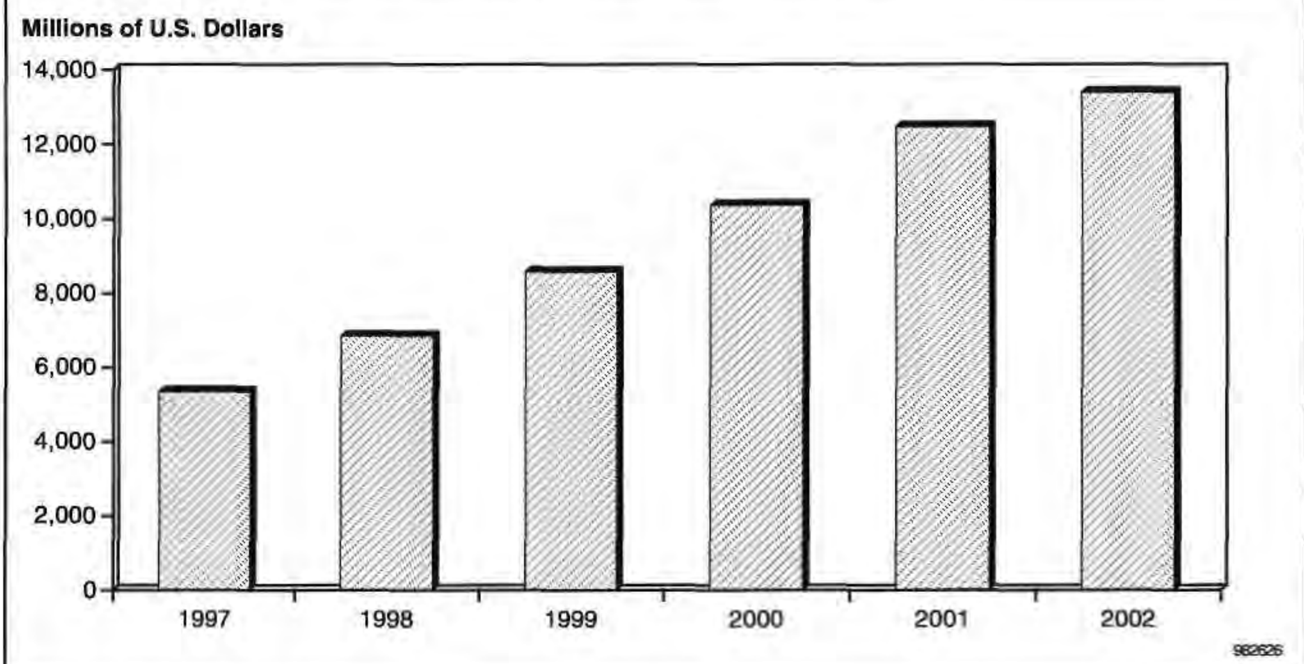
MOS Digital Logic	871	1,137	1,510	1,850	2,227	2,354	22.0
Analog-Monolithic	60	64	66	69	75	78	5.4
Total Discrete	-	-	-	-	-	-	-
Total Optical Semiconductor	-	-	-	-	-	-	-

Source: Dataquest (June 1998)

Figure 4-3
Taiwan's Semiconductor Production Forecast, 1997 to 2002



Source: Dataquest (June 1998)

MOS memory devices are expected to record the highest CAGR of 22.4 percent, followed closely by MOS digital logic devices. MOS microcomponent products should see the third-highest five-year growth rate of 15.3 percent. Again, these device growth trends are likely to be determined by the product mix of the foundries. Figure 4-4 illustrates semiconductor production's forecast growth from 1997 to 2002. Growth is expected to be driven by the production of these three large device segments: memory, logic, and microcomponent devices.

Figure 4-5 charts Taiwan's total semiconductor production by percentage share in 1997. Memory device production represented 50.9 percent of total revenue. By 2002, MOS memory devices are expected to widen the production share to 56.0 percent. The MOS logic device category is also estimated to account for a larger percentage share of production output.

Taiwanese companies' capital spending should be maintained despite the uncertainties surrounding the regional economies. The sound financial position of the island's semiconductor manufacturing companies means that there is no capital shortage for new facility investments.

Chapter 5
Singapore's Semiconductor Production

This chapter details Singapore's semiconductor production. Singapore's semiconductor production is diversified, both in terms of the geographic origin of companies and the device types that are produced. Multinational companies from Europe, Japan, and North America, and local companies picked the city state as their production center. A wide range of devices are manufactured, including analog, memory, microcomponents, and logic products.

The three largest semiconductor manufacturers in Singapore in 1997 were SGS-Thomson Microelectronics, Chartered Semiconductor Manufacturing Ltd. (CSM), and TECH Semiconductor Singapore Pte. Ltd. Hitachi Nippon Steel Semiconductor Singapore Pte. Ltd. came to the local manufacturing scene this year. As a production base, Singapore is positioned in the third place in Asia/Pacific.

Singapore is an attractive place for semiconductor production because it has strong government support, a well-trained, English-speaking workforce, good infrastructure, and a strategic location in the region. The government has a long-term view to realize the development of more than 20 wafer fabs in Singapore. To achieve this goal, many incentives have been offered to prospective investors. These include tax incentives and schemes such as pioneer status, development and expansion incentive, and investment allowance. The pioneer status exempts investors from corporate tax on profits for the next five to 10 years. In addition, the government also shares risks with investors by taking minority equity stakes in the projects.

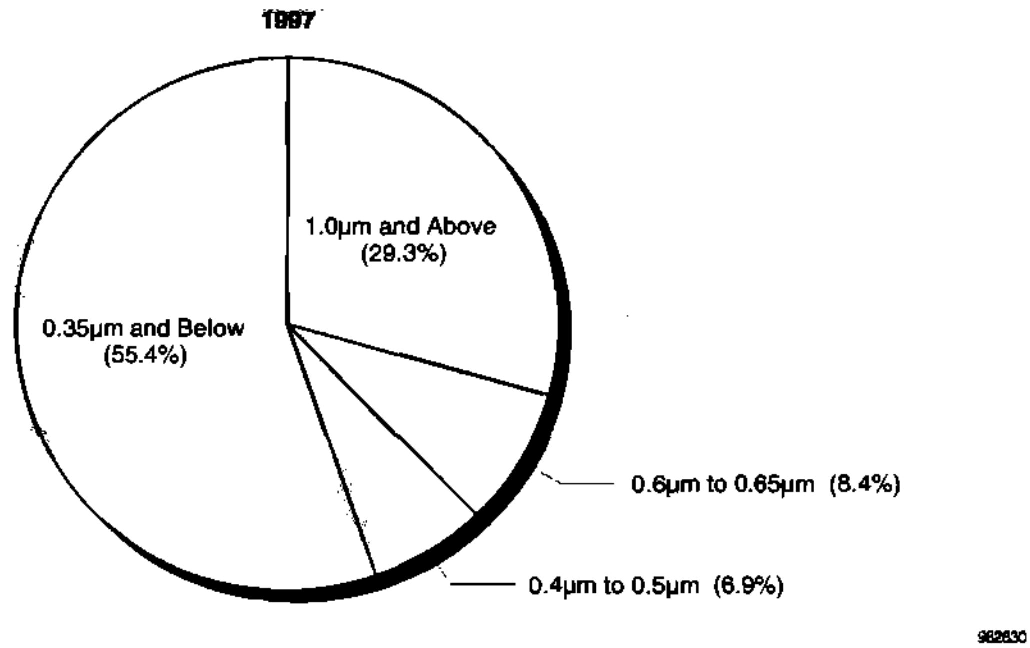
The development of a skilled workforce is also given high priority. The government's support extends to cosharing of training costs and funding research programs to assist the development of technical workforce. The island is known for its airport, sea port, and well-planned industrial parks. Advanced communications facilities and an efficient road transport network facilitate smooth access to its neighboring countries.

Semiconductor Manufacturing Capacity in Singapore

Figure 5-1 illustrates the estimated 1997 maximum-available manufacturing capacity in Singapore by process technology. More than 55 percent of total production capacity in the city state was equipped to make products with design rules of 0.35-micron and below. As a measure of its product diversity, slightly more than 29 percent of wafer fabrication plants in Singapore were making products using design rules of 1-micron and above. Many of the devices made using this process go into data processing and consumer electronics applications.

In 1998, the maximum-available manufacturing capacity, as measured in MSI, is projected to rise by 17 percent. The production capacity expansion increase comes as a result of companies following through on their investment plans, evidenced by Hitachi Nippon Steel Semiconductors starting commercial production this year. However, Asia's financial crisis is likely to influence companies operating in Singapore to exercise caution when evaluating their capital spending strategies. A slowdown in capital spending, may result in the moderation of capacity growth in the coming years.

Figure 5-1
Singapore's Maximum-Available Production Capacity by Process Technology, 1997 (Percent)



Source: Dataquest (June 1998)

Singapore Semiconductor Manufacturers' Revenue Ranking

Table 5-1 lists the top three semiconductor manufacturers' revenue in Singapore for 1997. SGS-Thomson Microelectronics maintained its leadership as the largest producer. According to Dataquest, the company was also ranked No. 2 worldwide analog chip vendor for 1997. The value of semiconductors produced by SGS-Thomson was estimated to have fallen by 3.4 percent to $1,133 million.

In 1997, CSM climbed into second place as a result of expanding production capacity. The dedicated foundry manufacturer was the only producer in Singapore to make revenue gains in 1997. DRAM foundry manufacturer TECH experienced declining revenue as prices nose-dived. The company's two wafer fabs should be producing 64Mb devices by the end of this year.

The total 1997 revenue semiconductor manufacturing companies in Singapore decreased by 2.5 percent, given the weak market conditions in 1997. This less-than-impressive growth can be attributed to pricing pressures on analog and DRAM products. CSM's estimated production revenue gains were not sufficient to improve the overall situation.

Semiconductor Contract Manufacturing Revenue in Singapore

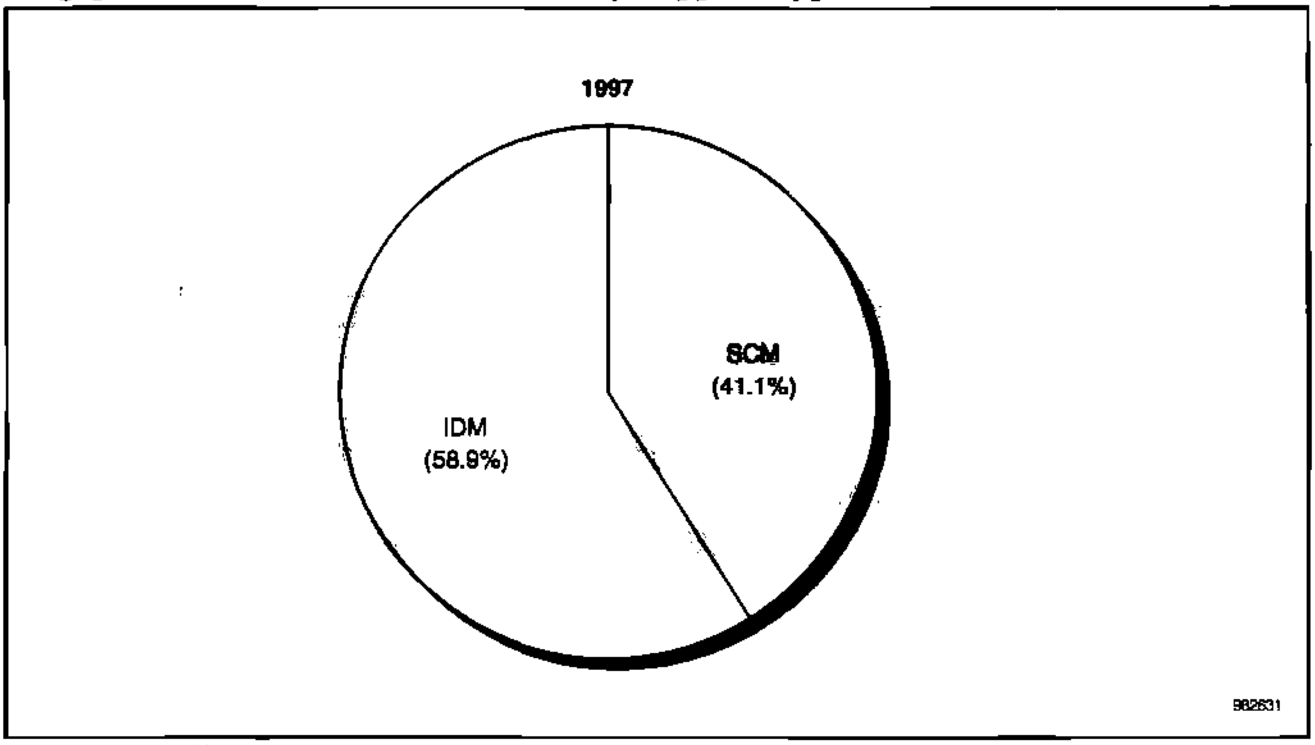
In 1997, revenue generated by the SCM business reached $796 million. SCM revenue represented a significant 41 percent of the total manufacturing revenue in Singapore (see Figure 5-2). Brand-name manufacturing dominates a majority 57 percent of the total revenue. However, the foundry business is expected to be of growing significance as CSM's production capacity expansion is expected to continue.

Table 5-1
Estimated Revenue of Semiconductor Manufacturing Companies in Singapore, Including Contract Manufacturing, 1996 and 1997 (Millions of U.S. Dollars)

Rank	Company	1996 Revenue	1997 Revenue	Percent Change (%) 1996 to 1997
1	SGS-Thomson	1,173	1,133	-3.4
2	Chartered Semiconductor Manufacturing	403	494	22.6
3	TECH Semiconductor	404	302	-25.2
	Others	7	8	14.3
	Total	**1,987**	**1,937**	**-2.5**

Source: Dataquest (June 1998)

Figure 5-2
Singapore's Semiconductor Production by Supplier Type, 1997



Source: Dataquest (June 1998)

Analysis of individual companies' SCM revenue shows that CSM had the largest share of the foundry business in 1997. CSM has entered into two agreements with Lucent Technologies Microelectronics and Hewlett-Packard Company, which will result in the setting up of two new wafer fab projects over the next two years. TECH Semiconductor is jointly owned by Texas Instruments Inc., the Singapore Economic Development Board, Hewlett-Packard, and Canon Inc. The company manufactures DRAMs for Texas Instruments. With a shortage of capital available for new investments in building and equipment, some delay of TECH's plans to expand capacity in the near term is expected.

Singapore Semiconductor Production Forecast

Table 5-2 shows the semiconductor production revenue forecast for Singapore. In 1997, production revenue reached $1,937 million. Production output was largely driven by analog device manufacturing. By 2002, Dataquest forecasts semiconductor production to reach $4,824 million. The value of Singapore's semiconductor production is forecast to grow at a CAGR of 20.0 percent as a result of the revenue boost coming from various device segments. The strongest annual growth rates are estimated to be achieved in 1998 and 2000 (see Figure 5-3).

MOS logic and microcomponent products are expected to record the highest CAGR of 43.5 percent and 40.7 percent, respectively, for the five-year forecast cycle. This is estimated to be followed by MOS memory devices. The device growth trends are likely to be determined by the expected recovery in the memory market and the foundries' efforts to upgrade equipment and to further raise capacity.

Figure 5-4 illustrates the trend of Singapore's semiconductor production. It is evident that no single device segment is expected to dominate the growth trend until 2002. Even though logic and microcomponent devices are predicted to be the fastest-growing product segments, total revenue from semiconductor production should also be determined by analog and memory products. The general trend of Singapore's semiconductor production will increasingly be driven by a diverse product portfolio.

Figure 5-5 illustrates the total semiconductor production by percentage share in 1997. Production of analog devices represented a majority 58.5 percent share of the total revenue, followed by memory devices with a 19.5 percent share. However, by 2002, analog chips' percentage share of the total production value is expected to be reduced to 26.8 percent. The two high-growth device categories, logic and microcomponents, are forecast to account for 27.8 percent and 22.4 percent share, respectively, and memory devices are projected to capture a 22.7 percent share of the total revenue.

Companies' capital spending in Singapore should continue after the regional economic turmoil has stabilized. With more wafer fabs predicted to come onstream in 1998 and 2000, Singapore is predicted to remain as the largest semiconductor producer in Southeast Asia.

Table 5-2
Singapore's Semiconductor Production Forecast, 1997 to 2002 (Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997-2002

Chapter 6
China/Hong Kong's Semiconductor Production

This chapter presents semiconductor production in China/Hong Kong. Among the four major semiconductor production countries, China/Hong Kong is the fastest emerging in Asia/Pacific. Although there are many semiconductor companies in China/Hong Kong, the largest manufacturers tend to be mainly foreign-owned companies. As a manufacturing base, China/Hong Kong occupies fourth place in Asia/Pacific.

China/Hong Kong is becoming a more important production center as a result of fast-expanding domestic semiconductor consumption and intensifying government efforts. Foreign investors are keen to start wafer fab projects in China as electronic equipment production drives increasing semiconductor consumption growth. The government is also striving to reduce the percentage of imported silicon. The authorities plan to achieve this by attracting more foreign semiconductor companies to set up front-end manufacturing in the country. The country would also gain from technology transfer.

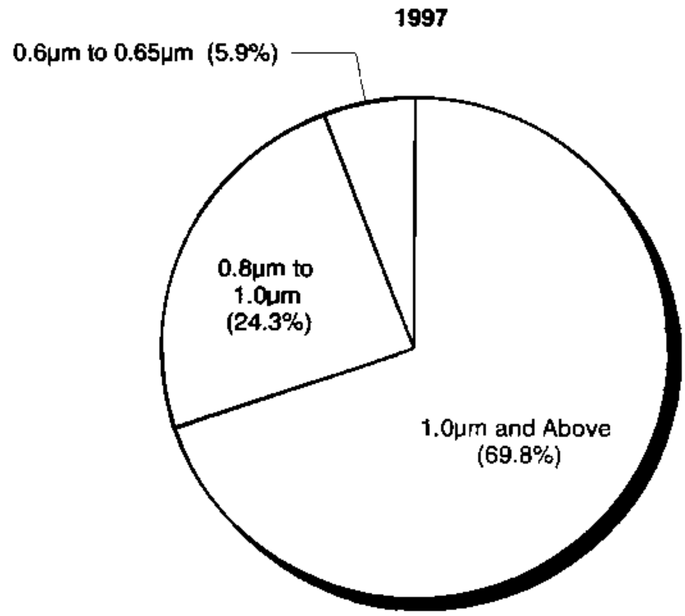
Most of the existing wafer fabrication plants in China are located in the Shanghai-Wuxi locale. The Shanghai, Jiangsu, and Zhejing provinces form an established manufacturing and industrial base. More than 50 science and engineering universities are located in these provinces, providing a steady supply of technical graduates. With central and regional government support to build higher-quality infrastructure such as industrial parks, the region's semiconductor manufacturing is set to expand.

Semiconductor Manufacturing Capacity in China/Hong Kong

Figure 6-1 depicts the 1997 maximum-available manufacturing capacity for China/Hong Kong by process technology. Process technologies used in China/Hong Kong are less advanced compared to the other three major semiconductor manufacturing countries in Asia/Pacific. Almost 70 percent of total production capacity was geared to make products with design rules of above 1-micron. Many of the products made using these processes are discrete devices and are used in consumer electronics applications.

In 1998, the maximum-available manufacturing capacity, as measured in MSI, is forecast to take off with a 55 percent growth rate. The rapid production capacity expansion comes as a result of the optimistic outlook for China/Hong Kong. Investments in the country are expected to continue despite the regional financial crisis. Foreign investors and local companies plan to further expand their existing production capacities and build new wafer fabrication facilities, particularly in mainland China.

Figure 6-1
Maximum-Available Production Capacity in China/Hong Kong by Process Technology, 1997 (Percent)



Source: Dataquest (June 1998)

China/Hong Kong Semiconductor Manufacturers' Revenue Ranking

Table 6-1 lists the top eight semiconductor manufacturers' revenue in China/Hong Kong for 1997. Shougang NEC Electronics Company maintained its leadership as the largest semiconductor producer in China/ Hong Kong. The company, 51 percent owned by NEC Corporation, manufactures 4Mb DRAM and analog devices. Up to 80 percent of the products are produced for export markets.

Second-ranked Shanghai Belling Microelectronics Manufacturing Company Limited showed a 12.7 percent growth in 1997, generating a $54 million revenue. The joint venture is 84 percent owned by China's Ministry of Posts and Telecommunications (MPT) and Alcatel Telecom, which has a 16 percent stake. The company sells up to 90 percent of its output to the domestic market, with Alcatel and the MPT being the main customers. The third-ranked company was Mosel Vitelic, located in Hong Kong. Besides Mosel Vitelic, two other companies on the list operating in Hong Kong are Hua Ko Electronics Limited and RCL Semiconductors Limited.

 ©1998 Dataquest

Table 6-1
Estimated Revenue of Semiconductor Manufacturing Companies in China/Hong Kong, Including Contract Manufacturing, 1996 and 1997 (Millions of U.S. Dollars)

Rank	Company	1996 Revenue	1997 Revenue	Percent Change (%) 1996 to 1997
1	Shougang NEC	150	165	10.0
2	Shanghai Belling	48	54	12.7
3	Mosel Vitelic Hong Kong	39	51	31.0
4	Huajing Electronics Group	28	44	57.2
5	ASMC	36	43	20.3
6	Hua Ko Electronics	30	32	6.7
7	RCL Semiconductors	14	18	28.6
8	Hua Yue Microelectronics	11	12	12.4
	Others	68	70	2.9
	Total	**424**	**490**	**16.7**

Source: Dataquest (June 1998)

The total 1997 revenue for semiconductor manufacturing companies in China/Hong Kong rose 16.7 percent. Although there are many semiconductor companies in China/Hong Kong, the total value from semiconductor production accounted for under 3 percent of total Asia/Pacific revenue. Most of the companies in China/Hong Kong make lower-valued semiconductors, such as discrete devices. The ownership structure is a defining characteristic of semiconductor companies operating in China/Hong Kong. A foreign-majority-owned company tends to produce for export markets, while a company with local (usually Chinese government) majority ownership will manufacture semiconductors for the domestic consumption market.

Semiconductor Contract Manufacturing Revenue in China/Hong Kong

In 1997, revenue generated by SCM business reached $267 million (see Figure 6-2). SCM revenue represented almost 55 percent of revenue from total semiconductor manufacturing. Brand-name manufacturing captured almost 46 percent of the total revenue. However, the brand-name manufacturing is expected to take up a larger revenue share in China/Hong Kong with the investment commitments made by Motorola Incorporated and Shanghai Hua Hong NEC Electronics Company Ltd.

Analysis of individual companies' SCM revenue shows that Shanghai Belling had the largest share of the foundry business in 1997. The company manufactures discrete devices and chips for consumer and telecommunications applications. China Huajing Electronics Group was in second place. The company benefited from the technology transfer from Toshiba Corporation and Lucent Technologies. Third-ranked Advanced Semiconductor Manufacturing Company (ASMC) is a dedicated foundry that produces automotive, consumer, industrial, and telecommunications equipment products. This venture—jointly owned by Philips Semiconductors Inc. (38 percent), Northern Telecom Inc. or Nortel (34 percent), and the Chinese government (28 percent)—is expected to increase production capacity this year.

China/Hong Kong Semiconductor Production Forecast

Table 6-2 shows the semiconductor production revenue forecast for China/Hong Kong. In 1997, production revenue reached $490 million. By 2002, Dataquest forecasts semiconductor production to reach $1,444 million. China/Hong Kong is expected to achieve a robust CAGR of 24.1 percent as a result of continued capital inflow pouring in from foreign investors around the turn of the century. The highest annual growth rates are estimated to be achieved in 1999 and 2000, with revenue increase projected to be more moderate in 2001 (see Figure 6-3).

Table 6-2
China/Hong Kong's Semiconductor Production Forecast, 1997 to 2002
(Millions of U.S. Dollars)

	1997	1998	1999	2000	2001	2002	CAGR (%) 1997-2002
Total Semiconductor	**490**	**588**	**814**	**1,251**	**1,466**	**1,444**	**24.1**
Total Integrated Circuit	251	312	508	909	1,093	1,076	33.8
Bipolar Digital	31	30	28	28	26	25	-4.7
MOS Memory	49	59	179	391	548	502	59.0

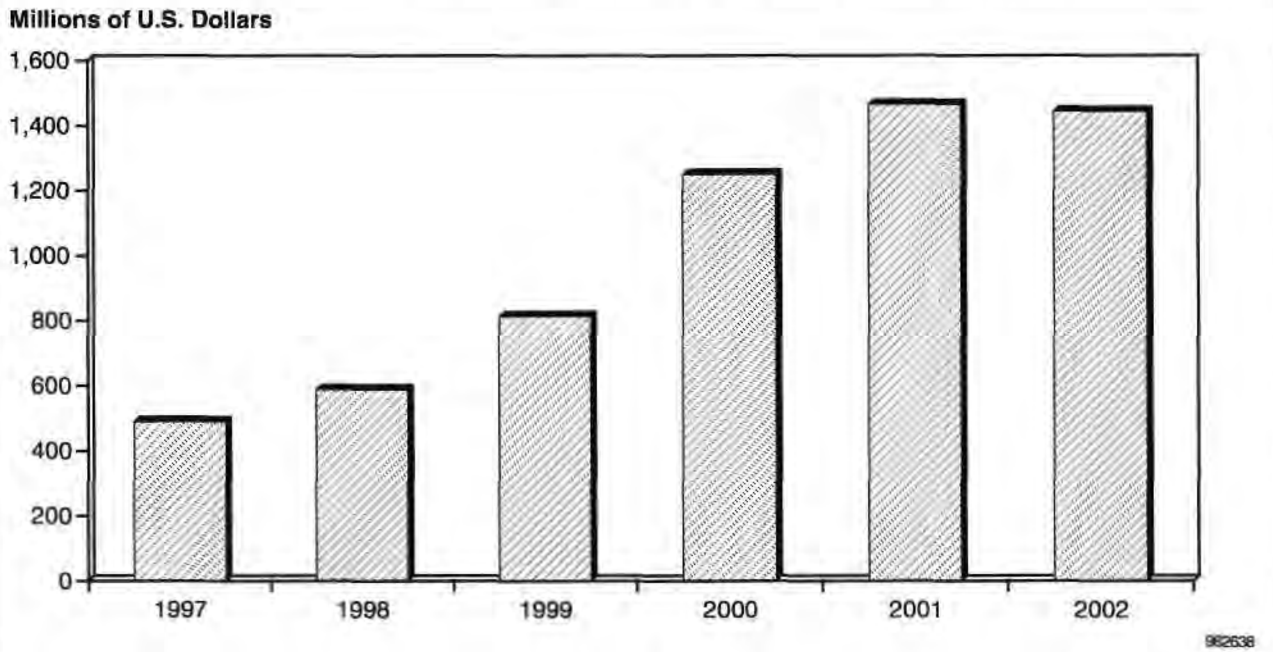
Total Discrete	239	275	306	341	373	368	9.1
Total Optical Semiconductor	1	1	1	1	1	1	0.8

Source: Dataquest (June 1998)

Figure 6-3
China/Hong Kong's Semiconductor Production Forecast, 1997 to 2002



Source: Dataquest (June 1998)

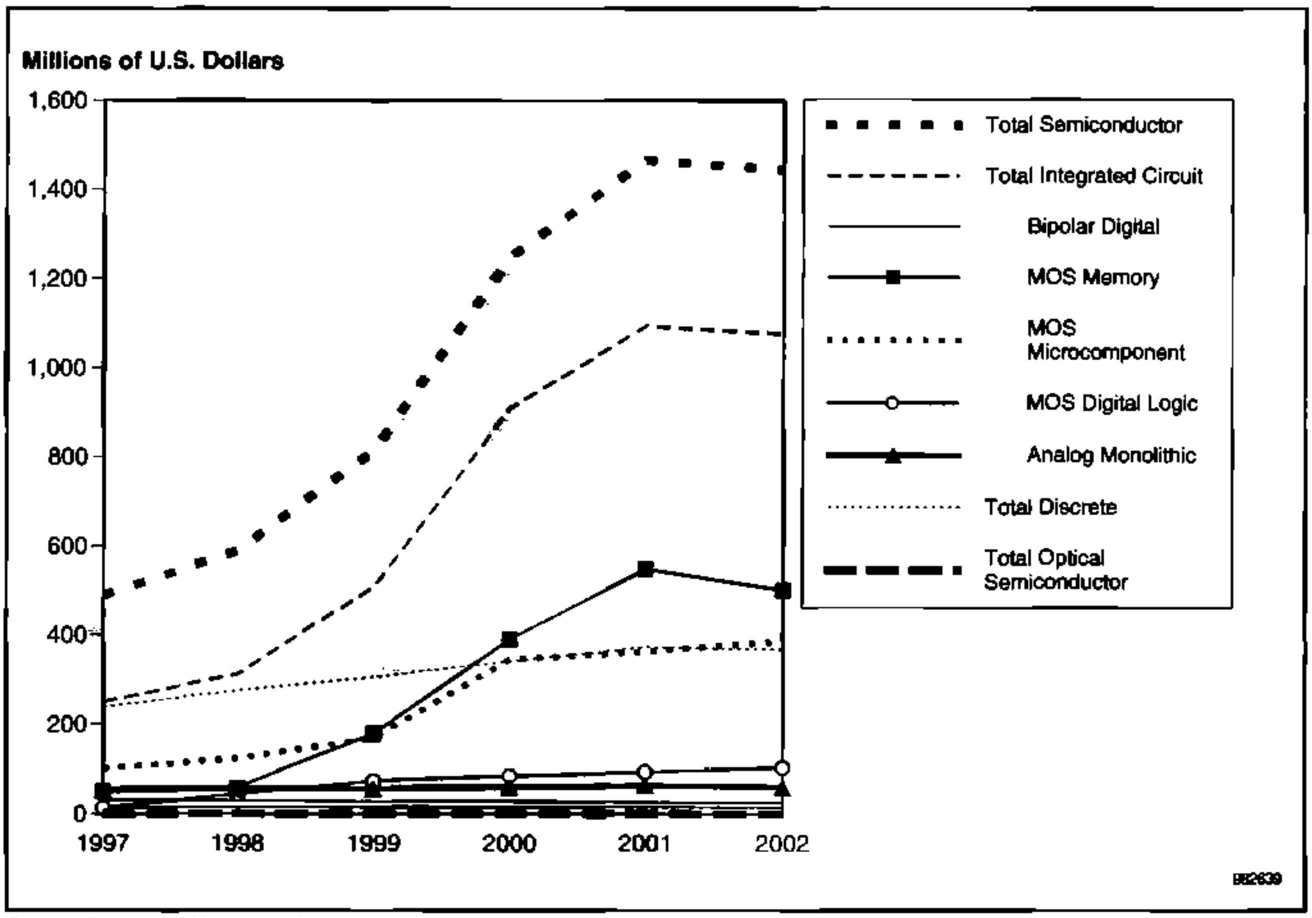
MOS memory devices are expected to record the highest CAGR of 59.0 percent for the next five-year forecast cycle. This is estimated to be followed by MOS logic devices. MOS microcomponent products should see the third-highest CAGR of 30.7 percent. These device growth trends are likely to be determined by the expected recovery in the memory market and foreign capital inflows. The anticipation of the largest and fastest-growing semiconductor consumption market in Asia/Pacific, together with incentives offered by the Chinese government, should increase the level of investments in wafer fab plants.

Figure 6-4 presents China/Hong Kong's semiconductor production trend. Although memory integrated circuits are predicted to be the most promising product category, discrete devices are expected to be the driver of semiconductor production in the country until 1999. In the subsequent years, the general semiconductor production trend is likely to be determined by the production of memory and microcomponent devices.

Figure 6-5 illustrates China/Hong Kong's percentage of semiconductors manufactured in 1997. Discrete devices production represented a significant 48.7 percent share of the total revenue. By 2002, the portfolio of semiconductor products in China/Hong Kong should become more broad-based.

By then, MOS memory devices are expected to take over with a 34.7 percent share of output. The other two top device categories, microcomponents and discrete, are forecast to account for 26.7 percent and 25.5 percent share of production output, respectively. However, the percentage share of analog chips should decline over this period.

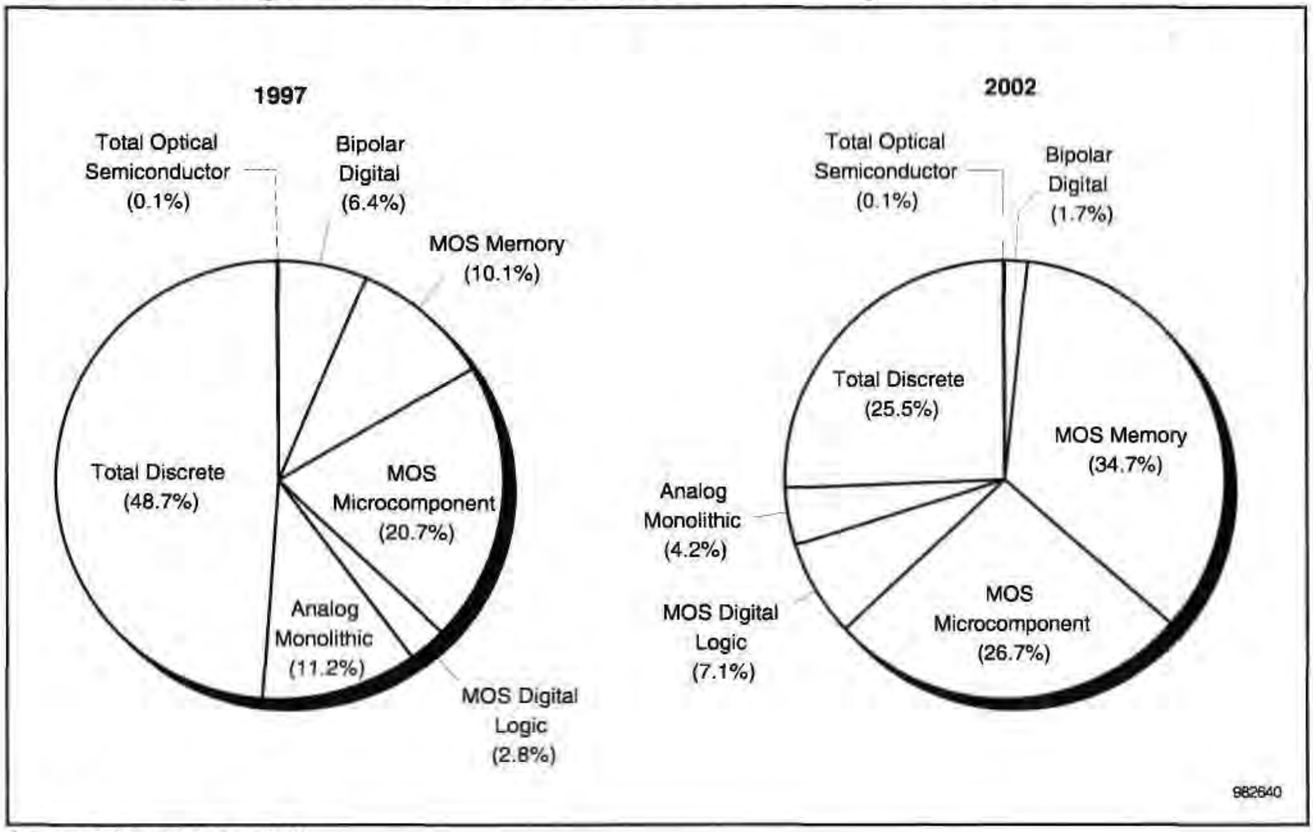
Figure 6-4
China/Hong Kong's Semiconductor Forecast Device Revenue, 1997 to 2002 (Millions of U.S. Dollars)



Source: Dataquest (June 1998)

Investors' capital spending plans to construct new facilities and to expand or upgrade existing plants should go ahead as the regional financial crisis appears not to have affected confidence in China/Hong Kong. Major commitments made by local-foreign ventures, such as the Hua Hong NEC wafer fab project, are expected to proceed as scheduled.

Figure 6-5
China/Hong Kong's Semiconductor Production Forecast by Device, 1997 and 2002



Source: Dataquest (June 1998)

Chapter 7
Dataquest Perspective

Semiconductor production growth in Asia/Pacific is determined by capital investments made to build new wafer fabrication plants and expand manufacturing capacities and the pricing level of memory products. The semiconductor production revenue declined in 1997 as a result of excess capacity and plunging memory prices. Dataquest forecasts the worldwide memory market to record flat growth in 1998, before registering three straight years of robust growth. However, memory devices are expected to be hit by a downturn again in 2002.

The region is likely to exhibit steady semiconductor production growth rates from this year to 2001. In 1998, growth is likely to be driven by capacity addition from new wafer plants in Korea, Taiwan, and Singapore. From 1999 to 2001, semiconductor production revenue is forecast to increase as a result of the recovering memory market and new companies starting commercial operations in the region.

However, annual growth rates at the country level fluctuate from year to year, and in some cases, take on a sporadic nature when increases in production capacity come onstream. Production in China/Hong Kong is likely to record a high-growth year in 1999, then peaking in 2000 when two new fabs start commercial production. Korean companies are predicted to enjoy booming growth in 2000 and 2001. Singapore's semiconductor production growth rate appears to be more "lumpy," with growth years in 1998 and 2000. Taiwan's production is expected to record highest revenue growth rates in 1998 and then peaking in 1999.

Korea and Taiwan are forecast to remain as the manufacturing powerhouses in Asia/Pacific for the coming five-year period. Korea's production revenue is likely to surge when the memory cycle picks up, while Taiwan's semiconductor production revenue takes on a different nature. Although Taiwanese companies are influenced by fluctuations in memory pricing, the product mix and the estimated production capacity increase are predicted to reduce revenue volatility.

Chapter 1
Asia/Pacific Fab Database

Background and Methodology

This report contains the Asia/Pacific portion of Dataquest's wafer fab database. The records in these tables are fabs located in the Asia/Pacific region. The Semiconductor Equipment, Materials, and Manufacturing Worldwide (SEMM) program conducts extensive annual surveys, complemented with quarterly secondary research to maintain this database. Published once a year, this document represents Dataquest's best insights and estimates into the end market of semiconductor equipment.

The tables in this report cover planned and existing merchant, captive, and foundry fab lines. A fab line is a series of equipment to do front-end (from initial oxide through wafer probe) semiconductor manufacturing. Occasionally, two or more separate product-specific fab lines or wafer sizes operate in a single clean room or physical plant. In this situation, Dataquest divides the clean room as separate fab lines if the company dedicates equipment to each wafer size or product line. If a company installs substantially different equipment during an expansion (for example, equipment to increase its maximum wafer diameter), again Dataquest divides the clean room and creates two entries into the database. Therefore, a company may operate many fab lines at one location.

Worldwide Geographic Region Definitions and Regional Roll-Ups

Americas
Includes Central America (all nations), Canada, Mexico, United States, Puerto Rico, and South America (all nations).

Japan
Japan is the only single-country region.

Europe, Africa, and Middle East
Includes Africa (all nations), Albania, Andorra, Armenia, Azerbaijan, Belarus, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Georgia, Germany, Gibraltar, Hungary, Iceland, Israel, Italy, Kazakhstan, Kyrgyzstan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Middle East (all nations), Moldova, Monaco, Netherlands, Norway, Poland, Romania, Russia, San Marino, Scandinavia, Slovakia, Spain, Sweden, Sweden, Switzerland, Tajikistan, Turkey, Turkmenistan, Ukraine, United Kingdom, Uzbekistan, Vatican City, and all nations within the former Yugoslavia.

Asia/Pacific
Includes Australia, Bangladesh, Cambodia, China, Hong Kong, India, Indonesia, Laos, Malaysia, Maldives, Myanmar, Nepal, New Zealand, Pakistan, Philippines, Singapore, South Korea, Sri Lanka, Taiwan, Thailand, and Vietnam.

Field Definitions

The Company field indicates the operator of the fab line. For contract manufacturers that trade capacity for capital investment in the fab, Dataquest lists the contract manufacturer. For incorporated joint ventures, Dataquest lists either the incorporated entity or the major investors, separated with slashes.

The City field displays the most detailed location information. This reference is usually a city or town, but could be an often-used district name (for example, Science Park in the city of Hsinchu, Taiwan). If this field lists a district, Dataquest will list the city in the State or Province field. In some cases, a reference to a state or province will be included in the City or District field to create a unique identifier for this location.

The Prefecture field denotes the second most detailed location. This reference is usually a state (for the United States), province (for Canada and many European and Asian countries), or a prefecture (for Japan). For countries within the United Kingdom, Dataquest lists the country name (for example, "Scotland") in this field so Dataquest can list the descriptor "U.K." in the Country field.

The Country field indicates the broadest location identifier in this report. This reference is usually a country, except in the case of the United Kingdom (see "State or Province" above). Because Japan is a single-country region, there is no regional qualifier for fabs in Japan.

The Fab Name field provides a reference to a particular fab or fab line to distinguish it from other fabs or lines owned by that company. Although Dataquest makes every attempt to match the nomenclature used by the company, occasionally some additional qualifiers (for example, "Phase 1") will appear to provide insight to the facility's history or organization.

The Products field lists the products manufactured at this site. The listings generally fall into five product groups, with the following nomenclature and definitions (when warranted):

- MOS memory
  - DRAM: Dynamic RAM
  - EEPROM: Electrically erasable PROM
  - EPROM: Ultraviolet erasable PROM
  - FERRAM: Ferroelectric RAM
  - FIFO: First-in/first-out memory
  - Flash: Flash memory
  - Mem: Memory
  - NV Mem: Nonvolatile memory (ROM, PROM, EPROM, EEPROM, and FERRAM)
  - PROM: Programmable ROM
  - RAM: Random-access memory

- ROM: Read-only memory
- SGRAM: Synchronous graphics RAM
- Sp Mem: Other specialty memory (such as dual-port, shift-register, or color lookup)
- SRAM: Static RAM
- VRAM: Video RAM

- MOS microcomponent/digital logic
  - Array: Gate array
  - ASIC: Application-specific IC
  - ASSP: Application-specific standard product
  - Bit: Bit slice (subset of MPU functions)
  - CBIC: Cell-based IC
  - Custom: Full-custom IC (single user)
  - DSP: Digital signal processor
  - FPGA: Field-programmable gate array
  - LISP: 32-bit list instruction set processor for AI
  - Logic: Standard logic
  - LSI: Large-scale integration
  - MCU: Microcontroller unit
  - MixSig ASIC: Mixed-signal ASIC
  - MPR: Microperipheral
  - MPRCom: MPR digital communication (ISDN, LAN, UART, or modem)
  - MPU: Microprocessor unit
  - PLD: Programmable logic device
  - RISC: Reduced-instruction-set computation 32-bit MPU
  - Telecom: Telecommunications chip
- Power/discrete/analog (including bipolar power)
  - A/D D/A: Analog-to-digital, digital-to-analog converter
  - Automotive: Dedicated to automobile applications
  - CODEC: Coder/decoder
  - Diode
  - Discrete
  - FET: Field-effect transistor
  - GTO: Gate turn-off thyristor
  - HEMT: High-electron-mobility transistor
  - IGBT: Insulated-gate bipolar transistor

©1999 Dataquest

- Interface: Interface IC
- Linear: Linear/analog device
- MDiode: Microwave diode
- MESFET: Metal semiconductor field-effect transistor
- MFET: Microwave field-effect transistor
- Modem: Modulator/demodulator
- MMIC: Monolithic Microwave IC
- MOSFET: MOS-based field-effect transistor
- Op Amp: Operational amplifier
- Pwr IC: Power IC
- Pwr Tran: Power transistor
- Rectifier
- Reg: Voltage regulator
- RF: Radio frequency
- SCR: Schottky rectifier
- Sensor
- Smart Pwr: Smart power
- SST: Small-signal transistor
- Switches: Switching device
- Thyristor
- Tran: Transistor
- Zener Diode

- Optoelectronic
  - CCD: Charge-coupled device (imaging)
  - Coupler: Photocoupler
  - IED: Infrared-emitting diode
  - Image Sensor
  - Laser: Semiconductor laser or laser IC
  - LED: Light-emitting diode
  - Opto: Optoelectronic
  - PDiode: Photo diode
  - PTran: Photo transistor
  - SAW: Surface acoustic wave device
  - SIT Image Sensor: Static induction transistor image sensor

 ©1999 Dataquest

- Bipolar Digital and Other Devices (includes all digital ICs using a bipolar process)
  - Darlington
  - Micromachining sensors
  - MilStd: Military Standard Logic
  - RadHard: Radiation hardened

The Process Technology field indicates each fab's use of five major types of processes. The process grouping is as follows:

- P/CMOS: P-channel metal-oxide semiconductor (PMOS) or complementary metal-oxide semiconductor (CMOS)
- NMOS: N-channel metal-oxide semiconductor (NMOS)
- BiCMOS: Bipolar and CMOS combined on a chip
- Bipolar
- III-V: Gallium arsenide and other compound semiconductor processes

The Estimated Minimum Geometry is the smallest linewidth feature size, measured in microns, attainable in production volume.

The Wafer Diameter represents the maximum wafer size that the fab or fab line can process. Wafer diameters, although expressed colloquially in inches, conform to metric specifications. For wafers greater than 3 inches in diameter, expression in inches becomes inaccurate. When calculating square inches, Dataquest uses the following approximations:

- Stated diameter of 4 inches (100mm) = Approximate diameter of 3.938 inches
- Stated diameter of 5 inches (125mm) = Approximate diameter of 4.922 inches
- Stated diameter of 6 inches (150mm) = Approximate diameter of 5.906 inches
- Stated diameter of 8 inches (200mm) = Approximate diameter of 7.87 inches
- Stated diameter of 12 inches (300 mm) = Approximate diameter of 11.84 inches.

The Year and Quarter of Initial Production displays the year (and quarter, if available) in which this line, having completed all qualifications, began manufacturing in production volumes. The format for this reference is "year.quarter" (for example, 1994.3 translates to the third calendar quarter of 1994).

The Initial Monthly Wafer Starts field indicates the initial monthly volume of production wafer throughput.

The Estimated Maximum Monthly Wafer Starts field contains the equipment-limited wafer start capacity per four-week period. Only the throughput of the installed equipment and the process complexity limits the maximum starts. Dataquest does not consider current staffing or the number of shifts operating in determining this metric.

©1999 Dataquest

The Fab Type field shows the types of semiconductor manufacturing performed at this location. The fab types include the following:

- "F" indicates that this is a production-based fab.
- "R" indicates a semiconductor R&D and/or trial production facility.
- "P" means that this location produces a pilot line.
- "T" means that this location performs assembly or testing.
- "N" indicates that this location performs foundry production, or contract manufacturing.
- "VD" means that this location performs VHDL design.
- "PD" means that this location performs IC place and route design.

Chapter 1
Final 1997 Asia/Pacific Semiconductor Market Share

Introduction

This document contains detailed information on Dataquest's view of the semiconductor market. Included in this document are 1996 and 1997 market share rankings.

Asia / Pacific market share estimates combine data from many countries, each of which has a different and fluctuating exchange rate. Estimates of non-U.S. market consumption or revenue are based on the average exchange rate for the given year. The section titled "Exchange Rates" gives more information on these average rates. As a rule, Dataquest's estimates are calculated in local currencies and then converted to U.S. dollars.

More detailed data on this market may be requested through Dataquest's client inquiry service. Qualitative analysis of this data is provided in Dataquest Perspectives.

Segmentation and Definitions

A detailed explanation of device segmentation and related definitions is contained in *Semiconductor Market Definitions, 1997* (SCND-WW-GU-9801).

Market Share Methodology

Dataquest uses both primary and secondary sources to produce market statistics data. In the fourth quarter of each year, Dataquest surveys all major participants within each industry. Selected companies are resurveyed during the first quarter of the following year to verify final annual results. This primary research is supplemented with additional primary research and secondary research to verify market size, shipment totals, and pricing information. Sources of data used by Dataquest include the following:

- Information published by major industry participants
- Estimates made by knowledgeable and reliable industry spokespersons
- Government data or trade association data (such as WSTS, MITI, and U.S. DOC)
- Published product literature and price lists
- Interviews with knowledgeable manufacturers, distributors, and users
- Relevant economic data
- Information and data from online and CD-ROM data banks
- Articles in both the general and trade press
- Reports from financial analysts
- End-user surveys

Dataquest believes that the estimates presented in this document are the most accurate and meaningful statistics available.

Despite the care taken in gathering, analyzing, and categorizing the data in a meaningful way, careful attention must be paid to the definitions and assumptions used when interpreting the estimates presented in this document. Various companies, government agencies, and trade associations may use slightly different definitions of product categories and regional groupings, or they may include different companies in their summaries. These differences should be kept in mind when making comparisons between data and numbers provided by Dataquest and those provided by other sources.

Notes on Market Share

In the process of conducting data collection and preparing market statistics information, Dataquest will sometimes consolidate or revise a particular company, model, series, or industry's numbers. In this section, we explain any such changes contained within this document for your reference.

Notes to Market Share Tables

- All rank tables in this document include only the top 30 semiconductor companies' revenue into the Asia/Pacific region. The total Asia/Pacific market in 1996 was U.S.$29,735 billion and included many more than those 30 companies.
- "Other Asia" refers to Asia/Pacific countries excluding Korea, China, Hong Kong, Singapore, and Taiwan.
- Cyrix was acquired by National Semiconductor in 1997.
- National Semiconductor divested itself of Fairchild in 1997.
- National Semiconductor's 1997 revenue includes all of Cyrix's 1997 revenue and part of Fairchild's calendar first quarter revenue.
- Power Innovations was formed through the acquisition of the Power Semiconductor interests of Texas Instruments.
- Melexis was formerly known as Elex.
- Micronas acquired ITT in 1997.
- The following companies were added to the market share database in 1997:
  - Fairchild
  - Vitesse
  - TriQuint
  - Power Innovations
  - Robert Bosch
  - Stanley

 ©1998 Dataquest

- Toko is now tracked in other Japanese companies.
- IBM's 1996 revenue was restated in 1997.
- Singapore revenue includes "as to" billings, some of which are re-exported from Singapore.

Exchange Rates

Dataquest uses an average annual exchange rate in converting revenue to U.S. dollar amounts. Table 1-1 outlines these rates for 1996 through 1997.

Table 1-1
Exchange Rates

	1996	1997
China (Renminbi/U.S.$)	8.34	8.32
Hong Kong (Dollar/U.S.$)	7.73	7.75
Singapore (Dollar/U.S.$)	1.41	1.99
South Korea (Won/U.S.$)	805.16	954.14
Taiwan (Dollar/U.S.$)	27.47	28.79

Chapter 4
China/Hong Kong Market Statistics Tables

Table 4-1
Top 30 Worldwide Vendors' Revenue from Shipments of Total Semiconductors to China/Hong Kong (Millions of U.S. Dollars)

1997 Rank	1996 Rank	Company	1996 Revenue	1997 Revenue	Percentage Change	1997 Market Share of Included Companies (%)*
1	1	Intel	558	684	22.6	11.6
2	2	Toshiba	504	637	26.4	10.8
3	3	Motorola	374	414	10.7	7.0
4	7	Samsung	302	405	34.1	6.9
5	5	Philips	320	359	12.2	6.1
6	4	NEC	363	353	-2.8	6.0
7	9	Texas Instruments	202	281	39.1	4.8
8	6	LG Semicon	306	280	-8.5	4.8
9	8	SANYO	224	268	19.6	4.6
10	13	Rohm	161	230	42.9	3.9
11	10	Hyundai	193	179	-7.3	3.0
12	11	SGS-Thomson	178	176	-1.1	3.0
13	12	Hitachi	164	166	1.2	2.8
14	15	National Semiconductor	131	146	11.5	2.5
15	23	Lucent Technologies	59	135	128.8	2.3
16	22	Advanced Micro Devices	61	121	98.4	2.1
17	20	Siemens	88	116	31.8	2.0
18	17	Mitsubishi	96	107	11.5	1.8
19	18	Sony	93	102	9.7	1.7
20	21	Matsushita	84	92	9.5	1.6
21	25	Atmel	52	92	76.9	1.6
22	19	United Microelectronics Corp.	90	90	0	1.5
23	27	Korean Electronic Co.	43	75	74.4	1.3
24	16	Sharp	120	69	-42.5	1.2
25	14	Fujitsu	134	68	-49.3	1.2
26	116	S3	0	59	NA	1.0
27	253	Vanguard	0	50	NA	0.9
28	24	IBM	57	39	-31.6	0.7
29	26	Sanken	46	34	-26.1	0.6
30	28	Winbond Electronics	26	32	23.1	0.5
		All Others	20	18	-10.0	0.3
		Americas Companies	1,500	1,977	31.8	33.6
		Japanese Companies	1,989	2,126	6.9	36.2
		European Companies	586	651	11.1	11.1
		Asia/Pacific Companies	974	1,123	15.3	19.1
		Included Companies Total	**5,049**	**5,877**	**16.4**	**100.0**

*The total includes only the top 32 companies by shipments into Asia/Pacific; it does not equal the total Asia/Pacific market.

Chapter 1
The Asia/Pacific MOS Memory Forecast

This Market Statistics report details Dataquest's forecast of six segments of the Asia/Pacific MOS memory market: DRAM, SRAM, EPROM, EEPROM, flash memory, and ROM. For each segment, Dataquest forecasts revenue, units shipped, average selling price, megabytes shipped, and price per megabyte.

Asia/Pacific MOS memory revenue should total U.S.$6.6 billion for 1998, a 1 percent increase from 1997 revenue of $6.5 billion. By the second half of 1999, Dataquest expects to see a successful return to a normal market. Although much of the profit has evaporated in SRAM and flash memory, Dataquest still expects that 1998 will be a profitable year in these two segments. On the other hand, 1998 is likely to be the least-profitable year in DRAM since 1992.

Dataquest sees a long-term growth in most segments, including DRAM, SRAM, flash, and EEPROM, but negative performance in the EPROM and ROM markets. Asia/Pacific memory revenue should grow at a compound annual growth rate (CAGR) of 14 percent from 1997 to 2002, with Asia/Pacific revenue reaching $16.6 billion in 2001 and retreating to about $12.5 billion in 2002.

Forecast Highlights and Assumptions

The following top-level assumptions guide Dataquest's forecast. The baseline assumptions associated with the six memory product forecasts appear in the sections that discuss those forecasts. This assessment highlights changes in assumptions since the previous forecast.

Dataquest's Asia/Pacific memory forecast assumes the following:

- The DRAM market will remain volatile. The DRAM revenue forecast could swing widely for both the near term and long term because of DRAM price fluctuations. DRAM bit consumption continues in line with Dataquest's prior projections. This means that unit demand should be strong, although pricing might remain weak. As indicated, the semiconductor forecast assumes a cyclical upturn in 2001. The DRAM market peak in 2001, however, has been moderated to match similar historical peaks.
- DRAM prices continue to hug a cost-based price curve that indicates low pricing. The cost-based price stifles the prospect for DRAM revenue growth. Dataquest expects this to remain the case through 1998 and into 1999. These prices are limited on the high side by DRAM oversupply, and on the low side by antidumping regulations.
- The effects of the current Asian financial crisis on DRAM prices will be "self-regulating" in that a temporary 1998 price downturn should shift market share to lower-cost producers, after which these low-cost suppliers' capacity will be utilized and DRAM prices will recover slightly.

©1998 Dataquest

- The current overcapacity will continue through 1999 and into 2000. Capital expenditure did not slow in 1997 as Dataquest had originally anticipated. To reflect the impact, the DRAM market revenue peak originally expected for 2000 has been pushed out by one year to 2001. (Some manufacturing capacity may eventually exit the DRAM market. However, this is not predicted in the current forecast.)
- The SRAM market is still oversubscribed. However, the analog-to-digital conversion of the cellular phones has increased SRAM usage dramatically in these phones. There is a big difference between this market and the PC market, the last big SRAM stronghold. Cellular phone manufacturers are much more selective about their supplier base, as they use parts from top-tier suppliers and shy away from small fabless companies. Dataquest still expects to see attrition in this market because many companies that thrived on an open market for PC cache chips will shortly be excluded from this previously highly penetrable market, and will not be able to participate in the cellular telephone market.
- In the nonvolatile memory market, there is a continuing slow conversion from EPROM toward flash memory. Most of this conversion is happening in new designs, and is, therefore, occurring at the higher densities. The flash memory market has moved from high profitability toward more competitive pricing as many competitors join the fold; however, unit growth remains strong. This new lower pricing has acted to enable the use of flash memory in a diverse array of new applications. Mask ROM has moved away from the "growth hump" that was characteristic of the game-cartridge boom and is back on the less dramatic pregame growth trend.
- There will be a continued, substantial growth in the relatively small EEPROM market fueled by this technology's use in everything from electronic commerce to microcontroller-based systems, including smart cards. New applications include universal serial bus (USB) interfaces for the PC. The conversion of DRAM modules from SIMMs to DIMMs will also help, as each new DIMMs will contain one EEPROM to identify the attributes of the module.

The following summarizes memory product outlook:

- The Asia/Pacific DRAM market should decrease by about 1 percent in 1998 and total $4.6 billion. By 2002, the Asia/Pacific DRAM market will total $8.5 billion, which marks a 12.9 percent CAGR from 1997 to 2002.
- The Asia/Pacific SRAM market will grow by 4.4 percent in 1998 and total $626 million. In the long term, the Asia/Pacific SRAM market will total $1,680 million, which means a 22.9 percent CAGR from 1997 to 2002.
- The Asia/Pacific flash memory market should increase by 21 percent in 1998 and reach the $731 million level. By 2002, Asia/Pacific flash memory market will total $1,565 million, which is a 21 percent CAGR from 1997 to 2002.
- The Asia/Pacific EEPROM market will increase by 7.6 percent in 1998 and reach the $227 million mark. By 2002, the Asia/Pacific EEPROM market will approach $420 million, nearly 15 percent CAGR from 1997 to 2002.

 ©1998 Dataquest

- The Asia/Pacific EPROM market should decrease by nearly 26 percent in 1998, declining to $152 million. By 2002, the Asia/Pacific EPROM market will decline to $92 million.
- The Asia/Pacific mask ROM market will decrease by nearly 14 percent in 1998, declining to $176 million. By 2002, the Asia/Pacific mask ROM market will edge upward, however, to the $188 million level.

Chapter 1
Final 1997 Asia/Pacific Semiconductor Market Share

Introduction

This document contains detailed information on Dataquest's view of the semiconductor market. Included in this document are the following:

- 1995-1997 market share estimates
- 1996-1997 market share rankings

Asia/PacificAsia/Pacific market share estimates combine data from many countries, each of which has a different and fluctuating exchange rate. Estimates of non-U.S. market consumption or revenue are based on the average exchange rate for the given year. Refer to the section titled "Exchange Rates" for more information regarding these average rates. As a rule, Dataquest's estimates are calculated in local currencies and then converted to U.S. dollars.

More detailed data on this market may be requested through Dataquest's client inquiry service. Qualitative analysis of this data is provided in the Dataquest Perspectives.

Segmentation and Definitions

A detailed explanation of device segmentation and related definitions is contained in the Semiconductor Market Definitions Guide (SCND-WW-GU-9801).

Market Share Methodology

Dataquest uses both primary and secondary sources to produce market statistics data. In the fourth quarter of each year, Dataquest surveys all major participants within each industry. Selected companies are resurveyed during the first quarter of the following year to verify final annual results. This primary research is supplemented with additional primary research and secondary research to verify market size, shipment totals, and pricing information. Sources of data used by Dataquest include the following:

- Information published by major industry participants
- Estimates made by knowledgeable and reliable industry spokespersons
- Government data or trade association data (such as WSTS, MITI, and U.S. DOC)
- Published product literature and price lists
- Interviews with knowledgeable manufacturers, distributors, and users
- Relevant economic data
- Information and data from online and CD-ROM data banks
- Articles in both the general and trade press

©1998 Dataquest

- Reports from financial analysts
- End-user surveys

Dataquest believes that the estimates presented in this document are the most accurate and meaningful statistics available.

Despite the care taken in gathering, analyzing, and categorizing the data in a meaningful way, careful attention must be paid to the definitions and assumptions used herein when interpreting the estimates presented in this document. Various companies, government agencies, and trade associations may use slightly different definitions of product categories and regional groupings, or they may include different companies in their summaries. These differences should be kept in mind when making comparisons between data and numbers provided by Dataquest and those provided by other sources.

Notes on Market Share

In the process of conducting data collection and preparing market statistics information, Dataquest will sometimes consolidate or revise a particular company, model, series, or industry's numbers. In this section, we explain any such changes contained within this document for your reference.

Notes to Market Share Tables

1. Cyrix was acquired by National Semiconductor in 1997.

2. National Semiconductor divested itself of Fairchild in 1997.

3. National Semiconductor's 1997 revenue includes all of Cyrix's 1997 revenue and part of Fairchild's calendar first quarter revenue.

4. Power Innovations was formed through the acquisition of the Power Semiconductor interests of Texas Instruments.

5. Melexis was formerly known as Elex.

6. Micronas acquired ITT in 1997.

7. The following companies were added to the market share database in 1997:

- Fairchild
- Vitesse
- TriQuint
- Power Innovations
- Robert Bosch
- Stanley

8. Toko is now tracked in other Japanese companies.

9. IBM's 1996 revenue was restated in 1997.

 ©1998 Dataquest

Exchange Rates

Dataquest uses an average annual exchange rate in converting revenue to U.S. dollar amounts. Table 1-1 outlines these rates for 1995 through 1997.

Table 1-1
Exchange Rates

	1995	1996	1997
Japan (Yen/U.S.$)	93.90	108.81	121.10
France (Franc/U.S.$)	4.97	5.12	5.84
Germany (Deutsche Mark/U.S.$)	1.43	1.50	1.73
United Kingdom (U.S.$/Pound Sterling)	1.59	1.56	1.64

Chapter 1
Executive Summary

This Focus Report surveys the semiconductor companies, covering merchant and captive manufacturers and users. This report contains information gathered through company surveys and telephone interviews, as well as secondary research. Secondary research was conducted using the following sources:

- Articles in the general business and trade press
- Company and product directories
- Company press release and product literature
- Financial information
- Local publications

In the Asia/Pacific region, there are 327 semiconductor companies in 1997. Dataquest has defined six categories of semiconductor companies as follows:

- Wafer fabrication companies
- Fabless companies
- Mask manufacturing
- Silicon wafer suppliers
- Equipment manufacturing companies
- Packaging and testing companies

All local and foreign companies, merchant and captive manufacturers, and users will be included. This report shows a potential industry trend—food chain—in Asia/Pacific, and it provides business opportunities for semiconductor or semiconductor-related industries. This report does not include some small companies with year-end revenue of less than U.S.$1 million. Therefore, the actual number of companies in each category should be more than those listed in the report—especially for the fabless and packaging/testing companies.

Table 1-1 shows the currency exchange rates of the major Asia/Pacific countries in 1997 and 1998.

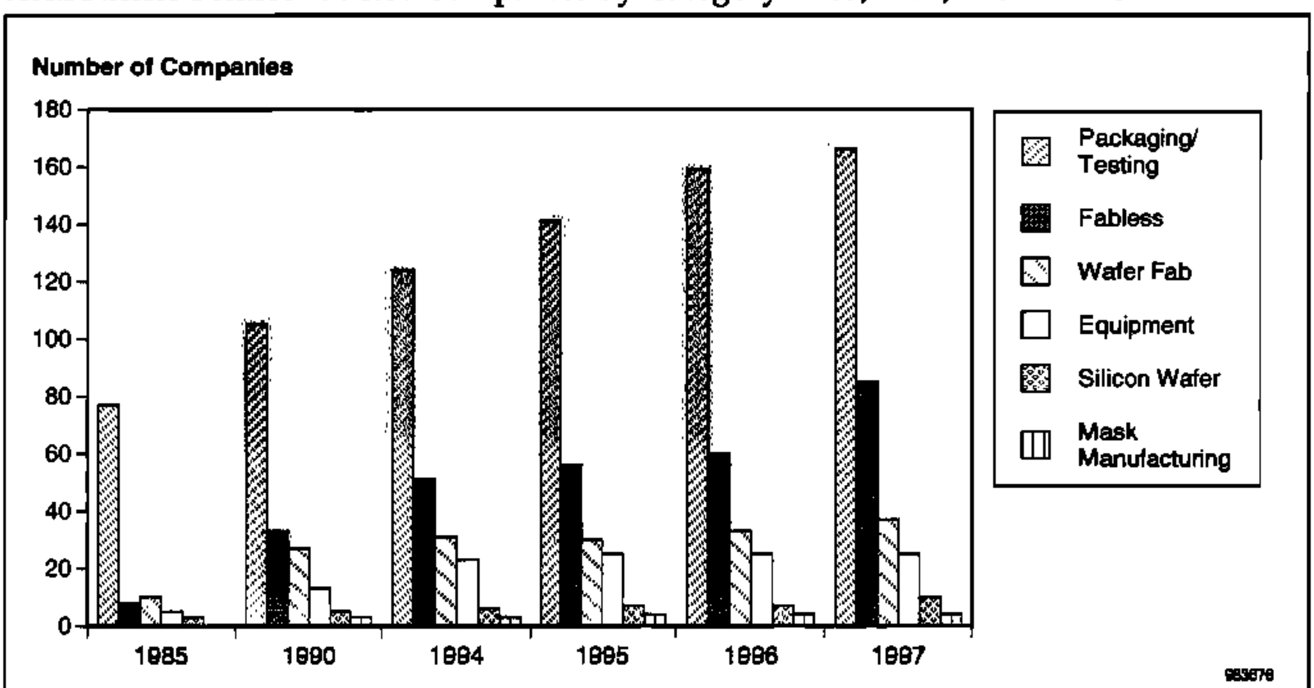
Chapter 2
An Overview of the Asia/Pacific Semiconductor Companies

Figure 2-1 illustrates Asia/Pacific's semiconductor companies by category. In 1997, the sluggish worldwide semiconductor market and the Asian financial crisis caused decelerating growth of the Asia/Pacific semiconductor revenue and reduced the total number of Asia/Pacific semiconductor companies, including merchant and captive. The total number of Asia/Pacific semiconductor companies in 1997 showed a modest increase, totaling 327 companies, at a 13.5 percent growth rate over the 1996 total. Taiwan shows a strong growth in fabless and assembly/testing companies.

Wafer Fabrication

The number of wafer fabrication companies reached 37, growing at 12.1 percent. Wafer fabrication grew fourfold between 1985 and 1997. The number of wafer fabrication companies grew strongly in 1990, but it faced slower growth between 1990 and 1995. In 1996, more new wafer fabrication companies started operation, which resulted in a surging capital spending. However, the sluggish semiconductor market and the Asian financial crisis impacted the industry, caused a stalling of a few planned companies, particularly in Thailand. Taiwan, a fast-growing country, also delayed its semiconductor equipment installation until 1998. The success of wafer fabrication expansion drove more demand on wafer manufacturing, mask, equipment and packaging, and testing in this area. However, the flat growth of 1997 slowed down the industry's growth path.

Figure 2-1
Asia/Pacific Semiconductor Companies by Category: 1985, 1990, and 1994 to 1997



Source: Dataquest (July 1998)

Fabless Companies

Fabless companies grew dramatically during the past decade. More new fabless companies started operation in 1997 because of the foundry services' success and the variety demand from application market. The number of fabless companies reached 85, growing at an impressive 41.7 percent. Although there are some start-up companies in 1997, their revenue was all relatively small. Taiwan shows a strong growth in fabless companies in the region, and it still maintained its lead in this category.

Mask Manufacturing

No additional country joined mask manufacturing in 1997. The number of companies in Taiwan and Korea in 1997 remained the same as in 1996. Except for a few semiconductor manufacturing companies, most of Taiwan's wafer fabrication companies did not have in-house mask manufacturing. The number of mask manufacturing is four in the region, the same as in 1996.

Silicon Wafer Suppliers

In 1997, the number of silicon wafer supplying companies in Taiwan and Korea remained the same as in 1996. A new supplier allowed Malaysia to become one of the major silicon wafer manufacturing-base countries in the region. The number of silicon wafer suppliers reached 10, three more than the 1996 total. Taiwan's fast-growing revenue, number of companies, and capacity will allow it to become the region's leading supplier by 2000.

Equipment Manufacturing Companies

The financial crisis and a weak demand resulted in Korean equipment manufacturing companies' withdrawing from this market. The Taiwanese equipment manufacturing industry was slower in 1997 than in 1996 because of continued sluggishness in the semiconductor market. In 1997, the number of equipment manufacturing companies remained the same as in 1996. Some Korean companies withdrew, and some Taiwanese companies joined the market.

Packaging and Testing Companies

The number of packaging and testing companies reached 166 in 1997. In this category, the number of Taiwanese companies grew significantly, offsetting Korean companies' decline. For many decades, the abundant and often cheap labor attracted worldwide investment in this region. Most of the packaging and testing companies were set up by multinational companies outside of Asia/Pacific. However, Taiwan, Korea, and Singapore's strong front-end manufacturing continued to consume the packaging and testing market locally. The packaging and testing industry has shown a restless growth in Asia/Pacific since the 1980s. The percentage of packaging and testing companies decreased substantially, while the total number of semiconductor companies grew; however, the number of packaging and testing companies doubled from 1985 to 1996.

Chapter 7
Semiconductor Equipment Manufacturers

Table 7-1
Korean Semiconductor Equipment Manufacturers

Company Name	Address	Phone No./ Fax No.	Business Start Year	No. of Employees	Revenue 1997 (U.S.$M)	Major Products
APEX	81-18, Ohjung-dong, Daeduk-gu, Daejeon-city, Korea	82-431-60-2000/ 82-431-60-2500	1991	75	4	Furnace, LP CVD (Low-pressure chemical vapor deposition), RTP (rapid thermal process)
DNS Korea	4-1, Chaam-dong, Chonan-city, Chungnam, Korea	82-417-550-8000/ 82-417-550-8008	1993	250	47	Spinner, spin scrubber, wet station
Dong Yang Semiconductor Equipment	41-2, Chungdam-dong, Kangnam-gu, Seoul, Korea	82-32-672-7023/ 82-32-672-7024	1980	75	16	Ink marking system, laser marking handler, automatic SMD mark system, mold and die set
Hangyang Technology	1048-5, Shingil-dong, Ansan-city, Kyunggi-do, Korea	82-345-491-0296/ 82-345-491-1746	1986	150	38	Special toxic gas cylinder cabinet, automatic wet station, automatic quartz tube cleaner, wet gas scrubber, cleaning equipment
Hanjoo	691-2, Kumjung-dong, Gunpo-city, Kyunggi-do, Korea	82-343-59-4777/ 82-343-29-0648	1990	30	9	I.P.A. vapor dryer, wet station, wet gas scrubber, parts clean station
Hanyang Engineering	31-6, Mangpo-ri, Taean-eup, Hwaseung-kun, Kyunggi-do, Korea	82-331-214-0141/ 82-331-214-0140	1988	305	66	Ultrahigh purity plant and piping system, central chemical supply system, ball cleaning system
Jaelim Engineering	4F, Cheonhae Bldg., Poee-dong, Kangnam-gu, Seoul, Korea	82-2-577-5493/ 82-2-573-3106	1988	20	3	Vacuum component, custom-designed system
Kuck Dong Numeric	200-10, Anyang 7-dong, Anyang-city, Kyungki-do, Korea	82-343-45-8141/ 82-343-45-8140	1986	66	12	Transistor/linear IC tester, direct-current/VBE tester
LG Industrial Systems	20, Yoido-dong, Yongdungpo-gu, Seoul, Korea	82-2-787-6780/ 82-2-787-4968	1987	NA	26	In-circuit tester, lead inspector, die bonder, wire bonder
Mirae Corporation	9-2 Chaam-dong, Chunan-city, Chungnam, Korea	82-417-554-5070/ 82-417-554-5090	1983	269	56	Test handler
Nano Hitec Electronics	816, Jowon-dong, Jangan-gu, Suwon-city, Kyunggi-do, Korea	82-331-44-2221/ 82-331-44-3633	1991	58	16	Burn-in board, test board, test system
Ohsung Technology	532-2 Yuchon-ri, Kumwang-up, Umsung-kun, Chungbuk, Korea	82-446-877-2717/ 82-446-877-2716	1990	14	3	Wet station
P.S.K. Tech	430-3, Mogok-dong, Songtan-city, Kyunggi-do, Korea	82-333-665-4521/ 82-333-665-4520	1990	46	18	Photoresist stripper, barrel-type asher, signal-type asher, LCD etcher/asher

Table 7-1 (Continued)
Korean Semiconductor Equipment Manufacturers

Company Name	Address	Phone No./ Fax No.	Business Start Year	No. of Employees	Revenue 1997 (U.S.$M)	Major Products
Shinsung Technology Research	59-4, Hwaam-dong, Yusung-gu, Taejon, Korea	82-42-861-1540/ 82-42-861-1544	1991	36	7	Air shower, clean bench, clean booth
Songwon Edwards	625-7, Upsung-dong, Chunan-city, Chungchongnam-do, Korea	82-417-554-7070/ 82-417-554-7300	1992	192	50	Dry-vacuum pump and pumping system, vacuum-coating system, freeze dryer
Sungdo Engineering	8F, Daegun Bldg., 822-5, Yoksam-dong, Kangnam-gu, Seoul, Korea	82-2-555-5231/ 82-2-553-6912	1987	150	37	Semiconductor-grade central chemical supply system, automatic chemical bottle/drum-cleaning machine, wet bench, effluent gas scrubber (dry/wet), clean-room utility system installation
Taesuk Machinery	149 Kongdan-dong, Gumi-city, Kyungbuk, Korea	82-546-461-7491/ 82-546-461-7493	1989	70	19	In-line bonder, die bonder, wire bonder, taping machine, laser marking, frame loader, handler, solder
Towa Korea	4-4, Chaam-dong, Chunan-city, Chungchongnam-do, Korea	82-417-559-5010/ 82-417-559-5005	1993	140	22	Molding machine, trim and form machine
Union Industry	278-3, Weisammi-dong, Osan-city, Kyunggi-do, Korea	82-339-72-9421/ 82-339-72-9427	1988	45	11	Spin dryer, wet station, hot DI system, tube cleaner
Varian Korea	433-1, Mogok-dong, Songtan-city, Kyunggi-do, Korea	82-333-665-5171/ 82-333-665-0115	1985	230	78	Ion implanter, sputtering system, chemical-vapor deposition system, evaporator system, vacuum coater, UHV system

Dataquest Predicts

Hong Kong's Electronics Future: Add Value or Die!

Abstract: *In light of new policies from the Hong Kong Special Administrative Region aimed at promoting information technology development and overall competitiveness, Dataquest presents forward-thinking scenarios for semiconductor vendors and distributors to consider if they wish to capitalize on the dramatic developments likely to come.*
By Daniel Heyler

Overview

It is well known that Hong Kong has disappeared as a major Asian base for electronic equipment or semiconductor manufacturing since the 1970s. "Activist" government spending and investment incentives in Japan, South Korea, Singapore, and Taiwan helped jump-start those electronics powerhouses, but Hong Kong adhered to its laissez-faire principles. After the exit of the British government and the establishment of the Special Administrative Region (SAR) government, the administration of the SAR's chief executive, C.H. Tung, began introducing ambitious measures to bolster both the development and commercialization of technology in Hong Kong. In the Hong Kong culture of lean, noninterfering government, such measures can be extremely controversial. However, the decline of the property market and the weakening of the financial markets has created a crisis, leading to support for Mr. Tung's development strategy focusing on information technology (IT). A confluence of government, industry, technological, economic, and mainland China forces suggests that Hong Kong's electronics development is at a turning point.

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Downstream Application of Information Technology

When a semiconductor executive thinks of Hong Kong, electronics production is the last thing to come to mind. Hong Kong is known for its efficient logistics and distribution, but most of its production has moved across the border to China (although product development remains in Hong Kong). Most consider Hong Kong's core competencies to be commerce, finance, and shipping or air cargo, especially trade with China's wealthy, industrialized South. But what semiconductor executives may be overlooking is that Hong Kong leads the region in its *application* of technology. Hong Kong industries and government are adept at testing and adopting new information technologies into business processes relative to the rest of Asia/Pacific. Hong Kong's companies are often the first to move and have gained competitive advantage in doing so. Some obvious examples are wireless communications, the Internet, a smart card-based transportation system, a new airport, electronic shopping, electronic data interchange in shipping, video-on-demand, electronic securities trading, and air cargo processing. Multinationals have often used Hong Kong as a test market because of its unique characteristics—high income, dense population, a multicultural society, bilingual economy, laissez-faire capitalism, free trade, efficient administration, transparent government (a three-branch system), and strong legal system. Leaders in the interactive television initiative, for example, believe that if a technology is not economically viable in Hong Kong, then it will not be viable anywhere.

The government initiative attempts to leverage this unique market position so that Hong Kong itself begins to develop products and services for its own economy. Those opposed say Hong Kong can keep importing what it needs rather than building it domestically, fearing government waste and preferential treatment. Those in favor of the initiative believe Hong Kong needs to find new areas of growth and believe it can leverage its understanding of applications and markets to develop and sell products to the rest of the region, particularly China.

Sources of Competitive Advantage

The 1998 Global Competitiveness Report of the World Economic Forum ranks the Hong Kong Special Administrative Region as second worldwide, after the United States, the same position as in 1997. The report judges the competitiveness of 53 countries by their ability to achieve sustained high rates of growth in gross domestic product per capita. The final rating assesses performance in eight categories: openness, government, finance, infrastructure, technology, management, labor, and institutions. For semiconductor users, this means that Hong Kong companies can purchase components less expensively and faster than those in any other country in Asia and incur lower taxes, financing costs, and transportation costs than companies in most other countries in the world. But what happens when IT enables transactions to bypass Hong Kong intermediaries and go directly to factories in China? Dataquest concurs that the Hong Kong government is

 ©1998 Dataquest

right to be concerned about the rate and scope of the structural changes in logistics. Won't Hong Kong lose its competitive advantage?

Do Laissez-Faire and IT Policies Mix?

Hong Kong's laissez-faire approach has led to success in the finance, transportation, cargo, and communications industries, enabled by access to cost-effective solutions without any government intervention. Other Asian governments levy duty on imports on the industries they intend to develop. An activist Hong Kong government would not adopt such protectionist measures because Hong Kong has a long history as a free port to components. It is likely to continue to rely on market forces and incentives. Many of the recent initiatives, described later, focus on building an environment in which innovation and technology can develop and become commercialized. Hong Kong is likely to remain a free port and the purest market economy in the world. Incentive programs will provide electronics and technology companies with preferential treatment, but these industries enable competition, and they add value to local service and traditional industries.

Lowering Fixed Costs of Doing Business

Hong Kong is the most productive economy in Asia and ranks second in the world, but it is criticized by executives as one of most expensive countries in which to do business. However, the main source of the high cost is property, because higher salaries must be paid to employees and higher rents must be paid by businesses. Two positive signs indicating that the days of speculation are passing are that prices have fallen 20 to 30 percent since 1997 and that the Tung administration is committed to regulating speculation and releasing more land. Singapore has successfully attracted corporate regional headquarters by reducing income taxes. The Hong Kong government appears to be continuing a hands-off strategy, keeping a competitive, level playing field. Hong Kong's competitive advantage will be found among small and medium-size industries, whereas Singapore depends on multinationals. Taiwan's success, even in the current financial crisis, is due primarily to the competitive power of small- and medium-size businesses. Hong Kong is adamant about avoiding becoming totally dependent on the innovation of outside parties and in their control. Hong Kong should be concerned that wealth creation will slow with a slowdown in the finance and property industries and that diversification into technology will enable sustainable value creation.

Technology and Innovation

Universities and institutes are not the answer but will be important, and the government will be pressured to modernize its education system. Dataquest does not believe that providing a university with a mission is the most effective approach. Most of the key technologies of today's IT era have come from pure research emanating from the U.S. military and space programs.

Hong Kong's newly established Commission on Innovation and Technology proposes establishing an applied science and technology research institute. The idea is that the institute would provide R&D capability by turning concepts into technologies, which could be commercialized by local companies. But local companies can continue to purchase fully developed, debugged, and commercially proven technologies from the United States, Japan, and Europe. The success of local industry is based on its ability to find the least expensive and most effective IT solutions from global sources. The so-called "weak R&D culture" is really part of a successful business formula. However, Dataquest believes that localized technology development would bolster Hong Kong companies competing in a digital economy. Electronics and software products and services need to be developed for the functions, features, and culture of the local Hong Kong/Chinese markets. If local businesses have access to local semiconductor design, software developers, and systems designers and integrators, this technology can be more effectively integrated into their business strategies. Manufacturing of ICs or hardware can be done in Taiwan or China, but products and services must suit local business needs for functionality, service, logistics, and time to market. The hope is that a robust information technology industry in Hong Kong will become a strong source of new revenue growth as businesses expand to Chinese businesses and consumers in China and the rest of Asia/Pacific.

The government is also proposing a long-term education initiative to turn preuniversity schools into dynamic and innovative learning institutions by linking students with the vast network of knowledge and information globally.

Obtaining and Retaining Talent

However, what has made Silicon Valley and Taiwan competitive is the ability to attract outside engineers, entrepreneurs, and investors (venture capitalists). In Taiwan, the government was instrumental in turning a brain drain into a brain gain by the early 1990s, which led to a world-class manufacturing base with strong connections to North American technology and talent. Hong Kong's approach—to tap its greatest asset, overseas Chinese—will not be difficult, given the scope and capital of the Tung government's initiative. Furthermore, Hong Kong has yet another card to play, mainland Chinese immigration policy. Hong Kong can grant residency to Chinese Ph.D.s and experts in such strategic areas as materials, communications, and software.

Electronic Government

Hong Kong's recently formed Information Technology Services Department has pledged that it will provide the ability to transact business with government online and seamlessly through the use of information kiosks installed at convenient public locations, personal computers at home or in the office, telephone interactive voice response systems, or interactive television. Public services are expected to be available 24 hours a day, and the scheme is intended to transform the way public services are delivered. The Information Technology Services Department will also build central gateways and a common Chinese interface for electronic communication between government departments and the public by 2000. An electronic link with Guangdong province will be set up next year.

The government is also looking into the need for a legal framework to enhance confidence in the conduct of electronic transactions. The objective is to help electronic transactions take hold in Hong Kong. Singapore has moved ahead of Hong Kong in developing a legal framework that has enabled banks to move quickly in an attempt to take market share from Hong Kong. Hong Kong must also move quickly if it is to keep its edge.

Links with China

Where will innovation come from in the future? Skeptics have denigrated the potential electronics innovation power of China and Hong Kong. Yet rapid advances in software and product development skills continue, largely because of inexpensive Internet-based communication between once-isolated academia in China and industry. A tremendous force will be unleashed in China as the Internet unlocks virtually unlimited information and enhances collaboration among a vast network of research institutes. The governments of Hong Kong and China realize the importance of these links and have set a budget of $23 million for the launch of the first phase of electronic service delivery in 2000. The Trade and Industry Bureau has been assigned the task of working on new projects to foster cooperation on information technology between industry and academia and between Hong Kong and the mainland. The Information Technology Broadcasting Bureau will focus on IT infrastructure in Hong Kong.

As many as 6,000 technology developers and resellers operating in the Chinese capital alone, the majority of them privately run, have maintained an average yearly growth of 30 percent for the past decade. Targeting the capital shortage facing most high-technology start-ups, the city government has launched a $24 million fund to provide guarantees for a select group of small and medium-size high-tech companies.

The more a product or system with an external network is used, the more valuable that investment becomes, as is the case with a telephone system. Linking Hong Kong with Chinese cities, universities, and stock markets will have major consequences for innovation and product development within the China/Hong Kong region. The value of these initiatives cannot be gauged by traditional return-on-investment or payback metrics because the outcomes reach every sector of the economy in positive but intangible ways.

Capital Sources and Financing

A variety of capital sources is being formulated by various parts of the Hong Kong government.

 ©1998 Dataquest

Second Securities Board

Hong Kong is planning a second securities board to encourage listings by new high-tech companies. Indeed, competition might heat up if Shanghai creates another board to encourage such listings. The Beijing Securities Regulatory Commission (SRC) reported that it raised U.S.$866 million from the securities market in 1997, 12 times its 1996 total. However, Beijing and Shanghai are welcoming Hong Kong's move, hoping that listing Beijing-based high-tech companies will contribute to both optimizing the diversity of the Hong Kong securities market and improving the management of high-tech start-ups. The SRC has not yet come up with regulations covering the listing of mainland high-tech companies on a Hong Kong board. The regulations will be based on how Hong Kong regulates the market.

Going public is the most attractive way for a venture capitalist to realize a return on an initial investment. It could take a year and a half for Shanghai's second board to open. The most likely initial start-ups in Hong Kong will be in software and networks.

Government Investment and Science Park

The chief executive of Hong Kong, Mr. Tung, has promised a total of $646 million in government investment in the SAR's electronics sector. About $84 million has been allocated to a newly formed innovation and technology fund by the SAR government; $3 million has been marked for a public intranet project; and $55 million is being spent on a technology and science park (currently under construction).

Incentives

Singapore has introduced a wide range of tax concessions to attract foreign investment. Hong Kong may follow suit by raising the allowance for corporate investment in high-tech infrastructure to 200 percent. Companies now enjoy a 100 percent tax break on the cost of bringing in computers and other high-tech equipment.

Overseas Chinese Capital

San Francisco's WI Harper Group recently announced that it is raising $50 million to invest in technology companies in China. The Beijing Technology Development Fund is the first offshore technology venture fund blessed by China's communist government, which is investing $10 million through Hong Kong's Beijing Enterprises Holdings. Peter Liu, Harper's chairman, expects to raise another $10 million to $15 million in Taiwan. The rest will come from U.S. technology companies, banks, and venture capital companies. The fund will invest in software, telecommunications, multimedia, and biotechnology start-ups, with a goal of taking the start-ups public in the United States.

Competitive Bandwidth

Hong Kong plans to allow greater competition in its broadcasting and telecommunications industries. The government will open up the pay-television and video-on-demand markets by allowing an unlimited number

©1998 Dataquest

of licenses. That means that monopoly license holders Wharf (Holdings), its subsidiary Wharf Cable, and Hong Kong Telecommunications, could soon face competition for services. The government wants telephone service providers to be able to provide television programs, including pay-television and video-on-demand, and for broadcasters to be able to provide telephony services. That would require more interconnection among broadcasters and telephone service providers, which the government is also proposing. The government wants to see trials of digital and high-definition television start in Hong Kong and will encourage broadcasters to apply digital technology. To further facilitate competition, the government wants to abolish subscription and advertising royalties that cost the industry U.S.$40 million and to revamp its broadcasting laws. But the government does not plan to offer more terrestrial network licenses, saying there is limited transmission space. The government has not yet decided whether to continue restricting the number of fixed-network telephone licenses, now held by four companies.

Scenarios for Semiconductor Distribution in China/Hong Kong

As discussed previously, Dataquest anticipated increasing economic interdependence between China and Hong Kong. The service sector continues to fuel Hong Kong's economy, but manufacturing is the largest and fastest-growing part of the mainland's economy. China's economic expansion in the past decade has broadened Hong Kong's service sector, which now supports China's industrialization. Hong Kong-based companies have provided critical links between Chinese manufacturers and imported technology and components. Hong Kong is now the source of more than two-thirds of the semiconductor components on which China depends.

Figure 1 illustrates the current trend of Hong Kong companies to act as intermediaries and not producers of electronics. Domestic exports have shown flat growth, while re-exports of components and equipment continue to increase. Are these intermediaries serving China or other markets? Figure 2 shows re-exports by destination. Hong Kong's role in China is growing fastest, but the growth is symmetrical.

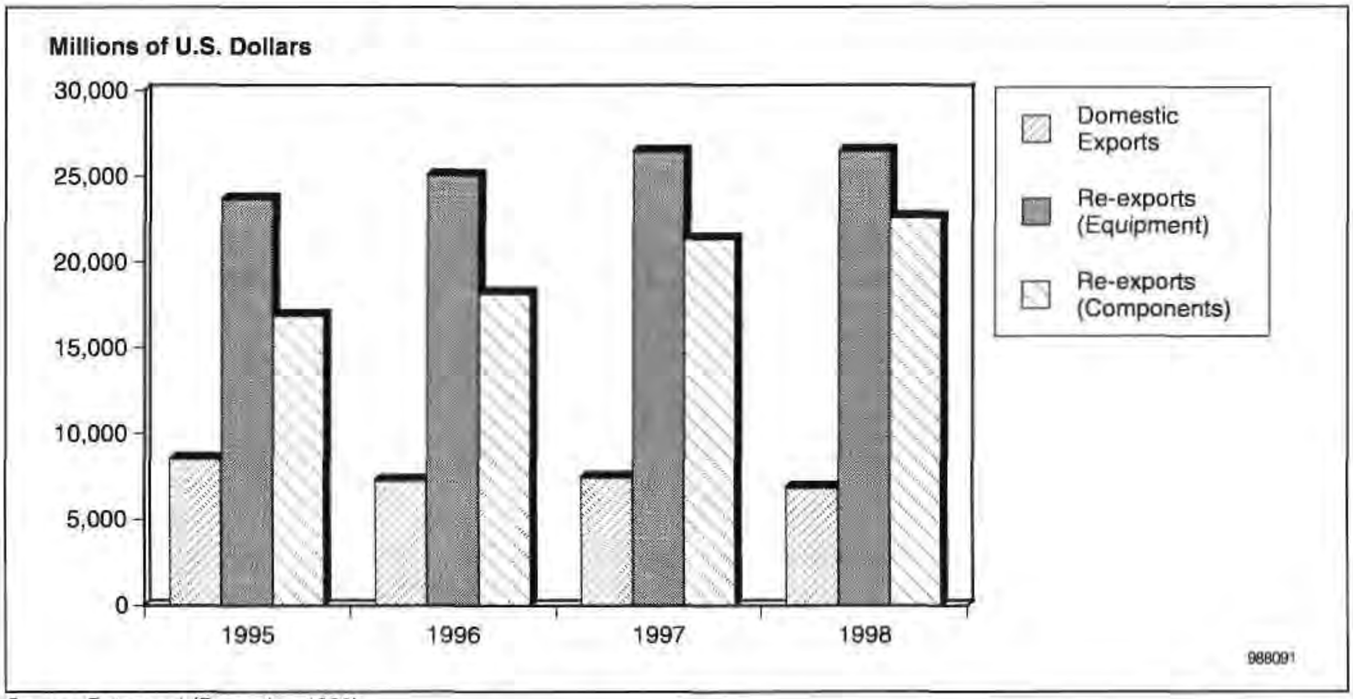
Disintermediation

Hong Kong's distributors serve as intermediaries for semiconductor vendors and electronics manufacturers in China. The competitive advantage of distributors consists essentially of logistics, information, and relationships. Semiconductor vendors in Asia/Pacific may still operate on a commodity product mentality, offering little service and focusing on low cost. But a key competitive advantage of semiconductor vendors in the region will be their ability to provide manufacturing services and development support to their customers. Asian OEMs are facing very competitive times and must rapidly transform their business processes or risk being supplanted by contract manufacturers with lower costs for procurement, inventory management, and built-to-order/configure-to-order business processes. Manufacturers in China/Hong Kong will rely on information technology to source components, seek technical support, manage logistics, and market or sell

 ©1998 Dataquest

their products. Hong Kong distributors and trading companies soon will become obsolete and must find ways to add value. We also see that design and development of products is moving closer to the markets in which they are consumed. Dataquest anticipates a continued increase in fabless semiconductor companies in China/Hong Kong because of the growth in local product development (for local consumption). Venture capital provides an important source of income, and the combination of local and overseas Chinese is providing the necessary technical and business talent.

Figure 1
Hong Kong Re-exports and Domestic Exports of Electronic Equipment and Components, 1995 to 1998 (Millions of U.S. Dollars)



Source: Dataquest (December 1998)

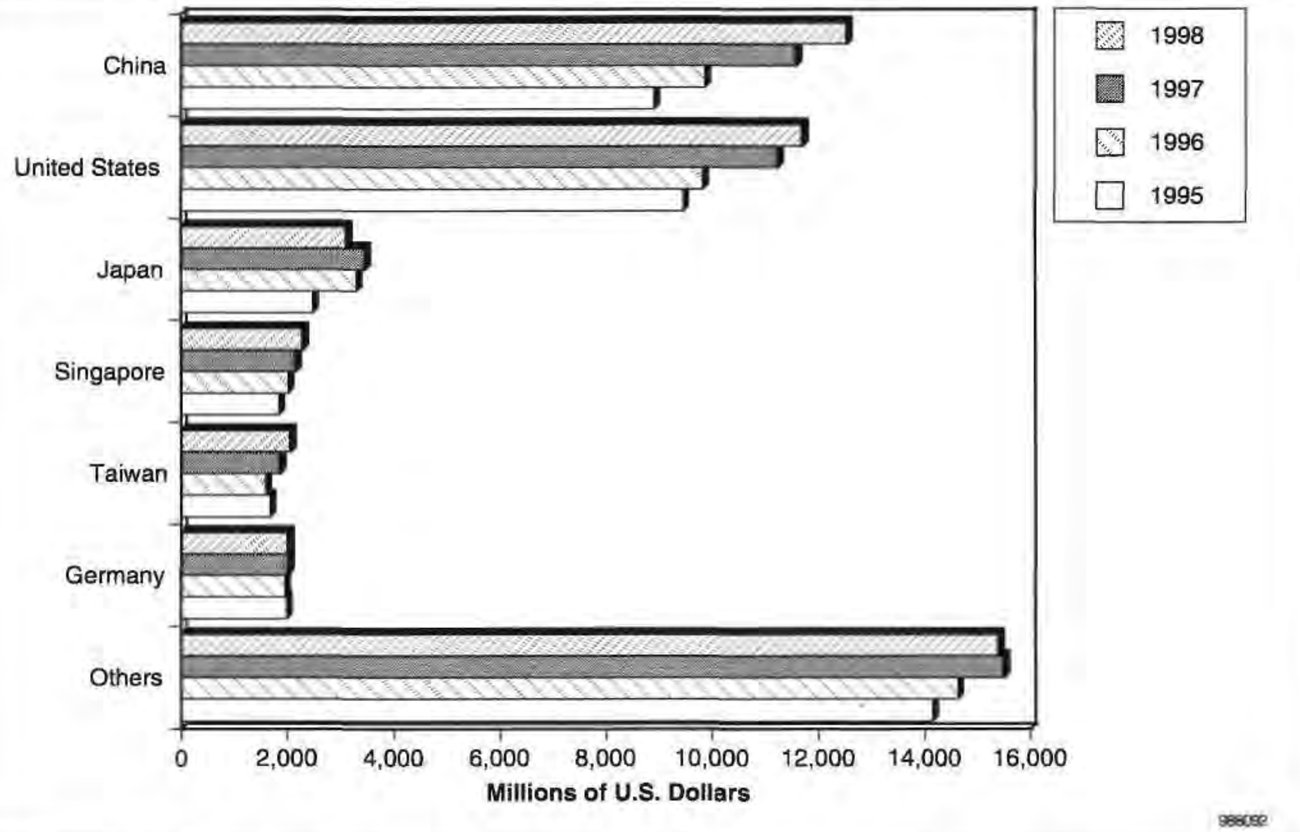
Reintermediate or Die!

The threat of disintermediation is not yet significant in Hong Kong and China but is increasing fast. Electronic commerce for semiconductor companies is enabling lower coordination costs with suppliers and customers, as well as internally. The role of the distributors will be diminished by vendors able to deliver real-time, online service, information, technical support, and logistics management. Hong Kong distributors will have to devise strategies to regain their status as intermediaries within a few years or simply close up shop. They will be challenged to introduce value-added services to semiconductor users (electronically) in China as links between vendors and manufacturers grow close. A possible scenario is that distributors will invest in IT, use their market power to become order collectors, and then negotiate the best prices and delivery terms with vendors. An extreme example of reintermediation would be if Hong Kong were to establish a semiconductor electronics market; it has no industry that

 ©1998 Dataquest

would be hurt, and it currently is the main source of semiconductors to Asia/Pacific's largest market.

Figure 2
Destination of Hong Kong Electronic Exports, 1995 to 1998 (Millions of U.S. Dollars)



Source: Dataquest (December 1998)

Future Start-Ups

Hong Kong has entrepreneurial zeal, access to information, and venture capital comparable to Taiwan's but lacks the industrial/technological infrastructure of small and medium-size component suppliers key to Taiwan's success. However, its population density, open markets, high income, and links with mainland China (for manufacturing, workforce, and markets) have made Hong Kong an ideal test market for services such as wireless communications, interactive television, electronic banking, electronic commerce, smart cards, transportation, electronic cash, and so on. It is commonly thought that if a product cannot become profitable in Hong Kong, then it certainly will not be profitable elsewhere in Asia.

Electronic products and systems development in Hong Kong and major Chinese cities is accelerating, and semiconductor vendors will find opportunities to lock in customers as local vendors and start-ups speed product development. Guangdong province provides a strong electronics manufacturing base nearby that will provide a competitive outsourcing center for Hong Kong product developers. It is likely that new and

 ©1998 Dataquest

innovative products and technology will be developed for the technology-driven Hong Kong service economy, but it will take two to five years for the current measures to take root and for local start-ups or spin-offs to begin to design semiconductors, equipment, software, or services marketable in Hong Kong's technology-hungry economy.

Dataquest Perspective

Government-led initiatives rarely seem to achieve what they set out to accomplish. However, they raise the level of public debate, which then leads to a realistic balance between government hype and commercial viability. The Hong Kong government is, by tradition, wary of bureaucracy but believes an electronics industry development strategy is critical in the long term. Aggressive IT adoption, access to capital, free trade and information flow, efficient telecommunications, logistics expertise, strong management skills, and strong links with China (between government, academics, and businesses) are critical factors for Hong Kong to remain an attractive conduit for and recipient of technology transfer.

The worst-case scenario would be that the government would drop its initiatives after being criticized for spending millions of dollars in the wrong areas with little results. This is the least likely scenario. The economic crisis has created an environment leading to rapid and dramatic policy changes. Unlike past initiatives, the government is appointing able, outside leadership to spearhead key commissions. The best-case scenario is that government investment and policies could lead to an acceleration of start-ups in Hong Kong from local entrepreneurs, academics, overseas Chinese, and mainland Chinese.

The most likely scenario is that the Hong Kong government will accelerate its commitment to the development of technology in Hong Kong as a matter of economic survival. But the model will not be one seen before in Asia. Hong Kong is not likely to become a tax-free assembler of imported manufacturing, which made Singapore a large producer—but not an innovator—of electronics. Nor will it become an OEM exporter of semiconductors, personal computers, consumer electronics, or high-end communications equipment, as seen in other parts of Asia.

Semiconductor vendors should continue to watch and influence downstream developments in Hong Kong, because the current course of government and business is a leading indicator of the shape of applications to come in all of Asia. It is not likely that semiconductor distributors will have the resources or culture to add value to OEMs or establish electronic commerce in the rest of the region. This means dramatic changes in the channels are ahead. Semiconductor vendors should prepare to establish an IT strategy in China/Hong Kong as a means of penetrating the large, fragmented market and of developing localized applications. Most companies are simply not thinking ahead and will miss huge growth opportunities. Companies that establish an IT strategy in China/Hong Kong will effectively lock in their future customer base and will help ensure that that base can remain competitive.

Market Analysis

The 1998 China/Hong Kong Semiconductor Market in Review

Abstract: *The year 1998 in the China/Hong Kong semiconductor market will be a year to forget for semiconductor vendors. While most of Asia/Pacific was crumbling, China could only stand by and watch nervously. As Dataquest makes sense of the events in 1998, it highlights events that significantly influenced the region's market development. This Market Analysis Perspective highlights industry events and announcements that exemplify significant strategic initiatives either from private companies or the Chinese government.*
By Daniel Heyler

Introduction

FILE COPY: MARIA VALENZUELA

Asia's 1998 economic downturn will fundamentally shift how local and foreign companies conduct business in China/Hong Kong in the future. The downturn is going to be a test not only of China and Hong Kong's new political leaders but also of the leaders who are charting their companies through dangerous and uncharted territory. Dataquest's various key industry surveys illustrate a wide variance in competitiveness among semiconductor vendors in the China/Hong Kong region. This Market Analysis Perspective highlights industry events and announcements that exemplify significant strategic initiatives either from private companies or the Chinese government.

First Quarter

After the Asian financial crisis began to sweep Asia/Pacific, China remained unscathed, and multinational companies' investments continued to pour into the country, but not as aggressively as in the first quarter of 1997. China's PC market showed little sign of slowdown, while the rest of the region contracted. The market pull and competition from Chinese domestic

Dataquest
Program: Semiconductors China
Product Code: SEMI-CH-DP-9812
Publication Date: November 23, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

manufacturers resulted in greater foreign investment from companies such as Dell Computer Corporation.

January

E-Commerce Was Started: GE Accelerated Investments in Downturn

General Electric Company seemed to be accelerating its bargain-hunting and strategic ventures in Asia/Pacific during the Asian financial crisis. General Electric (GE) Information Services, an arm of GE of the United States, announced that it would open an electronic commerce hub for Asia in Hong Kong, as well as an electronic commerce center in the Philippines in 1998.

GE officials said that its China center would be based in Shanghai, but the full details would be released only after an agreement with its partner, China's Ministry of Posts and Telecommunications (MPT), was finalized. Electronic commerce (e-commerce) is business transactions conducted through computers. This is intended to replace the previously required extensive paperwork and physical delivery of papers. E-commerce also includes the opening of a "virtual marketplace" where companies can shop for goods or seek business partners electronically, using computers to seek the best price.

February

IBM Invested $20 Million to Build RDD MR Heads in China

IBM announced plans to invest $20 million to build a new facility to manufacture magnetoresistive (MR) heads for rigid disk drives (RDDs) in southern China. The company said the new plant would be operated by Shenzhen IBM Technology Products Co., a newly established unit of IBM. IBM also said it will supply MR heads to Maxtor Corporation for its desktop PC drives.

This MR plant is another boost to IBM's storage investments China. In 1997, the company had established a $50 million joint venture to produce MR assemblies in Shenzhen. The venture involved two large Chinese companies, Great Wall Computer Group and Shenzhen Kaifa Technology (HK) Company. IBM's RDD investments are its largest in China. Based on past announcements, this one brings IBM's MR investment commitments to more than $100 million. There has not been a noticeable decline in technology-related ventures in China since the Asian financial crisis.

Government Reacted to the Asian Financial Crisis

China's new economic czar, Zhu Rongji, backed many of the 1998 initiatives to address China's inefficiencies and financial problems. By far the most dramatic gesture was the government's decision to raise $32.6 billion to recapitalize nearly bankrupt state banks. The money is to come from a special Ministry of Finance bond issue to be made sometime later this year. The plan was approved by the Standing Committee of the National People's Congress. A stabilization plan for China's banks, which the World Bank said have a "negative" net worth—has been mooted for weeks. But the amount is dozens of times higher than previous estimates, a sign that China is serious about dealing with the problem.

Similarly, the decision by Communist Party leaders to ask the NPC to approve the largest-scale streamlining of the country's bloated government bureaucracy in five decades calls for much more severe cuts. This is the largest reform of government departments since the People's Republic of China was formed in 1949 and the most dramatic.

March

Dell Announces Plans to Build a PC Assembly Plant in Southern China

Dell announced Chinese government approval for the establishment of a Dell China Customer Center (CCC) for order fulfillment in mainland China. The CCC will fulfill product configuration, inbound telephone sales, direct customer services, and technical support functions for the domestic market. Dell Asia Pacific has stated that the facility expects to employ about 200, and that operations are expected to commence before the end of 1998. The facility is to be leased in Xiamen—a Special Economic Zone (SEZ) on the Fujian coast directly across from Taichung, Taiwan—and will occupy a total of 13,658 square meters. Production will cover the full range of Dell desktop, notebook, workstation, and server systems.

This is first and foremost a market development initiative by Dell. The Chinese PC market is Asia/Pacific's fastest growing and largest, accounting for about one-third of the entire Asia/Pacific market (excluding Japan). However, competition is increasingly fierce among both local and foreign brands in China. Dell is a latecomer to China and is playing catch-up through this first major manufacturing investment. The president of Dell Computer Asia Pacific cited the main reasons for investing saying, "We have selected Xiamen for many reasons, primarily for its infrastructure, proximity to customers, favorable business climate, and highly educated and adaptable labor force."

Investments by PC manufacturers in China have been inherently different from their other facilities in Asia/Pacific. These investments in China have not detracted from investments in highly automated volume facilities in Singapore, Taiwan, and Malaysia, which are oriented to volume and global exports. Compaq Computer Corporation's facility in China, for example, is totally dedicated to the local market, while its Singapore facility maximizes economies of scale and automation and ships PC systems globally. Market development, government relationship-building, and distribution are critical success factors in China, which Dell has lacked. The downside risk for multinational vendors in China has been increased costs because of increased complexity in sourcing and operations, in addition to China's uniquely difficult business environment. However, high market growth and the need to compete for channels have resulted in foreign investment in local production. Compaq's facility and Xiamen's probusiness government, located in the southeastern province of Fujian, were able to offer the least risk for Dell to launch its market expansion to China's more prosperous coastal region.

Baiyi Electronic Information Center in Fuzhou, Fujian

China's Fujian Province has signed 10 high-tech contracts with investors from the United States, Japan, and Taiwan. Officials dubbed this region the

 ©1998 Dataquest

Silicon Valley of Fujian, with investment reaching $120 million. The two major contracts include a Sino-U.S. joint venture to produce PCs and a Taiwan-funded enterprise involving total investment of some $30 million each.

The center, which plans to attract more investors, has built a number of infrastructure facilities, including water plant, transformer substation, roads, gas pipeline, plant workshops, and an apartment complex. The center, which covers 3 square kilometers, is the largest electronics production base in Fujian. The province has approved 94 electronics enterprises and joint ventures for the center, with a total investment approaching $800 million. Fujian is the most popular destination of Taiwanese investors, and Baiyi accounted for one-third of investment in Fujian in 1997.

Second Quarter

April

Motorola Announced Ferroelectric R&D Alliance with Nanjing University

Motorola Electronics (China) Limited and Nanjing University, one of the noted universities in China, launched an advanced materials joint research program to investigate fundamental properties of ferroelectric thin-film materials. The project is focused mainly on fundamental research and understanding of the impact of microstructure on ferroelectric thin-film properties. Through this project, Motorola is expected to establish a long-term partnership with this key national lab, which will result in more extensive technology collaborations.

It is apparent that the joint project is intended to promote the rapid development of nonvolatile memory technology and spur development of applications of this kind of material. Motorola's Materials Research and Strategic Technologies Group will benefit from the talent and R&D brainpower of National Laboratory of Solid State Microstructures at Nanjing University, while Nanjing University benefits from Motorola's application prowess and technology. Similar announcements have been made by Texas Instruments Inc. during the past six months, and the company is ahead of the game in setting up applications-oriented laboratories at China's leading microelectronics graduate schools.

Dataquest often hears of electronics companies investing in China to develop their market presence or lower their manufacturing cost. Less known, but increasingly critical, is investment because of shortages of engineering talent worldwide. At China's current development rate, it will take less than 20 years, possibly 10, for the country to become the world's largest source of electrical engineers.

May

Intel Established a China Research Center

Intel Corporation announced that it will invest $50 million in the next five years in an information technology (IT) and development center in China. The announcement was made in Beijing by Chairman Andy Grove, who said

 ©1998 Dataquest

the investment is part of the $2.8 billion the company plans to spend on global research in 1998. The Intel China Research Center, to be based in Beijing, will focus on Internet research and other information technologies, such as speech recognition. It will conduct its own research and fund projects at China's universities and research institutes.

Unlike most leading semiconductor companies, Intel's investments in the semiconductor value chain within China, including design, wafer fabrication, and assembly and test, has been negligible relative to its revenue generated in the country. Intel's strategy remains focused on building brand equity in China, as achieved in other major markets. The company's only other major manufacturing investment is a flash memory assembly plant in Shanghai, which will commence production this year, exporting most of its production. Conversely, the company is accelerating spending in advertising campaigns and product education, while working with China's largest PC manufacturers.

Intel is investing only $50 million over a five-year period in this Research Design Center, which is small change for Intel. Nevertheless, it helps build good relations with the Chinese government. The project also has its technology relevance, however. It's a way for Intel to tap China's best brains and talent to try to develop voice recognition capabilities for PCs. Dataquest believes that voice recognition in China will be the most significant enabler of PC consumption growth in China since the introduction of the PC to this market. The keyboard remains a cumbersome PC interface for Chinese users because the Chinese language contains thousands of unique words, or characters, and more than 100 radicals, or components, as opposed to 26 for English. China consumed approximately 2.2 million new PCs in 1997, and the number is expect to increase by 50 period to 60 percent for the next two years. While the Asian financial crisis has seriously dampened PC growth in the rest of the region, Intel and other companies expect the Chinese market, consuming almost one-third of PCs shipped to Asia/Pacific today, to maintain its breakneck growth.

Third Quarter

July

China's Economy Far from Crisis: June Data Shows Output and Trade Increasing

When reading through the plethora of press reports on the Asian financial crisis, it becomes clear that the drivers for semiconductor demand have not been fundamentally shaken in China as in most other Asia/Pacific countries. The following three factors that have driven demand are facing downward pressure but are far from collapsing:

- Electronics exports have grown by about 8 percent during the first half of 1998.
- Domestic consumption continues to absorb more than half of domestic electronics production.
- Investment from foreign manufacturers continues to provide impetus to semiconductor demand.

 ©1998 Dataquest

Global semiconductor pricing is hurting margins for most vendors, but once the industry recovers from overcapacity, China's expanding export and consumption base can easily return to its double-digit growth.

China has yet to show any signs of a critical economic downturn attributable to the Asian financial crisis and the Asian economic crisis. Halfway through 1998, China's gross domestic product (GDP) growth forecast has been lowered somewhat, from 8 percent to 6.5 percent to 7 percent, which is still well above even Taiwan, the second-strongest economy in the region. Hong Kong is in recession, but most people believe that it will be the first to rebound within two years. China, Hong Kong, and Taiwan are considered the only first-tier economies in the region, which are two years away from recovery.

While the rest of Asia/Pacific's industrial base is contracting (or in a state of transition), China's industrial output rose 7.8 percent in June, compared with the same month in 1997. This growth rate was comparable to May's output. What about the export downturn in China many had expected? Exports have grown by 7.6 percent year on year from January to June 1998. Yes, this is slower than the breakneck 21 percent growth in 1997, but it is nevertheless a strong growth in light of the regional chaos. Considering that 1996 exports grew about 2 percent during the same period, China's 7.6 percent is well within its five-year trade cycle.

China seemed to face a currency disadvantage over other countries, but as Dataquest had noted six months ago, the following factors would enable China to maintain reasonable growth:

- Cash-flow problems inhibit Southeast Asian companies from expanding exports and increase the costs of key semiconductor components that are predominantly imported.
- Running day-to-day operations with a weak cash flow and unavailable short-term financing, China may have a relative currency disadvantage. But it must import most of its key components, which now are less expensive relative to devalued currencies.
- Plentiful, cheap labor has helped keep operating costs low in China.
- The most obvious and critical factor is the element of political stability and transparency, which currently prevent international investors from investing in affected countries.

There are new downward pressures and threats to growth to consider. Exports in the second half of the year will probably be weaker than in the first half, but no one is expecting an export or currency crisis. Total imports expanded by only 2.2 percent because of slowing domestic demand. State-owned enterprises (SOEs) will continue to pull down overall growth and experienced only 2.7 percent growth, as opposed to nonstate companies, which expanded by 12 percent. China is implementing $5 billion in infrastructure projects to boost the economy. The economy has a large tolerance for such deflationary pressure, as SOEs gradually privatize, resulting in rising unemployment and low inflation.

 ©1998 Dataquest

On the export threat, Dataquest sees Japan's policy stagnation and imminent weakening of the yen as China's major threat, rather than Southeast Asia's currency devaluation. But exports represent 20 percent of China's GDP, so such damage is controllable. Less expensive Japanese components, on which China depends, benefit electronics companies selling to China. Furthermore, the Chinese government is implementing tax rebates to exporters (17 percent) to help improve their bottom line and easing credit terms for export-oriented industries. These measures will have the same effect as a minor renminbi devaluation of about 7 percent to 10 percent for certain industries.

Semiconductor vendors are now turning their attention to China for growth in Asia/Pacific, but they are concerned that China may face the same fate as the rest of Asia. Dataquest highlights at least one fundamental difference in China: the way the government manages its economy. Economists whom Dataquest has spoken with believe that China's policymakers can successfully manage the renminbi by continuing a bottom-up economic policy rather than a top-down fiscal policy. Some even believe that the renminbi will not be convertible for the next 10 years because China will manage its economic growth through its various microeconomic levers to companies (such as tax cuts, extended credit, and discounted loans, among others).

China's economic planners can and will avoid the fiscal chaos experienced in Russia by keeping its currency nonconvertible. But the economic disparity between prosperous coastal provinces and poor inland provinces—likely to persist for another decade—could cause the greatest problems for policymakers, resulting in interest-rate havoc once the renminbi becomes convertible. China's long-term economic development plan is to build its economy on its own terms, rather than on international terms, through bottom-up economic management. To achieve this goal, its currency must remain unconvertible and the Hong Kong peg must remain intact.

June

China Announced Plans for Digital Broadcasts

China's broadcasting industry is looking for ways to boost its domestic TV, radio, and cable equipment sectors as planners decide whether to adopt a U.S. or European digital-broadcast standard. China's State Administration of Radio, Film, and Television announced that it was working to trace global technology progress in the TV and radio industry, such as direct broadcast by satellite (DBS), digital video and audio equipment, high-definition television (HDTV), set-top boxes, and other new-generation terminals. The government is focusing on pushing new technology transfers to industrial products from major foreign companies.

The sheer size of the Chinese TV and radio markets has caught the attention of European, Japanese, and U.S. manufacturers, as well as standards groups. China's government reports indicate an estimated 300 million analog television sets in China, along with about 500 million radios. The emerging digital market is expected to be equally large. Precisely when Chinese officials will select a digital TV standard is hard to predict, especially in light

 ©1998 Dataquest

of a government restructuring that involves various agencies and individuals that were charged with administering radio, TV, and film industry issues.

September

Samsung Announced Color Picture Tube Plant

South Korean conglomerate Samsung Electronics Company Ltd. announced that it plans to invest $838 million in a joint venture to manufacture color picture tubes for television sets and computer monitors in China. Chinese government sources reported that Tianjin-Samsung Display Device Co. Ltd. has been completed now with a designed capacity of 1.8 million units per year. Production was scheduled to begin early next year at the factory, which was one of six Samsung ventures in Tianjin.

The Chinese government estimates that South Korean companies had invested more than $1 billion in approximately 700 projects.

Nokia Expanded Switching Venture

Finnish telecommunications company Nokia Telecommunications announced that it will expand its four-year-old manufacturing venture with Chinese company Hang Xing Machinery Manufacturing. The venture already manufactures DX 20 fixed-switching systems and will cover mobile-switching centers and base station controllers for sale in China and other markets.

Ministry of Information Industry Announced Healthy Growth

China's telecommunications industry grew by 42 percent in the first eight months of this year with a RMB 119 billion turnover (U.S.$1 is about RMB 8.28), according to China's Ministry of Information Industry (MII). It reported that the number of households with access to a fixed-line telephone grew by 11.7 million to reach 82.0 million by the end of August, while mobile phone users increased by 6.8 million to 20.1 million during this period. In 1998, a total of RMB 160 billion will be invested in telecommunications fixed assets. That investment will add 30 million telephones to the country's network, according to MII.

Fourth Quarter

October

Chinese Government Announced Super-VCD Standard

The Chinese government announced the final specification for the super video compact disc (VDC) standard. C-Cube Microsystems Inc. had pushed for a competing VCD standard. The company would have to incur minor additional costs to switch from VCD to super VCD. C-Cube's chipset already has built-in support for both 1/2-D1 and 2/3-D1 picture resolutions—the key technical difference between the two incompatible formats. The super VCD standard specifies 2/3-D1 resolution; the VCD standard gives authoring companies the option of picking either one. C-Cube announced that it was encouraging authoring companies to drop the use of a copy-protection feature C-Cube developed for VCD encoding.

 ©1998 Dataquest

Legend to Build Printer for Hewlett-Packard Company

Legend Group, a mainland-backed computer company listed on Hong Kong's stock exchange, said it has invested RMB 6.0 million in a new factory in Huiyang in China's southern Guangdong province. The facility can produce up to 500,000 HP DeskJet 200 ink jet printers annually. Legend has been distributing Hewlett-Packard Company's PC and related products in China since 1987.

Taiwanese Government Approved Electronics Investments

After several years of chilly relations, tension on both sides of the Taiwan straits eased in October. The Ministry of Economic Affairs has approved 10 indirect investment projects by Taiwanese companies in the mainland worth $83.1 million. Among those companies given the green light, Kinpo Electronics Inc. has been approved to invest some $20 million in calculator manufacturing and marketing operations in China. Another, First International Computer Inc. has been given the go-ahead to inject $8 million into a desktop PC and motherboard plant in the southern Chinese province of Guangdong. Liton Electronic Corp. can also invest $10 million in power supply manufacturing operations in Guangdong.

China's PC Distribution Channels Consolidated, while Domestic Manufacturers Continued to Gain Market Share

While much of the Asia/Pacific market has slipped further into a recession, China's PC market has posted healthy growth because of the popularity of unbranded, white box PCs. White box PCs accounted for 27 percent of all first half 1998 shipments in Asia/Pacific and 60 percent of all units ordered directly by end users in this period. PC shipments in the China market alone (excluding Hong Kong) exceeded 1.4 million units in the first half of 1998, accounting for one-third of the region's total units. More than 600,000 PCs were ordered through direct means in China during the first half of the year. Continued growth in the volume of direct-channel PCs in Asia/Pacific reflects massive white box consumption and the impact of large markets such as China, which are still growing this year, according to Dataquest's PC and Printer Distribution Channels Asia/Pacific program.

Margin pressure from local brands and white boxes configured by PC stores and dealers from standardized, low-cost components is affecting the competitiveness of some traditional brands. The region's PC component volume remains high in the wake of tremendous price erosion from the original manufacturers. Asia/Pacific is already seeing the sub-$500 PCs creeping into the market, courtesy of the white box assemblers.

Channel consolidation is an inevitable trend in Asia/Pacific as buying power continues to diminish and the region's PC market grows less attractive to official resellers. With white box and entry-level PC prices eroding traditional margins, the low-cost, high-availability, direct-order model is being reinforced in the Asia/Pacific market this year.

 ©1998 Dataquest

Dataquest Perspective

The downturn in China/Hong Kong's semiconductor consumption is a result of worldwide industry problems, rather than the Asian financial crisis. For this reason, Dataquest believes that China/Hong Kong will be the first to bounce back once worldwide capacity reaches higher utilization rates.

Several factors appear to be driving China's semiconductor market, despite heavy pricing pressure and regional economic problems. China's exports have remained competitive, and the country will record a significant surplus in 1998, despite having enacted no currency devaluation measures. Domestic electronics consumption has slowed but not dived. China's PC consumption is expected to grow another 40 percent in 1998. Local computer-related industries proved even more competitive and cutthroat then ever, reflecting the pricing pressures in the semiconductor industry. Communications spending received a big boost from the Chinese government, but communications equipment companies have long-term plans that were not affected by the Asian financial crisis. Consumer electronics are showing slowing demand and overcapacity. But the government's initiatives in standards (such as SVCDs and its intention to begin digital broadcasting) are aimed to give local manufacturers a competitive edge. Foreign investments have slowed, but political chaos in Southeast Asia benefit China, which is now the most stable region to invest in production. It appears that the large domestic market, export competitiveness, and diverse semiconductor applications are stablizers, which enable China to weather very volatile market factors in 1998 and prepare for a slow but steady recovery in 1999.

Semiconductors China

Market Analysis

China/Hong Kong's Semiconductor Market Outlook: Slow Growth Strikes in 1998, Recovery Likely in 1999

Abstract: *Dataquest released its fall worldwide semiconductor forecast, describing a prolonged semiconductor downturn caused by persistent overcapacity and below-cost memory pricing. How is China/Hong Kong, the largest Asia/Pacific market, affected by the worldwide semiconductor slowdown and so-called Asia/Pacific financial crisis? This Perspective assesses the past year's market performance and our outlook for 1999 and 2000. Dataquest has also incorporated new worldwide assumptions to assess its new long-term outlook for China/Hong Kong, which has been lowered from last year's projections.*
By Daniel Heyler

An Overview of the China/Hong Kong Semiconductor Market

FILE COPY:
MARIA VALENZUELA

Dataquest has learned one thing from the worldwide overcapacity and financial crisis on four continents: No one is insulated from these effects. Until recently, China's semiconductor industry had been relatively protected from the worldwide downturn that started in 1996. The market had rebounded in 1997 to 15 percent growth, nearly double the Asia/Pacific rate. As explained in several Dataquest publications, the level of market growth has been severely impacted by two major phenomena. Technology and efficiency gains in semiconductor manufacturing have outpaced the pace of innovation in systems hardware and software. This protracted global overcapacity has spread from memories to other devices, and the industry is not expected to recover until late 1999, at best, assuming a handful of companies exit the memory market. The second major growth inhibitor has been the global financial crisis that has destroyed wealth-creation and economic activities. Lower worldwide gross domestic product (GDP) is exacerbating a slowdown in computer and consumer electronics consumption; hence, prices are falling in almost every product area.

Dataquest
Program: Semiconductors China
Product Code: SEMI-CH-DP-9811
Publication Date: November 16, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

China/Hong Kong remains an area of high electronic equipment production and consumption. There are signs of economic problems gradually worsening this year, but, as previously forecast, there has not been a dramatic industry decline as seen in most other Asia/Pacific countries. Dataquest's applications surveys revealed that much of this system-level volume is attributed to PCs, peripherals, and communications equipment production in China. Local demand and exports are helping China survive the global financial crisis. Consumer electronics are a slowing sector now because of overcapacity and weaker consumer spending. PC unit consumption will expand by another 40 percent to 50 percent in 1998 and average about 35 percent to 40 percent for the next four years. Furthermore, new investments in high-volume semiconductor consumption growth have been made by Japanese multinational manufacturers (albeit weakened by lower contribution margins).

What Has Changed since Dataquest's Previous Forecast?

While the Asian financial crisis continues to takes its toll on Asia/Pacific semiconductor consumption, China/Hong Kong's electronics industry has benefited from a number of key competitive advantages. These were discussed in Dataquest's previous (spring) forecast, but we will review them here and assess to what extent these assumptions have changed.

GDP Growth

When the global financial crisis began in Asia, Chinese Premier Zhu Rongji announced a bold plan to keep the economy on track. He vowed to make the collapsing state sector profitable in three years and to pump U.S.$750 billion into infrastructure by the end of the century. However, this announcement was made before the onset of the Russian financial crisis and the unraveling of the global financial system.

Growth through Public Spending

The Chinese government announced that it will issue an additional $12 billion worth of bonds to fund power, telecommunications, transport, housing, and irrigation projects before the end of the year, a steep increase over last year's public-spending injection. Economists say that the Chinese government's infrastructure spending may now reach $398 billion this year. In late August, Beijing also announced that it would raise this year's total bank lending quota from $108 billion to $120 billion. GDP growth appears on track, although most of Asia/Pacific is contracting. Dataquest has forecast 7.5 percent to 8 percent GDP growth in 1997, which was closely to projections because of these government measures.

Because China's neighbors have depreciated currencies, the pressure on the Chinese yuan has caused declines in China's exports. But, China is still expected to have a trade surplus again this year largely because of the demand from North America. The central government has reiterated that the Chinese yuan will not be devaluated.

 ©1998 Dataquest

Balancing the Trade-Off: Reform and Unemployment

Economists once believed that there was a systematic trade-off between inflation and unemployment. In China, this has been disproved certainly, because the economy is experiencing deflation and rising unemployment. It appears that the trade-off lies between banking and industry reform with unemployment.

Reforms of state-owned enterprises will slow until the world economy improves. This is to temper the rising unemployment that is leading to increased social unrest in the form of small-scale labor demonstrations. The risk is that nonperforming loans will grow at the expense of China's fragile banking system. Dataquest believes that China's $140 in billion foreign reserves will enable it to balance this trade-off between reform and unemployment for at least 18 months longer.

China's Electronic Equipment Exports

China's electronic equipment exports expanded by approximately 20 percent in 1997, Asia/Pacific's fastest-growing hardware export. Because Europe and the North America have increased their share of total exports to approximately 60 percent, China is weathering the Asian crisis relatively well, compared to the rest of the region. China's declining exports to Japan and Southeast Asia, which represent approximately 30 percent of its electronic exports globally, are where most of the industry's slowdown is occurring.

Overall, Dataquest expects electronics exports to expand by half of 1997's growth (10 percent) because of the decelerating growth since the beginning of the year. China's total exports in September tumbled 6.7 percent from the same period last year to reach $15.48 billion. The January-to-September export growth rate also slid to 3.9 percent from 5.5 percent by the end of August, according to the General Administration of Customs statistics. China's export growth rate has declined to 2.2 percent in the third quarter of 1998, from 1997's whopping 24 percent growth.

Measures for 1998 and 1999

Several government ministries have recognized the export problem and are taking measures to reverse this downward trend. Private companies no longer need export permits, tax rebates are being facilitated to exporting companies, approval for foreign investments is being streamlined, refunds on import tariffs are being expedited, corruption is being attacked, centralization of control is being implemented to improve the environment for multinational companies, and provincial-level governments are also trying to improve their exports through increased trade shows and easier approval steps.

Imports

Although imports into China have maintained a relatively constant growth for the first nine months in 1998, compared with 1997, their month-to-month performance has fluctuated. On a positive note, the Chinese government has relaxed tariffs on imports of communications and electronics equipment in

1997, which led to a substantial import increase during the first nine months of 1998.

IT Markets and Electronic Equipment Production

In the spring forecast, Dataquest assume that domestic consumption of electronics—especially domestically produced equipment—would not be impacted by the Asian financial crisis. Dataquest assumed that the Chinese government would not devalue the renminbi. Imported component costs have remained unaffected or fallen in relative terms, because all other Asian currencies (except the Hong Kong dollar) were depreciating. China imports 95 percent of its semiconductors, most of which come from Japan, Korea, and Taiwan. This assumption had been realized. However, semiconductor prices have fallen even more dramatically because of Asian semiconductor suppliers' financial woes and competitive challenges.

PC Market Momentum

While PC unit shipments are declining in most of Asia/Pacific, China's PC consumption shows no sign of deceleration in 1998, almost completely impervious to the market crises around Asia. PC vendors' shipment data, gathered by Dataquest's Computer Systems and Peripherals group on a quarterly basis, predicts total PC consumption to grow by 54 percent in 1998 and 26 percent in 1999.

The Chinese PC market continued to grow rapidly in 1998, as demand in this large country nearly doubled, rising some 48.3 percent. Companies driving the market are local, Chinese manufacturers that are aggressively expanding their powerful distribution channels. Their "push development" of the immature home market, forecast in 1997, is a now a powerful reality in the 1998 growth.

The results of Dataquest's Semiconductor group's survey of computer and peripherals manufacturers in August provide a consistent view of the PC market from a production point of view (see Dataquest Perspective "Semiannual Equipment Vendor Survey: Manufacturers' Scale Growth Plans for 1998 and 1999"). Local manufacturers now have a less optimistic view than in January, but they still expect factory revenue to increase by 34 percent on average. This is dramatically higher revenue growth than the single-digit revenue growth that is expected worldwide for the next few years. China's five-year revenue compound annual growth rate (CAGR) for PCs is 33 percent. Dataquest continues to focus on PCs as the primary semiconductor market driver in China/Hong Kong. Today, access to the Internet has become the major motivation for consumers buying PCs. Most estimates of China's Internet users exceed 1 million for 1998.

In early October, China's news service, Xinhua, said that the State Council, or cabinet, released a timetable calling for the government to fix its year 2000 problems by the end of March 1999 and complete a series of checks and tests by September 1999. Correcting the problem in advance is not considered difficult technically, but it is painstaking and time-consuming to complete the huge task by the Ministry of Information Industry's product department. China has more than 10 million computers and large numbers of embedded chips. Gartner Group projects the global bill for fixing the problem is expected to be approximately $600 billion, but the Chinese government has not estimated the cost to fix its system.

In contrast, Dataquest has seen Thailand, Indonesia, Korea, and Malaysia post the most substantial setbacks over 1997. The relatively small Indonesian PC market was crippled by the country's volatile economy as shipments were reduced by some 80.4 percent. Thailand saw its PC market cut in half (50.3 percent) during the same period. The Korean PC market was also significantly hurt, falling by an estimated 46.1 percent, with Malaysia not far behind, dropping by about 42 percent.

Communications Electronic Equipment Market

One positive effect of the downward GDP growth pressure has been accelerated government spending in telecommunications infrastructure. All major first-tier telecommunications infrastructure equipment manufacturers have set up joint ventures in China to tap the lucrative, high-growth market. Increased government spending is resulting in production expansion by these joint ventures. In October, Finnish telecommunications company Nokia expanded its four-year-old manufacturing venture with Chinese company Hang Xing Machinery Manufacturing. The venture already manufactured DX 200 fixed switching systems, and its role will be expanded to cover mobile switching centers and base station controllers for sale in China and other markets.

The communications sector has maintained steady growth since 1997, without suffering any major interruption caused by the Asian financial crisis. Dataquest's survey of China's major manufacturers revealed that their 1998 production plans of expanding 13 percent to 14 percent have not changed on average since January 1998. However, the mobile communications equipment segment is experiencing a deceleration in 1998, to a disappointing 7 percent revenue growth, and this growth is not expected to improve much in 1999. A high growth in premises equipment, namely, cordless handsets from southern China, will likely maintain a 20 percent growth forecast for 1998 and 15 percent for 1999.

Unfortunately, like data processing, this sector is experiencing severe pressure in semiconductor prices, which are causing semiconductor shipments to increase at a slower rate than electronic system revenue.

Consumer Electronics Markets

China's consumer electronics market has been the worst hit in 1998 because of multiple market inhibitors. Consumer spending is down in China because of the increased economic uncertainty and rising unemployment. Overcapacity plagues most of the major consumer electronics sectors, namely, video compact disc (VCD) players, color televisions, and other home audio/video and appliance electronics. Consumer electronics companies have suffered not only from shrinking domestic demand, but also from an investment slowdown from credit-constrained Japanese manufacturers. In addition, China's major export markets for consumer electronics for are Asia, Eastern Europe, and Russia, all of which are suffering economically.

Dataquest surveyed 20 companies in China's consumer electronics industry in August and concluded that companies have revised their growth plans from an average of 22 percent to 4 percent in 1998. Dataquest expects a 3 percent-to-5 percent contraction in 1999. Consumer-related semiconductor purchases are forecast to increase by 8.5 percent, rather than 18 percent as previously expected in spring. As forecast, manufacturers are experiencing a worsening market for the rest of 1998 and well into 1999. The main cause lies in VCD players, which were the consumer electronics market savior in 1997 but are facing saturation in 1998. However, there is some hope that the next-generation, government-sanctioned super-VCD (S-VCD) will begin shipping by year's end and reach mass production in early 1999. This product will help China avoid a declining consumer semiconductor market year in 1999.

China/Hong Kong's Semiconductor Market Outlook and Forecast Assumptions

While most of Dataquest's assumptions remain intact from its spring forecast, the most important one, semiconductor pricing, has been dramatically reduced. As explained in other Dataquest worldwide documents, overcapacity has expanded beyond memories to all major semiconductor segments, including MOS digital logic, MOS microcomponent, analog, and discretes. Companies continued to spend in 1997 and remained resistant to revamping their product strategy. To maintain cash flows, memory suppliers defied Dataquest's assumption by shipping at below-manufacturing cost. China/Hong Kong has been affected more severely by overcapacity because the countries with the worst overcapacity problems literally surround China. And because the Chinese market is not protected from dumping by any agency similar in function to the U.S. International Trade Commission (ITC) or the European Community (EC), pricing pressure has been severe. Hence, although China's demand is much stronger than the rest of Asia from a volume standpoint, vendors' shipment revenue growth into China has been reduced from the price cuts.

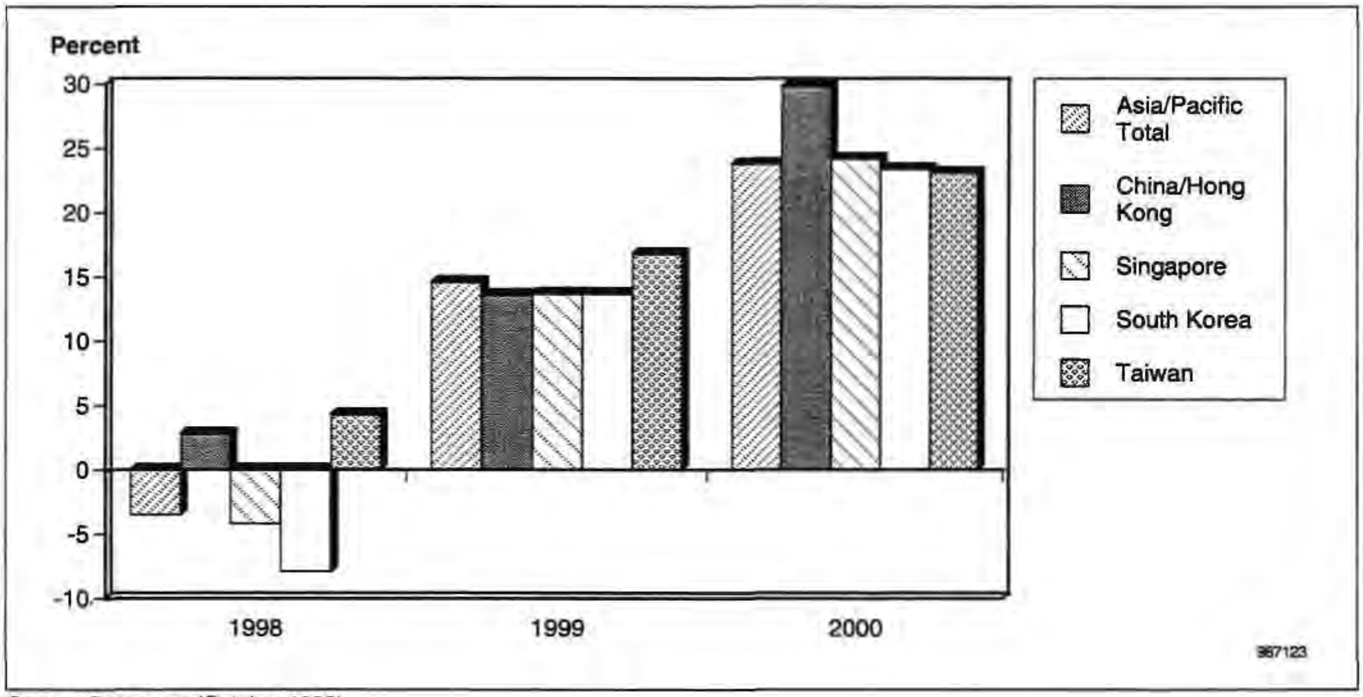
Dataquest's 1999-to-2000 Most Likely Scenario

Dataquest's worldwide view of 1999 is that the global financial crisis has increased the cost of capital because of risk-averse investors. The prolonged slump in the semiconductor industry exacerbates the capital cost problem. Reduced operating cash flows and falling rates of return on invested capital have impaired semiconductor manufacturers' investment for demand needed for the year 2000. Dataquest believes that bit prices will begin to rise in the second half of 1999 and assumes the exit of the several DRAM manufacturers. The DRAM market will enter a period of shortages starting from late 1999 and into 2000.

A Comparison of the China/Hong Kong and Asia/Pacific Semiconductor Markets

As a result of the previously discussed factors, Dataquest has revised its total semiconductor consumption forecast in line with local and worldwide market condition changes. Figure 1 illustrates Dataquest's total semiconductor consumption forecast for the major country markets in Asia/Pacific.

Figure 1
Comparison of Semiconductor Consumption Growth by Country in Asia/Pacific, 1998 to 2000



Source: Dataquest (October 1998)

In 1998, the China/Hong Kong market is likely to lose its status as the fastest-growing market in Asia/Pacific to Taiwan. The market is forecast to grow by only 3 percent in 1998. A recovery is expected to come in late 1999, but the market should still achieve a 14 percent growth. As expected, Korea is the most affected by the Asian financial crisis and the semiconductor market slump. Dataquest expects the Korean market to contract by 8 percent in 1998 and recover modestly by 14 percent in 1999. The Singapore market is also projected to contract in 1998 with a 4.2 percent decline. The disk driver industry has been the worst-affected sector. This market is expected to recover at a rate of 14 percent in 1999. Taiwan has been least affected by the downturn because of its successful OEM/ODM manufacturers, in large part, which are selling primarily to North America and Europe. The market is forecast to expand by 4 percent in 1998 and 18 percent in 1999, attributable primarily to memory and foundry pricing increases.

Long-Term Market Growth Scenario for the Next Silicon Cycle

Without a doubt, China/Hong Kong will remain the fastest-growing semiconductor market in Asia/Pacific from 1998 to 2002. As illustrated in Figure 2, Dataquest expects China/Hong Kong to achieve an 18 percent CAGR, compared to a 13 percent CAGR for Asia/Pacific. This growth trajectory incorporates another overcapacity in starting in 2002. Note that this is a lower level of growth from the previous silicon cycle, primarily attributable to an overall electronic industry slowdown that is affecting China's exports. Figure 3 illustrates Dataquest's electronic equipment production projections that will be driving the semiconductor demand.

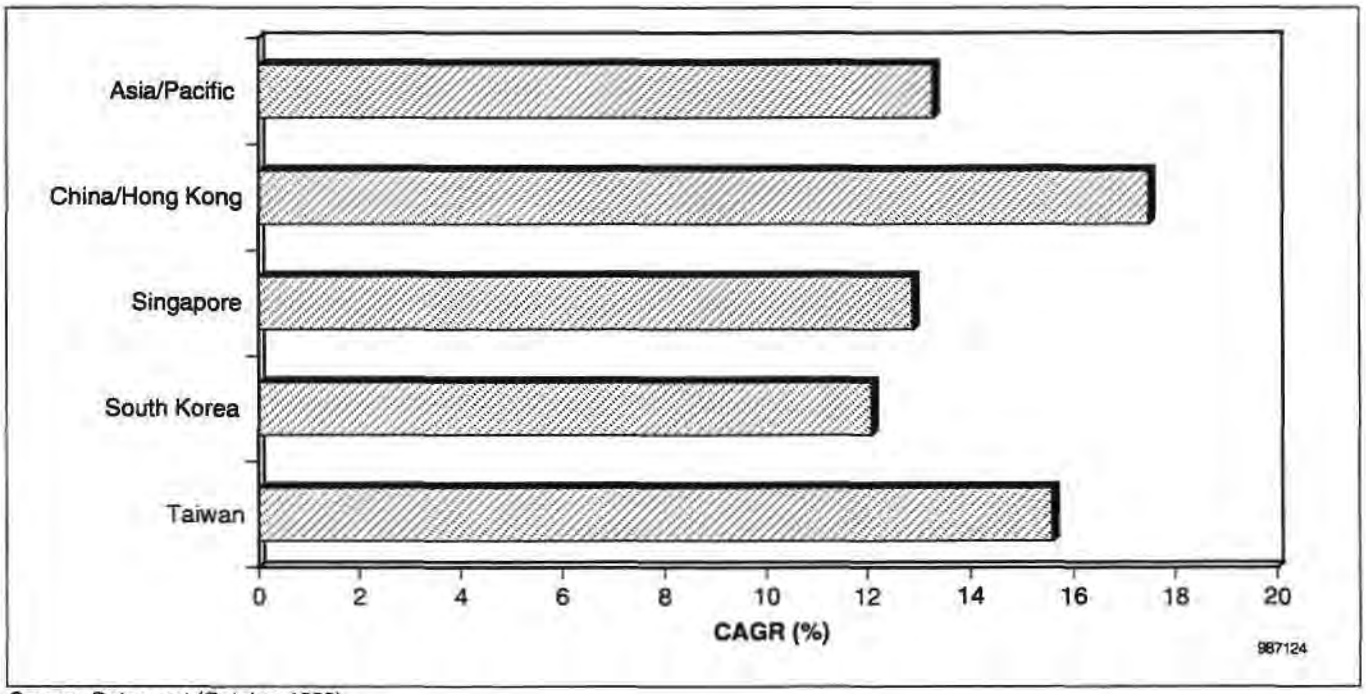
China/Hong Kong will maintain a high level of industry growth for the next four years and will continue to outpace the rest of Asia/Pacific.

Dataquest assumes that China's economy will maintain its relative stability during this forecast window. China will not change to a convertible currency during this period, despite the public promises by Chinese authorities to convert the currency within the next few years. Dataquest believes that at least the following three significant events must happen prior to convertibility:

- Restructuring of the state-owned enterprises
- Reform and development of China's domestic and international financial systems
- Reduction in economic disparities (economic development of central and western China)

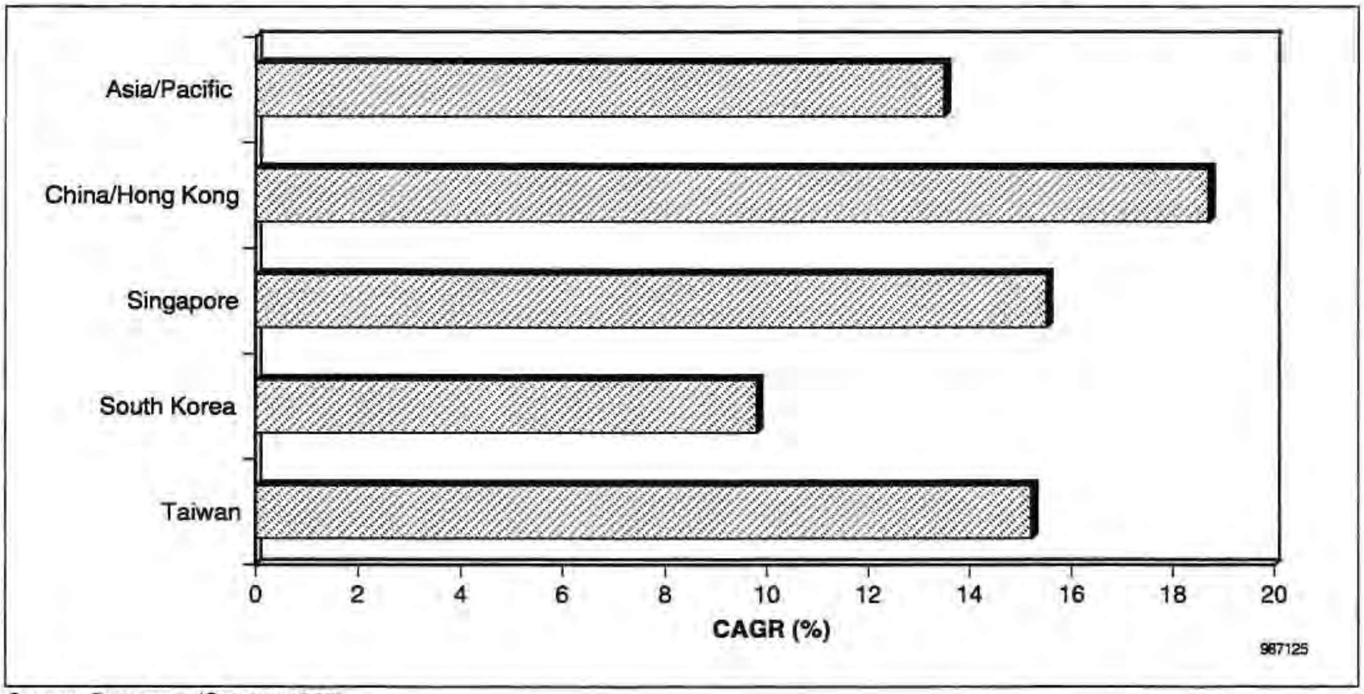
Because these events cannot happen in a recessionary world economy, Dataquest expects the completion of the agenda after 2002.

Figure 2
Long-Term Forecast of Semiconductor Consumption by Asia/Pacific Country, 1997 to 2002



Source: Dataquest (October 1998)

Figure 3
Electronic Equipment Production Forecast by Country in Asia/Pacific, 1996 to 2001



Source: Dataquest (October 1998)

As illustrated in Figure 4, China/Hong Kong is forecast to continue to outpace the rest of Asia/Pacific both in terms of electronic equipment production and semiconductor consumption. Dataquest predicts the following:

- China/Hong Kong's share of total Asia/Pacific electronic equipment production will rise from 26 percent in 1997 to 33 percent in 2002.
- China/Hong Kong's share of total Asia/Pacific semiconductor consumption will grow from 21 percent in 1997 to 25 percent in 2002.

Semiconductor Consumption in China/Hong Kong's PC Production

China's PC production is expected to maintain a 35 percent-to-40 percent unit growth rate. Dataquest sees negligible effects from the Asian financial crisis on China's PC demand. China's total PC consumption will expand by 30 percent from 1998 to 2002. Growth will be driven by the private or nonprofessional markets, with unit growth forecast to expand at a more than 60 percent CAGR. Chinese PC manufacturers will further strengthen their hold on the distribution channels. The less successful local manufacturers will likely focus on distribution of foreign brands or get bought out by larger Chinese manufacturers. The availability of multiple microprocessor suppliers and increased production localization will lower product costs and bolster market growth. In the next five years, although certain regions of China will experience slower growth, there will be no major inhibitors to the current growth rate because the overall market is still immature.

China's Semiconductor Consumption in Communications Electronic Equipment Production

China's communications electronic equipment semiconductor consumption is expected to accelerate in the next five years because of the following factors:

- Standardization of equipment design and semiconductor components will enable Chinese manufacturers, with the assistance of major semiconductor suppliers (with key components, intellectual property, and reference designs), to compete with first-tier imported equipment suppliers.
- Chinese government's support of localized production and the increased availability of turnkey production solutions will accelerate the localization of digital cellular phone manufacturing in China.
- First-tier equipment suppliers will move production to China to compete with local vendors for a local market share.
- Accelerated communications infrastructure spending with increased centralization by the superstrong Ministry of Information Industry (MII) and the Ministry of Foreign Trade, Exports, and Commerce (MOFTEC).

China's Semiconductor Consumption in Consumer Electronic Equipment Manufacturing

China's consumer electronic equipment market is entering a period of slow growth. Digital television standards will be implemented within the next

 ©1998 Dataquest

two years, enabling a new wave of consumer electronics growth in China from 2001 to 2002. Copyright protection is projected to progress slowly, but the issue will persist as a problem for software and media companies for the next five to 10 years. Dataquest's forecast assumes the current VCD industry model will continue. Ironically, pirated software and movie content will continue to be the hardware consumption and market-driving enabler. Super VCD is the new industry standard that will revitalize an industry for a short period until it quickly reaches a state of overcapacity, as experienced with the VCDs.

The problem with the DVD standard is that companies are putting the carriage before the horse. The consumer market *expects* an inexpensive content, as a result of the VCD experience. If DVD manufacturers want to establish a standard, it would make much more sense to offer inexpensive content (probably at a loss for a few years) to enable the hardware infrastructure to develop. Once the market is penetrated with DVD, then companies should worry about salvaging their investment in content by raising prices and enforcing intellectual property laws. A reverse strategy of pushing hardware and technology without recognizing consumer purchasing patterns will fail while the VCD model prevails with DVD.

Device Trends

Just as DRAMs led the industry into this far-reaching glut, Dataquest expects DRAMs to lead the industry to recovery. Figure 5 illustrates Dataquest's device-level forecast for DRAM, non-DRAM, and total semiconductor markets. The absence of DRAMs presents a market of high growth and high stability in China/Hong Kong. One major consequence of China/Hong Kong's PC market/industry boom has been increased volatility in the semiconductor market, attributable to DRAM fluctuations.

Dataquest forecasts that DRAM revenue will fall from $800 million to $580 million in 1998, a 28 percent contraction. Conversely, non-DRAM products will expand by 6.9 percent from $5.9 billion to $6.4 billion. As a result of the DRAM decline, Dataquest's overall semiconductor market forecast is on 2.8 percent growth in 1998. Assuming an optimistic DRAM recovery of 25 percent, the overall market could achieve a 14 percent growth in 1999.

Memories, Microcomponents, and Standard Logic/ASIC Forecast

Figure 6 illustrates the 1997-to-2002 consumption forecast of three MOS digital segments—memory, microcomponents, and standard logic/ASICs. In the next five years, Dataquest does not expect microcomponents and standard logic/ASICs to return to their impressive growth levels of 36 percent and 45 percent, respectively, in 1997. Pricing pressure in these sectors has reduced revenue growth, affecting even microprocessors. Nevertheless, these products will exhibit a healthy growth. Standard logic/ASICs will achieve a 13 percent CAGR, while microcomponents will grow by 18 percent during the 1997-to-2002 period. MOS memories will grow the fastest, at 20 percent, but this is attributable to both the decline in 1997 and the projected industry shortage in 2000.

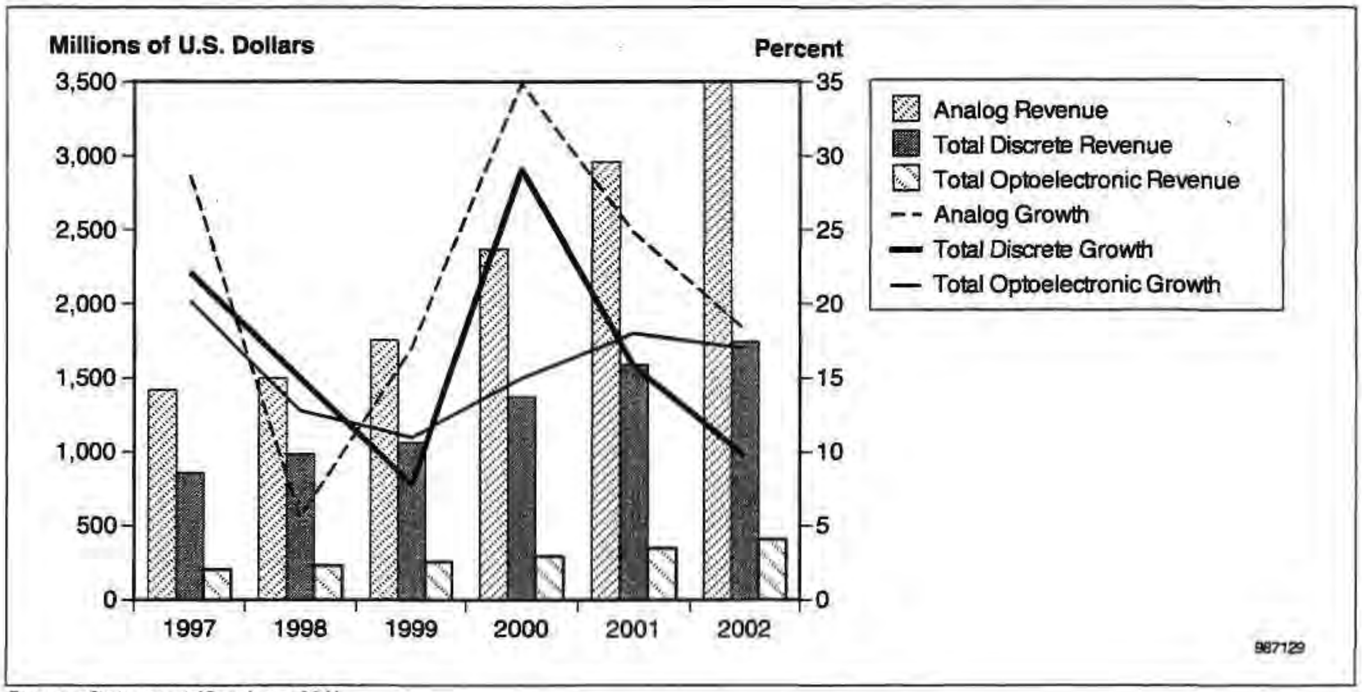
Analog, Discrete, and Optoelectronic Forecast

Figure 7 illustrates Dataquest's forecast of analog, discrete, and optoelectronic markets. These products are primarily influenced by the consumer electronics and, to some extent, communications markets (mixed-signal projects) in China/Hong Kong. All three sectors are slowing in 1998, but analog products have been hit the hardest. As discussed previously, the analog segments of consumer electronics, namely, audio and video equipment, are suffering in 1998. The worldwide analog glut and price erosion have aggravated China/Hong Kong's market. Hence, Dataquest forecasts this market to expand by 5.6 percent in 1998. In the long term, however, Dataquest expects analog to recover and maintain a 20 percent CAGR from 1997 to 2002.

Figure 7
China/Hong Kong's Analog, Discrete, and Optoelectronic Consumption Forecast, 1997 to 2002



Source: Dataquest (October 1998)

Tables 1 and 2 show detailed product splits and forecasts from 1997 to 2002.

Dataquest Perspective

A plethora of factors is enabling China/Hong Kong's electronics companies to weather the global financial storm, but the economic and market situation is likely to get worse before it gets better. The most significant factor in China/Hong Kong market's sliding semiconductor revenue stems from overcapacity rather than from any of Dataquest's key industry or economic assumptions. The year 1998 will be a down year for China/Hong Kong semiconductor suppliers. However, the market maintains a fundamental strength and robustness that will enable it to bounce back strongly once prices stabilize.

Semiconductors China

Market Analysis

Can Digital Consumer Electronics Become China's Future Cash Cow?

Abstract: *China is a large market for consumer electronics, which occupied 48 percent of China's total electronics production in 1998. China has surprised Westerners by becoming the largest consumption and production base for video compact disc (VCD) players in less than three years. As the worldwide consumer electronics market is being boosted by a digital transformation, foreign manufacturers are rushing to tap this lucrative market. This Perspective evaluates whether China has an appetite for digital electronics yet.*
By Kelvin Fu

China's Consumer Electronics Overview

FILE COPY:
MARIA VALENZUELA

China has one of the largest consumer electronic markets in the world, which has a high potential as its middle-income group grows. China's consumer electronics industry has achieved a double-digital growth, driven by traditional home appliances—such as color televisions, air conditioners, refrigerators, and, currently, video compact disc (VCD) players—and captured the world's attention.

In the past few years, consumer electronics has been the largest sector in the electronics equipment industry. In 1998, consumer electronics is the largest sector, occupying 48 percent of China's total electronics production. However, after a few years of rapid growth, it has reached a saturation point. A slowdown trend is expected to occur from 1998 to 1999 because of the Asian financial crisis and the restructuring of Chinese state-owned enterprises. Figure 1 illustrates China's consumer electronic equipment production revenue forecast from 1996 to 2002.

Dataquest

Program: Semiconductors China

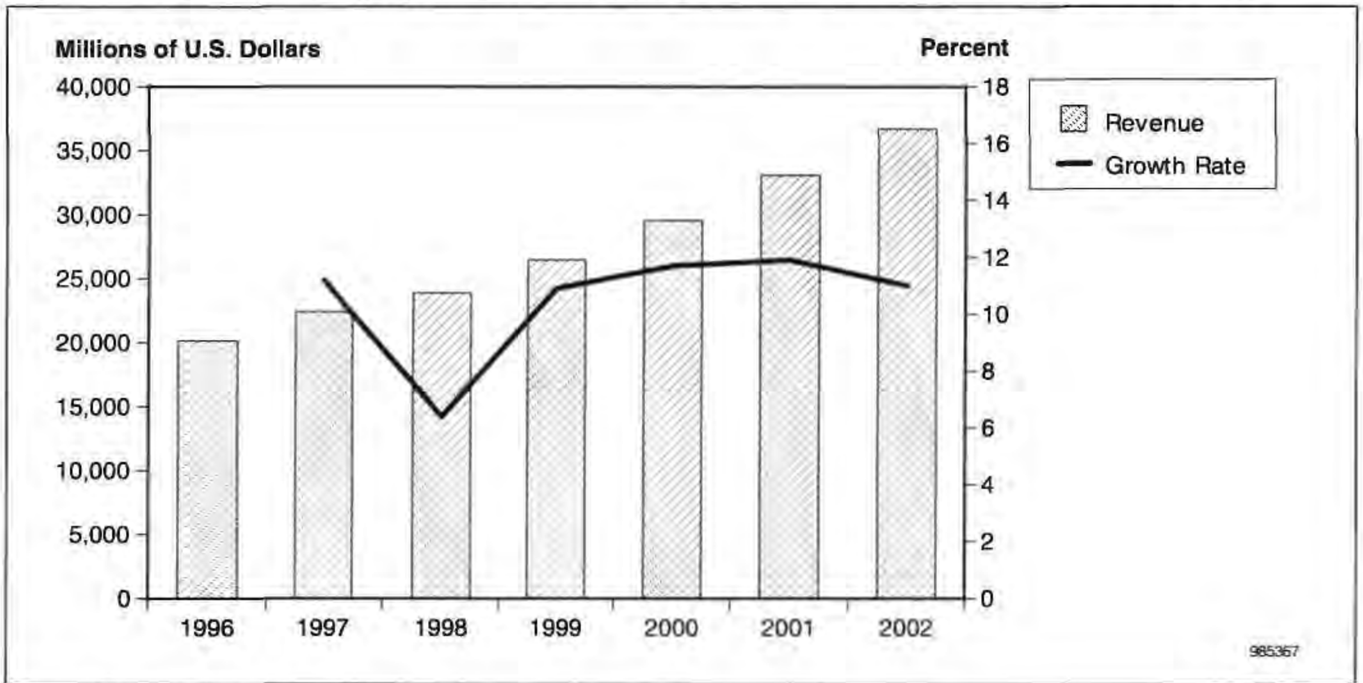
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Figure 1
Consumer Electronic Equipment Production Revenue Forecast in China, 1996 to 2002



Source: Dataquest (September 1998)

China's consumer electronics production mainly consisted of video and audio products, which combined to occupy more than 59 percent of the total consumer electronics manufacturing.

The recovery of the consumer electronics market will rely heavily on the market's new cash cow, digital electronics products, which just began selling worldwide. Many Chinese manufacturers are looking closely at the digital trends that will be the future driving force for industry growth.

Digital Technology

Digital transmission and coding certainly have many advantages over analog technology, has reached a point where further quality and capacity improvements become costly and difficult in technical terms. Digital technology, on the other hand, provides combined advantages of noise-free transmission, higher video and audio quality, robust response to channel problems, easier multiplexing of multiple forms of information (for example, data, voice, and video), greater error protection, and a higher system capacity achieved through compression of digital data. Digital compression enables more information to be stored and transmitted, thus new audiovisual applications in the fields of communications, multimedia, and broadcasting become possible based on digital technologies.

In addition, there are emerging international standards for digital coding and processing as this technology develops. One such standard used intensively for digital video coding is MPEG-1 and MPEG-2, issued by the Moving Picture Experts Group in 1992 and 1994, respectively. MPEG-1 compression technology is commonly seen in China's VCD players, whereas digital video disc (DVD) players and the currently debated products of the China video disc (CVD) type and later, super VCD players are based on MPEG-2 standards. Digital broadcasting in the United States and Europe will also be based on MPEG-2 as a digital compression standard. This kind of standardization has an immediate advantage of making video and audio communications equipment from different vendors compatible. It increases the attractiveness of using and buying digital equipment as it can enable large-scale international data exchange. This increased demand, in turn, can lead to economies of scale in chips, which will ultimately bring the equipment prices to a more affordable level.

The information transfer, processing, and storage for digital TV and computer will become identical and based on the same standards. Therefore, in the future, it is not difficult to see that digital TV sets equipped with communications hardware and software compatible with computers could be connected to the information superhighways. Meanwhile, computers can also receive information from terrestrial cable or satellite digital broadcasts. Both digital TV viewers and PC users will then be able to receive digital TV broadcasting, surf the Internet, and use high-density storage media such as DVDs.

With all the advantages of digital technology over its analog counterparts, consumer electronics digitalization will certainly be the future trend. As the first digital broadcasts begin in 1999, consumer electronics equipment manufacturers in the United States are expecting digital products, such as digital high-definition television (HDTV), to arouse consumer demand and stimulate volume sales throughout the industry.

However, the question remains for China: Will China follow the tide of digitalization? Do digital television, DVD players, digital satellite set-top boxes, and digital radios, or the like have a future in China?

Digital Is a Future Trend, but China Is Lagging

China's digital consumer electronics production is in its infancy, as most Chinese manufacturers have not yet mastered the digital technology and acquired the skill level required for the production of digital products. Digital cameras, digital VCRs, and digital camcorders are new terms to most Chinese people. However, with two digital superstars in China, the VCD and DVD players, this new electronics equipment will become familiar to people soon.

Dataquest expects China's VCD player production to reach 18.5 million units in 1998, sustaining a 26 percent growth. This growth is moderate, compared with 1997's nearly 155 percent growth over 1996.

In 1996 and 1997, the VCD player market grew explosively in China, with 5.8 million units and 14.7 million units, respectively, making it the world's No. 1 production and consumption base for such products.

VCD players were first introduced into China in 1993. China started VCD player production in 1994 when the output was only 20,000 units. In 1995, the output expanded at a factor of 10, reaching 220,000 units. Since then, the VCD has gained a wide acceptance among Chinese consumers; more suppliers have joined the production craze. Driven by the strong domestic consumption, the total VCD player output reached 5.8 million units in 1996. This dramatic increase is not the end of the story. In 1997, the VCD demand was fueled by suppliers' promotional efforts, and the output finally reached 14.7 million units.

Currently, there is a heated debate in China whether to adopt worldwide DVD standards or develop China's own version of digital production. There is an intensified standards war between CVD, led by C-Cube Microsystems Inc., Philips Electronics NV, and some major VCD player manufacturers, and Super VCD, represented by Japan Victor Corporation (JVC), Panasonic Communications & Systems Company, Philips Electronics, and Sony Corporation for the second-generation standard of VCD players. CVD and Super VCD players are based on MPEG-2, as core compression technology, and the players maintain backward compatibility with MPEG-1 VCD players. The immediate advantage of these new standards is improved picture quality at only minor hardware and software cost.

In the first half of 1998, Dataquest did not see any volume sales in DVD players and noticed no substantial efforts from DVD makers to promote their products in the market. Although a few leading VCD manufacturers have already announced their DVD product line for quite a while, they had been low profile in promotion in fear that it was still not the right time, right place, and right price for DVD players to take off. The environment is still not favorable to DVD players' popularity. Manufacturers have been hesitant to invest heavily in DVD player production because of the technical expertise involved and the fact that few DVD titles are available. A DVD player is still two to three times more expensive than a VCD player, whose price falls between U.S.$80 and U.S.$200. Dataquest has predicted that the price crossover point for DVD players to dominate over VCD players is likely to occur at a factor of 1.5, given that DVD players can offer better picture quality and backward compatibility with VCD players. Dataquest expects that this price crossover point will only be possible when DVD technology has been adopted by the rest of the world as standard digital media and core chips and mechanisms become more affordable.

Many television manufacturers—such as Changhong Group, Konka Group Co. Ltd., and Skyworth Electronics Co. Ltd.—have turned their initial efforts to digital TV development, competing to be the first mover in the market, because the Ministry of Information Industry (MII) is planning to introduce the first digital broadcast station in China in 2000. Table 1 shows the current activities of some major television and VCD player manufacturers in response to the digital tide.

Table 1
Major Television and VCD Manufacturers' Activities in Digital Electronics

Company	Product	Timing
Changhong Group	Large-screen DTV	Allocated $157 million for R&D
Great Wall Electronics Group	Digital TV	Year-end
Haier Electrical Appliances Co. Ltd.	Digital TV	Aggressive R&D

Color television manufacturers are moving their focus from large-screen television to digitally processing television, or the so-called multimedia televisions (MMTV), which can be connected to a PC serving as a "large-screen" monitor. One example of this is Konka Group's new, large, 38-inch television that can function as a computer monitor with a range of associated features including a screen saver.

Many Chinese have mistakenly regarded MMTV with digital-processing ICs as digital television. Current China-made TV sets receive only analog broadcast signals that should be distinguished from digital TV, which can receive digital broadcast signals. The standards for digital TV (DTV) technologies, according to the Federal Communications Commission (FCC), should include MPEG-2 video compression, Dolby AC-3 audio compression, and a digital-transmission technology. The end result is that DTV can provide high-quality pictures at resolutions and digital multichannel surround sound of CD quality.

China plans to produce 35 million color televisions and export 10 million units by the end of this century, according to the MII. China is determined to put its efforts into designing and developing large-screen television, and then manufacturing key components and parts for self-sufficiency. While maintaining the dominance in the domestic color television market, it will develop digital TV to form an annual production capacity of 600,000 HDTV units in 2004.

 ©1998 Dataquest

Demand Forecast of Digital Consumer Market

This section provides a local consumption forecast for the China's consumer market. This is not intended to be a shipment forecast of these products by Chinese manufacturers. As China is still at an earlier stage for digital consumer electronics, the forecast is based on Dataquest's understanding of the market through continuous research with key equipment manufacturers.

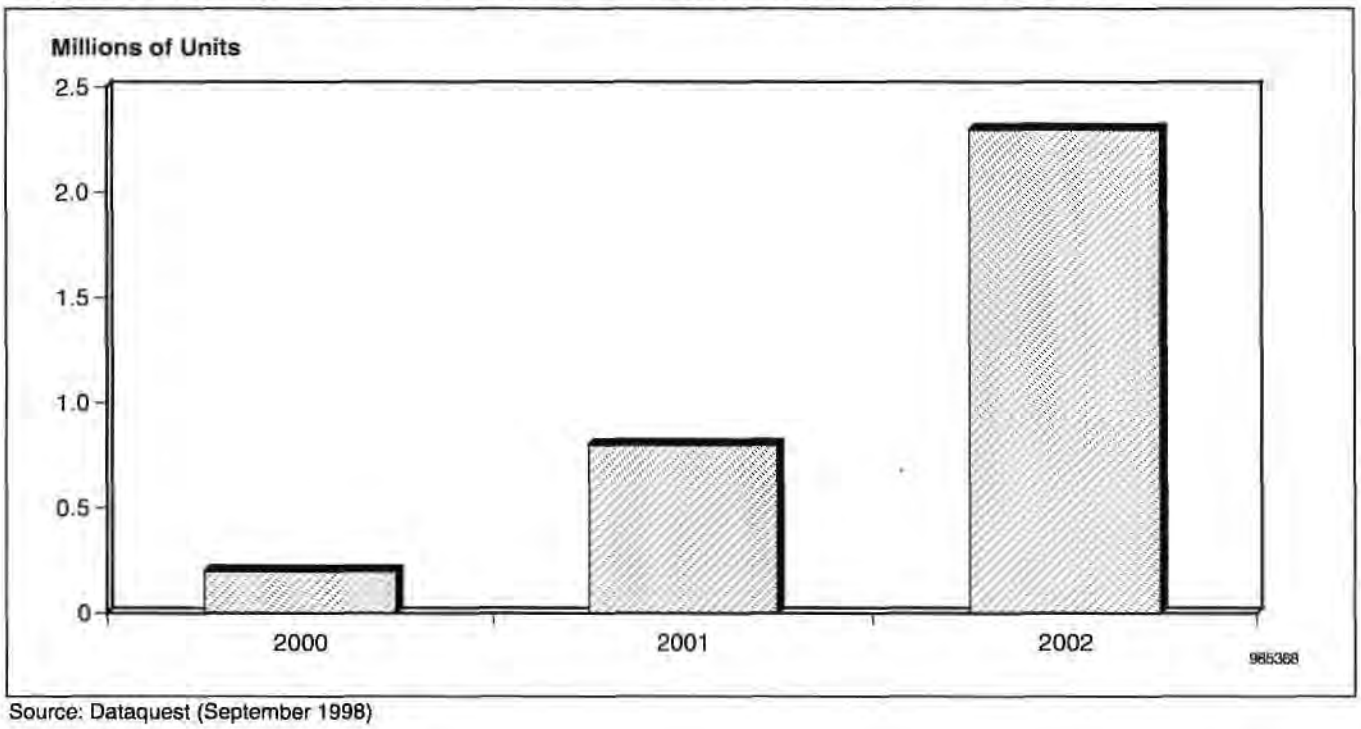
Digital TV

China is the largest analog color TV set production center in the world with an annual production capacity of more than 40 million units. Dataquest predicts that its color television production in 1998 will reach 26.7 million units.

Currently, China has a total installed base of 150 million to 160 million units of analog color television sets. The penetration rate per family has reached 93 percent in urban cities and 23 percent in rural areas. The Chinese government plans to start its first digital broadcast station in 2000. The digital broadcast standard will likely follow digital video broadcast (DVB) standards in Europe, but this is still under feasibility study.

Dataquest expects that the digital TV demand will begin after 2000, with the first-year consumption estimated at about 200,000 units. The growth will then accelerate as the Chinese people see the benefits of digital broadcasting, and as a result of digital equipment's downward price trends. Figure 2 illustrates the digital television set production forecast for China's consumer market from 2000 to 2002.

Figure 2
Digital Television Set Forecast for China's Consumer Market, 2000 to 2002



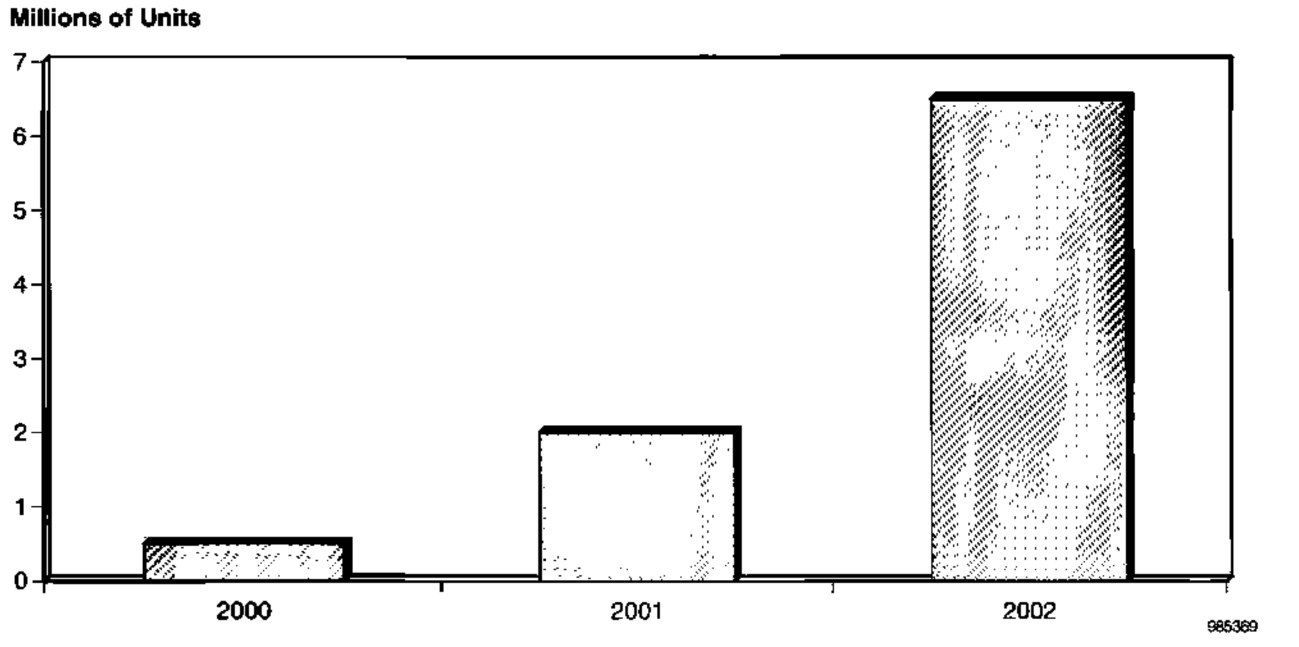
Source: Dataquest (September 1998)

 ©1998 Dataquest

Digital TV Set-Top Box

Digital TV set-top boxes will be used for the conversion of digital broadcast signals to analog signals. China's huge installed base of analog TV will provide a great potential market for digital TV set-top boxes. Figure 3 depicts the digital TV set-top box forecast for China's consumer market from 2000 to 2002.

Figure 3
Digital TV Set-Top Box Forecast for China's Consumer Market, 2000 to 2002



Source: Dataquest (September 1998)

The DTV growth will take off in 2001 and peak in 2004; possibly more digital broadcast stations will have been built. Compared to DTV sets, digital set-top boxes will be an economical solution for existing analog TV users to enjoy the digital-quality broadcast. However, for the long term, analog TV will be replaced by digital sets. The transformation from analog to fully digital broadcast will take about 15 years, compared to an estimated 10 years in the United States.

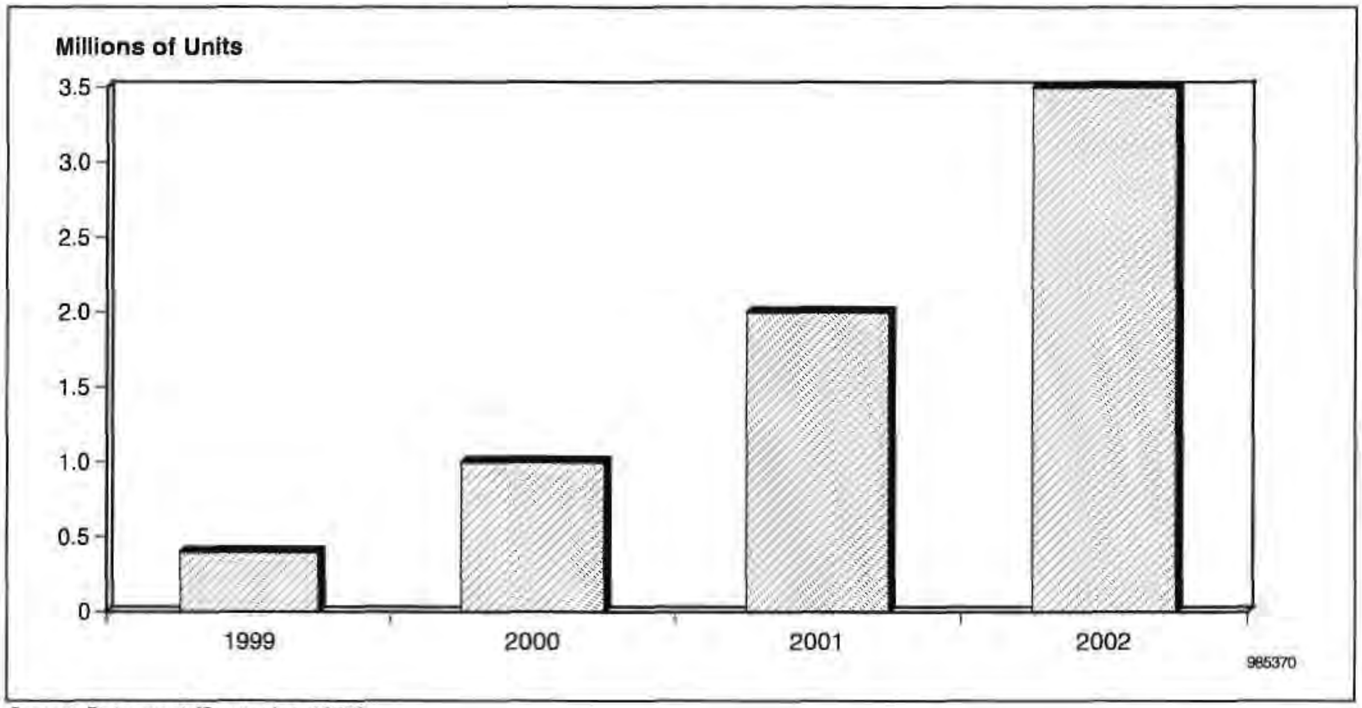
Digital Satellite Set-Top Box

Digital satellite set-top boxes may represent the fast-growing market for video and audio compression and processing devices based on primarily MPEG II compression technology. As the Chinese government, in general, does not allow individuals to receive satellite signals, the satellite set-top box market is very limited now. However, this limitation is gradually reduced in some cities in Jiangsu Province and Sichuan Province, and in Shanghai. The central government is also planning to reduce this restriction to encourage the country's digitalization. Dataquest expects this volume market to be established in the second half of 1999 and start to proliferate in 2000. Figure 4

 ©1998 Dataquest

shows a forecast of the digital satellite set-top boxes in the Chinese consumer market.

Figure 4
Digital Satellite Set-Top Box Forecast for China's Consumer Market, 1999 to 2002



Source: Dataquest (September 1998)

DVD Players

Consumers are still maintaining a wait-and-see attitude to anticipate a price drop. DVD players, being priced about three times more than VCD players, are still not affordable to most Chinese consumers. DVD players' mass adoption in the U.S. market is expected in 1999 and 2000, and its reception in China will likely take off after 2000, when the equipment price is at a more affordable level resulting from worldwide economies of scale. Figure 5 predicts the DVD player demand forecast in China's consumer market from 1998 to 2002.

VCD Players

The expected sales of VCD players will reach 12.8 million units in 1998. The introduction of CVD and Super VCD players (the final standard was issued by MII in early September), based on the MPEG-2 technology, will extend the product life of VCD players, giving consumers much better video quality at an affordable price. Dataquest expects that VCD players will still play a dominant role over DVD players in 1999. Figure 6 illustrates the VCD player forecast for China's consumer market from 1998 to 2002.

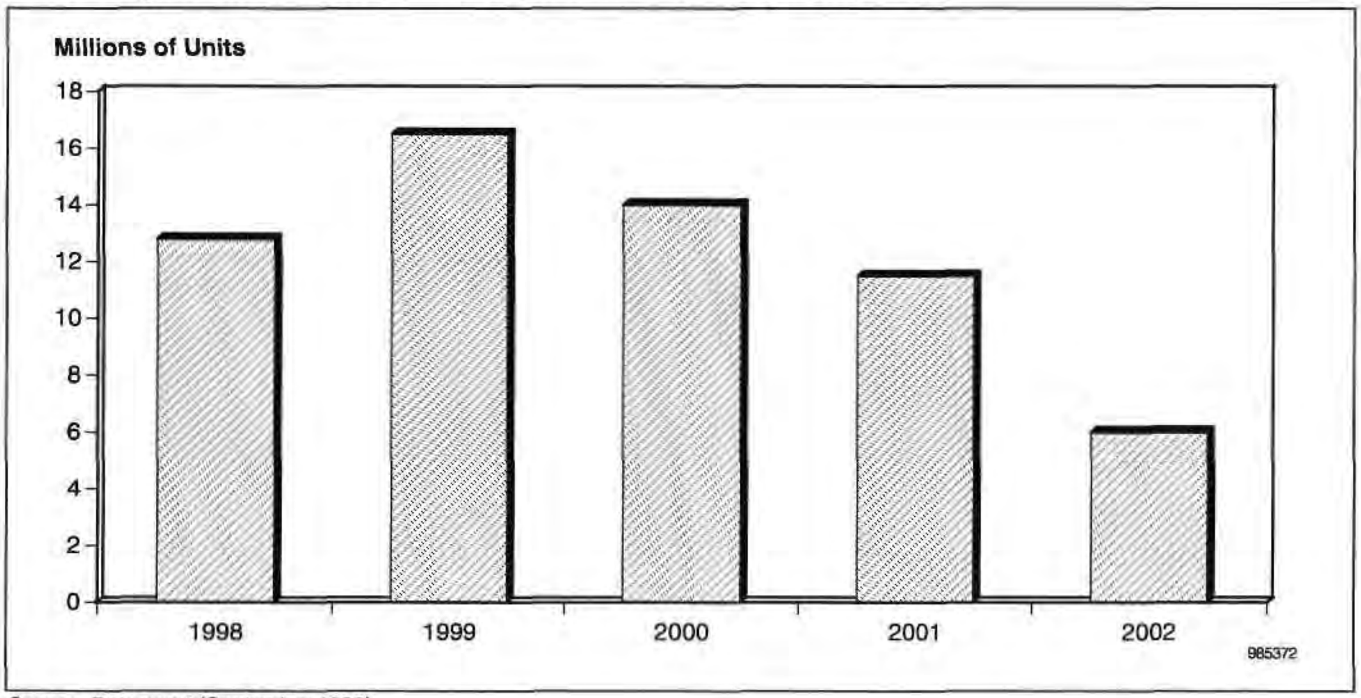
Source: Dataquest (September 1998)

Figure 6
VCD Player Forecast for China's Consumer Market, 1998 to 2002



Source: Dataquest (September 1998)

Digital Still Cameras

Digital still cameras are a niche market in China. The available market for digital cameras is expected to be limited to PC owners. Expected PC shipments in 1998 will reach 3.5 million units. Of these, less than 13 percent will enter the home market. With the majority of PC sales to the business sector, the demand for digital still cameras will be confined to business users. The volume sales of digital cameras will not be expected in the short term. Apart from the high price of digital cameras, more product education is also required for Chinese consumers because pictures taken by digital cameras demand processing by PC photo editors. Chinese consumers are still not ready for this product, and the penetration takes time and effort from the manufacturers.

Other Next-Generation Consumer Electronic Products

Other digital consumer electronics include digital camcorders based on digital videocassette (DVC) and DVD audio players. As these applications are just emerging, China is not expected to be the market innovator to absorb these products. Rather, Chinese consumers will wait and see the real benefits of these digital products before taking money out of their pocket.

Dataquest Perspective

Will digital consumer electronics be a future driver for the next boom in China? Probably, it is too early to draw a conclusion now. So far, Chinese consumers only taste the very inferior digital technology, as in the VCD players, which bring them just good enough personal movies with karaoke songs to sing with friends. Higher-quality DVD players at a higher price may not be the choice of the mass market now.

China is not yet a consumer with a digital appetite—at least, for the next few years. Most people are at still living at a low-income level. The median annual family income for urban dwellers is U.S.$1,200, and that for rural farmers is just about U.S.$720. According to a survey of household spending patterns from 3,700 families, the average portion of monthly income they would spend on entertainment is just better than 3.6 percent. Most of the people are still at the bottom, struggling to satisfy their basic needs. Hence, most consumers do not demand the high entertainment quality that digital electronics can deliver. Instead, they are looking for cheap entertainment that is affordable and the best value of their money. Complexity in digital electronic products will also be an obstacle to the acceptance. A digital TV equipped with Windows CE, for example, cannot become a mainstream product for the Chinese consumers who are generally less educated about PCs.

The Chinese government emphasizes the standards for China's own digital products, taking into consideration consumers' purchasing power. As in the case of new standards for VCD players, no matter what the standard is for CVD or Super VCD, both of them are serving the gap between low-quality VCD players and high-price DVD players. Few Chinese consumers can afford a complete set of home theater equipment to enjoy the superior picture quality with 5.1 multichannel surround sound provided by DVD players.

VCD player manufacturers probably understand China's situation well and, therefore, try to invent an intermediate solution to fill the demand gap. They want to provide a better value for consumers, while defending their falling revenue from the cutthroat price competition. In fact, the VCD, CVD/Super VCD, and DVD players can coexist in the market where they can serve different target segments. Like the PC market with different processor grades, VCD manufacturers can consider differentiating their products according to consumers' income level. The entry-level product can be VCD players that can tap the price-conscious, low-income group. The CVD or Super VCD players can be positioned to the "best-value" buyers, while DVD players can target the innovative buyers who look for performance and a status symbol. The three market segments can coexist until the DVD player price comes down to a level that is affordable for the mass market.

On the production side, China will be an attractive location for assembly. The proliferating of digital products in the United States, Europe, and Japan will drive China's production. China's electronics industry will be transformed by the worldwide digital tide and create a great business potential. Major digital manufacturers will begin manufacturing digital products in China, if they see a local demand there. With a 20 percent import tariff and a 17 percent value-added tax for foreign-made products, manufacturers cannot succeed in the market by staying outside.

Component makers will likely start to provide digital technology as a black box. A black-box assembly can ensure that Chinese manufacturers go to the digital playground with the lowest possible cost and quickest time. One example of this black box will be provided by a strategic alliance between Singapore's Thakral Corporation Ltd. and LSI Logic Corporation for providing DVD player manufacturing kits that offer a production-ready set of hardware, software, debugging, and testing tools. However, in the long term, Chinese companies will have to diversify from screwdriver plants. As they lag behind the hardware development technology, they will diversify into software development for digital products that adds value to their production capabilities.

Chinese consumer electronics makers have successfully moved their battlefield from cutthroat pricing competitions to diversification in functionality, features, and quality. The next battle stage will be set on digital technology, pushed forward by a handful of leading manufacturers worldwide. The successful digitalization of China's consumer electronics industry will need the votes from the Chinese consumers after all.

Market Analysis

China/Hong Kong Semiconductor User Ranking in 1997 and 1998

Abstract: *In this Perspective, Dataquest presents its ranking of the top 30 semiconductor consumers in China/Hong Kong in 1997 and forecasts usage in 1998 by vendor and application.*

By Daniel Heyler

Introduction

China/Hong Kong's semiconductor shipment revenue is concentrated among large manufacturers with about 25 percent of electronic equipment production, which accounted for more than 40 percent of semiconductor purchases. Recently, Dataquest has surveyed 60 major electronic equipment manufacturers (with one or multiple factories) in the computer, communications, and consumer electronic equipment segments to help anticipate future market trends vis-à-vis this sample group. This Perspective presents Dataquest's analysis, ranking, and forecasts of the top 31 electronic equipment manufacturers and the 20 largest semiconductor users by application from Dataquest's sample of 60 companies. (Dataquest's estimates include merchant market purchases, either from distributors or semiconductor vendors, as well as internally transferred products.)

FILE COPY:
MARIA VALENZUELA

Electronic Equipment Company Ranking

Table 1 lists the top 31 major electronic equipment producers in China/Hong Kong in 1997 and 1998, according to Dataquest. Seagate Technology Inc., which operates two major disk drive facilities in China, is the largest electronic equipment producer measured in factory revenue. After its rapid growth in 1997, Dataquest expects a modest 7.8 percent growth because of

Dataquest

Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

the eroding disk drive average selling price (ASP). China's Sichuan Changhong Electric Appliance Co. Ltd. ranked second but is also suffering from a consumer electronics slowdown in color televisions and video compact disc (VCD) players. We expect the company to expand by 7.3 percent in 1999. In the third place is China's Legend Group, which will repeat another year of rapid production expansion with a 70 percent growth in 1998. The company moved from No. 8 to No. 3 from 1997 to 1998. Its main products are PCs and motherboards that are sold mostly on China's domestic market.

China's second-largest color television manufacturer, behind Changhong, is Konka Electronics Group Company. The company has expanded by 41 percent in 1998 but is likely to face a slowdown in 1999 because of a saturation in color television and video compact disc players, its two main revenue sources. Samsung Electronics Company Ltd. ranked fifth because of its production of a variety of audio and video equipment in China. The company's main factory revenue comes from color televisions, VCRs, stereo equipment, and video compact disc players. Although Dataquest expects the company to outperform Changhong and Legend in 1998 with a 16 percent growth, it will probably contract by 2 percent in 1999 because no investments are being made in 1998 for new production in 1999. Revenue will decline because of falling ASPs in a surely saturated 1999 market.

Company-Level Semiconductor Consumption Ranking

Table 2 provides Dataquest's estimates and ranking of semiconductor usage by major equipment manufacturer. Company ranking varies considerably from the electronic equipment ranking. Legend moved from the second ranking to the first in 1998 to become China/Hong Kong's largest semiconductor consumer. Dataquest expects Legend to maintain its lead in 1999 and to expand purchases by 33 percent. Taiwan's PC Chips Manufacturing Ltd. is the largest motherboard manufacturer in China, but it exports all of its production. The company expanded production in 1998 by 21 percent but doesn't plan to add capacity for 1999. Dataquest forecasts the company's semiconductor consumption to increase by 7.7 percent, based on current production plans.

Source: Dataquest (August 1998)

The joint venture between China Great Wall Computer Group and IBM increased semiconductor usage from approximately $190 million to $278 million in 1998. Dataquest believes that about 15 percent of production is motherboards and the other 85 percent is functional PCs. In the fourth position is Taiwan First International Computer Inc. (FIC), which consumed $181 million in 1997 and is forecast to consume $217 million in 1998. This revenue growth of 20 percent stemmed from three product lines, motherboards, PCs, and computer monitors. Like PC Chips, FIC exports a high percentage of its products and, therefore, is likely to experience a slower growth in 1999 relative to Legend and Great Wall/IBM. Seagate ranked first in electronic equipment production (factory revenue) but fifth in semiconductor consumption both in 1997 and 1998. Semiconductor consumption is maintaining its high growth level because volumes at Seagate are not slowing, despite the sliding ASPs. Semiconductor consumption will increase by 28 percent in 1998 and is likely to slow slightly, growing by 20 percent in 1999.

 ©1998 Dataquest

Semiconductor Consumption Ranking by Application

Table 3 provides Dataquest's final ranking of semiconductor users in China/Hong Kong by end markets in 1998, which are aggregated in three major segments: communications, consumer, and data processing. The top five semiconductor consumers in China/Hong Kong are PC and/or motherboard manufacturers. Ranked No. 6 is Motorola Incorporated, the largest communications-related semiconductor user. Motorola manufactures cellular phones in Tianjin and Hangzhou and pagers in Tianjin and Shanghai. Following behind Motorola in semiconductor consumption are two consumer electronics companies, Changhong and Samsung. The remaining companies are a mix of consumer, computer, and communications equipment companies.

Communications Semiconductor Purchasers and Products

Table 4 lists major consumers, their respective communications products, and the estimated value of semiconductors used by those segments in 1998. Twenty-four companies consumed approximately $860 million in communication semiconductors in 1997, which is equal to 13 percent of the China/Hong Kong semiconductor market.

Five of the top 10 communications semiconductor consuming-companies are central office or PBX (CO/PBX) manufacturers. Four of the top 10 are cordless phone manufacturers. The top communications semiconductor consumer, Motorola (China) Electronics Company Ltd., is the largest of about six cellular phone handset manufacturers in China/Hong Kong. Motorola's $171 million in semiconductor consumption was derived from pagers ($67 million) and cellular phones ($104 million). The company will produce 1.5 million cellular phones in 1998 and is expected to increase output to 1.8 million in 1999.

Uniden Electronics Products' cordless phone business consumed about $92 million worth of semiconductors. Shanghai Bell Telephone Equipment Company is a Sino-American joint venture with Bell Atlantic Corporation manufacturing S1240 central office switches for sale in the Chinese market. The company purchased approximately $76.5 million in communications semiconductors in 1998, which was the third-largest amount in the communications sector. Dataquest expects Uniden, Vtech Communications Ltd., and TCL Communications Equipment Co. Ltd. to become the fastest-growing communications semiconductor users in 1998.

Consumer Semiconductor Purchasers and Products

The 24 companies listed in Table 5 consumed approximately $945 million in consumer semiconductors in 1998, or 14 percent of China/Hong Kong's $6.8 billion total semiconductor market. Eight of the top 10 users are VCD manufacturers, and five of those are color television (CTV) manufacturers. The three VCD manufacturers that are not color television makers are Guangzhou Idall Company Ltd., Shanghai Lejin Guangdian Electronics Co. Ltd., and Fujian Malata Company. Vtech was the first company to enter the set-top box market in late 1997 and shipped products to South Africa. The company plans to produce 300,000 units in 1998 using STMicroelectronics' standard application-specific integrated circuit (ASIC).

Data Processing Semiconductor Purchasers and Products

More than half of the semiconductor purchase revenue from Dataquest's preselected 63 companies is from data processing semiconductors. As shown in Table 6, this $2 billion will be shipped to 24 major manufacturers in 1998. But the concentration of purchases is among the top five PC and/or motherboard manufacturers (except for Seagate that only manufactures rigid disk drives), which accounted for approximately 70 percent of the revenue, or $1.3 billion. The three fastest-growing companies in 1998 are predicted to be Acer Computer International Inc., Langchao Electronic Group Co., and Xiamen Huaqiao Electronic Company (XiaHua). Most of Acer's production in China is located at the Suzhou Mingji Computer Company Ltd. in Jiangsu Province, which will double its monitor production from 600,000 units in 1997 to 1.3 million units in 1998, after several years of investment delays. By 1999, the company plans to produce 2 million monitors, 85 percent of which will be exported. Langchao Electronic Group Co., a small PC manufacturer shipping entirely to the Chinese domestic market, will expand production from 20,000 units in 1997 to 150,000 units in 1999.

Dataquest Perspective

The semiconductor consumption outlook for 1998 and 1999 appears increasingly pessimistic as the market shows signs of softening. Dataquest's fall survey concludes that 25 percent of the electronics industry will expand by 14 percent in 1999 after growing 22 percent in 1998. Because of the worsening market conditions, Dataquest believes that semiconductor purchases among these manufacturers will decline from between 20 percent and 25 percent growth in 1998 to between 15 percent and 20 percent in 1999. Currently, there are more growth inhibitors than stimulants in China/Hong Kong. The result is that exports are hurt by the Asian financial crisis, and local consumption of end equipment is impeded by slowing economic growth and overcapacity. Hence, most manufacturers are not expanding production capacity because of their concern about the worsening market conditions in late 1998 and most of 1999.

Market Analysis

Semiannual Equipment Vendor Survey: Manufacturers' Scale Growth Plans for 1998 and 1999

Abstract: *The recent increase in market uncertainty among semiconductor vendors warrants a closer, forward-looking survey of electronic equipment manufacturers. Dataquest has completed a survey of computer, consumer, and communications companies to measure their production plan changes. Dataquest uses this bottom-up research to gauge changes in semiconductor consumption resulting from increases or decreases in electronic equipment production plans. The fall data is compared with spring production plans for 1998 to understand downstream market threats or opportunities in the semiconductor market.*

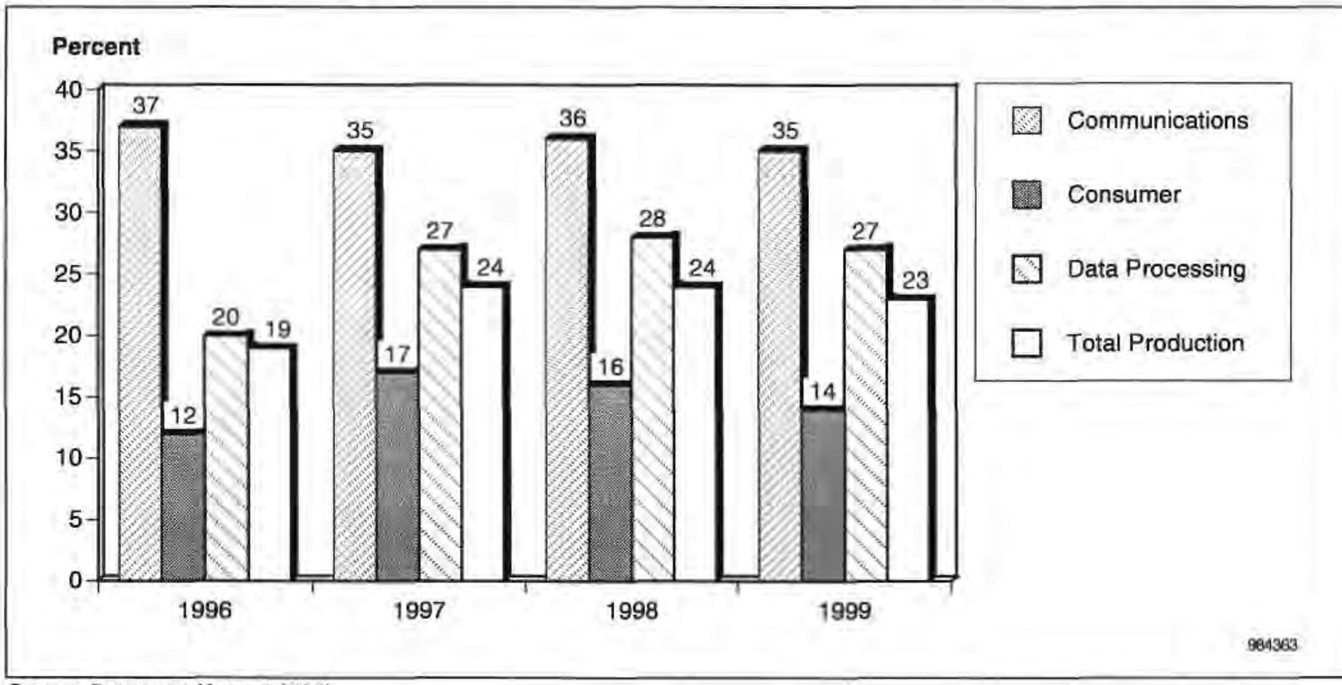
Introduction

The primary purpose of Dataquest's semiannual electronic manufacturer survey is to provide strategic planners with knowledge of major China/Hong Kong manufacturers' production plans and changes. Dataquest's aggregated sample production size is U.S.$12 billion, about 24 percent of all China/Hong Kong's electronic equipment production in 1998. This pool of companies represents 41 percent of China/Hong Kong's semiconductor consumption, thus providing a large enough sample size to gauge forthcoming consumption changes. Dataquest has chosen a stratified sampling by surveying high-volume manufacturers across two major dimensions: all major electronic equipment applications (communications, data processing, and consumer electronics) and ownership regions (Chinese, European, Japanese, Americas, Taiwanese, and Hong Kong companies). Dataquest's company-level tracking now accounts for 30 percent of China/Hong Kong's production, but for spring and fall 1998 comparison purposes, only the group for which Dataquest has two years' data is focused on.

Dataquest
Program: Semiconductors China
Product Code: SEMI-CH-DP-9808
Publication Date: August 17, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

As shown in Figure 1, communications companies represent the largest proportional sample group in 1998, with 36 percent of all communications factory revenue included. Data processing companies are the second-largest proportional group, representing 28 percent of data processing factory revenue. Because the consumer electronics sector is more dispersed (more companies with less revenue per company) than either the data processing or communications sector, this survey covers only 16 percent of consumer factory revenue in China/Hong Kong in 1998. On the whole, a statistically valid share of 24 percent of all electronics factory revenue is represented by Dataquest's selected sample group. The data, analysis, and conclusions presented are based entirely on the information provided by more than 100 manufacturers selected from the overall vendor population. As one would expect, there are new companies entering the Chinese market by investing in production, as well as companies that are exiting or changing products.

Figure 1
Surveyed China/Hong Kong Manufacturers' Share of Total Production, 1996 to 1999

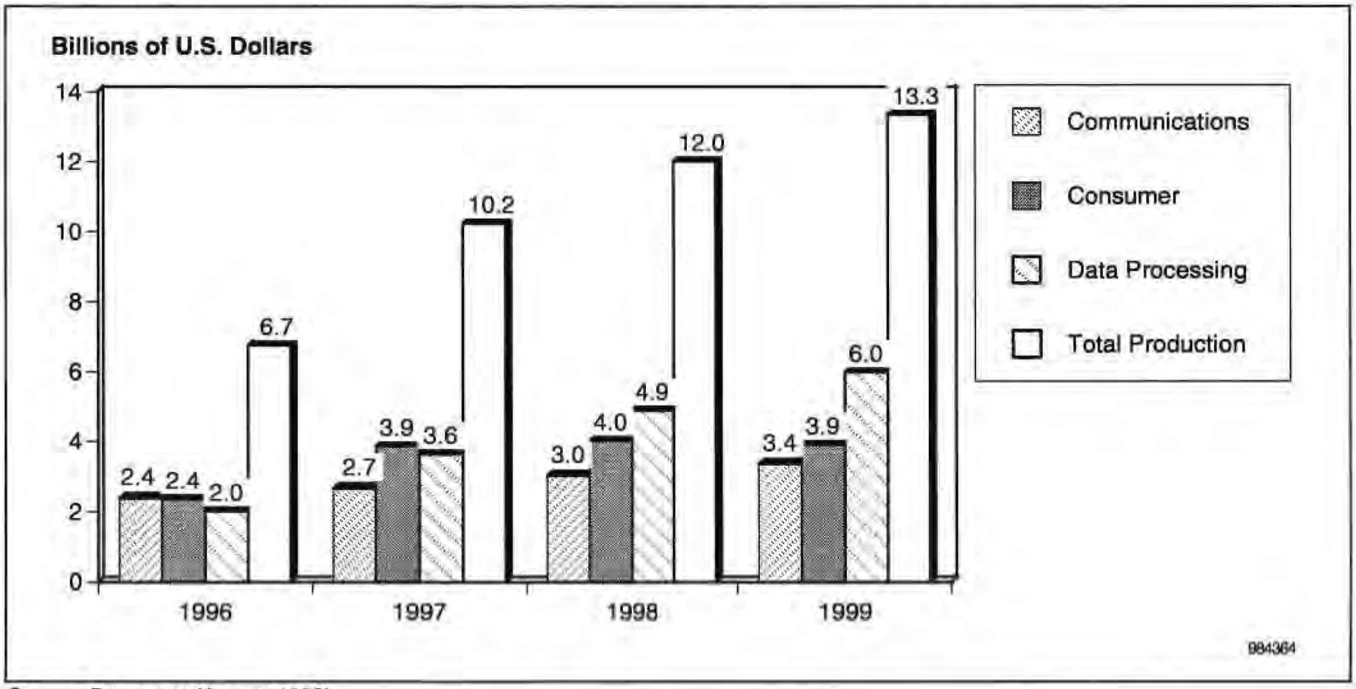


Source: Dataquest (August 1998)

Manufacturers Expect Slower Growth in 1998 than 1997

In dollar terms, the communications companies sampled (36 percent of this segment's production) expects to grow by 14 percent, from $2.7 billion in 1997 to $3.0 billion in 1998 (see Figure 2). Although 14 percent is modest growth for this market, it is actually a modest acceleration over 1997's 12 percent growth. The largest group in revenue terms, data processing expects a 36 percent growth from $3.6 billion in 1997 to $4.9 billion in 1998. This growth also represents a substantial slowdown from 1997's near doubling of revenue from $2 billion. The downside story is much more severe for consumer electronics companies, which expect a bleak 4.1 percent growth from $3.9 billion in 1997 to $4 billion in 1998. On the whole, in 1998, 24 percent of China/Hong Kong's electronics industry expects to expand by 17.4 percent on average, compared to 51.6 percent in 1997. Two key factors behind the high growth in 1997 were that new products were introduced into the Chinese market in 1997 (such as video compact discs [VCDs]) and that Chinese companies rapidly expanded production capacity in computer, communications, and consumer areas.

Figure 2
Surveyed China/Hong Kong Manufacturers' Total Production, 1996 to 1999



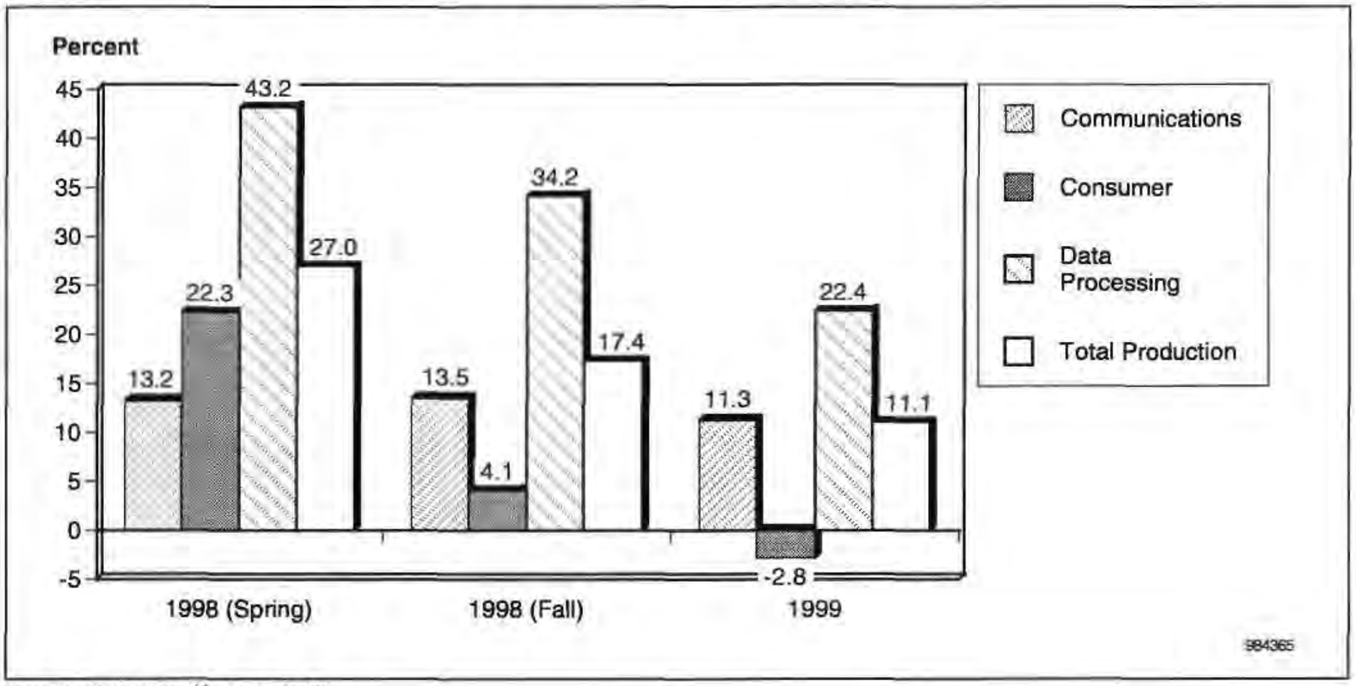
Source: Dataquest (August 1998)

Companies Prepare for a Prolonged Slowdown into 1999

As revealed in Figure 3, manufacturers' sentiments had substantially worsened since the beginning of 1998 as they slashed expansion plans from an average of 27 percent growth forecast in the spring to an average of 17 percent forecast in the fall. The most dramatic decline is seen among the consumer electronics companies that have reduced their 22 percent revenue growth forecast to 4 percent. Moreover, their expectations for 1999 worsen, with a projected revenue contraction of about 3 percent (this view is representative of 16 percent of the entire Chinese consumer electronics industry).

Dataquest believes the consumer electronics industry will probably experience a contraction in 1999 unless certain technology hurdles allow to be a second-generation VCD system is introduced in the Chinese market. Dataquest also believes that the impact of DVDs and set-top boxes won't be felt until late 1999 and 2000. Hence, the video segment of the consumer market has deteriorated, as a 22 percent projected factory revenue growth was slashed to 2 percent (see Table 1), and manufacturers expect another 5 percent decline in 1999.

Figure 3
A Comparison of Surveyed China/Hong Kong Manufacturers' 1998 Production Plans, Spring versus Fall, 1998 and 1999 (Growth Rate as Percentage)



Source: Dataquest (August 1998)

The data processing sector's sample group is the most bullish in its outlook for 1998, striving for 34 percent growth improvement over the 1997 level. This growth forecast is 9 percentage points less than the spring forecast of 43 percent, but it is a result of falling average selling prices rather than changes in unit production. A relatively strong demand in China's PC market is the main driver behind the data processing sector's higher level of growth, although this is only half of 1997's growth. However, most computer companies expect 1999 to be worse than 1998, and they look for an average production increase of 25 percent. Similarly, computer peripherals manufacturers (input/output segment), which expect a very strong 1998, are halving their 1999 growth plans from 71 percent in 1998 to 34 percent in 1999. Storage revenue has declined the most since Dataquest's last survey. In spring, Seagate Technology Inc. expected 34 percent growth in factory revenue, but lowered its forecast to 13 percent for fall.

 ©1998 Dataquest

The exception to the downward production changes observed across different segments of the electronics industry is the communications equipment manufacturers, which have maintained their 1998 production forecast of about 13 percent to 14 percent in the spring and fall. The mobile communications equipment segment has slowed in 1998 to a mere 7 percent revenue growth, and this growth is not expected to accelerate in 1999. A high growth in premises equipment, namely handsets, is still expected as surveyed companies maintain a 20 percent growth forecast for 1998 and 15 percent for 1999.

Semiconductor Purchases to Be Reduced by $650 Million

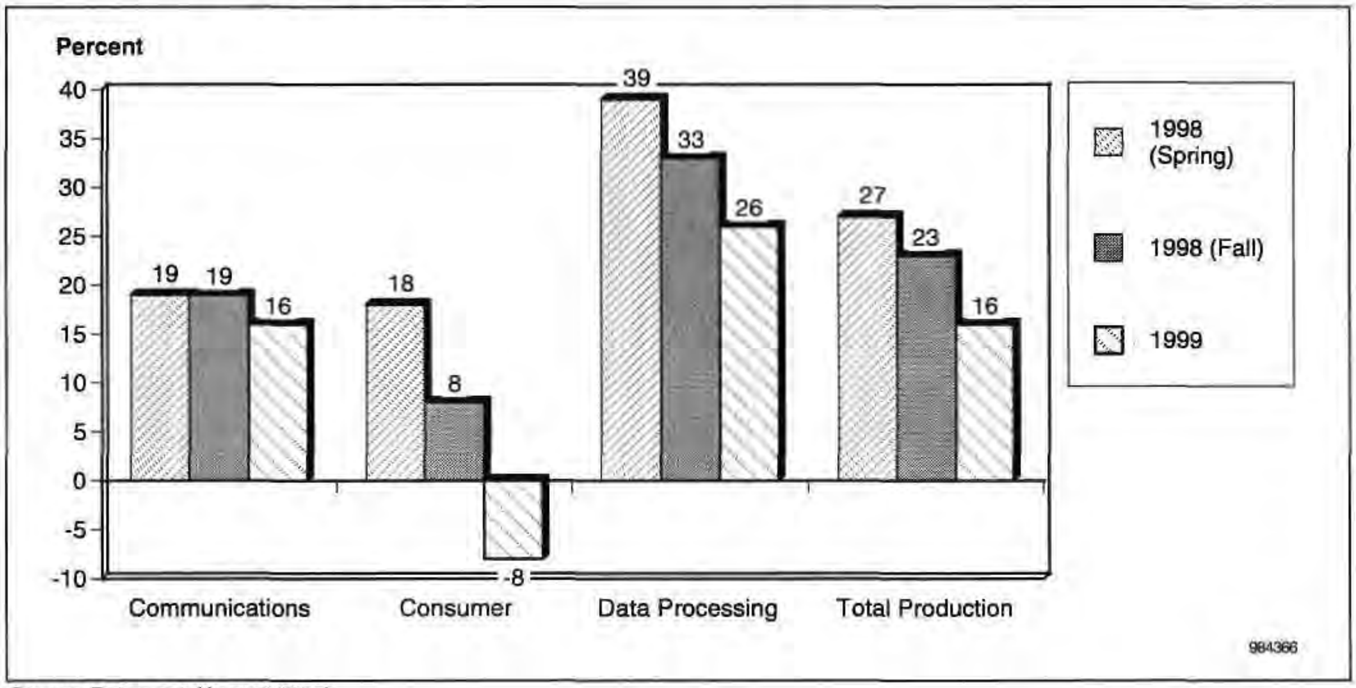
In terms of semiconductor consumption, all companies surveyed consume approximately $3.2 billion in semiconductors, or 41 percent of the total China/Hong Kong semiconductor market in 1998. Dataquest has increased its sample size in this fall survey, compared with the spring one, to account for a larger percentage of local Chinese manufacturers. Dataquest's rationale for covering more Chinese companies is that because multinationals are apt to consign product on global contracts, local companies represent a large opportunity because purchasing decisions are made entirely locally.

Figure 4 illustrates the impact of reduced growth on semiconductor consumption. The reduction in electronic equipment production plans from 27 percent to 17 percent growth in 1998 renders a reduction in semiconductor consumption of approximately $650 million. In growth terms, this is a decline from 27 percent (spring forecast) to 23 percent (fall forecast). In spring, Dataquest had forecast the total worldwide 1998 semiconductor market to grow by 19.6 percent to $7.8 billion, based on its sampling of manufacturers' production plans and pricing assumptions. But midyear reductions among Dataquest's sample population and falling prices will reduce growth by about half, to 9.7 percent, or $7.1 billion. Compounding the problem is the continued price erosion across various semiconductor segments, which will lessen growth further in 1998.

One exception to this midyear reduction trend is seen in the communications equipment companies, which have not needed to reduce their production plans. Factory revenue growth is still expected to expand by about 13 percent, while Dataquest estimates semiconductor consumption to sustain approximately 19 percent growth in the communications sector. As shown in Table 2, the primary driver for semiconductor consumption growth is in premises equipment, which is expanding by 23 percent. Mobile communications equipment production growth has dropped to 6 percent, as previously mentioned, attributed in part to declining pager demand. Dataquest expects mobile semiconductor consumption to maintain a 14 percent growth (no change from spring) among these companies in 1998, with 12 percent in 1999 (see Table 2).

 ©1998 Dataquest

Figure 4
Estimated 1998 and 1999 Semiconductor Consumption Growth Rates of Surveyed China/Hong Kong Companies



Source: Dataquest (August 1998)

Consumer electronics companies are suffering from a falling domestic demand, a slowdown in investments from credit-constrained Japanese manufacturers, and a sluggish export demand. Dataquest's surveyed companies (representing 20 percent of the overall consumer equipment production) slashed their growth plans from an average of 22.3 percent to 4.1 percent in 1998, and they expect a 2.8 percent contraction in 1999. Consumer-related semiconductor purchases are forecast to increase by 8.5 percent, rather than 18 percent as previously expected in spring. Manufacturers expect the situation to worsen in the latter half of 1998 and in 1999, which is forecast to contract by 8 percent. The main problem is that VCDs were the consumer market savior in 1997, but they faced saturation in 1998. However, there are next-generation VCDs under development that avoid the royalty constraints/costs on media content of DVDs and could surprise the market in 1999.

Data processing-related companies in Dataquest's survey expect to reduce production growth from 43 percent, as forecast in spring, to 34 percent in fall. The value of semiconductors purchased by data processing companies could reach $1.8 billion, but it is likely to fall short of vendors' expectations because of severe price erosion that was not previously anticipated. Most of the revenue reduction stems from cutbacks in rigid disk drive production. Data storage had been forecast to expand by 34 percent in the beginning of 1998, but manufacturers—namely Seagate—forecast an expansion of only 13 percent in output. Revenue reduction is attributed almost entirely to falling average selling prices rather than volume cuts.

Source: Dataquest (August 1998)

Therefore, Dataquest has not changed its storage semiconductor consumption forecasts from a 28 percent growth in the spring. Our outlook for 1999 calls for storage semiconductor purchases to slow to a 20 percent growth. The computer segment is also experiencing softer average selling prices in end equipment, especially among PC manufacturers that have reduced the growth projection from 41 percent to 37 percent. Computer-related semiconductor purchases are likely to grow by 32 percent rather than 39 percent, which was forecast in spring. As mentioned, computer peripherals' production continues to be the fastest-growing segment, as manufacturers stick to their targets of more than 70 percent growth, down only slightly from their previous target of 78 percent. Although peripherals' semiconductors consumption should maintain at about 77 percent growth, it is still a small segment.

Sentiment Varies by Origin of Vendor: Chinese and Taiwanese Companies Expand Production, While Americas Companies Scale Back Plans

Table 3 provides an electronic equipment production history and forecast of surveyed companies, grouped by their origin of ownership. Chinese and Hong Kong companies represent 37 percent of the sample group's production revenue, while multinational companies manufacturing within China/Hong Kong constituted 63 percent. The sum of Chinese, Hong Kong, and Taiwanese companies, or "Greater China companies," represent 50 percent of Dataquest's sample group. There is a high proportion of multinational companies included in this survey because high-volume products that are rich in semiconductor content are produced mainly by foreign companies.

Americas companies surveyed have scaled back production expansion plans made in the beginning of 1998. As shown in Table 3, Americas manufacturers have planned for 21 percent factory revenue increase but later reduced their forecasts dramatically to 0.7 percent. As previously mentioned, disk drive downsizing had the largest impact on the bottom-line growth.

Consistent with Dataquest's consumer electronics sector's scenario, we observed that Japanese companies that modified plans to expand output 23 percent were expecting only 15 percent at best. European companies, buoyed by China's communications market growth, altered production plans the least with only 1 percent change, from 27 percent to 26 percent growth expected for 1998. Taiwanese companies are, by far, the most aggressive of the group and show some signs of slowdown—but not significantly. They had planned for a 48 percent output increase in their spring forecast but now expect 40 percent for fall.

Source: Dataquest (August 1998)

Table 4 quantifies the resulting changes in semiconductor consumption by Dataquest's surveyed companies' origin of ownership. Chinese companies remain the fastest-growing segment of the semiconductor market with growth expected to sustain a 32 percent level (no change from spring estimates). Similarly, Taiwanese companies will likely consume 31 percent more semiconductors in 1998 than in 1997. Americas companies' semiconductor consumption is likely to contract by 2.8 percent in 1998 and show modest growth of about 13 percent in 1999. Japanese companies' 15 percent equipment growth may sustain a 22 percent growth in semiconductor purchases. In general, consumer products have suffered a market slowdown but have experienced less price erosion than computer products. Dataquest expects the European group's semiconductor consumption in 1998 to increase by 26 percent, compared with spring projections of 19 percent.

Dataquest Perspective

The growth reduction in electronic equipment production plans from 27 percent to 17 percent in 1998 renders a reduction in semiconductor consumption of approximately $650 million. This is a growth decline from 27 percent (spring forecast) to 23 percent (fall forecast). In spring, Dataquest had forecast the total 1998 semiconductor market to grow 19.6 percent to reach $7.8 billion—basing on a sampling analysis of manufacturers' production plans. However, a midyear slowdown in domestic shipments and exports among Dataquest's sample companies, in addition to falling semiconductor prices, will result in reduced semiconductor consumption growth from 19.6 percent to 9.7 percent, or $7.1 billion instead of $7.8 billion. Compounding the problem is continued price erosion in the second half of 1998 across various semiconductor segments, which will further lessen growth.

©1998 Dataquest

The following key findings and changes in the industry were observed from analyzing data on Americas, Chinese, European, Hong Kong, Japanese, Korean, and Taiwanese companies:

- Manufacturers' outlook has worsened substantially since spring, and Dataquest expects the declining trend to continue, thereby bringing the semiconductor market's growth rate to a single digit in 1998.
- The data processing segment remains healthy, albeit not as robust as in 1997.
- Consumer segments, especially video, have softened substantially, with more contractions expected in 1999.
- Communications markets have showed little variance between 1997 and 1998; these markets appear to be least affected by macroeconomic factors.
- Americas and Korean companies have scaled back expansion plans substantially, while Chinese and Taiwanese are sustaining high-growth projects despite the Asian economic slowdown.

Market Analysis

China/Hong Kong Market Share Survey Results: A Time of Dazzling Gains and Dismal Losses

Abstract: *Dataquest has released the final semiconductor shipment and market share estimates for China/Hong Kong. This Perspective summarizes Dataquest's survey results, as well as data tables with revenue, growth rates, and ranking for the top 10 suppliers in 1997 in memory, microcomponent, logic, analog, discrete, optoelectronic, and bipolar digital devices. Dataquest's Semiconductors China clients should refer to the complete Market Statistics database for further company or product information.*
By Daniel Heyler

Introduction

Dataquest provides market share statistics to clients twice a year. Worldwide companies' shipments to Asia/Pacific are released in April, and the China/Hong Kong (referred to in this Perspective as "China") statistics for the top 32 Asia/Pacific suppliers are published in July.

Company estimates are generated from a worldwide effort by Dataquest analysts located in Asia/Pacific, Europe, Japan, and North America. After finalizing each corporation's Asia/Pacific shipments, the Dataquest market share team conducts primary and secondary research to estimate country-level shipments for the largest vendors. Direct surveys of the top 32 semiconductor vendors are conducted with both the country or regional manager or the responsible representative based in the headquarters of the companies surveyed. Therefore, every company has an opportunity to review, revise, or comment on Dataquest's estimates. In rare cases, both headquarters and country/regional offices are surveyed to improve accuracy. Companies with large captive semiconductor markets are certainly surveyed at headquarters to ensure that all revenue is counted.

(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Dataquest's reporting of company shipments combines the revenue from China and Hong Kong into one China number because most vendors report internally as such. Whether a multinational company transfers semiconductors to subsidiaries in China or ships semiconductors directly to distributors or end users, Dataquest counts all revenue as "shipments" to China. Dataquest's definition for the China survey is consistent with worldwide market share definitions and methodology.

Dataquest's market share data provides a useful measurement for companies to benchmark their performance against their competitors. However, market share alone is not the only important benchmark of success because cash flow and profits enable a company to reinvest in its future technologies and markets. In a market downturn, maintaining market share for many companies can become religion, which usually hurts more than helps a company's competitiveness.

Market Overview: Nonmemory Recovery Results in Revenue Growth

As expected, the China overall market recovered in 1997. As shown in Table 1, the range of product growth among major product segments was dramatic. At the negative extreme, shipments of MOS memories declined 16 percent. At the positive-growth end, the MOS logic market expanded 38 percent, as well as microcomponents, which expanded by 36 percent. A healthy growth in commodity analog and discrete parts further contributed to the market rebound. The overall result was a 19.5 percent growth in total semiconductor consumption, compared with a meager 0.8 percent in 1996. As analyzed in latter sections, the dynamic and fragmented nature of China's market has resulted in wide disparity in company performances, even within the market's growth segments.

Performance variance within a declining memory market was even more severe. Japanese companies' memory shipments to China, for instance, declined by 54 percent, while U.S. companies increased 7.7 percent. The DRAM market went from bad to worse as the worldwide oversupply flooded even China's elaborate distribution channels. Even the emerging flash memories increased by only 6 percent to $92 million (in U.S. dollars).

Nevertheless, China's diverse semiconductor market was able buffer the memory slump in its third year of contraction. In addition to microcomponents and MOS logic, analog and discrete enjoyed strong growth and price stability. MOS logic had contracted 9 percent in 1996, and analog and discrete grew less than 10 percent. However, both bounced back in 1997: Analog and discrete grew 29 percent and 22 percent, respectively. Microcomponents remain the pillar of growth in China. Even with microprocessor (MPU) revenue slowing to 31.2 percent from a 50 percent growth in 1996, the overall microcomponent segment was still able to expand by 36 percent from 17 percent in 1996, because of strong microperipheral (MPR), microcontroller (MCU), and digital signal processor (DSP) demand.

Top 30 Total Semiconductor Suppliers: Newcomers Take Share

Dataquest's company-level market share statistics and demand analysis conclude that the total semiconductor market reached $6.8 billion in 1997. Excluding Rohm Company Ltd. and SANYO Semiconductor Corporation, the other eight suppliers in China's top 10 list also made the top 10 list in Asia/Pacific. China's top 10 suppliers lost share from 59 percent in 1996 to 57 percent in 1997. Similarly, as shown in Table 2, the top 32 companies in Asia/Pacific controlled 87 percent of the China semiconductor market in 1997, compared to 89 percent in 1996.

In Asia/Pacific, however, the top 32 companies gained market share, from 83 percent in 1996 to 83.2 percent in 1997. In China, established vendors had greater difficulty maintaining market share than other markets in the region.

 ©1998 Dataquest

The top 32 companies expanded by 16.4 percent, while the overall semiconductor market grew a few percentage points faster (19.5 percent). In previous years, these companies were controlling more and more of the market, but the following two factors explain this reversal in trend:

- Major DRAM suppliers (all within the top 32) lost significant overall market share because of revenue erosion.
- Other microcomponents and MOS logic vendors entered the Chinese market either to develop entirely new segments such as in video compact disks (VCDs), or to seek new demand for mature products such as microcontrollers (in the case of Samsung Semiconductor Inc.) or microprocessors (in the case of Advanced Micro Devices Inc.).

Table 2 lists the top 30 semiconductor suppliers in China/Hong Kong.

Another factor in the memory market was the increased market share of new players in China's varied emerging markets and plethora of channel opportunities. For example, several Taiwanese memory suppliers, facing excess capacity at home, increased their efforts in China's various PC sectors. Price-sensitive white-box PC markets throughout China have become well stocked in Taiwan-made memories, including DRAMs. White-box PCs represent about one-fourth of PCs manufactured in China. As explained in later sections, the DRAM market was particularly difficult for the market leaders, which saw market share and margins dissolve, even in China's booming PC market. As a result, the top 17 DRAM suppliers' revenue declined 23 percent, while the overall market declined 17 percent. Taiwan's Vanguard International Semiconductor Corp. had almost no sales in 1996 in China, but then was able to achieve a ranking of No. 27 with $50 million sales in 1997. For Japanese companies, DRAM revenue declined 54 percent, led by a 70 percent decline by Toshiba Corporation and Hitachi Ltd., both of which seemed to have exited the market.

Another important market trend was the entry of new players in China's various sectors. The market saw efforts from various vendors to seek growth opportunities in China. Some companies have ignored China, waiting for the "right time," but chose the 1997 downturn to seek necessary growth opportunities in China's robust electronics industry. Others have introduced new products into totally new segments and done extremely well. An example of new players with an old product are AMD and National Semiconductor Corporation (formerly Cyrix Corporation). AMD doubled its sales revenue and moved to No. 16 from No. 22. National Semiconductor grew from less than $1 million to $15 million in processor sales. S3 Incorporated was a new company creating an entirely new market. S3 was not a player prior to 1997, but appeared out of nowhere to penetrate the core logic chipset market for VCD players. The company ranked No. 2 in 1997 in microperipheral sales and immediately moved to rank No. 26 in overall sales.

Intel—Narrowed Focus, Increased Competition

Despite increased competition and loss of market share, Intel Corporation remained the largest semiconductor supplier to China in 1997. Demand for non-Intel microprocessors increased because of AMD's aggressive marketing and pricing efforts. Intel's revenue growth dropped sharply to 22.6 percent in 1997, compared to 48.8 percent in 1996. Intel's share of Asia/Pacific sales to China remained at approximately 17 percent. Intel has adopted a mass-marketing strategy with large advertising campaigns; these tactics are hard for any company other than Intel to match. However, the fragmented nature of the market enables a company such as AMD to gain market share through tactical wins in the marketplace. AMD doubled its revenue in China to $121 million, moving up six ranks to No. 16.

Toshiba—Broad Focus, Increased Penetration

Although Toshiba exited the DRAM market, it experienced strong growth by broadened penetration into communications, monitors, and, even home appliances. Exiting the DRAM market represented a critical strategic decision, which quickly paid off for Toshiba. Its overall growth of 26.4 percent exceeds Intel's 22.6 percent growth, and if the company has another good year, it could regain its No. 1 ranking after losing it in 1996. Toshiba was able to diversify end-market application markets. For example, its expansion in cordless phone (CT0 and 900-MHz) markets boosted the bottom line. Toshiba's flexibility further paid off as it was able to provide design support and kit solutions (MCUs and combo chips) to Chinese manufacturers. This had been a key to success in China's television markets in the 1980s, and the company applied this concept to the communications market.

Motorola—Medium Focus, Declining Penetration

Toshiba was able to exit losing markets and expand market penetration from its mainstream products. In contrast, Motorola Incorporated's growth slowed, while its own product market accelerated. There was no changing its product focus or broadened end markets, hence its sales penetration declined. In 1997, while all of the major markets that Motorola participated in recovered, Motorola's shipments expanded at half of these markets' 1996 growth rates.

Motorola's semiconductor shipments, including transfer shipments, grew 10.7 percent in 1997, about half of the overall market rate. In addition to missing merchant market opportunities, Motorola's semiconductor division has been unable to capitalize on its strong communications equipment sales since the pager market slumped in 1996. In short, the company lost market share in almost every major sector in which it competes. Its 1997 worldwide restructuring process evidently impeded the company's ability to compete. The lost business and opportunity costs will take years to recover, if at all. China was once the cornerstone of Motorola's Asian strategy, occupying about 26 percent of Asia/Pacific semiconductor sales. This share was on a declining slope, with only 24 percent share in 1997. When considering the fact that China increased its share of regional consumption from 19 percent to 21 percent in 1997, this decline in relative revenue was actually 5 percentage points.

Samsung—Broadened Focus, Increasing Penetration

In the worst memory downturn of China's semiconductor history, Samsung still emerged from the dust with a 34 percent revenue growth and improved market share ranking from No. 7 to No. 4. China was at the center of Samsung's Asia/Pacific sales growth. Samsung's regional sales expanded only 5 percent in 1997, while its sales to China expanded seven-times faster. Samsung's decision to diversify into MCUs seemed risky given the market decline in 1996. However, the company was able to expand its regional sales from $78 million to $205 million attributed largely to its success in China, which accounted for more than one-third of microcontroller sales in the region. Samsung moved from No. 12 to No. 1, replacing Motorola as the No. 1 MCU supplier in China, expanding sales from $16 million to $76 million, an impressive 375 percent growth rate. In addition to product diversification, Samsung was able to maintain or increase its market position in other key markets in which it participates, such as analog, discrete, and memories. MOS logic was the only area in which the company lost market share.

Table 3 ranks the top 30 worldwide vendors of integrated circuits in China/Hong Kong (total semiconductors minus discrete and optoelectronic devices).

Memories: Oversupply Led to Overcrowded Channels

Table 4 lists the top 10 MOS memory vendors in China during 1997. In no other segment do company performances vary as widely among the top 10 suppliers. The market leader Atmel Corporation moved from No. 11 to No. 5 on a 76 percent sales growth. At the other extreme, Hitachi's sales dropped 67 percent. Toshiba was not much better with a 61 percent revenue decline. NEC Corporation also faced a 35 percent revenue decline.

Taiwanese vendor Vanguard was able to increase DRAM revenue to $50 million after negligible sales in 1996. China proved to be a prime market for cheap 16Mb DRAMs, as well as a place to dump outdated 4Mb parts. Prices for most memory parts in China's major computer markets reached price points comparable with Taipei. Pressure from the U.S. International Trade Commission (ITC) on Taiwan's memory industry resulted in manufacturers and traders focusing more on China to shed excess inventories. Consequently, the DRAM market declined 17 percent and SRAMs slipped 15 percent. The capacity and marketing might of Samsung were too much for most SRAM vendors to match. Samsung was able to double its revenue in a declining market. Sony Corporation and Sharp Electronics Corporation were the only two other companies able to grow revenue, and they only did so by $2 million, while Samsung dramatically extended its SRAM market share to 23.8 percent.

Microcomponents: Non-Intel Players Take 14 Percent MPU Share, While MCUs, MPRs, and DSPs Accelerate

Table 5 lists the top 10 microcomponent vendors in China in 1997. Intel dominates this sector, but if one deducts Intel's $599 million in MPU sales, then only $67 million remains, which is split equally between microcontrollers and microperipherals. Intel's 22.9 percent growth is attributed to a 25.6 percent growth in microprocessors rather than to MCUs and MPRs, which were relatively flat products.

NA = Not available
Source: Dataquest (June 1998)

The overall microprocessor market expanded 31.2 percent, and Intel lost market share, with non-Intel parts expanding 75 percent. Non-Intel x86 MPU vendors, including AMD, National Semiconductor, STMicroelectronics NV (formerly SGS-Thomson Microelectronics NV), and IBM, accounted for 14.1 percent of x86 MPU shipments to China in 1997. However, this 14.1 percent share has a significant impact on Intel's pricing and product strategy in China. In 1998, tightened budgets in business and home resulted in price-conscious buying behavior that has benefited the non-Intel camp. Additional challenges lie ahead for Intel, as the market move to the sub-$1,000 PC diminishes brand association, which is likely to benefit non-Intel vendors. At the same time, diminished margins make retail-level marketing all the more expensive and difficult to rationalize, but, perhaps, all the more necessary.

The microperipheral market was bolstered by VCDs, communications, and continued strength in PC production. The market accelerated from a 22.7 percent growth to a 40 percent growth in 1997. S3 moved from insignificant sales to 15 percent market share in one year, ranking No. 2 behind United Microelectronics Corporation (UMC) in 1997. UMC remained as the dominant microperipherals vendor because of its dominance in the PC motherboard segment. Only a few major PC vendors rely on Intel's core logic chipsets and their combined revenue is one-third of UMC's.

The MCU market also accelerated recovery with 27.7 percent growth after experiencing a decline in 1996. The primary growth areas were communications and home appliance markets. As previously discussed, Samsung made an aggressive and successful splash in this market. Because of the diversity of applications, the success stories vary. Companies in the communications sector generally outperformed those in consumer electronics. Toshiba made strong gains in the home appliance sector, but low average selling prices (ASPs) resulted in below-average market performance.

The fourth segment in microcomponents is DSPs, which doubled from $81 million to $162 million in 1997. Lucent Technologies usurped the No. 1 position from Texas Instruments Inc. by doubling its sales, while TI experience a flat growth. Philips Electronics NV's market presence was felt as its sales went from zero to $8 million in 1997, securing a top five position. Toshiba promoted its DSPs in the communications markets and expanded revenue nearly sixfold to approximately $40 million.

MOS Logic: ASICs Decline but Standard Logic Recovers

Table 6 lists the top MOS digital logic vendors in China during 1997. The overall 37.8 percent market growth from a negative 9.3 was a sharp turnaround in the MOS logic market. However, the range of vendor performance was more dramatic than most years. The main reason for these variances is the volatility in various end markets. Although ASIC consumption declined 8.6 percent in 1997, standard logic kept pace with the broad-based growth within the communications, consumer, and computer sectors in China. Lucent, NEC, Motorola, and Fujitsu Ltd. are exceptions among the top 10, which experienced positive revenue growth in ASICs. The rest, Samsung, TI, Matsushita Electric Industrial Company Ltd., IBM,

 ©1998 Dataquest

Toshiba, and LG Semicon Co. Ltd. suffered declining sales. The MOS logic market was helped by strength in standard logic and other MOS logic, which grew 103 percent and 50 percent, respectively.

Analog Market: Major Vendors Gain Share

Table 7 lists the top 10 worldwide analog vendors in China in 1997. The total analog market in China expanded 28.6 percent in 1997 because of the surprisingly strong growth in China's communications markets. The large, dispersed monolithic-analog IC market represents a formidable 21 percent of China's total semiconductor consumption. The 32 companies surveyed increased sales by 32.7 percent, and therefore, gained market share. TI jumped from No. 8 to No. 2 because of its 149 percent revenue growth. Market leader Toshiba held first place with above-average growth of 31.6 percent. The consumer analog market also performed well in 1997 and vendors—such as SANYO and Rohm—expanded their market share.

Discrete Market: A Bright Spot for Japanese Companies

The discrete market represents 12.7 percent of total semiconductor consumption in China but continues to undergo steady growth year after year. In 1997, the market expanded 22.1 percent. The surveyed companies increased shipments to China by 25.8 percent and gained market share over less-competitive domestic manufacturers. This segment's consumer applications track relatively closely with discrete, as seen with the vendor shipment performance. Toshiba, SANYO, Rohm, and Philips are able to leverage their consumer market presence to ship analog and discrete products to the same customers. Among the top 10 discrete suppliers to China, only NEC, Korean Electronic Company, and Hitachi were not among the top 10 analog suppliers. Table 8 lists the top 10 monolithic analog vendors in China/Hong Kong in 1997.

Table 7
Top 10 Worldwide Vendor Revenue from Shipments of Total Analog to China/Hong Kong in 1997 (Millions of U.S. Dollars)

1997 Rank	1996 Rank	Company	1996 Revenue	1997 Revenue	Percent Change (%) 1996 to 1997	Market Share (%) 1997

Dataquest Perspective

What factors led to vendors' dazzling gains or dismal losses in China? It is clear that it is not enough to market the right products for a growing market. A company with a unique product can reap a windfall, such as S3 in 1997's VCD boom. But such successes are short-lived—unless there is an exceptional operational strategy in place—because competitors can quickly replicate or leapfrog lucrative technology. The best example of competition eroding once-monopolized markets is China's PC industry. PC production in unit terms expanded 83 percent in 1997, but Intel's revenue grew only 25 percent with a market share loss. Similarly, the DRAM market shrank 16 percent, and almost all suppliers suffered revenue declines.

On the other end of the spectrum, there are companies without technology focus or product innovations, which are still able to gain market share because of their more effective and efficient operations. Toshiba and Samsung, without any revolutionary products, were able to gain market share effectively in very competitive, mature markets. Samsung was able to grow 34 percent and entered the commodity microcontroller business with a huge success. Toshiba provided better service and support to manufacturers in China, which resulted in revenue gains for the same products.

Source: Dataquest (June 1998)

In the technology-driven semiconductor market where fixed costs dwarf variable operational costs, it is too easy for companies to lose sight of their after-manufacturing processes, which must be examined continually in light of the (ever-changing) strategic position of the company. The strategic position starts with understanding why a customer buys a product and then focuses people and processes in the company on meeting that need, whether technology or service driven. It sounds easy, but it is these gaps in customer awareness and in vendors' fit between their market strategy and operations where the most opportunities are lost.

Market Analysis

Video CD Player Craze in China

Abstract: *China is a huge market for electronic equipment. It has become the largest consumption and production base for video compact disc (VCD) players. China started its first VCD player production line in 1994, with an output of 20,000 units. Within three years, it has built up a 50 million production capacity, with an output reaching 14.7 million units in 1997. This astonishing growth has attracted a great number of local and foreign players that want to enter this market. Dataquest sees 1998 as a growing year for VCD players, with growth forecast at 26 percent over the 1997 level.*

By Kelvin Fu

Explosive Growth of Video Compact Disc (VCD) Players

FILE COPY:
MARIA VALENZUELA

Dataquest expects the video compact disc (VCD) player production in China to reach 18.5 million units in 1998, sustaining a 26 percent growth. This growth is moderate, compared with 1997's nearly 155 percent growth over 1996.

In 1996 and 1997, the VCD player market grew explosively in China with 5.8 and 14.7 million units, respectively, making it the world's No. 1 production and consumption base for such products.

VCD players were first introduced into China in 1993. China started VCD player production in 1994 when the output was only 20,000 units. In 1995, the output expanded at a factor of 10, reaching 220,000 units. Since then, the VCD has gained a wide acceptance among Chinese consumers; more suppliers have joined the production craze. Driven by the strong domestic consumption, the total VCD player output reached 5.8 million units in 1996. This dramatic increase did not end the story. In 1997, the demand was fueled by the suppliers' promotional efforts, and the output finally reached 14.7 million.

Dataquest

Program: Semiconductors China
Product Code: SEMI-CH-DP-9807
Publication Date: June 29, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

Compared to 1994, the 1997 VCD player output is over 700 times greater. This astonishing VCD player growth in China has taken many foreign manufacturers by surprise. When VCDs first appeared in the market, many Japanese and multinational manufacturers regarded them as an inferior product with poor image quality, which is ultimately expected to be replaced by digital video disc (DVD) players.

However, Chinese consumers have proved to the world an exceptional case by showing overwhelming acceptance of the product. Today, the VCD is a supplementary product to color television.

To cope with the massive increase in domestic demand for VCD players, many China and Hong Kong manufacturers are planning to increase, or even double, their VCD player production capacity in the coming year.

China's Consumer Electronics Market

China is a large country with a huge population of more than 1.2 billion people. As a result of the government's successful and continuing reform since 1979, China has become a focal point of economic attention worldwide. The main attraction is the potential of its huge consumer market.

The country's preferential foreign-investment policies, low wages, and vast natural resources are transforming China from an agricultural community into an industrial society. China is turning into a world manufacturing center as it continues to enjoy an influx of foreign direct investment and technology. China has maintained a high gross domestic product with double-digit growth during the 1990s. The high economic growth brings more disposable income to its consumers. The immediate benefits can be seen in the speedy growth in the consumer electronics market, which is growing at an average of 15 percent.

In the early 1990s, the three superstars in consumer electronics were color television sets, refrigerators, and washing machines. Possessing these gadgets symbolizes affluence and modernity. As incomes rise, consumer-spending behavior reflects the change. A current survey shows that in recent years, consumer electronics superstars have changed to VCD players, PCs, camcorders, and fax machines.

Also changed is the consumer-buying behavior in urban areas. Most consumers will first think of needs when they make purchasing decisions. Then, they will consider the brand and the price, respectively, in order of importance. Their value system has changed to a "need-brand-price" model rather than the "price-need-brand" of a few years ago, according to a report from China's State Statistics Bureau. Brand awareness has been gaining more importance when consumers shop for electronic goods.

Brand Localization

Supported by strong domestic demand, local brands have gained opportunities to grow and obtain more share in the consumer electronics market, which was dominated by foreign brands in the 1980s. Now, Chinese brands dominate the domestic consumer electronics market, occupying, on average, 70 percent, while foreign brands, imported or manufactured locally, take another 30 percent share. About 86 percent of VCD players consumed domestically are produced by local manufacturers. The explanation for their popularity is their price competitiveness. An imported VCD player costs 50 percent or more than the local VCD player.

Table 1 summarizes market share by Chinese brands in some major consumer electronics products.

Table 1
Localization of Eight Major Consumer Electronics Brands in China

Product	Market Share of Chinese Brands (%)
Air Conditioner	75
Color Television	80
Audio System	46
Microwave Oven	70
Refrigerator	93
VCD Player	86
VCR	3.5
Washing Machine	82

Source: Dataquest (June 1998)

Brand concentration on a few popular brands is another characteristic in the Chinese consumer electronics market. For most consumer electronics products, the top 10 usually occupy 75 percent or more of the market share. This high brand concentration is explained by the consumers' emphasis on promotional efforts by the manufacturers and word-of-mouth recommendations from other users. The top 10 brands' market share in the eight major consumer electronics segments is shown in Table 2. In the VCD player market, eight out of the top 10 are Chinese brands. The top 10 brands occupy 87 percent of the total VCD player market in China.

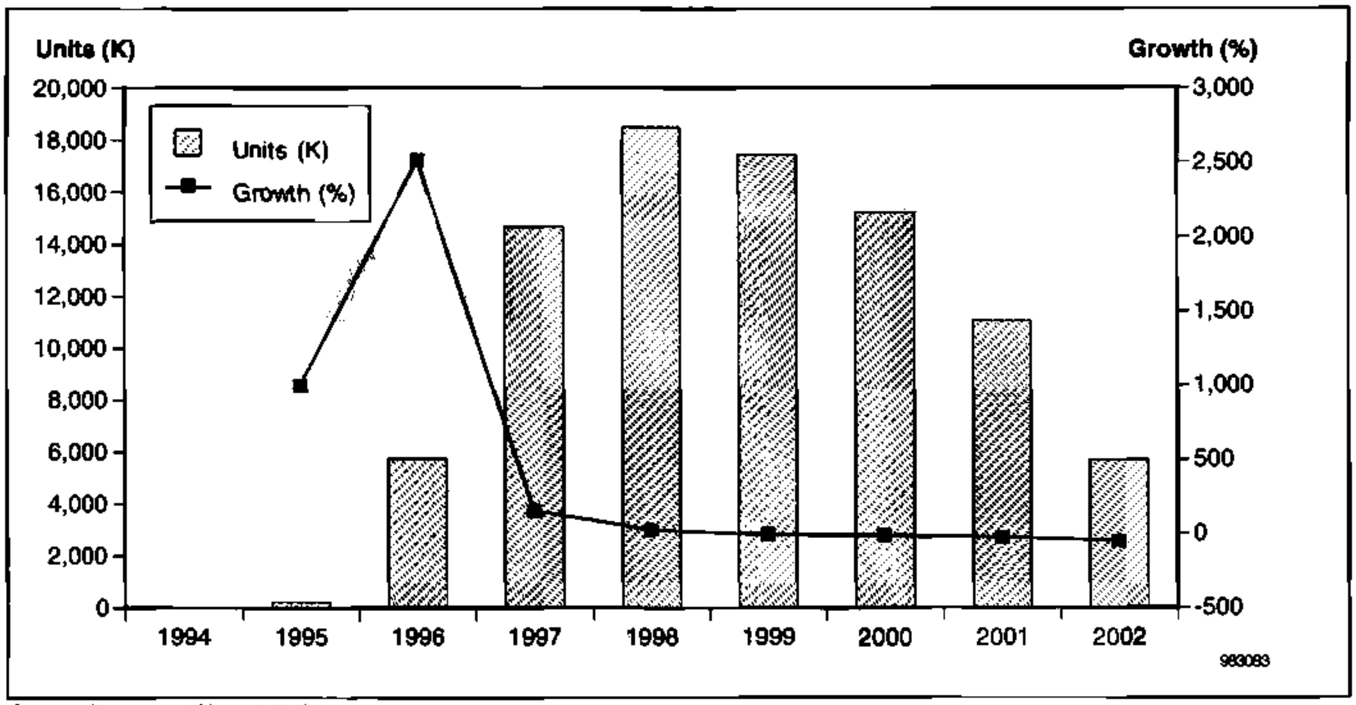
 ©1998 Dataquest

China had a substantial tax cut on 5,000 commodities effective October 1997. On average, the import tariff was reduced from 23 percent to 17 percent. The tariff cut will benefit the competitive domestic companies that are buying foreign technology, equipment, and raw materials; weak players will face tougher challenges from overseas competitions. In the VCD player market, more than 90 percent of key components—including CD mechanisms and decoding chips—are relying on imports. The import tariff reduction will benefit the local manufacturers and give them larger margins to compete with imported products.

VCD Player Production Forecast

Dataquest predicts that China's VCD player production will surge 26 percent on an annual basis to reach 18.5 million units in 1998 (see Figure 1). The growth trend will decline starting in 1999 when DVD players are expected to expand in the market and finally erode the market share of VCD players.

Figure 1
China's VCD Player Production Forecast, 1994 to 2001



Source: Dataquest (June 1998)

The top five VCD player makers are all Chinese brands; they combine to account for 53.6 percent of the total VCD player market. About one-fifth of this market is occupied by the largest market leader, Jiangsu Province's Jiangsu Shinco Electronic Group Company. The top three occupy nearly half of the overall player market. Table 3 shows the market share and the estimated production of the top five brands in the market in 1997.

Table 3
Top Five Manufacturers of VCD Players in China, 1997

Manufacturers	Brands	Market Share (%)	Estimated Production (K Units)
Jiangsu Shinco Electronic Group Co.	Shinco	21.8	3,200
Guangdong Idall Co. Ltd.	Idall	13.2	1,930
Fujian Malata Co. Ltd.	Malata	9.2	1,350
Shell Electric Manufacturing (Holdings) Co.	SMC	4.8	710
Shenzhen SAST Laserdisk System Co.	SAST	4.6	670

Source: Dataquest (June 1998)

In view of the VCD player market's explosive growth, many manufacturers want to share the piece of the pie that belongs to the leading manufacturers. The television giant, Changhong Electronic Group Co., has planned to expand its VCD player production capacity from 400,000 units to 3 million units in 1998.

Many Taiwanese makers are also eyeing China's VCD player market. The Acer Group and Sampo Corporation are both supplying VCD technology and OEM kits to their Chinese partner for assembly. Their ultimate goal, however, is to make and distribute DVD players to this market.

In the face of increased competitions in the VCD player market, the top 12 VCD manufacturers took the lead to join the nationwide warranty network to strengthen their market presence. This move was initiated by the Ministry of Electronics Industry to improve the "after-sales" services for consumers.

Demand Factors

VCD players are proliferating in the Chinese market for some simple reasons. First, the hardware is cheap and simple in technology. VCD players combine CD players with a MPEG decoder to produce acceptable video-playing capabilities. The majority of manufacturers get key components from a few suppliers: Sony Corporation of America and Philips Electronics NV for CD mechanisms, and C-Cube Microsystems Inc. and ESS Technology Inc. for decoding chips.

Second, the proliferation of private software has fueled the demand for the VCD market in China. The Intellectual-copyright concept is still weakly understood among Chinese consumers. They can easily get low-cost private software or even rent VCD movies at a cost below U.S.$1 in some cities. The third reason is the lack of an installed base of VCRs and audio CDs in China. The popularity of color TV and karaoke among the Chinese has also contributed to the strong demand of VCD players.

In terms of the substitution by DVD players, the price and software gap will lengthen the time needed for DVD players to take off in the market. Although DVD players provide consumers with high-quality pictures and sounds, better performance, and a wider range of features, Chinese consumers do not currently have the purchasing power to buy them. The higher price is not the only barrier for DVD players to enter the China

 ©1998 Dataquest

market. Consumers are concerned about the limited availability of DVD titles that cost much more than VCD titles. Also the existing color television sets, limited by 350-line, cannot produce a high-resolution effect required by DVD players.

On the other hand, the DVD player emergence will encourage VCD player manufacturers to improve the quality of their VCD products. Because of the backward compatibility of DVD players, VCD software will still prevail unless the prices of DVD titles can match. VCD players will be able to survive in the presence of DVD players.

Future Consumption Drivers

As most consumer electronics show a slowdown in the cities, VCD players can find their way into the rural areas that are home to 72 percent of the country's 1.2 billion population. As farmers' income level and living standard rise, their consumer demand is also expected to grow. The consumer electronics market for products such as TV sets and VCD players will be brisk—especially in the central and western areas where most families still do not own these products. The key for this market segment is low price. As the VCD player prices continue at a downward trend, farmers can easily afford to buy one.

Another driving force comes from the government, which plans to adopt international standards for digital-consumer electronics that will be produced in China alone. The government is taking a leading role to build China's digital electronics.

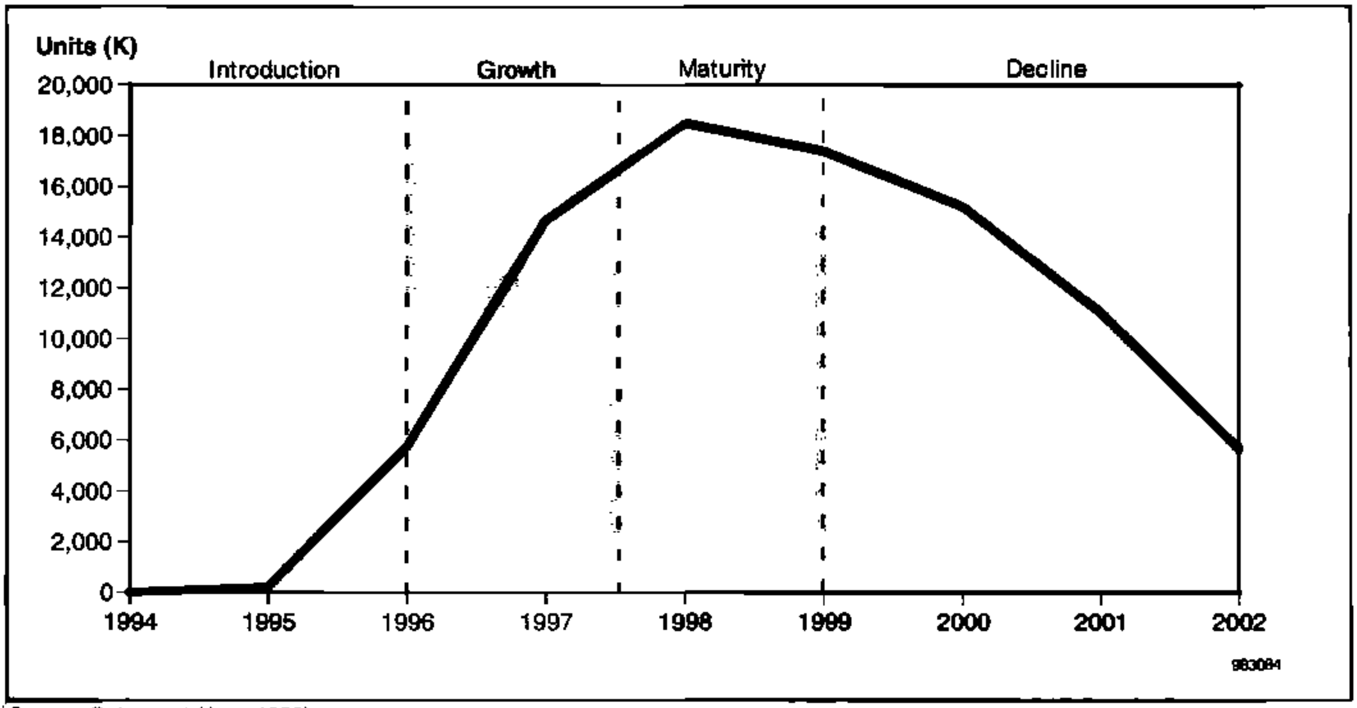
Dataquest expects VCD players in China will be able to keep their dominance in the market for another three years. Although DVD players have a higher definition and larger capacity, prices of both hardware and software are at least more than double that of VCD players, which will defer consumers' buying decisions.

Product Trend

China's VCD player market follows a typical product life cycle; it has gone through the introduction stage and high-growth stage and is now approaching the maturity stage. The declining stage will start in 1999 when DVD players begin to penetrate the market. Figure 2 depicts the four stages of the product life cycle of VCD players in China.

At the current maturity stage, manufacturers are competing on prices to achieve volume and fighting for market shares. Efforts are being put into efficiency and cost reduction. Meanwhile, market leaders like Shinco and Idall are advertising heavily to emphasize brand differentiation and special product features. Manufacturers extend the product life by means of incorporating more functions into their VCD players. Built-in karaoke functions are now a standard. Other choices are integrated VCD hi-fi systems, multidisk changers, and two-in-one TV/VCD sets. There are also many manufacturers that are concerned with improving the picture quality.

Figure 2
Product Life Cycle of VCD Players in China



Source: Dataquest (June 1998)

New Standards

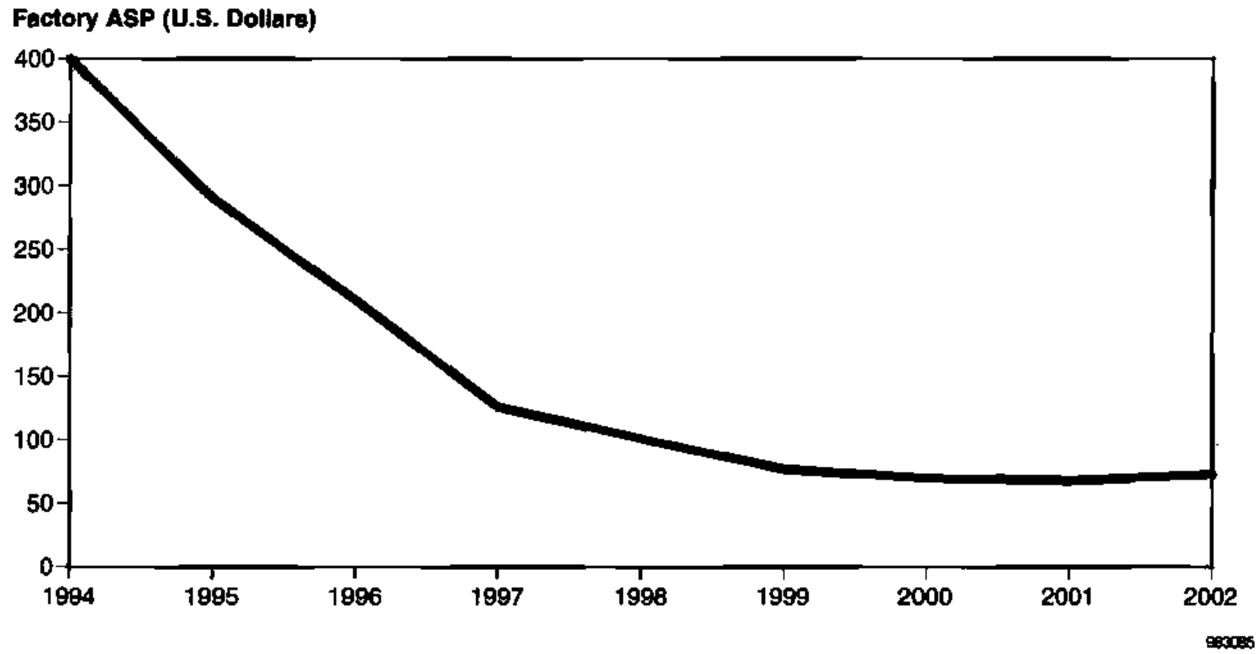
One example of extended product life in China can been seen in Yuanwei Technological Co. Ltd. under Yuanwang Group. The company recently announced a four-in-one VCD in Beijing. The four-in-one VCD player uses MPEG I 3.0. The product has built-in new functions such as enlarging pictures and digital echoing for karaoke.

Japan Victor Corporation (JVC), Panasonic Communications & Systems Company, Philips Electronics, and Sony Corporation are planning to introduce Super VCD players to the market, priced at about U.S.$200. A Super VCD player has improved picture quality by using a disk that is encoded at a higher bit rate. The images produced are near-DVD quality. The disadvantage of this is its requirement of multiple disks because images are encoded at higher bit rates that require more storage space. C-Cube will be the first to supply Super VCD technology to Chinese manufacturers to protect and expand its dominance in the VCD player market.

Price Trends

The average selling prices (ASPs) of VCD players follow an exponential decay curve. The price decline resulted from the economies of scale and increasing competition. A VCD player sold for more than U.S.$400 in 1994, U.S.$290 at the beginning of 1995, U.S.$210 at the end of 1996, and at U.S.$126 last year. Driven by the tough competition in the market, the manufacturers' cutthroat prices will continue until they finally bottom out at about the U.S.$70 level. At this price level, vendors can hardly make profits, and Dataquest expects that small-scale manufacturers will be squeezed out of the market. Figure 3 illustrates the VCD player ASP in China from 1994 to 2002.

Figure 3
Average Selling Prices of VCD Players in China, 1994 to 2002



Source: Dataquest (June 1998)

DVD Dominance in 2000

More than 50 percent of a DVD player's cost comes from the drive's optics, drive mechanism, and decoding chips. Many DVD manufacturers are looking for sources of cheaper bill of materials. As DVD players have many advantages in quality and function aspects over VCD players, Chinese consumers are willing to pay more within their range of affordability. When the DVD's downward price curve drops to about 150 percent of the VCD player prices, the DVD players may begin to take over the VCD player market, and consumers will become willing to buy DVD players that have incorporated backward compatibility for VCD. Dataquest expects the DVD takeover to occur in 2000.

Many foreign manufacturers are preparing for the arrival of the DVD boom in China because they cannot afford to again miss this potential market of millions of units a year. Matsushita Electric Industrial Company Ltd., for example, began manufacturing DVD players in China early this year at an initial production units of 500 units per month at Matsushita's Dalian plant. Local television set manufacturer Panda Electronics Group Co. has also started DVD research and development in the hope of getting a piece of the pie from the VCD player market.

Overcapacity Problems of VCD Players

The threat of China's VCD player market is not only from the substitution of DVD players, but also from its serious overcapacity problem. There are more than 400 VCD player makers in the country, with an estimated production capacity of 50 million units per year. These are far beyond the domestic demand and exports. To be scale-efficient in VCD player production, a manufacturer is estimated to have an output between 150,000 and 200,000 units per year. More than 85 percent of the share is concentrated among the top 10 suppliers, with other small players not expected to achieve scale economy. The smaller manufacturers will be forced to quit as margins continue to shrink.

From the VCD manufacturers' point of view, the expanded production line of VCD players will not be wasted because when VCD players are replaced by DVD players, their production lines can provide an immediate, cost-effective solution to assemble DVD players. Though Chinese manufacturers have great manufacturing and assembly skills, they lack technology for the research and development of DVD players. Because the core materials will still rely on imports, it will be difficult, but not impossible, for Chinese makers to become the cost leader in DVD player production.

Internal Consumption

State-owned enterprise reform by Zhu Rongji has made one-third of the state workers redundant. Official figures estimate that 16.5 million urban dwellers are unemployed or have been laid off. Another 30 million will likely join the unemployed in a few years. This number represents 13.8 percent of urban residents. Urbanites may therefore spend less on immediate needs and put aside more for the future. The government has already felt the people's worries over the future and sensed the pressure in the slowdown of internal consumption. Therefore, it is planning to spend billions on infrastructure construction and has cut the country's interest rates to vitalize the retail consumption, especially in consumer goods. The unemployment problem in China is so great that it may cause consumers to defer purchase decisions, therefore endangering the VCD manufacturers' plan for achieving their production target in 1998. The problem of overcapacity will soon surface if there is not enough internal demand.

Dataquest Perspective

This year, the competition in the China VCD player market will be in two dimensions. One is the head-to-head competition between local manufacturers for shares, and the other is the product dominance competition between VCD players and DVD players represented by local and foreign manufacturers, respectively.

Dataquest expects China's VCD player market in 1998 to be dominated by local suppliers that are mainly competing on prices. Price cutting and promotional efforts of manufacturers will drive the growth rate to 26 percent, reaching 18.5 million units; however, it will slow down and become negative in 1999 when the DVD player emerges. Foreign vendors face difficulty in

©1998 Dataquest

trying to squeeze into this low-profit market, but they may turn their target to the DVD player market or enhanced-quality VCD players, which offer more growing opportunities.

Dataquest Predicts

China's Semiconductor Industry: Leader of the New Asian Order or the Next Victim of the Asian Financial Crisis?

Abstract: *Dataquest recently completed four country "Semiconductor Predicts" seminars held in South Korea, Taiwan, Hong Kong, and Singapore. This Perspective summarizes the content of the presentation on China/Hong Kong's economy, electronics, and semiconductor consumption outlook.*

By Daniel Heyler

Introduction: Predictions Made

The immediate impact of the Asian financial crisis (AFC) poses the following important questions for strategic planners and marketers in Asia/Pacific:

- How important is the China/Hong Kong semiconductor market?
- Will the economy hold up? What about investments and exports?
- What is the export-downside risk for electronics?
- Will the domestic market's IT spending compensate for a possible exports slowdown?
- How will domestic and foreign manufacturers respond?
- What about electronic equipment production prospects, including computers, communications, and consumer?
- What is the outlook on semiconductor consumption?
- How important is China to Asia/Pacific demand?
- Which vendors are winning in China/Hong Kong?

Publication Date: June 1, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

How China's economic growth holds up impacts both electronic equipment export competitiveness and domestic IT spending.

Dataquest discusses which areas of electronic equipment production potentially benefit and lose from the Asian financial crisis, both in exports and local shipments. Dataquest then assesses and quantifies short- and long-term semiconductor demand and lists vendors' performance. Dataquest also assesses the prospects of China's semiconductor industry.

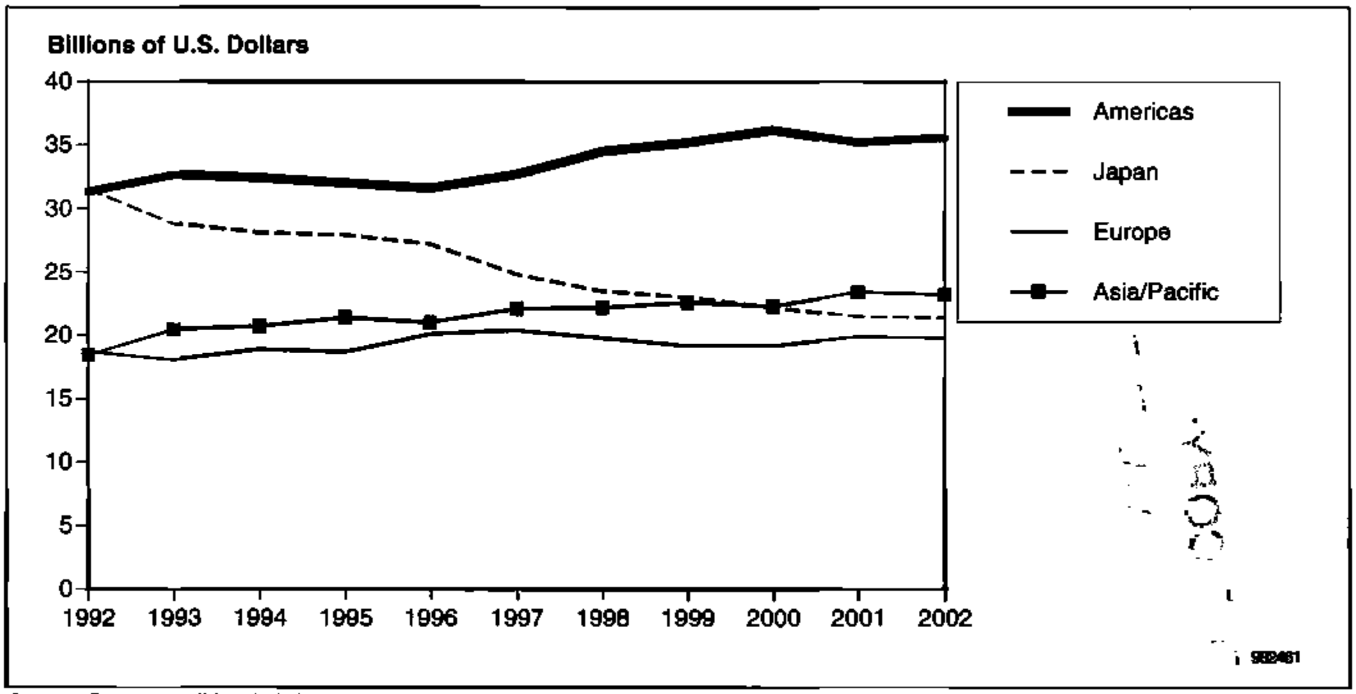
The Importance of China/Hong Kong to Asia/Pacific

First of all, why even talk about China/Hong Kong? How important is the China/Hong Kong semiconductor market in a regional and global context?

The Asia/Pacific region surpassed Europe in 1992 to become the third-largest semiconductor market. Europe has maintained an average share of about 20 percent. Japan has continued to lose share, since its consumer electronic boom during the 1980s. The Americas and Asia/Pacific have benefited from the 1990s PC industry boom and have been gaining share.

Asia/Pacific will increase share from about 21 percent to 23 percent within four years and is forecast to surpass Japan to become the second-largest consuming region in the world. China is playing a key part in this growth. Figure 1 illustrates semiconductor consumption by region from 1992 to 2002.

Figure 1
Semiconductor Consumption by Region, 1992 to 2002



Source: Dataquest (May 1998)

©1998 Dataquest

In revenue terms, China/Hong Kong is now the largest and fastest-growing semiconductor market within Asia/Pacific, accounting for 20 percent of consumption in 1997. China/Hong Kong is the growth engine, approaching 5 percent of worldwide semiconductor consumption in 1998.

Where is China/Hong Kong in terms of electronic equipment production? China/Hong Kong is the largest electronics producer on the whole because of the large consumer electronics volumes and, more recently, computer, peripherals and communications equipment. So, from both a semiconductor consumer and electronic equipment manufacturing standpoint, China/Hong Kong is important now.

But will this trend continue in light of the new competitive dynamics? This question is the subject of this Perspective.

A Recent Look at the Currency, GDP, Trade, and Investment

Before discussing the economy and electronic equipment production, it is useful to look at the electronic production interrelationship with semiconductor demand.

At a worldwide level, electronic production has grown three times faster than the GDP, and semiconductor shipments have increased three times faster than electronics shipments.

In immature markets such as China, there will be a delayed effect. As electronic technologies and design improve in China, the electronic equipment manufactured in China will increasingly become richer in semiconductor content, thus further bolstering demand for semiconductors. It is this increase in semiconductor content that will enable the Chinese market to accelerate, even though the GDP may decelerate.

China's Currency and Stock Markets Remain Stable while Most of Asia/Pacific Crashes

The currency devaluation created critical problems for Asia/Pacific semiconductor suppliers and users that are almost entirely dependent on imports. Indonesia's currency devalued more than 70 percent during the past six months, and its stock market dropped more than 80 percent. As a result of the financial turmoil, stock markets in Korea, Thailand, the Philippines, and Malaysia have declined by approximately 60 percent. China and Hong Kong have remained unaffected, but Hong Kong's economy is suffering. China's stock market share value increased by an average 28 percent in 1997.

In theory, one would expect exports from Southeast Asia to become more competitive, assuming component costs (mostly imported) and financing costs do not outstrip these gains. However, this has yet to be the case because of the difficulties many companies are having in financing their operations and investing.

 ©1998 Dataquest

GDP Forecast

Dataquest's latest economic data in March 1998 averages data from more than 10 major banks. Recently released April data from the Organization of Economic Cooperation and Development (OECD) corresponds rather closely with Dataquest's numbers. Most economists agree that China's stable currency and domestic reform will enable it to sustain between 7.5 percent to 8.0 percent GDP growth in 1998. China is expected to improve performance to more than 8 percent in 1999. Japan is the wild card, which would stimulate growth in Asia/Pacific economic recovery. On top of growth, China's population creates tremendous market pull, especially in electronics, as discussed later. Not only is China's GDP about three times the rest of Asia/Pacific, its population accounts for nearly one-half of Asia/Pacific. An important factor in China's GDP growth is that the economy is diversified with expansion taking place in industries, manufacturing, services, and agriculture. This broad-based growth will enable the economy to weather exterior financial crises or industry cycles.

Hong Kong has an absolutely pivotal role in capital, expertise, and information flow to foster China's consecutive GDP growth. This role is enhanced, not hindered, by the handover from the United Kingdom. The combination of China's and Hong Kong's GDP was approximately U.S.$1 billion in 1997. The combination of Hong Kong's services economy (83 percent of GDP) and China's industries (50 percent of GDP) represents an overall economy that is not dependent on one sector and, therefore, is less vulnerable to specific industry cycles than most other Asian countries. Another important driver of China's economy, investments, and information technology (IT) is the continuous geographic expansion from the coastal to the land-locked provinces.

Foreign Investment Trends in China

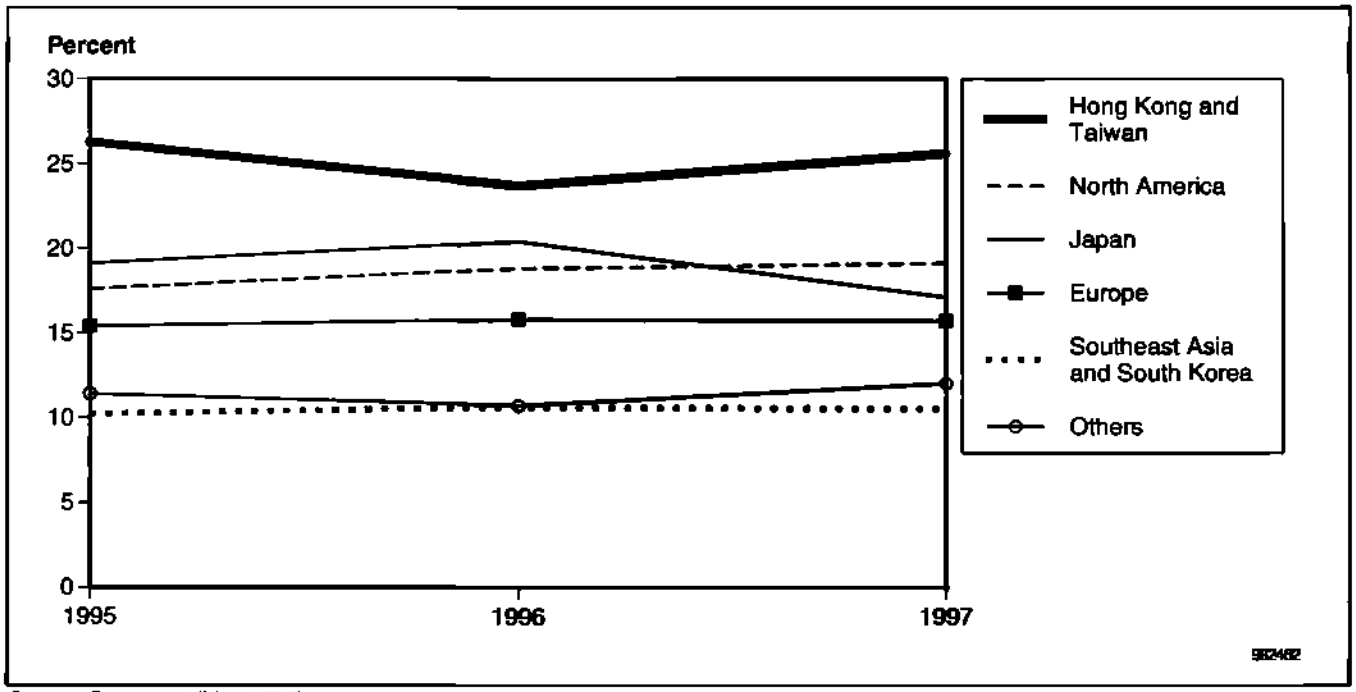
Hong Kong accounted for 59 percent of foreign-invested capital in China from 1980 to 1997. In the past few years, there has been a decline of contracted investments in China from $88 billion in 1994 to $72 billion in 1997. However, the actual utilized investment increased from $33 billion to $44 billion during this period. There is uncertainty in 1998, and most forecasts indicate a decline in utilized investments to $37 billion for the first time in at least five years. Dataquest also expects contracted investments to decrease because of the investor uncertainty that is the short-term outcome of China's aggressive reforms to be undertaken in 1998. However, once the dust settles, investment flow is expected to resume in 1999. In the first quarter of 1998 figures show growth of more than 10 percent over 1997, an indication that the Asian financial crisis has not dramatically affected China.

The Importance of Foreign Trade

China's GDP will exceed $900 billion in 1998, of which total trade is nearly $400 billion. China's export machine has proved to be formidable. The economy's trade surplus was expected to increase beyond $50 billion in 1998 prior to the financial crisis, but as the result of the financial crisis, it is expected to decrease. The first two months of 1998 show exports to the United States to be at the same levels as 1997, while imports are slightly down. In short, there is no dramatic downturn expected in China because of a slowdown in Asia/Pacific economies.

As illustrated in Figure 2, China is exposed to the Asian financial crisis by about 11 percent because 11 percent of its exports go to Southeast Asia and Korea. Exports to Japan have been declining since 1995, but exports to Europe, North America, and Taiwan have been increasing and represent the lion's share of exports. More than 60 percent of China's exports head for Europe, North America, and Taiwan, and 15 percent go to Japan.

Figure 2
China's Worldwide Exports by Region, 1995 to 1997



Source: Dataquest (May 1998)

Electronic Equipment Exports

Out of China's $190 billion in exports, 12 percent was related to electronics, and the sector is increasing in total share. The following three important factors help buffer China's electronics exports from the AFC:

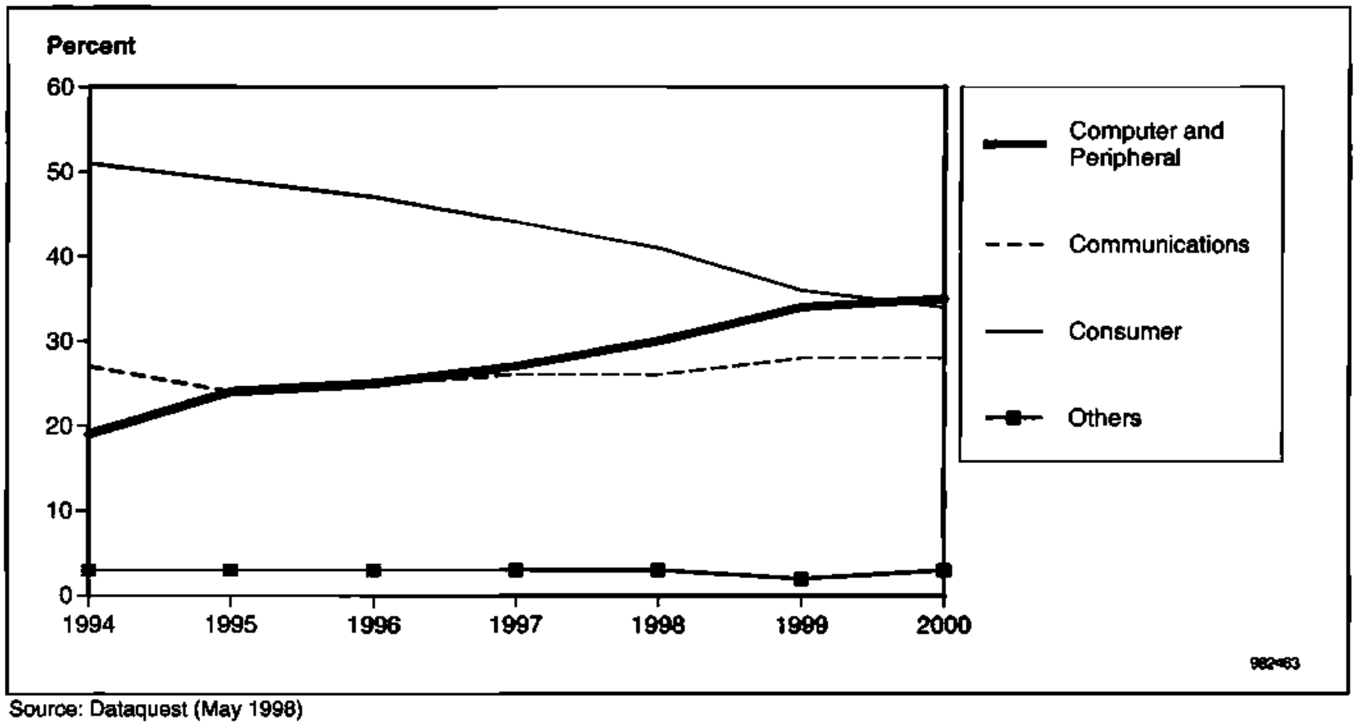
- Components are about half of finished equipment, but they are rising the fastest.
- The United States has become the major importer of China-made electronics, accounting for about 40 percent of China's component and equipment exports.
- Overall export growth is helped by U.S. demand, which is not only the largest but the fastest growing.

However, we believe that consumer electronic exports will be negatively impacted by the AFC pinch, more so than computers and communications

 ©1998 Dataquest

equipment. Dataquest's trend analysis is consistent with previous data, suggesting a consumer electronics export decline, impeded primarily by Japan's protracted economic troubles. The AFC will cause this trend to continue, even if the Japanese economy recovers. Conversely, there has been rapid investment in computer and communications manufacturing within China by U.S., European, and Taiwanese manufacturers. Dataquest forecasts a convergence of consumer electronics and computer and peripheral exports by 2000 (see Figure 3).

Figure 3
Chinese Electronic Export Share by Sector, History and Forecast, 1994 to 2000



Source: Dataquest (May 1998)

Of the $46.5 billion in electronic equipment production in 1997, Dataquest estimates that 56 percent, or $26 billion, will be exported. Dataquest has established that the exports' downside risk is insignificant, and that the domestic market is playing an increasing important role in electronic equipment production growth.

Key Domestic Market Trends

Dataquest places China at the high end of both spending magnitude and growth, second only to Japan. China is expected to reduce its IT spending by less than 5 percent as a result of the AFC.

Personal Computer Market

The PC market growth is a revealing window into future IT growth prospects. The currency, economic, and financial problems associated with the Asian turmoil have seriously impacted electronic equipment shipments to several countries. Dataquest reported a severe decline in fourth-quarter

 ©1998 Dataquest

1997 and first-quarter 1998 PC shipments in half of the Asian countries after years of double-digit growth. Hong Kong's consumption declined 14 percent. China has been least affected thus far, experiencing about three-to-five times Asia/Pacific's average growth rate.

Without a doubt, businesses have been the largest PC and IT equipment and service purchasers in China. China's attempt to streamline the government's administrative bureaucracies and the financial sector will result in continued spending. As ministries reorganize, some are delaying purchases, however. The home and education markets are rapidly awakening segments of IT spending growth.

Overall shipment growth will slow from a high of 60 percent for three years and settle at a more sustainable 30 percent unit growth from 2000 to 2002. Desktops still dominate, but notebooks and servers will become significant in a few years.

The long-term forecast has not changed significantly from Dataquest's projections in 1997. Most agree that the industry will ship 10 million PCs to China in 2002. There is a plethora of peripherals and communications equipment that will mirror this shipment level.

Electronic Equipment Production Trends

Consistent with export and market trends, there is a slowdown in 1998 in all sectors based on Dataquest's survey of manufacturers in China/Hong Kong. Semiconductor revenue growth will improve slightly because of the bottoming out of average selling price (ASP) declines in 1998, laying the base for acceleration in 1999.

Dataquest's semiannual survey of electronic equipment production in China/Hong Kong represents a significant sample size of 30 percent of overall electronic equipment revenue. In data processing, Dataquest covers about 30 percent of China/Hong Kong's production, 25 percent of consumer, and 40 percent of communications equipment.

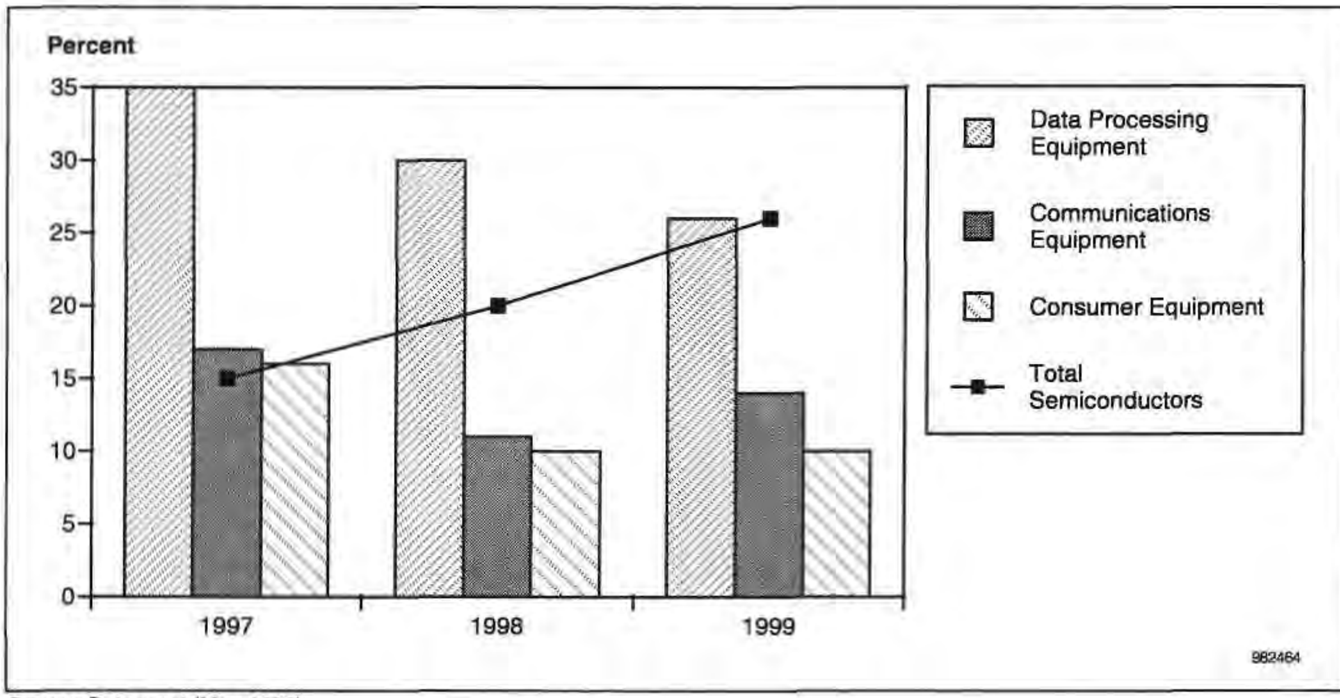
This data indicates that 1997 was a very good year in all sectors—but not as good as expected in August 1997. And the expectation for 1998 is cautious with expansion plans at nearly half of the 1997 level.

There is an anomaly in consumer electronics, which is showing a falling export growth and high cable TV penetration (as mentioned previously). The reason for the unexpected strong growth is the surge in video compact disc (VCD) manufacturing, which joined the fray in late 1997.

Several factors contribute to data processing's high growth. Figure 4 illustrates Dataquest's view of the Asia/Pacific semiconductor consumption and electronic equipment production from 1997 to 1999.

 ©1998 Dataquest

Figure 4
Semiconductor Consumption and Electronic Equipment Production, 1997 to 1999 (Growth)



Source: Dataquest (May 1998)

Personal Computer Production

Vendor shipments include imports and locally produced PCs, while manufacturer shipments includes all PCs produced in China (including what is exported). Dataquest's research indicates that imports and exports have reached parity, hence China is now producing as many PCs as it is consuming. Dataquest's long-term outlook shows the local industry will continue to keep pace with the surging market because of local manufacturers' competitive advantage over importers.

Foreign and joint-venture manufacturers are producing as many PCs as Chinese companies, but they will export about 50 percent of output compared to about 1 percent by Chinese companies. Foreign companies have trouble shipping locally, primarily because of the restrictions established by the Chinese government when the ventures were established. Although Chinese companies' products have inferior quality, because of consumers' lack of brand awareness, they have gained market share by accessing the local sales channels and lowering production costs. The lower production costs are a result of faster time to market, lower taxes (by 15 percent to 25 percent), lower inventory costs, and the ability to source components locally (a key cost advantage in an oversupplied market).

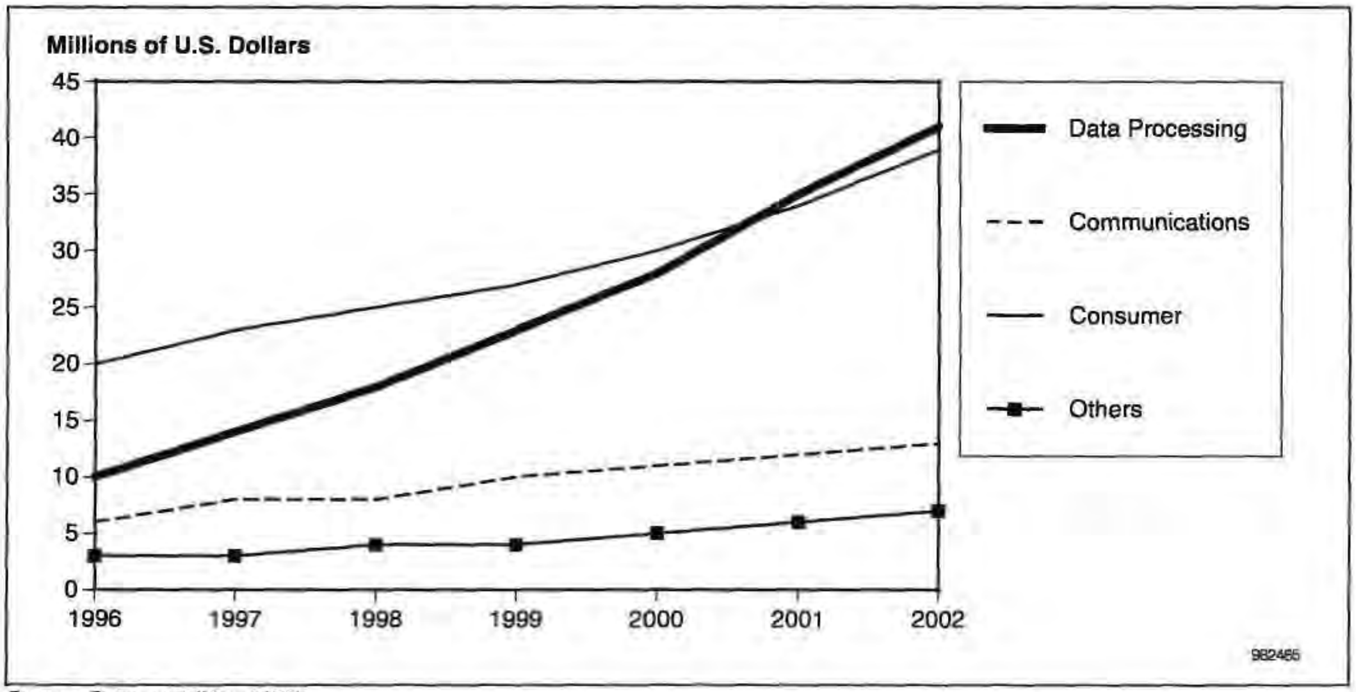
Long-Term Electronic Equipment Production Forecast

Dataquest's aggregated forecast of each sector indicates strong growth driven by a healthy balance of computer, consumer, and communications production, and a balance between exports and consumption. Dataquest

 ©1998 Dataquest

expects data processing, led by PCs and peripherals, to overtake consumer electronics by 2001 (see Dataquest's Semiconductors China Perspective titled "PC and Peripherals Semiconductor Forecast"). PCs and peripherals will become the largest semiconductor markets, with more than 48 million motherboards and 13 million PCs to be manufactured in 2002. But consumer electronics will be able to continue to grow, despite the maturity of TVs and radios. The latest, newfangled consumer electronics are the digital consumer electronics, in which China is already proving to be a major player. Communications equipment is growing quickly for switching equipment, cordless telephones, answering machines, pagers, and cellular phones. However, pricing pressure is pulling down overall revenue growth. Figure 5 depicts the electronic equipment production forecast trend in China/Hong Kong.

Figure 5
China/Hong Kong Electronic Equipment Production Forecast, 1996 to 2002



Source: Dataquest (May 1998)

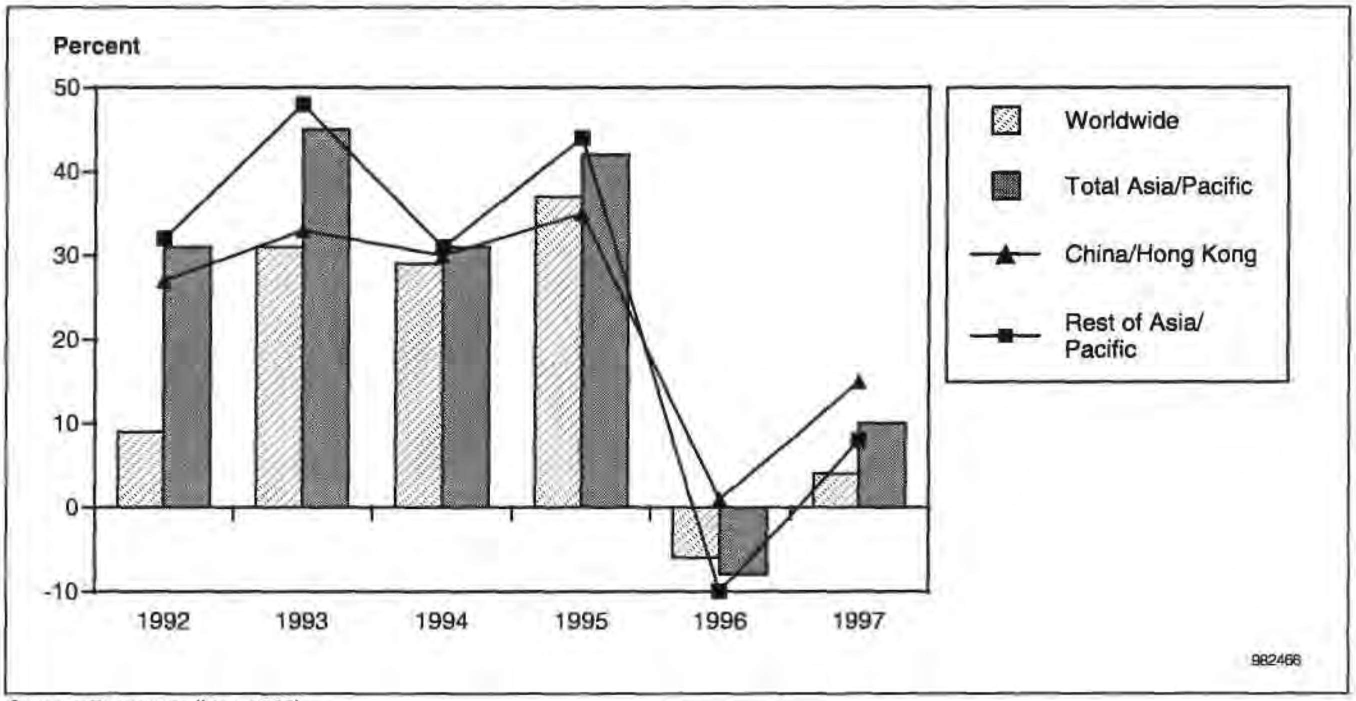
Semiconductor Market Forecast

The Asia/Pacific semiconductor market has been the fastest-growing region worldwide since 1992. As shown in Figure 6, China/Hong Kong did not expand as quickly as Asia/Pacific as a whole. Much of the new demand growth was generated by Southeast Asia and Taiwan, attributed, in part, to strong memory prices and high memory consumption in these regions.

The China/Hong Kong market expansion actually accelerated in 1996 and 1997, but the ASP pressure reduced revenue growth in China. In addition, because memories are a smaller percentage of its market, China has been more insulated than the rest of the region.

 ©1998 Dataquest

Figure 6
Semiconductor Market Growth by Region, 1992 to 1997



Source: Dataquest (May 1998)

Figure 7 depicts Dataquest forecast by product segment.

Dataquest expects China/Hong Kong to lead the region in semiconductor consumption during the next five years. Dataquest forecasts the semiconductor market to expand by a CAGR of 25 percent from 1997 to 2002, compared to Asia/Pacific's 18 percent growth.

Which Devices?

Microcomponents are forecast to grow by a CAGR of about 28 percent, analog by 19 percent, discrete by 15 percent, and logic and ASICs by 19 percent. Because of the existing overcapacity, the beginning of the next memory silicon cycle will not begin until 2000. By that time, China will be producing 10 million PCs and 40 million motherboards. Hence, memory consumption will grow by 35 percent to $5.3 billion.

Which Applications Will Set the Pace?

Where will these semiconductors be consumed? As indicated earlier, PCs and motherboards will be the largest semiconductor consumers by 2002, followed by cordless telephones, color televisions, corded phones, digital cellular phones, and central office line cards. These seven applications alone will account for about 35 percent of China's $20 million market in 2002.

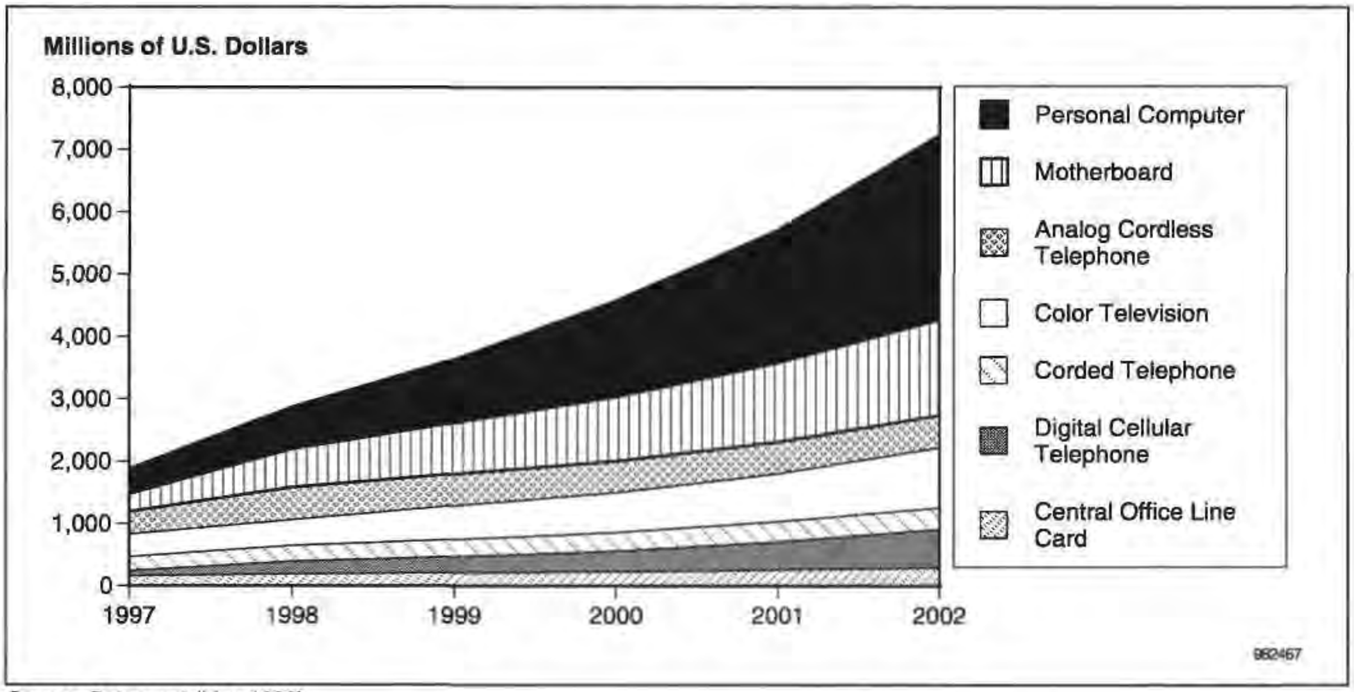
Who's Buying?

Dataquest's 1997 survey of semiconductor consumption by origin of factory ownership shows China with about 35 percent of semiconductor consumption (see Figure 8). Chinese companies include joint-venture companies, wholly owned Chinese companies, and state-owned enterprises.

 ©1998 Dataquest

Dataquest includes semiconductors purchased locally as well as those shipped via internal transfer.

Figure 7
Top Seven Semiconductor Application Markets, 1997 to 2002



Source: Dataquest (May 1998)

Who's Selling?

It should come as no surprise to see Intel Corporation at the top of both Asia/Pacific and China/Hong Kong ranking in 1997. Table 1 presents Dataquest's preliminary estimates of top-tier semiconductor vendors' revenue concentration in China/Hong Kong.

Table 1 answers the question, "Which company has the largest share of Asia/Pacific sales in China/Hong Kong?" Rohm Company Ltd. had a 34 percent share because of its discrete, analog, and optoelectronic sales. Rohm was followed by NEC Corporation and Motorola Incorporated, which ranked third and fifth, respectively, with 26 percent and 28 percent of their Asia/Pacific revenue generated from China/Hong Kong.

How are these companies shipping products into China/Hong Kong? Approximately 42 percent of total revenue from semiconductor shipments goes to distributors, while 49 percent goes directly to manufacturers and the rest, 9 percent, comes from internal transfer from one subsidiary to another. Note that this includes shipment to China and Hong Kong. Hong Kong predominates in the distributor business. There will be a large variance in channel mix between products. Dataquest estimates that more than 90 percent of memory shipments come from distributors, for example.

SANYO	24.5	9	11
Texas Instruments	11.6	10	3
SGS-Thomson	15.7	11	8

* Preliminary
Source: Dataquest (May 1998)

Motorola has also become the largest investor in both front- and back-end semiconductor manufacturing. NEC is in close second. Earlier, we indicated that these two companies had the largest share of Asia/Pacific sales in China/Hong Kong in 1997. It is not a coincidence. In fact, semiconductors

 ©1998 Dataquest

are not different from PCs. Manufacturing is following markets in China as it its elsewhere in the world. So, although China's semiconductor industry has yet to boom, the building blocks are being laid for rapid expansion after 1999.

Dataquest Perspective

Because of the Asian financial turmoil, economic growth has been lower than previously forecast. However, with Zhu Rongji at the helm, it is apparent that state-owned enterprises' aggressive reforms, balanced export growth, and prudent fiscal policies will enable China to avoid its own crisis.

IT spending will continue to lead the region in size and growth rates. Local consumption reduces China's export exposure as production follows markets to improve time to market and access to distribution channels, and potentially improve design to market performance.

About 50 percent of China's total production is exported to the United States, representing the largest share. Since the majority of the exports are manufactured by foreign investors, Dataquest believes that exports will continue to grow.

Dataquest's key predictions for 1998 are as follows:

- The importance of the Chinese market—China occupies 20 percent of Asia/Pacific's semiconductor market and 27 percent of electronics production.
- The economy—China's GDP growth is expected to be 7.8 percent this year.
- Electronic exports—China's 10 percent growth represents 47 percent of total production.
- IT spending—PCs are expected to grow 60 percent in unit terms.
- Electronic equipment production—This sector will show a 16 percent growth.
- Semiconductor market—China's market will grow approximately 19 percent.
- Semiconductor industry—China has $600 million in production, and capital spending will surge to $1.5 billion in 1999.

Semiconductors China

Market Analysis

PC and Peripheral Semiconductor Market Forecast

Abstract: *This Perspective presents Dataquest's final 1997 figures and the forecast from 1998 to 2002 for the production of personal computers, monitors, motherboards, multimedia cards, and printers. Dataquest presents an integrated supply and demand view of the PC industry in China/Hong Kong. As a means of forecasting semiconductor consumption, this Perspective also analyzes PC technology (microprocessor consumption), product (form factors), and market trends (imports, exports, and local shipments).*
By Daniel Heyler

Introduction

To help semiconductor component suppliers stay abreast of PC semiconductor trends in China/Hong Kong, Dataquest presents an integrated analysis of manufacturers of PC systems and subsystems, combined with an end-user, or PC market, analysis. Dataquest's understanding of the market is critical in anticipating how manufacturers might respond, and ultimately, which companies will achieve their production targets.

Dataquest's approach in analyzing semiconductor demand in PCs and peripherals is stated straightforward as follows:

- Survey the manufacturers (market push)
- Analyze the market segments (industry pull)
- Assess the technologies and pricing (semiconductor content)

FILE COPY:
MARIA VALENZUELA

PC manufacturing success and marketing success are increasingly interdependent in China, as the market moves away from imports to locally made products. Thus, the impact on semiconductor demand will continue to be huge. Dataquest's final 1997 figures estimate the size of the PC-related

Dataquest
Program: Semiconductors China
Product Code: SEMI-CH-DP-9804
Publication Date: April 20, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

semiconductor market to be $1.6 billion in China/Hong Kong. This Perspective attempts to provide insights into this fast-growing semiconductor segment by addressing the following six questions:

- What are the production plans of major manufacturers of PC systems, motherboards, disk drives, monitors, and printers in 1998, and to what extend do these companies represent all of China/Hong Kong?
- To what extent will the combined effects of desire for foreign PC brands and Southeast Asia's currency depreciation result in a PC import boom, thereby weakening production growth?
- Will foreign-owned or foreign-invested (joint-venture) companies continue to invest in manufacturing within China given the intense competition from local manufacturers and white box assemblers?
- Can local manufacturers maintain their high production growth and slim margin even in face of China's open markets to foreign products and falling import prices?
- What PC products or peripherals will China export, and will China become a global contract manufacturer to either compete or complement Taiwan's leadership?
- Assuming that the above scenario occurs, what is the PC semiconductors revenue demand forecast for China/Hong Kong?

The phenomenal growth in PC consumption *and* production in China has resulted in significant semiconductor market growth. Multinational companies have invested in China expecting high market growth, but they have not performed as well as their Chinese competitors in the recent past year. Dataquest first examines these manufacturers' production plans and then turn to the analysis of the key driving force: the booming PC market in China.

Dataquest notes that the analysis of the PC market focuses on China (mainland), while industry or production analysis includes both China and Hong Kong (denoted as China/Hong Kong). Dataquest's rationale is that Hong Kong market has little bearing on the overall PC production (as a free port), but it is an integral part of production, distribution, and component sourcing for China's PC producers.

Personal Computer and Peripherals Production Forecast

Dataquest surveyed PC and peripheral manufacturers in China/Hong Kong in September 1997 and again in March 1998 for unit level production figures. The survey results contain Dataquest's final unit numbers for 1997 and forecast for 1998, as summarized by product type in Figure 1. Dataquest continues to update and add companies to its company-level electronic equipment unit production surveys. To provide accurate comparisons of production over two points in time, Dataquest will input the historical data of the manufacturer to reflect their rate of growth accurately. Dataquest's discussion of key unit-survey results, containing final 1997 and forecast 1998 figures, are as follows:

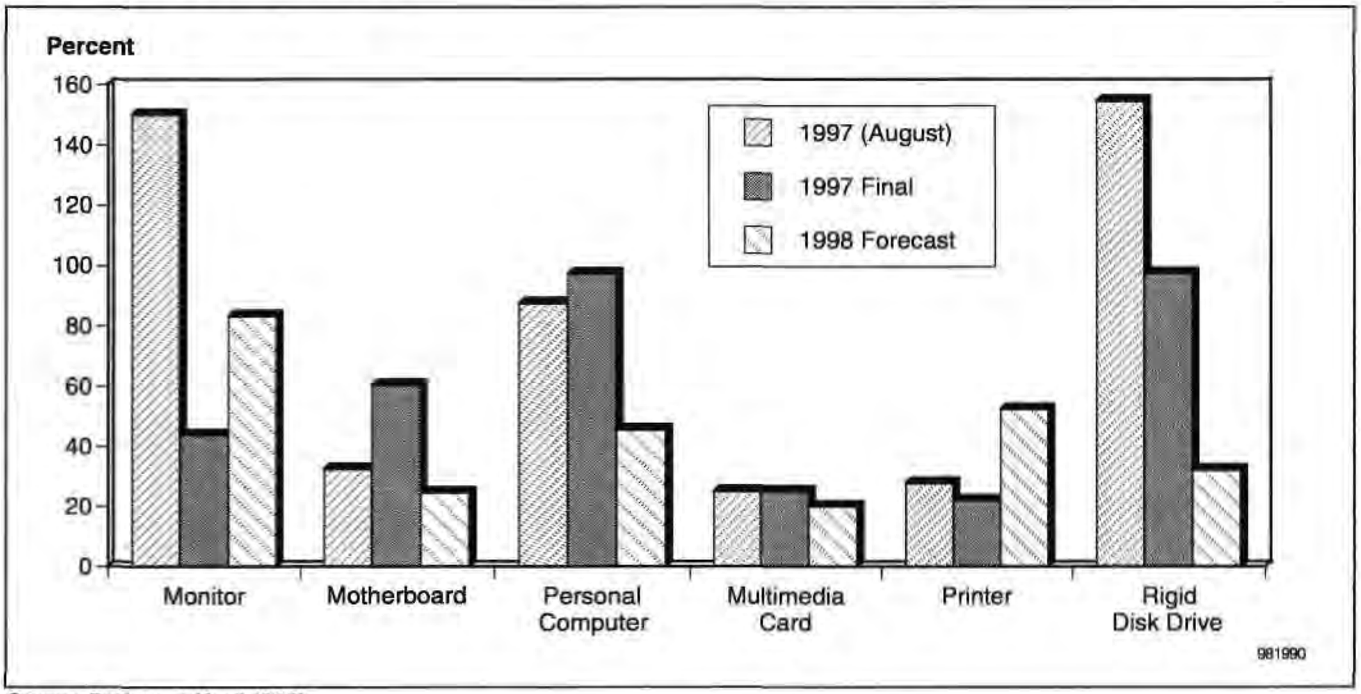
Personal Computer Manufacturers' Forecast

PC manufacturers expect a significant slowdown in production expansion in 1998 relative to 1997—from 97 percent to 46 percent, respectively (see Figure 1). Approximately 84 percent of China/Hong Kong-based PC manufacturers' unit output was surveyed in both periods (see Figure 2). These manufacturers, as a group, had exceeded their production plans of 88 percent growth in September 1997 and reported their final 1997 growth to be 97 percent. This performance is consistent with local Chinese companies' local market share gains, which expanded by 44 percent to 2.2 million units in 1997.

Motherboard Manufacturers' Forecast

Production is dominated by volume manufacturers from Taiwan. China/Hong Kong production grew 60 percent to reach 15.2 million units in 1997, but it is expected to slow to 24 percent in 1998. Exports constituted the majority of growth in 1997. Dataquest's sample represented 98 percent of volume production in China/Hong Kong.

Figure 1
Surveyed Companies' PC and Peripheral Production Quantity in China/Hong Kong, 1997 and 1998 (Unit Growth)



Source: Dataquest (April 1998)

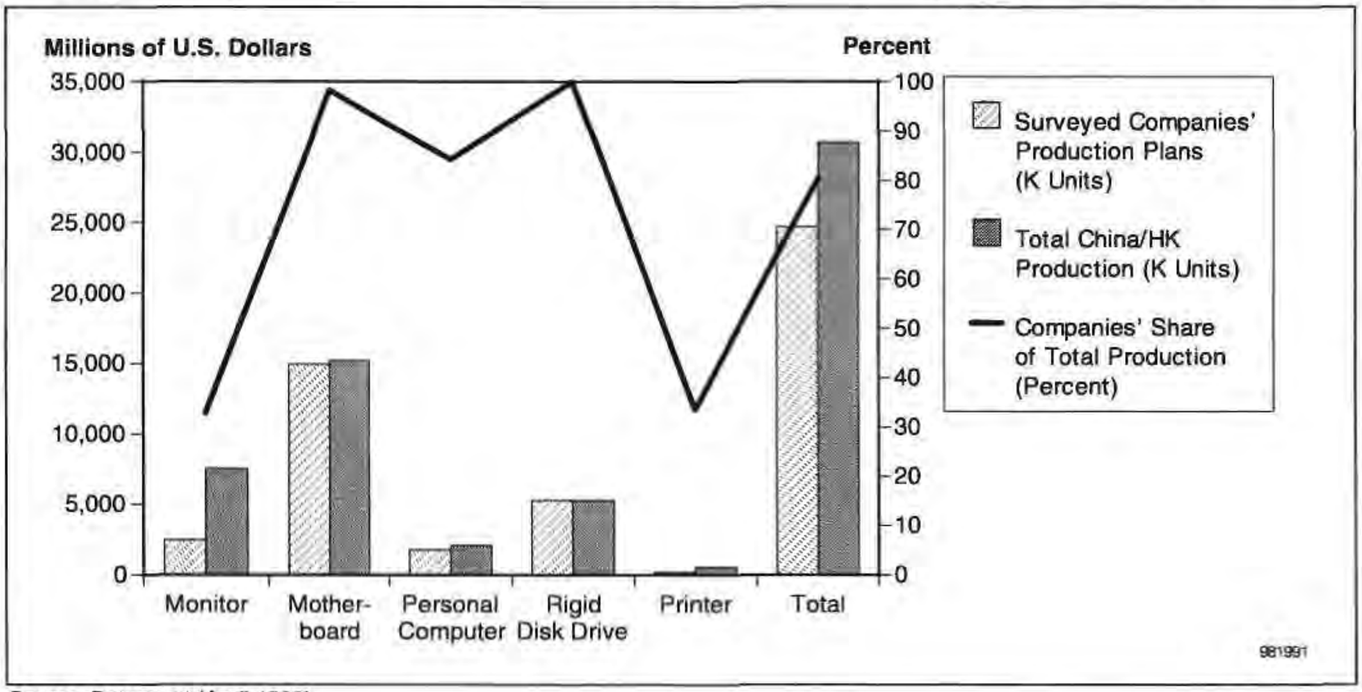
Monitor Production Forecast

Total monitor production increased by 39 percent in 1997. Monitor production was much weaker in 1997 than previously forecast, primarily attributed to LG Electronics (Shenyang) Co. Ltd. terminating monitor production in China. Approximately one-third of the industry was surveyed: Production expanded by 44 percent in 1997. Dataquest expects production to increase by 88 percent in 1998. This growth is attributed to a doubling of production at Suzhou Mingji Computer Co. Ltd., which is owned by Acer Computer International Ltd. and Suzhou Philips Consuming Electronics Co. Ltd.

Printer Production Forecast

Total production of page printer and serial printer manufacturers expanded 15 percent to reach 653,000 units in 1997. Production was dominated by serial printers, and the market relied heavily on imported foreign brands for laser or page printers. Dataquest's survey sample of 34 percent of total production did not meet 1997's expectations of 28 percent production growth. After growing 22 percent, these manufacturers forecast even stronger growth of 52 percent for 1998. Dataquest expects page printers to grow 45 percent, while serial printer growth will remain at about 13 percent in 1998.

Figure 2
Surveyed Companies' Revenue and Share of Total China/Hong Kong Production, 1997



Source: Dataquest (April 1998)

Rigid Disk Drives (RDD) Production Forecast

Dataquest includes Seagate Technology Inc. as the only rigid disk drive (RDD) manufacturer in China/Hong Kong, although Dataquest knows about the small assemblers of low-end drivers. Seagate expanded the RDD production at its established plant, Seagate (Shenzhen) International Technology Co. Ltd., and ramped production at Seagate (Wuxi) International Technology Co. Ltd. from 783,000 units in 1996 to 2.8 million units in 1997. Fully 90 percent of production is exported, but Seagate's strategy has proved successful, as it continues to dominate the RDD market in China.

Multimedia Board Production Forecast

This category consists mainly of audio and video add-in or plug-in cards that are sold to PC manufacturers or retailers in China or exported to vendors or distributors. Dataquest currently does not have a total production number for China/Hong Kong. However, Dataquest estimates that 1 million boards are produced by the Taiwanese-owned factory, Weijia Technology Co. Ltd., in 1997. The company expects to increase production to 1.2 million in 1998 and exports 100 percent of its product.

PC Market Segmentation and Demand Factors

China's PC market will represent about one-third of all shipments to the Asia/Pacific region (excluding Japan) in 1998. At the same time, its unit growth will likely double the regional average.

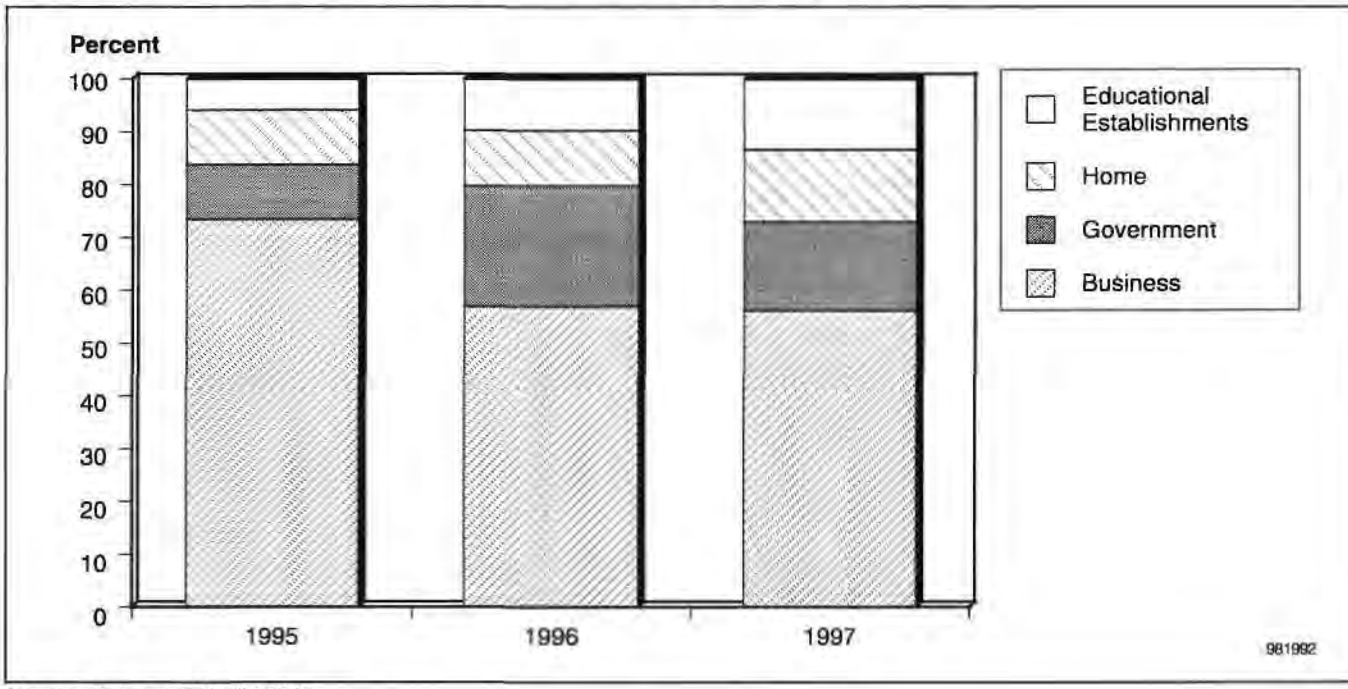
Only a couple of years ago, PC vendors were debating whether or not the Chinese would buy computers given their high prices, character-entry difficulty, and a lack of applications (in business and entertainment software, as well as Internet access). The market has not yet addressed these issues, but Chinese professionals are learning and adopting the PC to business uses (entertainment is a small, but growing, market). The point skeptics missed is that the nascent demand for PCs can be attributed to their high perceived value in China from years of media attention to the computer age and modernization. Although most Chinese have limited exposure to PCs, consumer awareness is high. So when prices declined, channels increased, and compelling Chinese software applications appeared, it took little product promotion and end-user training for sales to skyrocket.

Business Markets Dominate and Still Show High Growth

To understand the source of the business markets' growth, Dataquest segments the market by customer, form factor, and processor class. The business market was the first to adopt PCs in China. In 1995, the business segment absorbed nearly three-fourths of all PCs shipped in China (see Figure 3). Strong demand from foreign businesses in China later spilled over into local export-oriented companies. Foreign brands will not be the automatic product of choice because many local vendors now produce credible quality and are learning aftersales service. The private sector remains China's engine for economic growth, and PCs will be rapidly deployed in this large and booming sector. However, the emergence of government, home, and education markets lowered business segment's share to 56 percent in 1997. But the PC market more than doubled, so PCs for business use still grew from 700,000 to 1.2 million units from 1995 to 1997.

 ©1998 Dataquest

Figure 3
PC Market Segments by User in China, 1995 to 1997 (Percent)



Source: Dataquest (April 1998)

Government Sector Shows Strength

The government market accounted for about 10 percent of the PC market in 1995 and nearly doubled in share to 17 percent by 1997. The government and home markets each purchased only about 100,000 units in 1995. But the government segment grew faster, reaching 372,000 units in 1997. The government's recent initiative to streamline government, reduce ministries, and cut red tape will necessitate the computerization of administrative functions across China's central government. However, the pace at which China can achieve such a mammoth task will be slow, and the funds available will be increasingly scarce.

Home Market Awakes

There are few reasons to believe that the Chinese will have any less of a desire for home PCs than is seen in the United States, where approximately 40 percent of homes have PCs. This is another example of high nascent demand, since urban families have shown a high interest in PCs to educate their children to get ahead in China's competitive education system. In China, about 0.05 percent of the population own PCs, and only about 0.25 of 1 percent of families own PCs (assuming an average family size of five persons). The current economic growth rate, resulting in higher disposable incomes, would suggest that it will take about 10 years for 20 percent of Chinese families to own PCs. Another way to look at this trend is as follows: If an average of 5 percent of PCs are retired per year in the next decade, and the home market grows by 50 percent per year, then 85 million PCs would be sold just to families in China between now and 2008.

Education Users Surge

China's education market was the fastest growing during the past three years. Only 6 percent of PCs sold in 1995 went to educational establishments, but by 1997, this more than doubled to 13 percent. The university environment is the heaviest user on a per-PC basis, with hundreds of students sharing one or two PCs. But it is also the least funded. Vendors are wise to develop market share in this segment (providing discounts) as an efficient means of building brand recognition with China's next generation of business and government leaders.

Form-Factor Trends

In addition to market segmentation by end user, Dataquest segments PC shipments by form factor, as shown in Figure 4. The Chinese market has been dominated by desktop computers. But in 1997, the notebook computer market doubled to 173,000 units after several years of slow growth. Dataquest forecasts the market to continue this growth level through 1999 and then settle to a 50 percent average growth from 2000 to 2002. Dataquest has yet to see a local notebook computer manufacturer in China, but expects volume production to begin in 1999. Significant semiconductor opportunities will emerge as portables grow from a mere 9 percent in 1997 to 26 percent in 2002. Desktop PCs remain the "bread and butter" of the industry. Desktop PC shipments will grow from 1.7 million units in 1997 to 6.5 million units in 2002. Overall PC shipment share will fall from a high of 88 percent in 1997 to 68 percent in 2002. Figure 5 illustrates the compound annual growth rates (CAGR) for each form-factor segment from 1997 to 2002.

Brands in China

Dataquest currently divides brands in China into the following three major categories. PC production within China cuts across all three types of brands with white box and minor brands increasing share rapidly.

- **Major brand**—Multinational PC brands tracked globally by Dataquest. Vendors in the major-brand market include Compaq Computer Corporation, IBM, Hewlett-Packard Company, Acer, Siemens Nixdorf Informationssysteme, Dell Computer Corporation, NEC Technologies Inc., and Toshiba Corporation.
- **Minor brand**—PC brands that are recognized nationally within any one country but are not generally known to buyers outside of that region.
- **White box**—PCs that are unbranded, or have brands that are only recognized within restricted geographic boundaries such as in a province or small town, but are not recognized nationally. Marketing is typically restricted to advertising in local newspapers, window advertising, distributing printed flyers, and/or adding a unique badge to the external casing.

Manufacturers' Response to Market Trends

Multinational companies have invested in China, expecting high market growth. However, their contracts require a high percentage of production to be exported, and their large investments also translated into a higher market share until China's domestic manufacturers entered the fray. These local manufacturers have the coveted local sales permit (*"nei xiao pai"*) issued by the government. Quality has been Chinese consumers' major concern, so the consumers were willing to pay more for a foreign brand. However, since much of demand growth has been in the government sector, local brands have gained an advantage. Incentives are provided to agencies that purchase Chinese brands. The joint venture between IBM and China Great Wall Computer Group has responded to these market conditions by producing both IBM and Great Wall brands for both government and private sectors.

Dataquest has yet to see one company that can do both manufacturing and marketing on a sustained basis within China's tumultuous, high-growth PC market. High growth does not come without risk and fluidity in the marketplace. AST Research Inc. was once the envy and business model for vendors seeking market entry to China. AST seemed have the ideal formula of manufacturing and marketing in China. But dynamic market changes and AST management's inability to respond to competition quickly eroded its margins. High turnover of personnel and persistent quality problems plagued the company, which now shows little sign of recovery.

A Five-Year Forecast for Key PC Industries

Dataquest believes that the previously discussed industry and market force will translate into a 45 percent CAGR for PCs. (Dataquest's five-year forecast of PC and peripherals are itemized in Table 1.) Motherboards, monitors, and RDDs will exceed a 26 percent CAGR. But the component growth has been lagging PC growth because a large portion of the current production is exported. Dataquest expects production to increasingly serve the local market. Dataquest also expects Southeast Asia's currency depreciation to result in that region attracting more foreign investments in export-oriented industries. Therefore, Dataquest forecasts a foreign-capital-commitment slowdown in China from 1998 to 2000, compared with the previous three years. Furthermore, China's entry to the World Trade Organization (WTO) will further open markets.

Despite these factors that will slow foreign investment, Dataquest cannot discount the pull of China's IT markets. With increased competition in China, products increasingly have similar features at similar costs. Vendors' main competitive advantage in China will be their distribution channels and time to market. Vendors with a local key component supply and designs are clearly going to be tomorrow's leaders.

PC Semiconductor Market Forecast

The consumption of PC-related semiconductors reached $1.6 billion in 1997, a 61 percent increase. If not for falling memory prices, the revenue growth would have exceed 100 percent. Instead, semiconductor market growth merely matched equipment production unit growth, a dismal performance on the whole. Dataquest's long-term forecast assumes a modest, rather than dramatic, recover in memory average selling prices (ASPs) after 2000.

Consequently, Dataquest now forecasts that PC semiconductor demand will expand at a 33 percent CAGR from 1997 to 2002.

Microprocessor Adoption Rates

If not for a near monopoly in microprocessors, we might even see a decline in semiconductor content per system. Table 2 presents Dataquest's estimates of PC production by microprocessor type in each quarter of 1997. Pentium II and Advanced Micro Devices Inc.'s (AMD) K6 were the only other non-Pentium, x86 products to increase in the fourth quarter of 1997. The success of domestic manufacturers within China is attributed to their ability to introduce next-generation products before technically superior foreign brands could import and distribute their products in China. Their proximity to their channels and ability to source locally buys critical time to market.

Chinese companies are accelerating their rate of technology adoption and surpassing their foreign counterparts in Pentium II consumption in the fourth quarter of 1997, as illustrated in Figure 6. For the year, foreign versus local Pentium-class processor consumption was proportional to total PC production. In short, there was no marked difference between foreign and local manufacturers' technology level relative to the Chinese market.

Table 2
China/Hong Kong Quarterly PC Production by Microprocessor Configuration (Units and Growth Rates)

	1996 Total	Q1/97	Q2/97	Q3/97	Q4/97	1997 Total

Personal Computer Export and Import Trend Analysis

Exports as a percentage of total PC production continues to drop in China. In 1996, 38 percent of production was exported; by 1997, this amount had dropped to 27 percent. Dataquest forecasts exports to drop to 25 percent in 1998 attributable to a high currency valuation of the renminbi relative to Southeast Asian nations. The Asian financial crisis will hurt foreign and joint-venture manufacturers more than their Chinese competitors because about half of their production in China is exported (see Table 3).

Table 3
PC Production and Exports: Chinese versus Foreign/Joint-Venture Companies, 1996 to 1998 (Thousands of Units)

				Annual Growth (%)	
	1996	**1997**	**1998**	**1997**	**1998**

Total Export Share of Production (%)	**38**	**27**	**25**	-	-

Source: Dataquest (April 1998)

PC imports in China declined in 1997 relative to 1996 because of the local producers' ability to steal market share from branded (imported) products. The declining imports and exports confirm a clear trend that local producers are increasingly dependent upon and successful in their own high-growth markets. It also raises doubt whether Chinese companies have the need or ability to emphasize exports as announced prior to the Asian financial crisis. In fact, Dataquest expects Chinese companies to remain focused on their local markets and to face difficult challenges in exporting. Dataquest forecasts the Chinese companies' exports to drop from 4 percent to 1 percent of total production and foreign/joint-venture companies to drop from 57 percent to 50 percent, as they try to turn as much production to the local market as possible (see Figure 7).

Dataquest Perspective

Dataquest summarizes the following answers to the original six questions that have been analyzed in this report:

Q: What are the production plans of major manufacturers of PC systems, motherboards, disk drives, monitors, and printers in 1998, and to what extent do these companies represent all of China/Hong Kong?

A: Production is expanding for both multinational companies and Chinese companies, but Chinese manufacturers are winning in both production and marketing of PCs. PC peripherals are export-oriented, but they will increasingly be turned to the local market because of the demand surge from system makers and currency depreciation in other Asian countries.

Q: To what extent will the desire for foreign PC brands and the currency depreciation in Southeast Asia result in a PC import boom, thereby weakening production growth?

A: Imports of major and minor brands will increase after their decline in 1996 and 1997 because of the falling PC prices from Southeast Asia, Korea, and to a lesser extent, Taiwan. But time to market and distribution are the major competitive advantages for local vendors in China, so import growth will be only modest compared with local production growth. PC exports will also decline for both Chinese and multinational manufacturers in China—as a result of China's and Hong Kong's relatively higher currency values. But

 ©1998 Dataquest

Chinese companies currently export less than 4 percent of total production, while multinational companies export 57 percent of their production.

Q: Will foreign-owned or foreign-invested (joint-venture) companies continue to invest in manufacturing within China given the intense competition from local manufacturers and white box assemblers?

A: Foreign investments will continue to compete within the local market. Chinese consumers have become sophisticated buyers in a short period of time and they now have a local supply to offset slow-to-market, more expensive foreign brands. Waiting until the last possible moment to purchase key components means lower prices for Chinese brands over their imported competitors that also face tariff and distribution expenses.

Q: What PC products or peripherals will China export, and will China become a global contract manufacturer to either compete with or complement Taiwan's leadership?

A: China will only become a world PC and peripheral powerhouse if local companies can compete within China and match their multinational competitors' market growth. The government is moving toward building *chaebols* (Korean-style conglomerates), but China faces a massive bureaucracy and limited capital and technology. As for low-end products such as power supplies and consumer electronics, China will continue to expand worldwide market share.

Q: Assuming that the above scenario occurs, what is the PC semiconductors revenue demand forecast for China/Hong Kong?

A: Consumption in 1997 was about $1.6 billion and will grow at 33 percent CAGR to reach $6.7 billion in 2002.

Perspective

Semiconductors China
Market Analysis

Electronics Manufacturing Issues and Outlook in 1998

Abstract: *Dataquest recently conducted a survey of major American, Chinese, European, Japanese, Korean, and Taiwanese electronic equipment manufacturers in China to ascertain the impact of domestic and Asian economic problems on various sectors of China's electronics industries. Dataquest's January Perspective provided a view of the key industry factors influencing the electronics industry. This Perspective analyzes the performance of specific electronic industry segments in 1997 and forecasts 1998.*
By Daniel Heyler

Survey Overview

The slowdown in semiconductor consumption during the January and February time frame is a seasonal phenomenon caused, in part, by two to three weeks (or longer) of Chinese New Year's holidays for many manufacturers and, in part, to a strong fourth quarter push by exporters. By the end of February, however, vendors typically begin to see obvious indications of stronger demand and market recovery. It is this lack of a demand upsurge for many vendors that is causing concern. Dataquest has surveyed major manufacturers to understand their short-term (1998) outlook and explore below the various levels of market factors impacting current growth.

Dataquest's sampling of manufacturers represents approximately 30 percent of total electronic equipment revenue in 1998. As shown in Figure 1, Dataquest varied the survey across communications, consumer, and data processing sectors to provide a segmented view of the marketplace. Dataquest concentrated on volume manufacturers that produce mainstream or high-growth products for both export and local consumption. For these

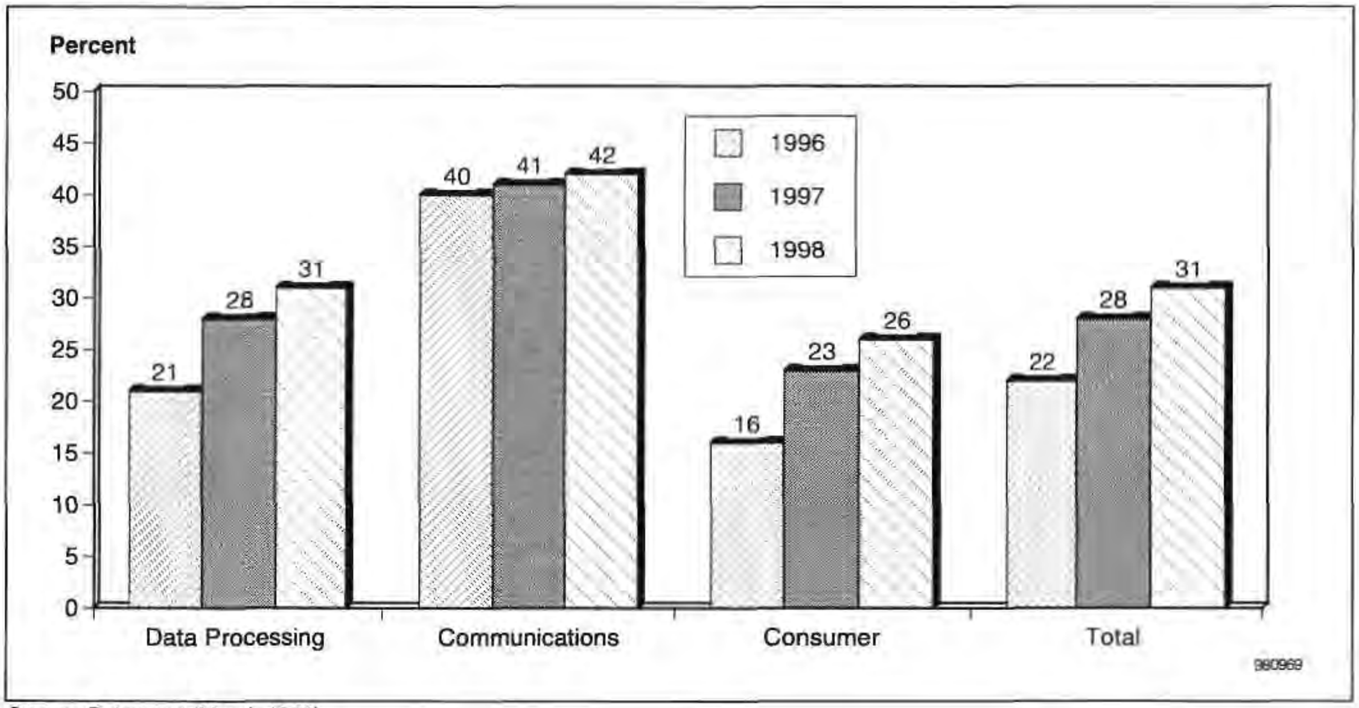
reasons, Dataquest's sample group is outpacing the overall industry average (see Figure 2).

Figure 1
Surveyed Companies' Share of Electronic Equipment Production by Segment in China/Hong Kong, Revenue



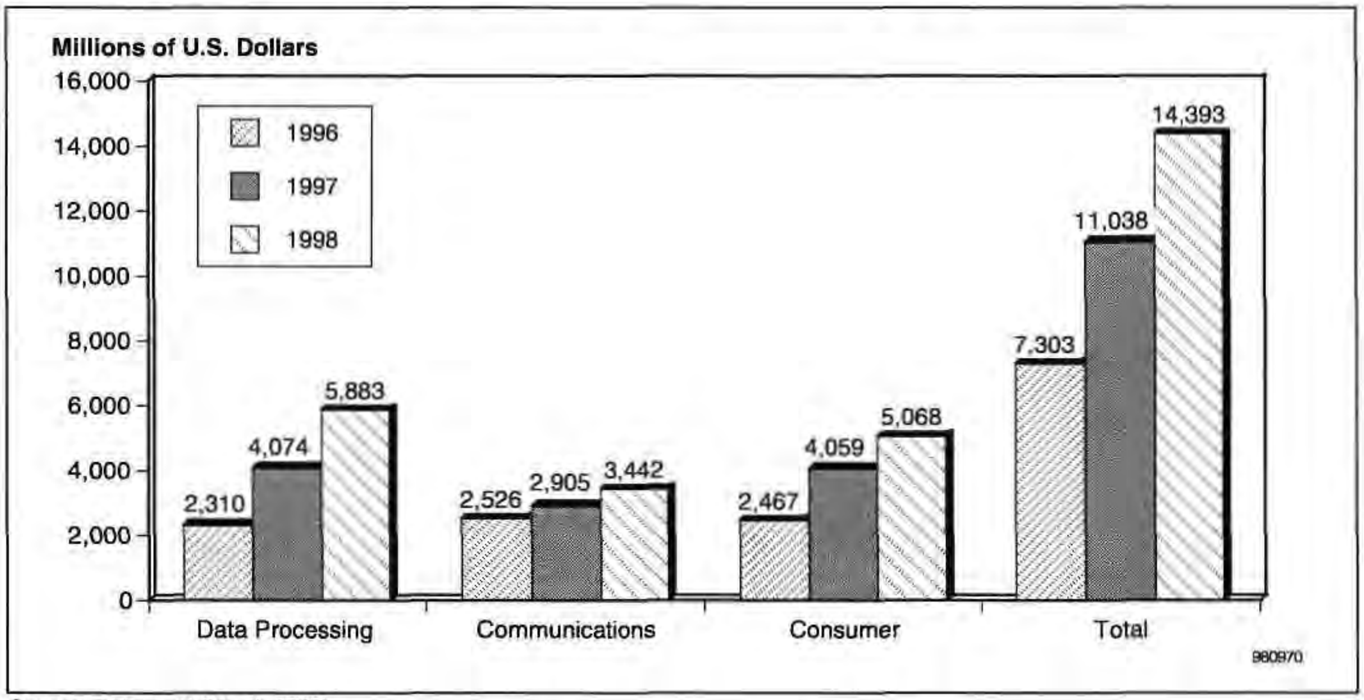
Source: Dataquest (March 1998)

Computer and Peripheral Manufacturers

The overall computer market has yet to show signs of decline, which have been felt elsewhere in the region. Dataquest's survey of 28 percent of the data processing equipment producers indicates that manufacturers did not meet their 1997 production plans in revenue terms and are slowing production expansion in 1998 (see Figure 3). Although the outlook indicates an impressive 44 percent production growth, this is much lower than 1997's 76 percent growth. (Dataquest's methodology for calculating production revenue growth includes surveying companies for unit production and growth, then applying a standard per-unit average selling price across all companies.)

Dataquest observes increased competitive pressure by foreign suppliers that are attempting to counter weak markets in Southeast Asia by focusing on the Chinese market. It appears that manufacturers are expecting increased competition in the domestic market and have lowered their expansion growth for 1998. It is also valid that the near-doubling of industry expansion will be unable to be replicated as it reaches a critical mass.

Figure 2
Production Plans of Surveyed Manufacturers in China/Hong Kong, 1996 to 1998 (Millions of U.S. Dollars)



Source: Dataquest (March 1998)

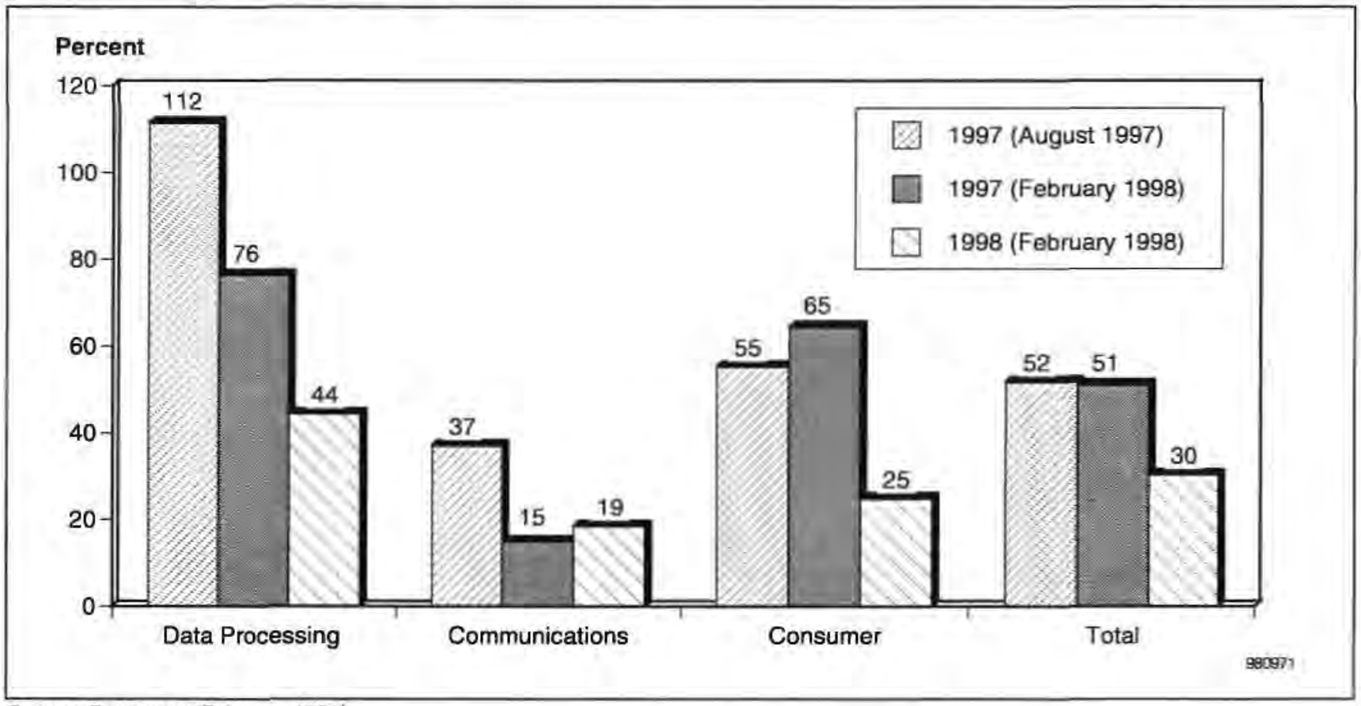
Personal Computers

The most aggressive and optimistic of the PC manufacturers is Beijing Legend Computer Company. Legend manufactured approximately 420,000 PCs in 1997 and is sticking to its plans of reaching 760,000 units in 1998. Most manufacturers have maintained their expectations for a healthy 1998. The joint venture between China Great Wall Computer Group and IBM, which produces both brands, grew 58 percent in 1997 and is expected to grow 104 percent in 1998 to 615,000 units. The Beida Founder Group did not meet its projections of producing 178,000 PCs in 1997. It plans to grow from 134,000 units in 1997 to 182,000 units in 1998. Acer Computer International Ltd.'s Beijing Minji Computer Company did not convert its mouse and keyboard manufacturing plant into a PC plant, as originally anticipated in 1997. The company expects to assemble about 105,000 units in 1998 and claims to be assembling PCs already at this location.

There are exceptions to aggressive planning and expansion, however. Nanjing Power Computer Co., a joint venture with Motorola Incorporated, decided to discontinue its Power PC computer business plans. Compaq Computer Corporation's assembly plant in Shenzhen will not be scaled up to export PCs but, instead, will service only the Hong Kong and China markets by assembling about 10,000 PCs per month. Its facility will emphasize power supplies for global export, a more labor-intensive industry.

 ©1998 Dataquest

Figure 3
Production Plans of Surveyed Electronic Equipment Companies in China/Hong Kong, 1997 to 1998 (Percent Growth)



Source: Dataquest (February 1998)

PC manufacturers express optimism about China's domestic market, which grew by about 50 percent in 1997. The rate of shipments had slowed in the second half of 1997, which was factored into Dataquest's 1998 forecast of approximately 40 percent growth. The main impetus for this growth forecast appears to be continued growth in the government and business sectors, which will account for the majority of shipments. If companies meet or come close to their current plans, PC production will expand by about 55 percent to 2.9 million units in 1998. From Dataquest's survey, the top 10 vendors are expanding by 70 percent.

Motherboards

Dataquest has revised its motherboard production estimates in 1997 from 8.3 million to 15.2 million because of the inclusion of PC Chip Manufacturing Company Limited (Taiwan) in the survey. Located in Dongguan, Guangdong, this manufacturer produced about 6.9 million motherboards in 1997 and is the largest motherboard manufacturing in China. However, less than 5 percent of its production is shipped to the China market; the remainder is exported globally. This company epitomizes "low-cost strategy." PC Chip does little advertising, has minimal customer support, and cuts administration and sales to the bare bones. Its business philosophy is survival by price and price alone. For example, PC Chip's socket-7 motherboard, with VIA Technologies Inc.'s accelerated graphics port (AGP) averaging less than U.S.$70 in Hong Kong in February, compared to an Asus Company's board that sells for U.S.$125.

 ©1998 Dataquest

China's own and largest vendor, Legend, is now capable of producing approximately 300,000 motherboards per month. Legend's production is likely to expand 30 percent from 2.3 million in 1997 to 3 million in 1998. Expansion plans for most major vendors in 1998 are more conservative than 1997 after experiencing spectacular growth of 128 percent. Dataquest estimates its unit growth to be 32 percent in 1998. The top five manufacturers will expand by 23 percent to 8.7 million units. Dataquest notes that a formidable group of small and medium-size companies exist in this segment. Dataquest estimates total motherboard production at 15 million units in 1997, growing to 18 million units in 1998.

Monitors

This sector is not slowing in growth. Dataquest forecasts monitors' unit production to grow 50 percent. Leading the sector is Acer Group, which plans to double its production at its Suzhou Minji facility from 600,000 units in 1997 to about 1.3 million in 1998. China's own Great Wall and Founder are keeping pace with Acer Suzhou, and they expect to produce about 500,000 units each in 1998. Although Founder initiated production at a new facility in 1997, Founder Likang Technology Co., its major facility is in Dongguan. The company expects to ramp Likang quickly and match Dongguan in unit output in 1998. LG Electronics Inc. will move away from monitor production at its Shenyang facility and produce consumer products, presumably TV monitors. Samsung Electronics Company Ltd., also in Shenyang, plans to utilize its operations for more sales and distribution rather than monitor production.

Rigid Disk Drives

Seagate (Shenzhen) International Technology Company Ltd.'s 1997 production fell short of its projection but reached 2.5 million units in 1997 and is expected to reach 3 million units in 1998. Production at Seagate (Wuxi) International Technology Company Ltd. met expectations with 2.8 million drives in 1997. It raised its target for 1998 to 4 million units. Combined production is expected grow 32 percent to 7 million units in 1998.

Page Printers

China's 51,100-unit page printer industry is small and has yet to experience a boom many have been waiting for following the computer boom. Dataquest forecasts 45 percent growth, or 74,200 units, in 1998. Imported products are strongly preferred by Chinese users, and formidable competition by any local companies has yet to emerge because of tight technology controls by foreign manufacturers.

Consumer Electronics Manufacturers

Dataquest's survey covered approximately 23 percent of China/Hong Kong's consumer electronic production revenue, as shown in Figure 1. This is the only segment that outperformed its August 1997 expectations for annual growth. In August, surveyed manufacturers of eight products (camcorders, color televisions, stereos, radios, video compact disc players, VCRs, and video games), indicated a 55 percent average growth for 1997. However, since that time, a flurry of VCD manufacturers have entered the market. Dataquest surveyed and estimated these companies in February, which explains the production increase.

But from VCDs to color televisions, there is a wide variance of opinion among consumer electronics manufacturers. As the oldest sector, a large number of companies are inefficient, state-owned enterprises that are going through major restructuring. On the other hand, economic growth has raised disposable income levels and spurred spending on stereos, televisions, and appliances—even in remote rural areas. And still, opportunities for new technologies and standards are ripe, irrespective of worldwide standards, making the case for the VCD-consumption boom in China.

Color Televisions

Color television production, the pillar of China's consumer electronics, expanded by about 10 percent in 1997. Based on manufacturers' input, the color TV industry will accelerate to 15 percent. The top 10 producers' expansion plans remain aggressive. However, such growth will be difficult to achieve because of high inventory levels, inexpensive Korean imports that are beginning to enter the Chinese market, and an anticipated economic slowdown in 1998 to between 7 percent and 8 percent, relative to 1997 levels of 8 percent to 9 percent.

Leading the optimists in 1998 is Sichuan Changhong Electric Appliances Company Ltd., which boasts that it will expand production by 31 percent to reach 8 million units. Dataquest's China research staff believes that inventories have risen dramatically in recent months to as high as 1 million units. What could potentially exacerbate the problem is the fact that Korean-made television prices are falling. If these TV sets start to meet Chinese-made price points, then consumers could gradually start to buy Korean. Until now, the market has been strongly segmented with Japanese-made brands dominating the high-end market and Chinese-made products popular with the value-conscious buyers.

Video Compact Discs

Dataquest estimates the VCD industry to produce 15 million to 16 million units in 1998, which is equal to two-thirds of the number of TV sets produced in China. Production is concentrated in the top 10 manufacturers that account for about 75 percent of production, and it is expected to grow 61 percent over 1997. Changhong has recently entered the foray of manufacturers and has made significant investments in an attempt to lead this industry by the end of 1998. It expects to expand output from 400,000 units in 1997 to 3 million sets in 1998. Last year, Changhong had forecast 2.2 million sets for 1998 and has raised its forecast to 3 million units, apparently becoming increasingly optimistic about its prospects for success. The company has been working closely with C-Cube Microsystems Inc. Competition is fierce in this cut-throat, price-sensitive business. The VCD system designs are readily available and mechanical parts are readily copied by competitors. Electronics technologies are also readily available from the plethora of foreign partners with facilities such as LG Electronics, Philips Electronics NV, Samsung, and Sharp Electronics Corporation.

 ©1998 Dataquest

Videocassette/Tape Recorders

There was little good news from VCR manufacturers that sell products in China mainly because of the adoption of VCDs. Dataquest expects consolidation among local manufacturers. But because this industry is dominated by five manufacturers that export most of their production, the overall industry appears to be growing. The combined production of Shanghai Lejing Guangdian Electronics Company, Hualu Matsushita VCR Co. Ltd., Xiaxin Electronics Co. Ltd., Tianjin Samsung Electronics Ltd., and Shenzhen Huangqiang Sanyo Electronics Co. Ltd. reached 1.9 million units in 1997 and is expected to reach 2.2 million units in 1998.

Communications Equipment Manufacturers

The communications segment did not meet manufacturers' expectations in 1997. The companies surveyed accounted for 41 percent of communications production revenue in 1997. After several years of impressive growth, these companies' average expected growth in production was 37 percent. The February estimates indicate only 15 percent growth in revenue as shown in Figure 3. Central-office equipment and mobile-communications-infrastructure equipment are two categories that met expectations, expanding about 41 percent and 40 percent, respectively. In 1997, all other sectors grew less than was forecast. The most dramatic surprise to the market was the falloff in the pager market.

Pagers

Motorola, Matsushita Communications Industry Co. Ltd., and TCL/NEC, for example, had planned to expand production from 5.5 million units in 1996 to 7.8 million pagers in 1997. Dataquest's preliminary estimates show the actual 1997 number to be 6.1 million units, a meager 10 percent growth. As the largest producer, Motorola's two plans were impacted the hardest. The Motorola (China) Electronics Ltd. in Tianjin expanded by about 11 percent, while Shanghai Motorola Paging Products Co. Ltd. remained flat at about 1 million units. The manufacturers' goal is to expand production by more than 17 percent, and they are presumably looking to an export-demand boost. One of the main reasons for the pager-production decline was the widespread adoption of cellular phones in China as a substitute product.

Cellular Handsets

Dataquest estimates that China's top six cellular phone manufacturers produced about 500,000 more phones than originally planned in 1997. Total production of Ericsson, Matsushita, Motorola, NEC Corporation, Nokia Telecommunications, and Siemens AG reached 2.2 million sets in 1997, a growth of 70 percent over 1996. Motorola's Hangzhou and Tianjin plants accounted for approximately 1.2 million units according to company reports; the company plans to reach 1.5 million units in 1998. These six manufacturers plan to expand production of cellular handsets by 21 percent in 1998.

Party Congress Meeting in March Contributes to Short-Term Uncertainty in the Electronics Industry

We hear and read about government's and large manufacturers' optimism on China's electronics industry. However, the uncertainty as to how the government's vision will play out in practice is causing widespread concern, especially among the Chinese companies. The government is showing signs that it will accelerate its ambitious plans to adopt information technology to modernize public and business sectors and to support "localization" of technology. There is no major slowdown in telecommunications deals being signed at central and provincial levels of government. In February, the Guangdong Post and Telecommunications Authority (GPTA) signed a $34 million networking deal with Newbridge Networks Corp. In other areas relating to manufacturing, however, projects appear to be more carefully viewed and delayed as the state-run enterprises are being restructured. The Communist Party Congress meeting in March further raises the prospects of change and short-term uncertainty, contributing to the very cautious business environment.

Large Chinese manufacturers also express optimism, echoing the government's advocates of IT spending. But information from component suppliers tells a different story. Planning managers are also cutting inventories and planning conservatively. This caution is partly attributed to uncertainty in how government restructuring of state-owned enterprises will affect the specific industry. Adding to business planners' concerns are the Asian financial crisis' effects on exports and the Chinese economy's performance in 1998. As discussed earlier, one immediate effect of the financial crisis has been the inexpensive Korean televisions competing with Chinese products in the low-cost segment of the market.

Manufacturing Trends: Subcontracting Reconsidered

Because foreign-owned manufacturers tend to export the majority of their production and, in general, do not procure semiconductors locally, this sector continues to expand. These entities tend to export the majority of their production and do not have localized procurement.

Dataquest has yet to see any sign that foreign manufacturers are abandoning or changing their investment strategy radically in China. Most of their existing plans are long-term and are unlikely to be affected by the Asian financial crisis. As for new investments—whether to invest in new plants in China or Southeast Asia—the uncertainty within China's political systems poses significant risk. Investment policies and the financial system are undergoing radical change, so new investors in the region are reticent. On the other hand, companies with existing facilities and capital are able to expand production and benefit from the lower exchange rates.

Dataquest believes the foreign investors' tactical changes within China to be more significant. Foreign manufacturers are faced with various investment model options when setting up operations in China. The once-popular model to fully localize management and operations has proved less effective than hybrid variations that are now evolving. Cost controls, intellectual property, and material costs are key business concerns for foreign manufacturers in China. In new technology areas such as PCs and VCDs, intellectual property is the foreign manufacturers' only competitive advantage because manufacturing costs are comparable in each sector. How to control these assets is increasingly important. Therefore, foreign companies once believed that operating their own facility would give them maximum control and, therefore, the biggest cost advantage.

Dataquest believes that a more cost-effective model will emerge, and that this model is subcontracting. Multinational companies (MNCs) can avoid huge setup costs, government regulations, and heavy taxation by using a subcontractor. And the long-term advantage is increased competition among local manufacturers, which benefits the original equipment manufacturers (OEMs). The possibility of losing intellectual property to one's subcontractor was feared previously, and that was the reason for setting up a fully owned operation. However, MNCs are finding that full ownership does not guarantee full control because there is a high turnover of key, senior staff and company-critical information often goes with these departing staff.

The OEMs appear to be devising better ways to control intellectual property (IP), which is making subcontracting an increasingly viable alternative to full-ownership production in China. Both full ownership and subcontracting have risks, but the risk/benefit of subcontracting is improving. A beneficial approach is through inventory management.

In a fully owned subsidiary or joint-venture company, oftentimes, operational, financial, R&D, and supplier information are divulged to the management team in China. When middle and upper managers leave, they not only have the OEM's board designs and manufacturing processes, but speedy access to key components and support. In a subcontractor relationship, the power shifts back to the OEM, which can negotiate for the lowest-possible cost between competitors. Key components and access to suppliers is controlled by the OEM that centrally purchases and warehouses components. Each component can be accounted for with each unit of finished good that is shipped. This may not halt the loss of IP but it may lengthen the time necessary for competitors to reverse engineer, produce, and mass market. With total control of parts and purchasing, a subcontractor in China is impaired long enough for the OEM to phase out its product and start producing its next generation of products.

Dataquest Perspective

Dataquest's survey of manufacturers in China represented 30 percent of electronic equipment production, 28 percent of data processing, 41 percent of communications, and 23 percent of consumer electronics. At an aggregate level, companies surveyed met their expected growth of 51 percent in 1997. The high level of growth, spurred primarily by foreign manufacturers, had begun to slow prior to the Asian financial crisis. Despite the recent turmoil, these companies anticipate a healthy average 30 percent growth in 1998. The manufacturing of many products will far exceed the average, but that will struggle to match 1997's production levels. The manufacturing environment, like the market, is very dynamic. Companies continue to change and adopt new operation models to deal with these forces. At the same time, the central government will continue to exert a huge influence on industry growth until the state-owned sector can begin to stand on its own.

Market Analysis

China's Economic Outlook: Assessing Asia/Pacific's Financial Crisis on Growth

Abstract: *Watching the unfolding of Asia/Pacific's economic events, Dataquest sees China weathering the storm better than its neighbors. But to what extent will cheaper exports from the rest of Asia/Pacific impact semiconductor consumption in China? Dataquest highlights its economic assumptions for 1998 as the baseline for the formal forecast of China's electronic equipment production. Dataquest also assesses the impact of this financial crisis on China.*
By Daniel Heyler

An Outlook

In this Perspective, Dataquest presents its economic assumptions for China, prior to the formal electronics production and semiconductor consumption forecasts scheduled in March and April. The recent rise of risk and uncertainty as a result of Asia's financial crisis (AFC) has led to questions and concerns from clients about China. In this Perspective, Dataquest analyzes the effect of the currency crisis and discusses China's key economic indicators and growth outlook as they relate to electronics production. Dataquest then provides a qualitative analysis of electronics and semiconductors production, in addition to providing a qualitative analysis of the currency crisis's potential impact on electronic equipment production in China. But first, several key conclusions of this Perspective are summarized as follows:

FILE COPY:
MARIA VALENZUELA

- China has been immune from the Asian currency crisis because of the structural difference of its economy and immaturity of its financial markets. While exports have been falling in Southeast Asia, China's exports have surged. China's trade strength also contributes to this crisis.

Dataquest
Program: Semiconductors China
Product Code: SEMI-CH-DP-9802
Publication Date: February 16, 1998
Filing: Perspective
(For Cross-Technology, file in the Semiconductor Regional Markets and Manufacturing binder)

- Problems with bad loans in China are *not* as serious as elsewhere in Asia because China's loans are made by Chinese banks to Chinese companies within a nonconvertible monetary system. By staying on the current course of economic growth and reform, the Chinese government is capable of working through its financial problems. In addition, China's financial markets are too small and tightly controlled to become a target of international speculators, who are busy elsewhere. So China's U.S.$120 billion foreign reserves are available to the government to assist local banks and continue the rapid pace of reforms, albeit now more cautiously.
- Dataquest expects new foreign investments in China to decline in 1998 due to the both Asia's financial crisis and production overcapacity in 1997. Investments from foreign companies have been the key driver to growth in China's electronic equipment industry, especially in the past four years. These investments have resulted in high export growth that represented more than 70 percent of electronics output in 1995. In 1997, Dataquest estimates electronic equipment exports reached $26 billion, or 62 percent of total production. Large investments continued in 1997, which boosted multinational companies' electronic production capacity by more than 40 percent. With plentiful capacity and the threat of goods from other countries flooding the global market, multinationals have little need or incentive to expand capacity in China.
- Dataquest does not expect a slowdown in strategic investments that are the primary purpose of developing the Chinese markets. Investments targeting market expansion within China may, in fact, increase as multinational equipment vendors turn to China to compensate for market losses in Southeast Asia and Korea. In January, one of the most unstable months in Asia, Motorola Incorporated announced an integrated smart card system development/manufacturing joint venture. In semiconductors, Dataquest sees that MEMC Electronic Materials Inc. is planning to build a silicon plant in China.
- Dataquest expects the impact of weaker exports from China to reduce electronic equipment production by $1.2 billion in 1998 and $2.8 billion by 1999.
- Assuming semiconductor contents of 15.8 percent in 1998 and 17.5 percent in 1999, weaker exports translate into $189 million and $496 million in lower semiconductor consumption, respectively. The top-line growth would then be 20 percent in 1998 and 27 percent in 1999. Dataquest's last formal forecast estimated 23 percent growth in 1998 and 31 percent in 1999, respectively—a loss of 3 percentage points in 1998 and 4 percentage points in 1999.

Year of the Tiger: A Meow or a Roar for GDP?

Key economic data suggests that China will be able to sustain strong economic growth, although its Asian neighbors will face a downturn caused by high interest rates and a weak consumer purchasing power. Dataquest presents the economic assumptions for China and its view of the Asian financial crisis on China following the forecast.

China is the only major economy in Asia/Pacific that has not been hurt by the Asian financial turmoil during the past five months. However, economic growth slowed to about 8 percent during the second half of 1997 from 9.5 percent in the first half, due in part to slower industrial output and domestic consumption. Industrial production declined from 15 percent in 1996 to 10 percent in 1997 because of the consolidation of money-losing, state-run enterprises. The good news for the economy was that inflation dropped from an expected 10 percent to 3.8 percent (see Table 1).

Another factor behind the slowdown was that direct foreign investments increased only 8 percent in 1997. The planned, approved investments for 1998 dropped by about 40 percent. The slowdown in economic growth, combined with declining investments, has caused Beijing to cut or extend import tariffs on equipment. The second initiative in 1998 is to finance state-owned enterprise reform through government treasury bonds and to relax their tax burden. These factors also have resulted in a lower consensus forecast for gross domestic product (GDP) growth in 1998 and 1999. Previous expectations for 1998 GDP growth has been lowered from 11 percent (with high inflation) to 8.7 percent (with low inflation), with an 8.5 percent (with low inflation) in 1999.

Exports Face Threat in the Second Half of 1998

Although China is a large country and its economy has exhibited remarkable change and growth, the role of exports has been a critical element of growth. China's largest trading partner is the United States, which accounts for

Table 1
Key Economic Data and Forecast Assumptions for China, 1995 to 1999

	1995	1996	1997	Forecast 1998	Forecast 1999

 ©1998 Dataquest

approximately 15 percent of China's total worldwide trade. Trade with the United States increased by a healthy 14 percent in 1997.

There is good news and bad news for China on the export front in 1998. The good news is that exports were much higher than anticipated in 1997. The bad news is that China will be negatively impacted by the currency crisis in other Asian countries. Many of the goods produced in Southeast Asia are also produced in China, so devaluation directly affects the overall trade. Dataquest had forecast a smaller trade surplus than China achieved in 1997, but China's strong performance was related to a fall in imports rather than a surge in exports. Merchandised export growth was flat in 1996 (at 1.5 percent) but accelerated to 15 percent in 1997. At the same time, Chinese imports did not rise as quickly; they grew 5 percent in 1996 and declined by 8.5 percent in 1997.

As shown in Figure 1, exports represent about 16 percent of China's GDP. Unlike most other Asian economic "miracles," China's growth has been a balance of domestic consumption and export growth, as previously mentioned. This balance will give China an advantage over the long run, especially since the sheer size of the economy is expected double in real terms to $1.6 trillion in 2001. Consistent with Dataquest's views of electronic production, economists also believe that exports will fall as a percent of GDP due to robust domestic consumption. In short, currency devaluation in other parts of Asia will affect economic growth in China, but the country is far less vulnerable than other Asia/Pacific countries. Figure 2 illustrates China's trade balance from 1995 to 1999.

Asia's Financial Crisis: Is China the Next Prey?

At a worldwide level, the pause in the Asia/Pacific region's breakneck economic growth is assumed by Dataquest to have a direct impact on consumer and business electronics purchases within Asia/Pacific. This situation will directly impact equipment companies selling in Asia/Pacific. For this main reason, Dataquest anticipates a lower semiconductor consumption at a worldwide level than was forecast in October 1997, since Asia/Pacific accounts for approximately one-fifth of all electronics consumed in the world. Asia/Pacific's electronic companies have the most to lose from a market slowdown because they have the largest share of production sold within the region.

However, what has been dubbed the "Asian financial crisis" has yet to include China, which accounts for half of Asia's population, one-fifth of electronic equipment production, and one-fourth of semiconductor consumption. (Dataquest uses the term "Asia's financial crisis" for simplicity

Figure 1
China's Real GDP and Merchandise Exports (Billions of U.S. Dollars)

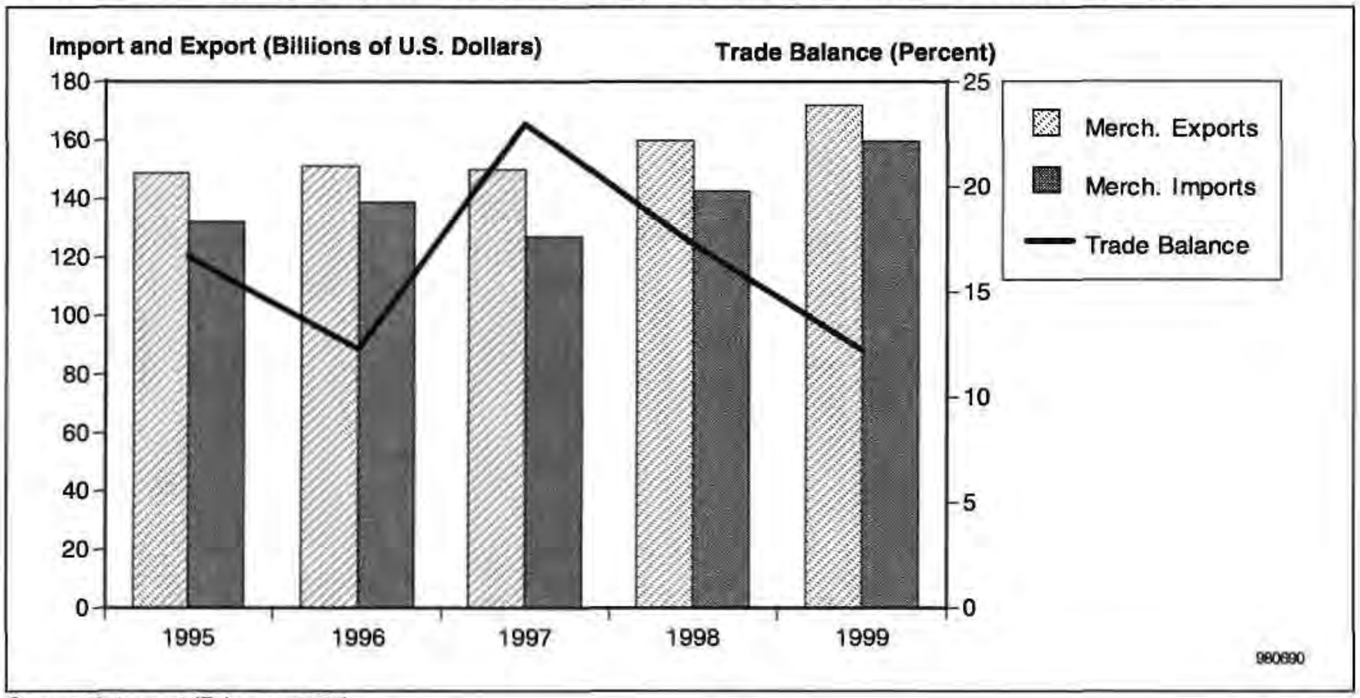
China's Imports, Exports, and Trade Balance, 1995 to 1999 (Billions of U.S. Dollars)



Source: Dataquest (February 1998)

sake to describe the recent fall in once-pegged currencies that have weakened Asia's financial systems and economic growth.) Chinese manufacturers still benefit from the robust local market and are negligibly affected by decreased exports to Asia/Pacific countries. To what extent multinational companies that export most of their products may reduce expenditures in China is also examined in this Perspective.

The question is not whether China will devalue its currency, but when. Currently, the government adamantly denies any inclination to devalue its currency (such words would put more devaluation pressure on other Asian currencies, thus impacting the Hong Kong peg). China is not immune from currency speculators, but its lack of large financial markets makes it unattractive to speculators. It is not yet relevant to compare China to other Asian countries. China has a completely different set of economic and financial issues because the Chinese economy is still at an early stage of economic development (at least 10 years behind Thailand and Malaysia and 20 years behind Taiwan, South Korea, and Singapore). China may not follow the same pattern as other countries in the near term. Because China does not have a convertible currency, it is more difficult to ascertain whether the currency is overvalued or undervalued. One can look to the black market to see what traders are charging for U.S. dollars; the current rate has been edging up to RMB 8.8 to the dollar, compared to the official rate of RMB 8.32.

There is little doubt that China's exports will be hurt by devalued currencies in the rest of Asia, but from which consequence and to what extend is less clear. China's largest investors are from within Asia/Pacific itself. Companies have been accelerating investments due to rising costs in their own countries and inexpensive operating costs in China. There is less reason to invest in China other than for the local market. So Dataquest believes that China's RMB will be devalued, but when the government does this depends whether exports can continue to grow and how critical exports are to maintaining strong economic growth. If local consumption continues its lackluster growth, for instance, then unemployment could rise, causing the government to emphasize export-driven economic growth. China has shown restraint in exacerbating the current crisis and is treading carefully in the early stages of this crisis.

AFC's Effects on Electronic Equipment Production

Dataquest believes that the key issues of the crisis are as follows:

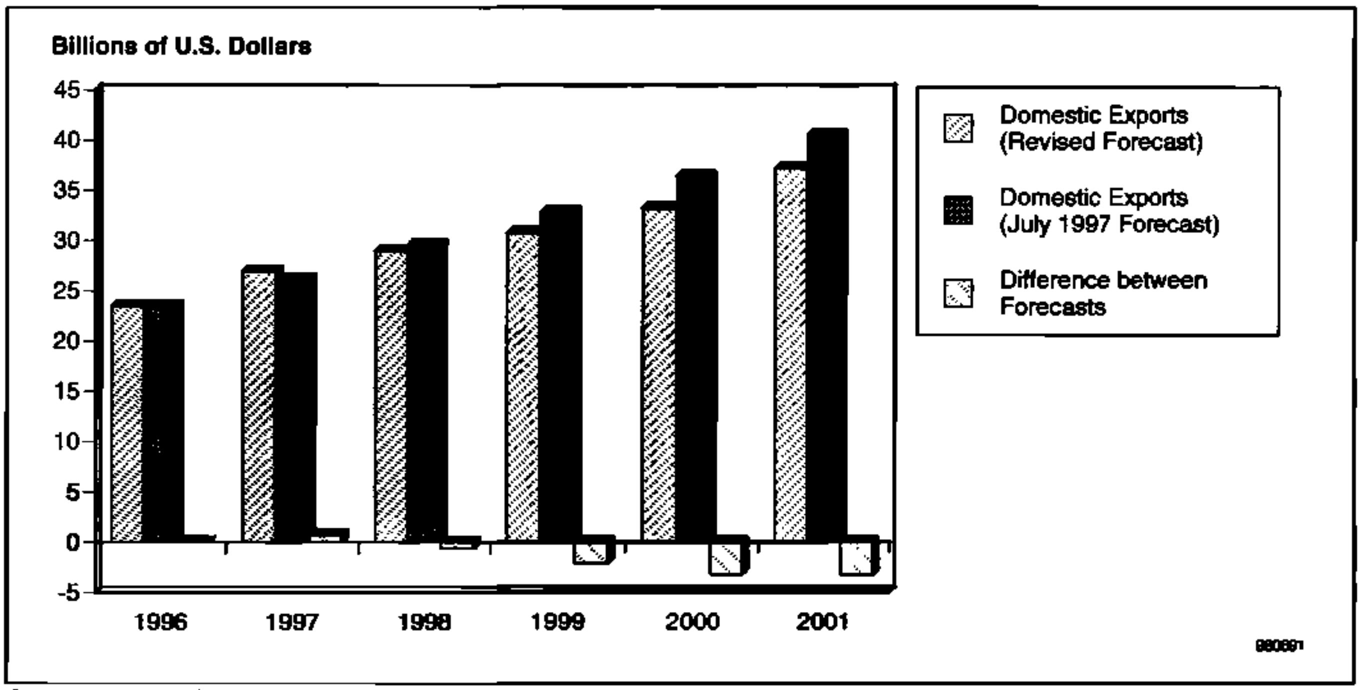
- As a competitor, will China's cost advantage be overtaken by Southeast Asian countries' lower exchange rates?
- To what extend will Southeast Asia's slower economic growth and weaker currencies negatively affect China's exports?
- Investments to China have outpaced all other regions within Asia/Pacific the past few years. Will China lose factory investments to Southeast Asia?

The lion's share of China's electronic equipment exports are produced by the multinational corporations (MNCs) or joint ventures within China and shipped to Europe, Japan, the United States, and Southeast Asia. Dataquest does not anticipate MNCs making a radical shift in production to other facilities in Southeast Asia and displace China-based production in the short term. Manufacturers are taking a wait-and-see attitude because China could easily devalue its currency to make exports more competitive. In the short run, it is not feasible from a logistics standpoint to shift production quickly to other facilities. Additionally, the majority of production costs for MNCs is fixed costs (such as plant and equipment) rather than variable costs (such as labor). Since the largest portion of costs is components that are predominantly imported by Asian countries, Southeast Asia's cheaper export currency means higher import costs (as well as debt-servicing costs). In sum, Southeast Asian manufacturers may gain from weaker currencies, but this likelihood should not be overstated because costs may also rise.

Since currency devaluation's short-term effects are not likely to be huge, one needs to examine its potential long-term consequences for China. Export growth in 1999 will be impacted more severely (see Figure 3). However, Dataquest can be sure that China will do what it has to do to maintain a steady economic growth, foreign investments, and manageable unemployment levels. If some Asian countries do not reform their economies and adopt an "export-or-die" mentality, China has the option to devalue its currency. The size and strength of China's export industries warrant caution among its Asian neighbors. Indeed, everyone will be watching Asia's export picture with great concern throughout 1998.

These costs can best be recovered by operating at the maximum capacity. Furthermore, most products and facilities were put in China in the first place

Figure 3
China's Electronic Equipment Exports (with AFC Effect)



Source: Dataquest (February 1998)

to take advantage of the potential or current local market opportunities. Based on these new numbers, Dataquest does not foresee a major revision in the short-term assumptions of electronic equipment exports for regional or macroeconomic reasons.

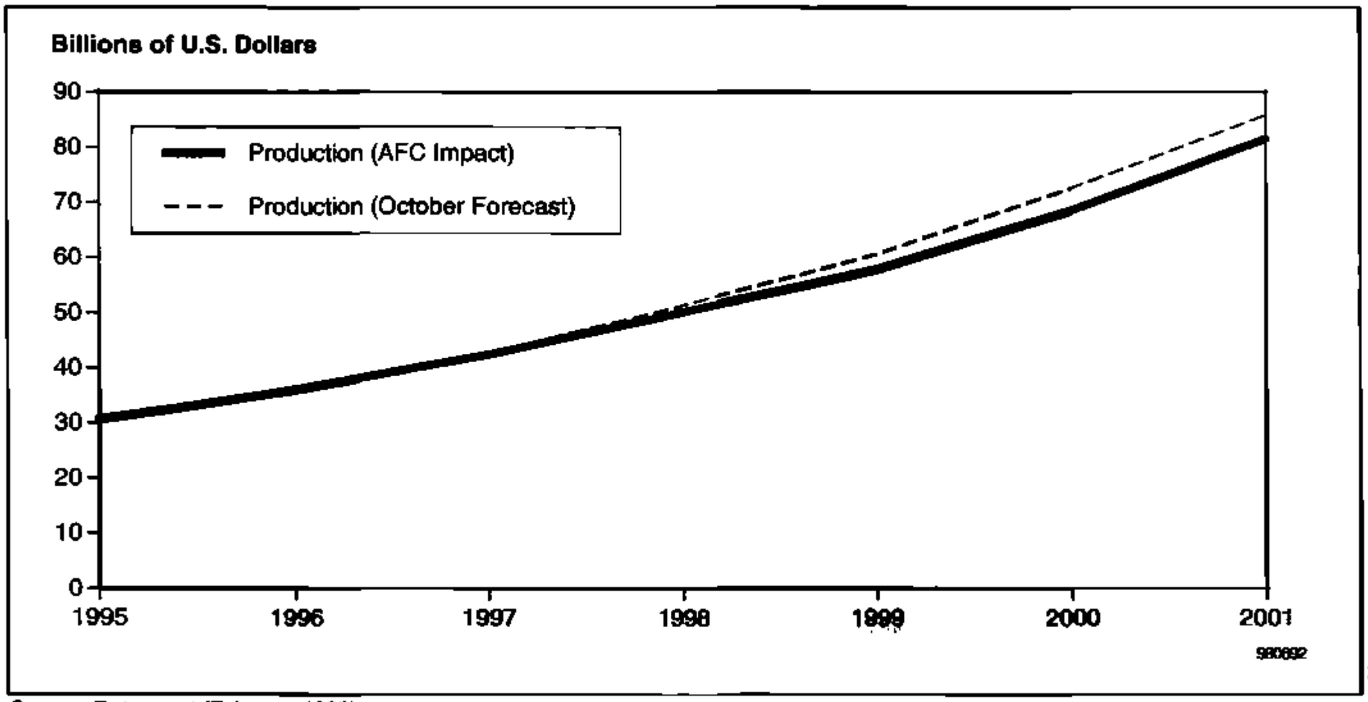
As shown in Figure 4, Dataquest expects the impact of weaker exports from China to reduce electronic equipment production by $1.2 billion in 1998 and $2.8 billion by 1999. Assuming a semiconductor content of 15.8 percent in 1998 and 17.5 percent in 1999, weaker exports translate into $189 million and $496 million in lower semiconductor consumption, respectively. The top-line growth would then be 20 percent in 1998 and 27 percent in 1999. Dataquest's last formal forecast estimated a 23 percent growth in 1998 and 31 percent in 1999, respectively—a loss of 3 percentage points in 1998 and 4 percentage points in 1999.

Dataquest's research shows that electronic equipment production's overcapacity became apparent in 1997. Dataquest does not view this situation as a high risk for these investments because some investors may believe that Southeast Asia can easily ramp up capacity. The region's local companies are in no financial position to make large capital equipment purchases to steal market share from the Chinese companies. Chinese companies are impacted only as far as their exports to Southeast Asia will be reduced due to lower economic growth there.

Multinational Investments Cut in 1998

On another level, comparing multinational companies in China with those in Southeast Asia is appropriate to developing some conclusions on this

Figure 4
China's Electronic Production (with AFC Effect)



Source: Dataquest (February 1998)

©1998 Dataquest

segment. To conclude that this market segment will be hurt by the financial crisis is to assume that multinationals will reduce production in China and increase production of the same goods in other facilities. There may be cases when this situation occurs, but various factors make such moves impractical.

The investments made in China are strategically different from those made in Southeast Asia. Shifting production from China to Southeast Asia as a currency hedge does not conclusively lower costs, assuming that such a logistical move is even feasible in the first place. Many companies that target global exports invest in Southeast Asia instead of China. Southeast Asia has offered much more transparent investment regulations, tax holidays, and government support than China during the past two decades. Worldwide capital-intensive investments have tended to migrate to Southeast Asia due to its securer infrastructure than in China. While there have been high-end, globally exporting facilities in China (for example, Motorola Incorporated's pagers, and Seagate Technology Inc.'s disk drives), the overwhelming majority of production facilities is located in Southeast Asia.

Multinational companies' (that is, electronic equipment companies) still look to China as a production site either exclusively or primarily to develop sales channels and relationships within China's complex socialist economy. (Data shows that companies with production facilities in China are more successful and sell more.) For this reason, joint-venture agreements between foreign and Chinese partners represent the lion's share of electronic equipment production.

Dataquest highlights China as the beneficiary of an emerging domestic market as well as export competitiveness that provides a strong economic base over the long term, compared to the export-dependent economies in Asia. China's rapid electronics consumption growth has been tied to strong business growth and to the development of a middle class in urban areas. Disposable income is rising faster in China than in any other Asian countries. Average annual income for urban families has increase fivefold since 1985 to nearly RMB 5,000 (about 300 million Chinese live in cities). These are long-term manufacturing strategies that will not be abandoned in an attempt to gain from short-term currency gains. Furthermore, the Chinese government could devalue its currency any day to compete with Southeast Asia. It has done so in the past and is expected to do so in 1999. Dataquest believes that multinational electronic equipment companies in China will ride out the crisis. Market-focused investments will continue in line with rapid market growth. However, the short-term ride will be bumpy because export-oriented investments will stall until the Southeast Asian economies stabilize.

Chinese Electronics Companies Face Export Challenges

Dataquest turns the assessment of potential market threats to Chinese companies. Dataquest's research indicates that approximately 40 percent of semiconductor consumption (in revenue terms) comes from Chinese-owned enterprises. The currency crisis in Asia is likely to cause Beijing to reassess either its goals or its strategies to build Chinese electronic conglomerates from export prowess.

 ©1998 Dataquest

After years of failed government policies and protectionism, a flurry of successful domestic companies have emerged in the areas of computers, consumer electronics, and telecommunications. A new model for development has emerged from Beijing as a result, and that is to consolidate smaller, unprofitable companies or allow them to be merged by these leading companies. The next step is to support these manufacturers and motivate them to export globally. For example, the Legend Group has moved its headquarters to Hong Kong to implement this strategy. Konka successfully exported color televisions from its facility in southern China.

Countless others were aggressively following their government's lead by developing strategies to boost their exports. The rationale is that for China to enter the World Trade Organization (WTO), it will have to open its markets. If companies cannot compete in foreign markets, then how will they be able to compete against these same companies in China? Dataquest believes that the currency crisis did not seriously hurt the leading manufacturers because they, as a whole, rely on their domestic market. The crisis will, however, slow the implementation of this initiative until new competitive dynamics emerge. For now, the Ministry of Electronics has placed public emphasis on companies to maintaining strong share in the domestic markets, presumably in preparing for weakened export growth this year.

Government Response

One cannot forecast government policy. Dataquest can make some educated guesses based on past behavior and understand the issues facing policymakers. Already, Dataquest hears about a change in emphasis from China's influential Ministry of Electronics (MEI) due to this currency turmoil.

Several months before the Asian currency crisis, MEI officials expressed a need for China's large domestic companies to position themselves for export competitiveness. The thinking was that if domestic companies could compete internationally, then they could complete domestically. Domestic competitiveness will be a necessity if China begins to open its markets with the intention of entering the WTO.

Led by the electronics, China's manufacturing sector has been expanding by 15 percent during the past several years, primarily because of economic reforms and foreign investments. However, inefficiencies in the unreformed, state-owned enterprises have plagued the economy, exacerbating corruption and income disparities. Accelerating growth in electronics production has come from foreign manufacturers that export the majority of production as well as domestic manufacturers that now compete against foreign brands within China. Exporters benefited when China devalued its currency several years ago, taking away the market share from Southeast Asia and spurring investments from Taiwan, Korea, and elsewhere.

In 1997, China's exports soared 20 percent. However, with Asian currencies now cheaper, Dataquest expects a slowdown in investments from the multinationals and a diversion of investments to southeast Asia during the

 ©1998 Dataquest

next few years. China's currency is nonconvertible and the government *could* conveniently take this opportunity to devalue to help exports. But China is showing restraint and is avoiding the aggravation of Southeast Asia's problems. If China can continue to grow its domestic economy and reform its industries, it can delay or even avoid devaluing the Renminbi, which will positively impact the rest of Asia. However, a domestic consumption slowdown and a serious unemployment rise will cause the leadership to turn to the export front to save the economy.

What about Hong Kong?

The cost of Hong Kong maintaining its pegged currency will be higher interest rates and slower economic growth. The upside will be the lower costs of doing business in Hong Kong and southern China. As China's main semiconductor supply channel, lower costs in Hong Kong benefit almost all semiconductor suppliers over the long run (rents alone have declined 20 percent to 30 percent in three months and are still falling). Labor markets have loosened and inflation is down, and salary pressures have been relaxed. Hong Kong's GDP is expected to increase 4.5 percent in 1998 compared to 5.6 percent in 1997. Consumer prices' increases are expected to decelerate from 6 percent in 1997 to 5.5 percent in 1998. And, Dataquest agrees with the consensus that the Hong Kong peg will remain in place through 1999.

Dataquest Perspective

The "Year of the Tiger" will indeed be one of the most interesting since China's Tiananmen Square incident shocked Asia and the rest of the world. The currency crisis's influences on electronic equipment companies in China is multifaceted. The largest and the most important segment of semiconductor demand comes from foreign companies operating in China. Dataquest estimates that nearly 60 percent of China's semiconductor demand (in dollar terms) came from multinational and joint-venture enterprises in 1997. Multinational companies' investments in China have been the main impetus to high semiconductor demand growth. China has outpaced the rest of Asia during the past five years and surpassed Taiwan to become the largest semiconductor market in Asia/Pacific in 1996.

Dataquest's discussion of economic factors and the effect of Asia's currency crisis centers on two main issues affecting semiconductor demand. First, multinationals have invested in production facilities within China primarily for export or domestic shipment. Second, Chinese-owned (domestic) companies have the largest stake in the local markets and, conversely, export a smaller share of their output than the multinationals. For these companies, local demand is important because the majority of production is shipped locally rather than exported globally.

Market Analysis

Movers, Shakers, and Key Events in China and Hong Kong in 1997

Abstract: *The year 1997 proved to be pivotal for China and Hong Kong from several perspectives. Dataquest has compiled key events' summary and perspective of their effects on the semiconductor markets and industries in China and Hong Kong.*
By Daniel Heyler

Overview

Dataquest sees 1997 as a year of impressive achievements but is uncertain as to how 1997 will affect 1998 and the years ahead.

The smooth handover of Hong Kong from British to Chinese rule enabled both economies to maintain impressive growth with record-low inflation and ensured foreign investments continue to flow into the region, outpacing most other Asian countries. Multinational investments in electronic equipment production continued to surge after explosive growth in 1996, and end-equipment markets such as PCs and VCDs exceeded expectations while pagers missed the mark, and numerous semiconductor companies restructured their business strategies in China with the establishment of assembly/text, wafer fab, design, or direct sales operations. Most companies across the entire semiconductor food chain expressed a strong intent to ensure their long-term position in Asia/Pacific's largest, fastest-growing semiconductor market. Dataquest has summarized companies or branches of the Chinese bureaucracy that made significant announcements in 1997.

Shenzhen Government Promotes Its Own VLSI Project, Countering Shanghai's Recent Moves

In January, sources in China reported that Zhongxingxin Telecom Equipment Ltd. and Kaifa Group have formed a consortium to raise U.S.$1.2 billion to U.S.$1.4 billion to establish a semiconductor wafer fab in Shenzhen's Futian Free Trade Zone. The project aims to establish a production base for 0.25-to-0.5-micron technology with an estimated monthly capacity of 20,000 8-inch wafers per month.

The Shenzhen/HK VLSI project was actually approved in 1991 by the Central Government's State Planning Commission (SPC), but the project continued to take many twists and turns. Phase 1 of the project was to establish a back-end facility and Phase 2 aimed at setting up a front-end fab. The main objective was to raise the ratio of domestically produced integrated circuits (ICs) used in telecommunications switching and computers. SGS-Thomson Microelectronics B.V. (owning 60 percent) and the Shenzhen local government (owning 40 percent) have cooperated to establish an assembly test facility (now in pilot production) and design center. This latest announcement raises the price tag and technology level of Phase 2 in an attempt to hasten the project, especially because Shanghai's front-end project (also sanctioned by SPC) is progressing faster. The main barrier in both project remains which side, foreign partner or Chinese government, will control the operations, finance, and management of the semiconductor company.

C-Cube Enters Alliance with Subcor (China) to Mass-Produce VCDs

C-Cube Microsystems Inc. announced that it entered a strategic alliance with one of China's largest consumer electronics manufacturer, Subor Video and Audeo Equipment Co. Ltd. Subor will use C-Cube's decoder technology in its line of video compact disc (VCD) players and will stamp C-Cube's brand name on every VCD to be sold.

Subor was the third-major Chinese manufacturer to enter a branding and manufacturing agreement with C-Cube in China. Two other Chinese partners included Idall and Changhong Electronics Group Co. Other Asian manufacturers included Hyundai Electronics Company Ltd. in Korea and Aiwa in Japan. C-Cube's high level of integration and advanced feature-set has translated into surging sales growth within China, which Dataquest estimates to be the largest VCDs market currently in the world in 1997.

This recent alliance was prompted by an opportunity for high-growth demand in China for VCD players. The quick attraction to the VCD in China has been its low cost, high quality (C-Cube's ClearView technology based on MPEG1), the ability to read all VCD titles universally, and the availability of cheap VCD titles.

Sino-Lucent Technologies' Joint Venture Receives DNV ISO9001 Quality Certification: Company Agrees to Transfers 5ESS-2000 Technology

One of the major international quality system certification agencies, DNV, certified Lucent Technologies Qingdao Telecom Equipment Ltd. as an ISO9001 factory. The facility's capacity is approximately 1.5 million lines per year. The joint venture was founded in 1995 and has sold more than 2 million lines of its 5ESS-2000 switch gears in China, according to Lucent. Located in a high-technology zone in Qingdao, the venture involves a joint investment of $100 million from Lucent Technologies and four other Chinese partners.

Qingdao may become famous now for more things than its world renowned export of "Tsingdao Beer." Lucent is the city's largest joint venture so far and a first-rate facility. This is the largest manufacturing center for program-controlled switch gears for Lucent outside the United States. This joint venture offers two points for all industry observers to consider: (1) It is a misnomer to think of "Made in China" as necessarily poor quality. Progress through effective management and training is being made quickly and multinational companies are leading the way. In fact, Motorola Incorporated's Tianjin Pager facility received the 6-Sigma Gold Metal in 1995 as the best of all Motorola pager facilities worldwide. (2) This venture's sales success is due largely to Lucent's ability to transfer technology to China, which is always a necessary but difficult balancing act in this market. Lucent recently signed a memorandum of understanding with the State Planning Commission to transfer 5ESS-2000 technology through this joint venture.

Texas Instruments Establishes DSP Partnership

Texas Instruments Inc. of the United States said that it has agreed with Shanghai Computer Application & Industry Development Leadership Group, a municipal agency, to establish four technology centers in Shanghai.

Three of the centers will focus on digital signal processing (DSP) solutions and the fourth will handle DSP training, TI said. The centers will use TI technology to develop products suitable for the China market, including servers, switches for automatic teller machines (ATM), modems, digital cameras, and other advanced electronic products, the company said. The value of the agreement wasn't disclosed.

Second Quarter

Project 909 Announced to Bolster China's Semiconductor Industry

The Chinese government is proceeding with a national semiconductor project named the "909 Project" under its ninth five-year economics plan (1996 to 2000). This project's total investment will be 9.6 billion yuan, making it one of the biggest projects for China's electronics industry so far. A new facility is under construction in Shanghai involving 93,700 square meters of land, 62,700 square meters of building space, and 5,000 square meters of clean room. The total employees in this plant will be 700 at full operation.

The initial capital investment will be shared by the Chinese government and Shanghai City, at 52 percent and 48 percent, percent, respectively. The plant will have 20,000 8-inch wafers per month starting capacity and could handle 0.5-micron processes in the future. The new plant will produce smart card ICs, microcontrollers (MCUs), memories, and various kinds of ICs for communications equipment for OEMs or foundry. Plant construction started November 1996.

At present, China has more than 10 semiconductor production lines, which produce mostly consumer ICs, logic ICs, entry-level MCUs, and MPUs, and memory ICs. However, most of the products are not competitive in the global market. In general, production lines in China are not as well modernized as the facilities in advanced countries. The Chinese government is aware of this fact, and to improve this situation, the government has decided to invest in building the modernized plant in Shanghai.

Through this project, China will be capable of mastering the 0.5-micron process technology, and thus should be able to be involved in the 0.5-micron foundry business, which is the major requirement for foundry business in 1997. China might need to invest more to have 0.35-micron process capacity, however, which is be expected to be a major part of the foundry business in 1998. With China's participation in semiconductor competition added to Korea's and Taiwan's, the Asia/Pacific region will have three strong semiconductor countries.

Rockwell Signs Agreement with M.E.I. in China, Targets Microelectronics

Rockwell International Corporation signed an agreement with China's Ministry of Electronics to increase technical cooperation as part of the U.S. company's drive to secure a large contract for microelectronics. The agreement provides for the establishment of design centers across China to facilitate cooperation in modem and wireless communications. Rockwell's chairman said in the memorandum of understanding (MOU) with the Ministry of Electronics will "lead to greater cooperation between the Chinese government and several of Rockwell's areas."

Rockwell has invested only $50 million in China to date this year and is jockeying to expand its business in several areas in China. It would appear that Rockwell's modem chipsets for computers and faxes have potentially huge gains in China. In addition to setting up design centers to help sell Rockwell modems, Rockwell, sources in China say, is one of several companies discussing technology transfer to Huahong Semiconductor or "Project 909." The Chinese government has big goals and dollars behind Huahong (already under construction), but it lacks a partner/source of technology and management expertise. Dataquest believes that it will not be a viable semiconductor business until a long-term partner is secured.

To what other areas does the Rockwell chairman refer? A potential opportunity for Rockwell in China will be to sell its factory automation equipment that could modernize China's money-losing and bankrupt state-owned factories. Also, China's rapidly growing avionics market has influenced government officials to build a nascent aircraft industry, which is another potentially lucrative area for Rockwell. Rockwell generated about $200 million in revenue in China in 1996 and forecast sales to exceed $1 billion by 2000. To reach this business level and achieve this nationwide expansion level, Dataquest believes that Rockwell will have to increase its investments at least 10 times to $500 million and transfer technology (probably microelectronics) by the end of 1998.

HP Accelerated Joint-Venture Investments in China—Its Latest Venture to Ramp Production in May

China Hewlett-Packard Company's newest joint venture, Hewlett-Packard (China) Shanghai Jinqiao Computer Company, announced that production will begin in May. In the announcement, a U.S.-based HP vice-president stated that China had been elevated to "the most important market for Hewlett-Packard."

HP's strategy in China has been relatively successful because of its ability to secure partnership with China's central government. The China Electronic Import and Export Company, a company under the Ministry of Electronics, has a minority stake in China Hewlett-Packard. China HP reports total business revenue of $550 million in 1996 sales, primarily from HP's computer hardware businesses, such as scanners, servers, printers, and personal computers. Furthermore, CHP has aggressively invested in manufacturing joint ventures throughout China and has garnered more than 6 percent of the computer market, in part because of the success of its five joint ventures. The company has invested about $200 million during the past 18 months, but these ventures are understandably not expected to turn a profit this year. China is HP's third-largest market in Asia/Pacific, which represents about 20 percent of worldwide revenue. China is the fastest-growing market for HP in Asia/Pacific and is planned soon to become the largest.

Seagate Expected to Double Disk Drive Production in China

Seagate Technology Inc. is expanding production in China and has recently announced plans to inject $32 million into its Wuxi facility, bringing total direct investment to $52 million. Aggregate production in Wuxi was reported to be 3 million units in 1996, with about 3,300 workers employed. This investment level adds about 1,600 workers and doubles Seagate's capacity in China, which serves both local and export markets.

The new Wuxi facility is Seagate's second rigid disk drive (RDD) plant in China. The first is its Shenzhen plant that Seagate has operated for more than two years. Seagate's acquisition of Conner Peripherals Inc. enabled it to buy market share in China by acquiring Conner's Shenzhen RDD plant. It also enabled Seagate to adopt Conner's successful business model for selling in China, which Seagate has successfully expanded. Since then, the combined efforts have proved to be effective for Seagate, which now controls more than 50 percent of the market and exports for RDDs from China.

China's PC breakneck market growth has resulted in a huge increase in rigid disk drives demand. However, RDD competition is increasing for Seagate, which is attempting to hang onto its position in China's computer mass storage market. By expanding production, Seagate is leveraging its current competitive advantage in the market to combat the new market entrants. For this reason, Dataquest's current electronic equipment production forecast indicates RDD production outpacing PC production. This is because of locally produced RDDs taking market share from more expensive imported ones. By locating facilities in both southern and, now, central China, Seagate is well-positioned for serving China's high-growth coastal provinces. Another advantage of Shenzhen and Wuxi is their proximity to major shipping ports, enabling Seagate to effectively export to global markets. Both of these industry-intensive regions have relatively good infrastructures and have succeeded in attracting electronics and component suppliers.

ASMC Receives QS-9000 and Targets China's Automotive Market

Advanced Semiconductor Mfg. Corp. (ASMC), a wafer foundry company in Shanghai, announced that it had received registration under QS-9000 quality standards. QS-9000 is a comprehensive quality system developed by Chrysler, Ford, and General Motors that goes beyond ISO 9000 by requiring use of specific technical and managerial practices. ASMC is a joint venture of Philips Electronics NV (owns 38 percent), Northern Telecom Inc. or Nortel (34 percent), and Chinese institutional investors, which was set up in 1995. ASMC, which employs 470 people, now functions as a pure-play independent foundry providing subcontract manufacturing to companies outside China, mainly to Philips and Nortel.

This operation dates back to 1988, when Philips Semiconductor established a joint venture to provide semiconductors to government-run TV and radio factories in China. But the initial goals were not met, and Philips became the major customer. Less than 1 percent of ASMC's 1996 business was from mainland-based companies. However, the situation for ASMC and other component suppliers is gradually changing. (For further discussion of this issue, see the Dataquest Perspective "The Growing Importance of Electronics to China's Economy," SEMI-CH-DP-9702, in June 1997). The Chinese government is pushing companies to localize procurement rather than rely on imports, in part because of rising unemployment from unprofitable state-owned enterprises. Semiconductor companies with production in China will be the first to benefit, for two main reasons: China's electronics industry is growing at more than 20 percent per year, and semiconductors represent a high percentage of total materials costs. Dataquest expects a continuation of the current trend to set up assembly and test or wafer fabrication in China.

Also, most multinationals are aware of the long-term strategic benefits of building a reliable, local supplier base in China. As the first QS-9000 fab in China, the opportunity for ASMC to provide foundry service for General Motors, Ford, Chrysler, and other major automakers in China will be greatly increased as the big three automakers localize sourcing. ASMC plans to leverage its CMOS and bipolar production capabilities to enter the bipolar analog business. And, as ASMC expands capabilities this year, it also plans to ship direct to Nortel in China, a company that is also significantly expanding localization.

Mitsubishi Establishes Its First Direct Sales Company in China: A New Trend in China?

Mitsubishi Corporation announced the establishment of its first-direct semiconductor sales company, called Keling Electric and Machinery (Shanghai), which is part of Mitsubishi's plan to more than double its semiconductor business by 2000. In 1996, Mitsubishi shipped most of its U.S.$100 million in semiconductor products through Hong Kong into China. The company plans to ship more than $250 million by 2000 as a result of its aggressive expansion plans.

This is another sign supporting Dataquest's prediction that strong market growth in 1997 will cause semiconductor companies to expand distribution further north into China. The past five years of booming semiconductor consumption growth in China (except 1996) stemmed largely from southern provinces like Guangdong and Fujian and spread north. Consequently, the overall Chinese market for an increasing number of companies has reached high enough revenue levels to warrant the establishment of direct sales channels in China. Most foreign electronics companies initially moved to China to lower production costs, and the south provided the best cost, quality, and investment conditions for exported products. However, the high consumption growth of end equipment, particularly communications equipment, in the coastal middle and northern provinces is quickly increasing and expanding inland. Semiconductor demand is following this trend, which will result in more announcements relating to direct business. A related Mitsubishi announcement indicates the company's intention of setting up semiconductor design centers next.

As for Hong Kong's role, Dataquest believes semiconductor vendors will continue to rely heavily on Hong Kong as a key distribution point because of the continued growth in southern China, which would be fostered by the establishment of the Hong Kong Special Administrative Region (SAR) on July 1. Furthermore, for practical reasons, using Hong Kong distributors ensures payment, which often eludes mainland companies that are strapped for cash, and ensures their access to the largest semiconductor consuming region in southern China.

Third Quarter

Hong Kong Electronics Industry after the Handover

As expected, there was a wide range of reports on Hong Kong's future coming from the more than 8,000 reporters who visited Hong Kong (many for the first time) looking for a unique angle. To clarify Dataquest's position, this excerpt presents Dataquest's statistics and analysis, which were published in a Dataquest report titled "Hong Kong's Electronics Industry after the Handover" and which Dataquest hopes would provide a reality check.

To forecast Hong Kong's economic and electronics prospects, it is necessary to understand and forecast China's, because these economies have become inextricably connected through Hong Kong's investment in China. To put this point into perspective, consider that Hong Kong companies have invested some $25 billion into Chinese companies (mostly state-owned companies), compared to the United States' $13 billion investment.

With Hong Kong playing a critical role, China's economy grew by an average annual rate of 12.8 percent from 1990 to 1995, compared to the worldwide growth of only 2 percent, according to the World Bank. Hong Kong's economy expanded by 5.6 percent during the same period. In three blistering growth years, China's nominal gross domestic product (GDP) doubled from $426 billion in 1993 to an estimated $840 billion in 1996. Dataquest's research of more than 20 reputable economic forecasters shows a broad range of estimates, from 9 percent to 12 percent, for 1997 and 1998. Indeed, recent statistics confirm a modest GDP acceleration in 1997. With the current favorable global and local economic and trade conditions, this growth momentum is likely to carry into 1998. Although such growth figures are impressive, a closer look at 1996 per capita GDP by urban area illustrates that the pivotal role of Hong Kong on China's growth has moved from south to north:

- Hong Kong: U.S.$25,000
- Shenzhen: U.S.$3,400
- Shanghai: U.S.$2,100
- Beijing: U.S.$1,400
- China: U.S.$700

Recent World Bank statistics indicate that Hong Kong's economy expanded by 4.6 percent in 1996. Because of the increasing economic interdependence between China and Hong Kong, Hong Kong's growth is also forecast to accelerate to 5.6 percent in 1997 and 1998. The service sector continues to fuel Hong Kong's economy and increase its share, but manufacturing is the largest and the fastest-growing part of the mainland's economy. By no accident, China's economic expansion in the past decade has broadened Hong Kong's service sector that now supports China's industrialization. Hong Kong-based companies have provided critical links among Chinese manufacturers and imported technology and components. Hong Kong is now the source of more than two-thirds of the semiconductor components on which China depends. The Hong Kong distributors, traders, assemblers, and manufacturers have maintained the following competitive advantages in China:

- Hong Kong is Asia/Pacific's financial center and multinational bankers' China headquarters (and this is likely to be the case for at least 30 to 50 more years).
- An elaborate network and strong relationships within China's layers of red tape has developed during the past 10 years. Newcomers to the

region face barriers in directly entering the mainland and thus must go through Hong Kong companies to gain a foothold.

- Hong Kong offers timely access to global product and technology information because of its position as Asia/Pacific's media center.
- Accurate, daily semiconductor and equipment pricing data allows Hong Kong companies to supply components to China at bargain-basement prices.
- Flexible, efficient, and decentralized management allows quick market response and adaptability to China's changeable business environment.
- Varied global sourcing networks serve China's diverse and expanding telecommunications, computer, and consumer markets.

Hong Kong offers the ability to get paid. This art eludes many multinational vendors trying to sell directly to China. Most multinational vendors have neither the internal structure nor the will to work in China's high-risk, sometimes chaotic distribution systems.

China's electronic equipment production will continue to grow by an annual average of 20 percent in the next five years, and exports are playing a vital role in its expansion. Guangdong Province, which borders Hong Kong, is the largest electronics-producing region in China and is increasingly an export powerhouse of multinational factories. The trend of continuing migration of Hong Kong electronics companies to southern China will also continue to boost Guangdong's electronics production and, consequently, Hong Kong re-exports. Hong Kong's economy is more knowledge-based than any economy in Asia/Pacific, and its services sector continues to grow.

Whether Hong Kong continues its current path or takes a radically new course (which is not likely) will depend heavily on the new Hong Kong government and Beijing. With the advent of the new Hong Kong Special Administrative Region (SAR), there has been hope among industry leaders of a government-led electronics industry strategy to prevent Hong Kong's losing its manufacturing base completely to China.

Hong Kong has moved ahead of many Asian countries because of its knowledge-based economy with high numbers of valued-added businesses. It would be unwise to change this unique dynamism to a centralized model that may have suited Singapore well but has less relevance to Hong Kong. Hong Kong has thrived on its flexibility to meet China's dynamic growth. Its superb infrastructure, legal and financial system, and professional workforce make it an ideal place to set up capital-intensive, export-driven industries such as semiconductor manufacturing. However, Hong Kong has no semiconductor industry (it has only a few low-end fabs) because of the lack of government industrial planning and strategy. With other governments eagerly courting foreign investors and providing long-term policy and vision, companies are unlikely to consider Hong Kong and its laissez-faire approach to industrial development. There is hope on the horizon, and the majority of multinational electronic companies are maintaining a wait-and-

 ©1998 Dataquest

see posture, wondering what SAR chief executive Tung Chee-hwa and Beijing will do in Hong Kong.

The Tung government will be working on a 21st-century vision of Hong Kong, which many sources believe will incorporate an information technology strategy. Dataquest expects to hear parts of this vision in an October speech. Nevertheless, Hong Kong will remain vital to growth of electronic equipment production and semiconductor supply to China. Hong Kong's and southern China's electronics industries are already inseparably linked. Hong Kong's rising growth in re-exports is attributed mainly to its ability to supply components, technology, financing, expertise, information, and global market channels.

Therefore, talking about Hong Kong in isolation presents a skewed picture of its integration with southern China during the past 10 years. For this reason, the handover is largely a nonevent in view of the speed, scope, and scale of Southern China's electronics industrialization.

Mitsubishi Participates in First Foreign Trade Joint Venture in China

One of Japan's major trading houses, Mitsubishi Corporation, Continental Grain of the United States, and the local Oriental International Group have formed one of the first two joint venture (JV) foreign trade companies in Shanghai Pudong New Zone last week. The JV company can take advantage of its local and foreign partners' existing channels to import and export machinery, electronics, and high-tech products in China. The newly formed Dongling Trading has a registered capital of $12.5 million, 51 percent of which comes from Oriental International, 27 percent from Mitsubishi, and 22 percent from Continental Grain.

Another JV foreign trade company called Shanghai Lansheng-Daewoo was formed between Daewoo Group and local Shanghai Lansheng. Both JV companies have obtained import/export licenses from the Ministry of Foreign Trade and Economic Cooperation (MOFTEC) and will soon go into operation.

The establishment of JV foreign trade companies, which allows foreign companies to participate in China's import and export trade, marks a breakthrough in China's existing and conservative foreign trade system. Before the establishment of these JV foreign trade companies, all imports and exports must be handled by the government-authorized foreign trade corporations that are state-owned companies. Foreign companies are not allowed to do import and export trade on their own. Foreign vendors lacking local relationship usually have difficulties in getting access to China's potential market because of this restriction. That is why many foreign vendors complain that China market is "big in sight but small in touch."

The tentative procedures issued by the MOFTEC on September 30, 1996, allow JV foreign trade companies to be set up in two trial areas: the Shanghai Pudong New Zone and the Shenzhen Special Economic Zone. Dataquest expects such JV companies will also soon be set up in Shenzhen, which will

 ©1998 Dataquest

serve southern China, following the first two JV foreign trade companies in Pudong.

As driven by the strong market demand in high-technology areas, especially in telecommunications, the JV foreign trade companies will mainly handle foreign trade of high-technology products. Foreign vendors of electronic equipment and semiconductors may benefit most from the establishment of these JV companies but the benefits will only be gradual.

The establishment of JV foreign trade companies is a result of China's fast expanding economy that requires the reform of low-efficiency foreign trade system currently monopolized by state-run companies. It is unlikely, however, that Chinese government will fully open up its foreign trade in the foreseeable future because protectionism still exists. Dataquest believes that semiconductor vendors will still have to rely on Hong Kong as a key distribution center for southern China where most of export-oriented manufacturing companies are based.

Changhong Plans International Sales and Listing on Hong Kong Stock Market

China's largest color television producer, Changhong Electronics Group Co., plans to begin exporting color televisions by 1999 and to open its first overseas production site to cater for foreign markets. The United States is the first country Changhong will target for international sales as the company hopes to develop a reputation as a low-cost, reliable brand name. Changhong is listed on the Shanghai Stock Exchange and reported posttax profits of RMB 1.67 billion (U.S.$200.2 million), but the company plans to raise money for its expansion plans on the Hong Kong stock market.

China's color television industry continues to undergo consolidation. Changhong is looking for ways to expand beyond the domestic market in China. This overcapacity is the result of central planning in the late 1980s that supported national color television industrial development. With the increase in imports or locally assembled foreign brands in China, these factories have had difficulty competing in China.

Changhong has been able to complete in a market that is flooded with foreign-brand goods and is taking the lead in the consolidation by acquiring smaller, less successful companies in China. Consequently, the company will have increased market share from about 23 percent to a forecast 33 percent by the end of 1997, primarily through acquisitions and aggressive marketing. The acquisition of regional television producers in Nantong (in Jiangsu province), and in Changchun (in Jilin province), is expected to be completed by the end of August. Dataquest expects, as does Changhong, that competition in China's electronics market will increase as the country moves to enter the World Trade Organization. China's major electronics companies realize they must prepare to compete on a global basis because import tariffs will continue to be reduced and the privatization pace will quicken.

Lexmark Opens Two World-Class Ink Jet Printer Plants in China

Lexmark International Inc. has begun high-volume production of ink jet printers at two new manufacturing plants in the People's Republic of China. These facilities, established with partners in Shanghai and Shenzhen, will export about 75 percent to Europe and the United States, while about 25 percent will be shipped to China and other Asia/Pacific countries. Full capacity of both ink jet facilities is expected to be reached by first quarter 1998. The second announcement indicated that Hong Kong would become the company's distribution center servicing the entire Asia/Pacific region.

A number of relevant details were not provided by Lexmark, such as its joint-venture partner, investment amount, or plant capacity. However, the trends are clear. Dataquest's quarterly PC shipment statistics show China growing by 41 percent in second quarter 1997 over second quarter 1996, becoming Asia/Pacific's largest consumer of PCs. Similarly, the printer market is booming in China, and Lexmark is attempting to create a competitive advantage in the dynamic, competitive mainland market. Lexmark has recently extended relationships with two distributors—China Great Wall Computer Group and Stone Computing Group—as another aspect of its market development effort. The relationship with Stone has included a joint effort to develop China-specific printer products, such as a low-cost ink jet (CJ1000). Great Wall will focus on sales of networked laser printers in China. Confident or not, the importance of Hong Kong increases each day. The SAR is now a vital artery of electronic equipment and technology flowing from low-cost production in China to global markets and from Asian neighbors (particularly for key components) into the Chinese market.

AMD Demonstrates Commitment to the China and Hong Kong Microprocessor Markets

At press conferences in Beijing and Hong Kong, Advanced Micro Devices Inc. (AMD) affirmed its commitment to the China/Hong Kong semiconductor market by announcing various initiatives to develop its presence in the Chinese markets. ADM took three actual steps, including the construction of Suzhou Limited, an AMD subsidiary, which will assemble and test integrated circuits; opening a telecommunications laboratory at Qinghua University; and the recent opening of three sales offices in China. Company spokesmen explained other initiatives to (1) work closely with switching manufacturers; (2) develop programs for government, industry, and academic associations; (3) provide silicon technology and applications support to "empower local companies to compete with foreign manufacturers;" and (4) provide low-cost microprocessors to low-cost PC suppliers in China, such as Legend Group, Acer Computer International Ltd., and First International Computer Inc. (FIC). Acer and FIC have recently announced PC products between U.S.$500 and U.S.$1,000, respectively.

Behind the words spoken at AMD's press conferences are messages that attempt to address some important concerns on the minds of mainland government and industry leaders. Dataquest believes these issues to be the following:

 ©1998 Dataquest

- Chinese government-run electronics equipment manufacturers are, generally speaking, not succeeding in China, while foreign products are gaining appeal and increasing market share. AMD's effort to support the end users in China at the systems level is important to both government and already-privatized mainland companies. Switching, in particular, is a huge immediate opportunity.
- Assembling and testing in China demonstrates a manufacturing commitment to Chinese officials and will enable AMD to establish operations and training programs.
- Relationships with universities and government associations attempt to provide long-term sources of much-needed engineers with applied rather than just theoretical engineering experience.
- If sub-$1,000 PCs are available to the Chinese home, Dataquest believes that demand will surge due to current pent-up demand in Chinese families wishing to educate their child(ren). Dataquest PC analysts estimated that the government and industry markets are already growing between 40 percent and 50 percent each year.

Fourth Quarter

Asian Currency Crisis on Semiconductor Demand in the Rest of Asia/Pacific

Dataquest believes the currency devaluation in some of the countries within the Asia/Pacific region will have varying positive and negative effects on semiconductor consumption in the region. The countries primarily affected and discussed here are Korea, Taiwan, Singapore, Thailand, Malaysia, Indonesia, and the Philippines. Dataquest would like to note that the Hong Kong dollar remains the least vulnerable currency, although it was attacked by speculators only after the Southeast Asian devaluation. Dataquest also believes that Taiwan's electronics industry will fare well in this crisis, primarily because a larger percentage of components is supplied locally and because its financial sector is stronger than in these other countries.

In the short run, numerous companies selling equipment or semiconductor components to these countries report difficulty in getting payment from their channels. Consumption of end equipment such as PCs, cellular phones, and color televisions will be affected, but these markets are small, developing markets relative to worldwide consumption. Since last year, Dataquest has observed a deceleration of growth in Southeast Asia and an acceleration in China. China's electronics equipment production will grow at nearly 20 percent this year and is now the largest semiconductor market in Asia/Pacific. China also represents a huge consumer of communications and computer equipment, representing 25 percent of all personal computers purchased in Asia/Pacific, with growth exceeding 40 percent. Although electronics consumption may be lower than previously expected in selected countries, the region as a whole will continue to enjoy the fastest growth rates in the world.

©1998 Dataquest

The long-term impact on overall semiconductor consumption in Asia/Pacific is better understood from a company-level view. Companies in the affected Asian countries, which rely primarily on imported components, are experiencing increased costs because of their weaker local currency. However, if their finished products are exported, then this cost increase can be reversed, because more local currency is received for the same U.S. dollar price. If an electronics manufacturer receives components through internal transfer or global sourcing agreements (billed out of headquarters) and exports its finished product, then it benefits significantly—it has no cost increase yet does have increased revenue (in local currency).

So which situation is more common in Southeast Asia? The majority of production in these countries is exported rather than shipped locally. However, most components are imported from Europe, Japan, or North America. And the lion's share of these semiconductors is imported by multinational companies that either have global procurement agreements or receive large amounts of transshipments from other subsidiaries. Although recent trends show increased shipments to Southeast Asia from manufacturers based there, this output represents less than 15 percent of total production. Exports have and will continue to drive electronics production in Asia/Pacific and, therefore, strong semiconductor demand. Weaker currency means more expensive parts for some, but all will have more competitive exports. Although certain companies may be hurt, aggregate demand will not be damaged and could well be helped in the long run.

Texas Instruments Announces Its Fourth DSP Development Center in China

Texas Instruments Inc. announced that it will jointly build a digital signal processing (DSP) research center at the Changed Electronic Science & Technology University, located in central China's Sichuan Province. The university will provide facilities, while TI agrees to provide workstations, development tools, system software and hardware, and training. The center will not only provide a laboratory for students to learn about DSPs, but, more importantly, enable students and industry to develop DSP applications.

TI's quick success in China/Hong Kong's DSP market has warranted a rapid response to harness potential long-term market growth. The China/Hong Kong DSP market grew threefold in 1996 and continues its remarkable momentum attributable to China's burgeoning communications markets. TI's initial success is attributed to the rapidly expanding, foreign-invested manufacturers of wireless local loop, digital switching, and digital cellular handsets. However, local Chinese companies are adapting the technology quickly and represent a significant long-term market. New opportunities also are emerging in China's sizable consumer electronics industry, in which TI plans to be a major player.

TI has clearly targeted the top universities across China—others including Beijing's Qinghua University, Shanghai's Jiaotong University, and

©1998 Dataquest

Guangdong's Zhongshan University. This latest partnership is TI's fourth center in China. At least six more centers are planned to be established in China and Hong Kong in the near future. Their long-term goal is to accelerate the commercialization of DSP technologies to China's electronics industry. Universities in Singapore and Taiwan have started similar programs several years ago. However, the number of professors trained in DSP technology in China exceeds those in other Asian countries. Where China is falling behind is in commercialization of this and other semiconductor technologies.

The university program enables TI to disperse DSP technology to China's local industries at an accelerated rate. For nearly a decade, China has been trying to reform its education system from theoretical to applied science. There is no shortage of bright engineering students in China, but there is huge vacuum of application engineers. Signal processing studies in some cases has existed for nearly a decade. TI's partner schools are among the best electrical engineering universities in China and are, by no coincidence, located in thriving electronic industry centers. These technology transfers are not restricted to academic use but, conversely, strongly encouraged to be shared with the commercial community.

Currency Crisis: The Market Impact

Dataquest believes that the currency and financial market problems in Asia/Pacific have a lot to do with speculative investment "bubbles" in property, construction, semiconductors, and other industries, rather than to fundamental manufacturing efficiencies. Asia/Pacific will continue to be a high-growth, efficient exporter of electronic equipment. But it is clear what will happen when rapid economic growth goes unchecked by a transparent financial system and clean government regulation: overcapacity and irrational loans. These bubbles can become so serious as to bring down entire financial systems and impair international confidence, and hence, future economic growth. This situation is what people are witnessing in Korea and Thailand. The impact of electronics production will be weakened by local consumption of information technology products. But electronics exports, the mainstay of semiconductor consumption in Asia/Pacific, will be less effected—a good news for semiconductor suppliers.

China and Hong Kong appear to be weathering the financial turmoil sweeping Asia. As the largest electronics-producing and semiconductor-consuming region, China/Hong Kong's strong export growth and local consumption are proving positive to the region. However, China and Hong Kong are not immune to these problems, although they seemed to be dealing with these bubbles more effectively by proactively popping them before they get too big. China's economic "czar," Zhu Rongji, successfully burst the stock market bubble, property bubble, and construction bubble in 1996 and 1997. After the October Party Congress, he was more empowered than ever to pop the next speculative runs, whatever they may be. In 1998, he will be promoted to prime minister. Zhu's charter is to fix the state-owned enterprises to avoid overwhelming the financial system with bad loans.

If China slacks off, its financial system will face serious problems, potentially worse than that that of Korea. China is learning to avoid Korea's expensive lesson—although having $200 billion in combined reserves with Hong Kong will help, too. A strong economic growth in North America and Europe will be critical to China and the region because Japanese consumption is weakening with its own economic malaise.

As was the case with Russia, the nonconvertibility of China's currency may help in the short run, although it does not necessarily insulate China from the possibility of a major depreciation. In 1994, the Chinese government significantly devalued its renminbi. It may have to do the same in the near future because of the mounting pressure in the region, as well as competition from Asian neighbors on the export front. However, because the government's stated long-term goal is to merge the renminbi with the Hong Kong dollar, it is not likely that the Hong Kong dollar will lose its U.S. dollar peg. Hong Kong's financial systems have remained fundamentally strong and safe from speculators.

Currency depreciation has lowered production costs in various Southeast Asian countries. So, will China become less competitive for its vital export markets? Currency depreciation will lower export costs in numerous Asia/Pacific countries, but only to the extent that they do not need imported components (most do, though).

This means that short-term competition with China for exports and possible long-term competition for foreign investment. However, there are even broader issues affecting China, which are highlighted as follows, including the currencies and economies in neighboring countries:

- Raising the competitiveness of its faltering domestic companies, especially state-owned enterprises before entering the World Trade Organization (WTO)
- Countering the serious slowdown in foreign investments because of rising costs of doing business in China
- Maintaining 7 percent to 10 percent GDP growth and raising the rate of domestic consumption to absorb excess capacity and over dependence on exports
- A slowdown in Japanese imports of consumer electronics and PCs from Asia/Pacific. China may be hurt the most because its currency has not depreciated and therefore its costs are increasing relative to other countries
- Korea and other affected countries will rely heavily on exports to try to pull themselves out of their economic turmoil

The following factors will help China to counter these major challenges and maintain relatively strong electronic industry growth:

- A large proportion of Chinese electronics companies are successfully competing against major multinational corporations (MNS), particularly in computer and consumer equipment markets. Dataquest believes that

 ©1998 Dataquest

the Chinese government will continue to support these companies before and after entry into the WTO because their international competitiveness will be imperative to their future survival. The government's priority lies in improving efficiencies and quality and, therefore, information technology will continue to be rapidly deployed as an infrastructure necessity.

- Although total investment is down in 1997, production capacity of the large MNC and local electronics manufacturers has increased by more than 50 percent. Although business costs are rising in China, the two main reasons for investing remain to (1) develop the long-term potential of the domestic market and (2) take advantage of an abundant, inexpensive labor force. Note that efficiencies and quality are increasing faster than costs. Investment from Taiwan to China increased by nearly 30 percent in 1997, despite R.O.C. government's attempt to slow the flow of business to China. China will continue to attract investments as a necessary requirement for foreign companies to develop long-term market share there.
- Inflation was the major concern last year at this time; now deflation is the top priority of the government. Interest rates are likely to fall to stimulate growth. However, the demand for information technology continues to boom in China.
- Japanese manufacturers are shipping goods worldwide from China. China's electronics exports to Japan represent 10 percent to 15 percent of China's total electronic exports. Therefore, Japan's consumption slowdown has a minor effect on Chinese production.
- Korean and other affected Asia/Pacific electronics and semiconductor companies may have an increasing currency advantage for exports relative to China in the short term. However, these companies are seriously hurt by increase debt-service costs. With depreciation, there is a debt-service ratio increase of one-to-one, while exports cannot possibly expand enough to counter such costs. Major cost-cutting measures may be necessary to service foreign and local debt that impairs the level of export expansion necessary for recovery. Certainly, capacity expansion is not viable at this point.

All five issues impact the electronics industry in China and Hong Kong. In light of these challenges and Dataquest's survey of producers in China and Hong Kong, Dataquest believes 20 percent growth in electronic production is achievable in 1998, decelerating to 18 percent in 1999. Although Dataquest expects China to maintain a relatively high-level growth, Dataquest has also lowered its 1996-to-2001 forecast for China/Hong Kong's electronic equipment production from a CAGR of 26 percent to 24 percent in light of recent deflationary industry developments in the region.

Dataquest expects the electronics industry of China/Hong Kong to reach $70 billion by 2000 and $85 billion by 2001, rather than $90 billion as previously forecast in August 1997. From 1996 to 2001, China/Hong Kong is expected to exceed Asia/Pacific growth in electronics production by 6.8 percent and semiconductor market growth by 9.6 percent. Consequently, its share of

Asia/Pacific semiconductor market revenue will grow from 20 percent in 1997 to 26 percent.

Cautious business planning is required at this time because the volatile financial markets will take another three to six months to begin to stabilize. The situation requires rapid and extreme government action in Korea and Japan before the downward financial slide in the region reverses course.

Dataquest Perspective

It is clear that never has China's electronics industry experienced such breadth of significant developments in a single year, which included significant semiconductor assembly expansion, major fab announcement, electronic equipment production expansion, design centers, and an unprecedented domestic consumption of PCs, and communications and consumer equipment. Dataquest believes that China will remain an attractive destination for investments in 1998 because of its relative stability of currency markets and financial system compared to most other Asian countries.

August 20, 1998

Dear Semiconductors China Client:

In Dataquest's Semiconductors China Market Trends report, "An Analysis of the China/Hong Kong Semiconductor Market: Suppliers, Drivers, and Forecasts" (SEMI-CH-MT-9801, August 10, 1998), the titles for Figures 4-13 and 4-14 were incorrect.

Please replace Figures 4-13 and 4-14 with the attached figures because the title was mislabeled "Analog-Monolithic" rather than "Discretes." The company names and market share data remain the same, only the titles have been renamed.

Dataquest regrets the error and apologizes for any inconvenience. For further information, contact industry analyst Daniel Heyler at daniel.heyler@dataquest.com.

Sincerely,

Randolph F. Frey

Discrete Market Share Rankings

Dataquest estimates that in 1997, the value of China/Hong Kong's discrete devices reached $859 million. The discrete market represents a 12.7 percent share of China's total semiconductor consumption, but it continues to undergo steady growth year after year. In 1997, the market expanded 22.1 percent. The surveyed companies increased shipments to China by 25.8 percent and gained market share over less competitive domestic manufacturers. This segment's consumer applications are relatively close to discrete devices, as Dataquest observes the vendors' shipment performance. Toshiba, SANYO, Rohm, and Philips are able to leverage their consumer market presence to ship analog and discrete products to the same customers. Among the top 10 discrete suppliers to China, only NEC, Korea Electronic Company Ltd., and Hitachi are not among the top 10 analog suppliers (see Figures 4-13 and 4-14).

Chapter 1
Asia/Pacific Fab Database

Background and Methodology

This report contains the Asia/Pacific portion of Dataquest's wafer fab database. The records in these tables are fabs located in the Asia/Pacific region. The Semiconductor Equipment, Materials, and Manufacturing Worldwide (SEMM) program conducts extensive annual surveys, complemented with quarterly secondary research to maintain this database. Published once a year, this document represents Dataquest's best insights and estimates into the end market of semiconductor equipment.

The tables in this report cover planned and existing merchant, captive, and foundry fab lines. A fab line is a series of equipment to do front-end (from initial oxide through wafer probe) semiconductor manufacturing. Occasionally, two or more separate product-specific fab lines or wafer sizes operate in a single clean room or physical plant. In this situation, Dataquest divides the clean room as separate fab lines if the company dedicates equipment to each wafer size or product line. If a company installs substantially different equipment during an expansion (for example, equipment to increase its maximum wafer diameter), again Dataquest divides the clean room and creates two entries into the database. Therefore, a company may operate many fab lines at one location.

Worldwide Geographic Region Definitions and Regional Roll-Ups

Americas

Includes Central America (all nations), Canada, Mexico, United States, Puerto Rico, and South America (all nations).

Japan

Japan is the only single-country region.

Europe, Africa, and Middle East

Includes Africa (all nations), Albania, Andorra, Armenia, Azerbaijan, Belarus, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Georgia, Germany, Gibraltar, Hungary, Iceland, Israel, Italy, Kazakhstan, Kyrgyzstan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Middle East (all nations), Moldova, Monaco, Netherlands, Norway, Poland, Romania, Russia, San Marino, Scandinavia, Slovakia, Spain, Sweden, Sweden, Switzerland, Tajikistan, Turkey, Turkmenistan, Ukraine, United Kingdom, Uzbekistan, Vatican City, and all nations within the former Yugoslavia.

Asia/Pacific

Includes Australia, Bangladesh, Cambodia, China, Hong Kong, India, Indonesia, Laos, Malaysia, Maldives, Myanmar, Nepal, New Zealand, Pakistan, Philippines, Singapore, South Korea, Sri Lanka, Taiwan, Thailand, and Vietnam.

©1999 Dataquest

Field Definitions

The Company field indicates the operator of the fab line. For contract manufacturers that trade capacity for capital investment in the fab, Dataquest lists the contract manufacturer. For incorporated joint ventures, Dataquest lists either the incorporated entity or the major investors, separated with slashes.

The City field displays the most detailed location information. This reference is usually a city or town, but could be an often-used district name (for example, Science Park in the city of Hsinchu, Taiwan). If this field lists a district, Dataquest will list the city in the State or Province field. In some cases, a reference to a state or province will be included in the City or District field to create a unique identifier for this location.

The Prefecture field denotes the second most detailed location. This reference is usually a state (for the United States), province (for Canada and many European and Asian countries), or a prefecture (for Japan). For countries within the United Kingdom, Dataquest lists the country name (for example, "Scotland") in this field so Dataquest can list the descriptor "U.K." in the Country field.

The Country field indicates the broadest location identifier in this report. This reference is usually a country, except in the case of the United Kingdom (see "State or Province" above). Because Japan is a single-country region, there is no regional qualifier for fabs in Japan.

The Fab Name field provides a reference to a particular fab or fab line to distinguish it from other fabs or lines owned by that company. Although Dataquest makes every attempt to match the nomenclature used by the company, occasionally some additional qualifiers (for example, "Phase 1") will appear to provide insight to the facility's history or organization.

The Products field lists the products manufactured at this site. The listings generally fall into five product groups, with the following nomenclature and definitions (when warranted):

- MOS memory
  - DRAM: Dynamic RAM
  - EEPROM: Electrically erasable PROM
  - EPROM: Ultraviolet erasable PROM
  - FERRAM: Ferroelectric RAM
  - FIFO: First-in/first-out memory
  - Flash: Flash memory
  - Mem: Memory
  - NV Mem: Nonvolatile memory (ROM, PROM, EPROM, EEPROM, and FERRAM)
  - PROM: Programmable ROM
  - RAM: Random-access memory

- ROM: Read-only memory
- SGRAM: Synchronous graphics RAM
- Sp Mem: Other specialty memory (such as dual-port, shift-register, or color lookup)
- SRAM: Static RAM
- VRAM: Video RAM

■ MOS microcomponent/digital logic

- Array: Gate array
- ASIC: Application-specific IC
- ASSP: Application-specific standard product
- Bit: Bit slice (subset of MPU functions)
- CBIC: Cell-based IC
- Custom: Full-custom IC (single user)
- DSP: Digital signal processor
- FPGA: Field-programmable gate array
- LISP: 32-bit list instruction set processor for AI
- Logic: Standard logic
- LSI: Large-scale integration
- MCU: Microcontroller unit
- MixSig ASIC: Mixed-signal ASIC
- MPR: Microperipheral
- MPRCom: MPR digital communication (ISDN, LAN, UART, or modem)
- MPU: Microprocessor unit
- PLD: Programmable logic device
- RISC: Reduced-instruction-set computation 32-bit MPU
- Telecom: Telecommunications chip

■ Power/discrete/analog (including bipolar power)

- A/D D/A: Analog-to-digital, digital-to-analog converter
- Automotive: Dedicated to automobile applications
- CODEC: Coder/decoder
- Diode
- Discrete
- FET: Field-effect transistor
- GTO: Gate turn-off thyristor
- HEMT: High-electron-mobility transistor
- IGBT: Insulated-gate bipolar transistor

©1999 Dataquest

- Interface: Interface IC
- Linear: Linear/analog device
- MDiode: Microwave diode
- MESFET: Metal semiconductor field-effect transistor
- MFET: Microwave field-effect transistor
- Modem: Modulator/demodulator
- MMIC: Monolithic Microwave IC
- MOSFET: MOS-based field-effect transistor
- Op Amp: Operational amplifier
- Pwr IC: Power IC
- Pwr Tran: Power transistor
- Rectifier
- Reg: Voltage regulator
- RF: Radio frequency
- SCR: Schottky rectifier
- Sensor
- Smart Pwr: Smart power
- SST: Small-signal transistor
- Switches: Switching device
- Thyristor
- Tran: Transistor
- Zener Diode

- Optoelectronic
  - CCD: Charge-coupled device (imaging)
  - Coupler: Photocoupler
  - IED: Infrared-emitting diode
  - Image Sensor
  - Laser: Semiconductor laser or laser IC
  - LED: Light-emitting diode
  - Opto: Optoelectronic
  - PDiode: Photo diode
  - PTran: Photo transistor
  - SAW: Surface acoustic wave device
  - SIT Image Sensor: Static induction transistor image sensor

 ©1999 Dataquest

- Bipolar Digital and Other Devices (includes all digital ICs using a bipolar process)
  - Darlington
  - Micromachining sensors
  - MilStd: Military Standard Logic
  - RadHard: Radiation hardened

The Process Technology field indicates each fab's use of five major types of processes. The process grouping is as follows:

- P/CMOS: P-channel metal-oxide semiconductor (PMOS) or complementary metal-oxide semiconductor (CMOS)
- NMOS: N-channel metal-oxide semiconductor (NMOS)
- BiCMOS: Bipolar and CMOS combined on a chip
- Bipolar
- III-V: Gallium arsenide and other compound semiconductor processes

The Estimated Minimum Geometry is the smallest linewidth feature size, measured in microns, attainable in production volume.

The Wafer Diameter represents the maximum wafer size that the fab or fab line can process. Wafer diameters, although expressed colloquially in inches, conform to metric specifications. For wafers greater than 3 inches in diameter, expression in inches becomes inaccurate. When calculating square inches, Dataquest uses the following approximations:

- Stated diameter of 4 inches (100mm) = Approximate diameter of 3.938 inches
- Stated diameter of 5 inches (125mm) = Approximate diameter of 4.922 inches
- Stated diameter of 6 inches (150mm) = Approximate diameter of 5.906 inches
- Stated diameter of 8 inches (200mm) = Approximate diameter of 7.87 inches
- Stated diameter of 12 inches (300 mm) = Approximate diameter of 11.84 inches.

The Year and Quarter of Initial Production displays the year (and quarter, if available) in which this line, having completed all qualifications, began manufacturing in production volumes. The format for this reference is "year.quarter" (for example, 1994.3 translates to the third calendar quarter of 1994).

The Initial Monthly Wafer Starts field indicates the initial monthly volume of production wafer throughput.

The Estimated Maximum Monthly Wafer Starts field contains the equipment-limited wafer start capacity per four-week period. Only the throughput of the installed equipment and the process complexity limits the maximum starts. Dataquest does not consider current staffing or the number of shifts operating in determining this metric.

 ©1999 Dataquest

The Fab Type field shows the types of semiconductor manufacturing performed at this location. The fab types include the following:

- "F" indicates that this is a production-based fab.
- "R" indicates a semiconductor R&D and/or trial production facility.
- "P" means that this location produces a pilot line.
- "T" means that this location performs assembly or testing.
- "N" indicates that this location performs foundry production, or contract manufacturing.
- "VD" means that this location performs VHDL design.
- "PD" means that this location performs IC place and route design.

Chapter 1
Introduction

China/Hong Kong's Semiconductor Market Forecast Summary

While most Asia/Pacific countries will experience a market contraction in 1998, Dataquest predicts that China/Hong Kong's semiconductor market will grow by 2.8 percent and reach U.S.$7 billion. Dataquest expects that it will sustain growth, despite the current Asian financial crisis, because China has a relatively better economic health than other Asian nations, particularly steady growth with low inflation. By 2002, China/Hong Kong's semiconductor market will total $15 billion, which marks a 17.5 percent compound annual growth rate (CAGR) from 1997 to 2002. Figures 1-1 to 1-3 illustrate China/Hong Kong's semiconductor consumption forecast.

Forecast Highlights and Assumptions

The following are key assumptions and highlights of this forecast:

- China's economy is expected to grow by an estimated 7 percent, while Hong Kong's economy will shrink by 4 percent in 1998. The Asia/Pacific region should begin to recover from the economic turmoil in 1999.
- China's electronics equipment production will grow 12.6 percent this year, and its semiconductor market by 2.8 percent. China is now the largest semiconductor consumer in Asia/Pacific. It represents the largest consumer of computer equipment, accounting for a quarter of all PC shipments in the region. China's PC unit shipments are expected to reach 3 million units, a 53 percent increase over the 1997 level.
- China/Hong Kong's semiconductor market will expand from $6.8 billion in 1997 to $15 billion in 2002, at a 17.5 percent CAGR, far higher than the region's 13.3 percent CAGR. In 1998, China/Hong Kong's semiconductor market is forecast to grow 2.8 percent, reaching nearly $7 billion.
- Computers will be the dominant driving force for the semiconductor consumption in China/Hong Kong, especially PCs, whose semiconductor use is expected to growth at a 35.2 percent CAGR from 1997 to 2002.
- PCs represent the largest semiconductor consumption application in China, which account for 26 percent of the total semiconductor consumption in computers. However, because of the fast downward pricing of component prices (especially in DRAM and CPU), although the unit growth will be substantial, the revenue terms may still show a flat trend. The serious component price drop will probably hinder the semiconductor consumption growth.
- Memory devices are estimated to decline in 1998 because of the sluggish DRAM price in 1998. DRAM alone is expected to shrink 27.5 percent in 1998, which is a result of vendors' cutthroat price competition, but it will recover gradually from 1999 after vendors' concerted efforts to reduce production. DRAM prices will have a direct impact on the prices of PCs, whose DRAM contents are expected to increase over time.
- China/Hong Kong's MOS microcomponent market is forecast to grow at an 18 percent CAGR from 1997 to 2002, primarily driven by use in PCs and increasing usage of microcontrollers (MCUs) and digital signal processors (DSPs).
- The semiconductor market for optical disk drives will become stagnant in 1999, as the demand of CD-ROM drives reaches saturation and semiconductor prices fall in a downward trend. However, this market will recover in 2000 when high-content digital video disc (DVD) ROM drives will become more popular, gradually replacing CD-ROM drives.
- CRT monitors will be gradually replaced by thin film transistor (TFT) displays in the coming years. The demand for TFT displays will be the main growth driver of semiconductor market of monitors.

 ©1998 Dataquest

- The average growth of semiconductors used in communications equipment manufacturing will be 9.9 percent this year and is forecast at 11.1 percent in 1999. Digital cordless phones and digital mobile phones will be the sector's key growth drivers. The analog cordless phones will be replaced by digital cordless, while digital cellular phones have already taken the dominant position over analog cellular.
- Semiconductors used in pager manufacturing will show a flat growth of less than 4 percent in 1999, as the market is eroded by the popularity of cellular phones.
- The other area of high growth in communications equipment production is broadcast and studio, which will be driven by the digitalization in broadcasting. As China plans to start its first digital broadcast station in 2000, the related applications are expected to start booming at that time. The high semiconductor content in digital products will make the market attractive.
- China's unemployment rate increases because of the nationwide restructuring of state-owned enterprises (SOEs) and employee layoffs. Because of rising unemployment, the consumer price index (CPI) deflated by 2 percent in the second quarter, suggesting that the consumer consumption was low. The lack of internal consumption will probably bring down the economy and, ultimately, the consumption of semiconductor chips.
- The average growth of semiconductor consumption in consumer electronics will be at a stagnant 4.5 percent this year. The slow growth is attributed to several factors—such as poor export performance, large layoffs of SOE employees, and the disastrous floods in August 1998. The consumer electronics market is forecast to recover gradually and peak in 2001, driven by the global trend of digitalization.
- Digital consumer electronics will be the future growth driver. As the government plans to start its first digital broadcast station in 2000 and to produce fully digital high-definition television (HDTV) in 2004 with a target capacity of 600,000 per year, digitalization will revive the slow growth of consumer electronics.
- Color TV will be one of the applications to benefit from the digitalization. With China's first digital broadcast station to be established in 2000, digital color TV and analog set-top boxes for converting the digital signals will be growing fast, with an expected 23 percent CAGR and 66 percent CAGR, respectively. In addition to local demand, the growth will also be driven by exports as digitalization becomes a global trend.
- China is currently the largest VCD player production base and consumption center. In October 1998, the Ministry of Information Industry (MII) announced a new extended standard for super video compact disc (VCD). VCD players are expected to dominate until 2000 when DVD players become popular and more affordable.
- The home appliance market will be flat this year because of the unfavorable environment for consumers to make purchases. However, the growth is expected to recover from 1999, as the market is still unsaturated in some segments and there is room for replacement purchases.

Electronic Equipment Production in China/Hong Kong

China/Hong Kong's electronic equipment manufacturing is expected to continue growing at a 15.1 percent CAGR to 2002, reaching $92.2 billion. This growth is driven by emerging applications in the data processing equipment, communications equipment, and consumer electronics segments.

Electronic equipment manufacturing is forecast to grow 12.6 percent in 1998, in contrast to 18.6 percent in 1997. The dollar value is expected to reach $51.3 billion in 1998, compared to $45.6 billion in 1997. Its slower growth in 1998 is attributed to the impacts of the Asian financial crisis and the nationwide restructuring of SOEs, which suppress the export growth and internal consumption.

However, given the encouraging macroeconomic developments and continued favorable government policy, China's equipment production will remain on an upward curve through the end of the decade, at 15.1 percent CAGR, to reach $92.2 billion by 2002.

The Market Statistics Report Format

This Market Statistics report contains Dataquest's forecast of China/Hong Kong's semiconductor consumption by electronics application from 1997 to 2002. Readers will note these two forecasts were previously published in separate reports. This is the second of two semiannual forecasts that Dataquest publishes this year. This second forecast reflects changes in Dataquest's view of semiconductor consumption by electronic equipment in China/Hong Kong since spring. It incorporates changes suggested by Dataquest's recently updated forecasts of electronic equipment production and semiconductor shipments.

In contrast to previous forecasts, Dataquest is only reporting its forecast for the 1997-to-2002 period. More significantly, Dataquest has greatly expanded the electronic equipment details to support its forecast of the total semiconductor consumption. These changes are related to a fundamental change in Dataquest's forecast methodology. Whereas Dataquest's previous semiconductor consumption forecasts represent a top-down mathematical reconciliation of its updated electronic equipment production and semiconductor shipment forecasts, this forecast is an effort at a bottom-up estimate of the semiconductor consumption generated by Dataquest's forecast of electronics production. As such, this forecast no longer attempts to specify how Dataquest's forecast of semiconductor shipments will distribute themselves across electronic applications. Instead, it attempts to estimate semiconductor consumption separately by electronic systems unconstrained by the requirement that semiconductor consumption equal semiconductor shipments. Thus, it leaves open the possibility that estimated semiconductor consumption may differ from estimated semiconductor shipments. Unfortunately, this is not the forum to discuss the consequences of the semiconductor demand-supply imbalance implied by persistent differences between estimated semiconductor consumption and estimated semiconductor shipments. Dataquest leaves that task for other publications.

©1998 Dataquest

This report's tables present data that is intended to answer the following questions:

- What is the estimated semiconductor consumption of various broad categories of electronic equipment?
- What is the estimated semiconductor consumption of the key individual electronic systems that make up these broad categories?

The estimates offered here are intended to provide very general answers to these questions. They are meant as a broad guide to semiconductor consumption by electronic equipment production. Dataquest publishes several reports concerning semiconductor applications in specific electronic equipment categories. Readers interested in more detailed information about estimated semiconductor consumption by individual electronic systems are encouraged to consult these publications.

The semiconductor consumption forecasts presented here complement Dataquest's recently updated forecasts of electronic equipment production and semiconductor shipments. A summary of these forecasts down to the individual electronic systems level appears in Chapter 3. Regional forecasts for the Americas, Japan, and Europe, Middle East, and Africa may be requested through Dataquest's inquiry service. Additional regional and semiconductor device detail for this forecast may also be requested through Dataquest's inquiry service.

This report contains tables organized as follows:

- Tables 2-1 to 2-2 summarize Dataquest's China/Hong Kong semiconductor consumption forecast by electronic product group.
- Tables 2-3 to 2-10 detail China/Hong Kong's semiconductor consumption by individual electronic system grouped by equipment type.
- Tables 2-11 to 2-12 summarize the China/Hong Kong semiconductor consumption forecast by device.
- Tables 3-1 to 3-12 detail the China/Hong Kong electronic equipment production forecast.

Segmentation of Semiconductor Applications

Dataquest forecasts semiconductor consumption by end-use electronic application. We divide electronic applications into six broad groups in accordance with our segmentation of electronic equipment production. These groups are, in turn, disaggregated into narrower electronic systems categories, as follows:

- Data processing equipment
  - Computers
  - Data storage equipment
  - Input/output devices
  - Dedicated systems
  - Other data processing equipment

 ©1998 Dataquest

- Communications equipment
  - Premise telecom equipment
  - Public telecom equipment
  - Mobile communications equipment
  - Broadcast and studio equipment
  - Other communications equipment
- Industrial electronic equipment
  - Security and energy management systems
  - Manufacturing systems and instruments
  - Medical equipment
  - Other industrial equipment
- Consumer electronics
  - Audio equipment
  - Video equipment
  - Personal electronics
  - Appliances
  - Other consumer equipment
- Military/civil aerospace systems
- Transportation electronic equipment

As part of our forecast process, we develop forecasts for roughly 40 individual electronic systems within these various categories and subcategories. These include the following:

- Data processing equipment
  - Mainframe/supercomputers (computers)
  - Midrange computers (computers)
  - Workstations (computers)
  - PCs (computers)
  - PC motherboards (computers)
  - Rigid disk drives (data storage)
  - Optical disk drives (data storage)
  - Removable magnetic storage (data storage)
  - Page printers (input/output devices)
  - Serial printers (input/output devices)
  - Monitors (input/output devices)

 ©1998 Dataquest

- Communications equipment
  - LAN cards (premise telecom equipment)
  - Premise line cards (premise telecom equipment)
  - Fax machines (premise telecom equipment)
  - Modems (premise telecom equipment)
  - Corded telephones (premise telecom equipment)
  - Analog cordless phones (premise telecom equipment)
  - Digital cordless phones (premise telecom equipment)
  - Central office line cards (public telecom equipment)
  - Analog cellular phones (mobile telecom equipment)
  - Digital cellular phones (mobile telecom equipment)
  - Mobile telecom infrastructure (mobile telecom equipment)
  - Other mobile telecom products (mobile telecom equipment)
- Consumer electronics
  - Personal/portable stereo (audio systems)
  - Color TVs (video devices)
  - VCRs (video devices)
  - Analog camcorders (video devices)
  - Digital camcorders (video devices)
  - DVDs (video devices)
  - Analog set-top boxes (video devices)
  - Digital set-top boxes (video devices)
  - Digital still cameras (personal electronics)
  - Video game controllers (personal electronics)
  - Video game cartridges (personal electronics)
- Transportation electronic equipment
  - Automotive stereos
  - Automotive engine control units (ECUs)
  - Antilock braking systems
  - Air bags
  - Automotive navigation systems

Readers interested in more detailed discussion of our applications segmentation are encouraged to consult the Dataquest publication guide, *Semiconductor Application Market Definitions Guide,* which may also be requested through Dataquest's inquiry service.

 ©1998 Dataquest

Geographic Segmentation

Dataquest's worldwide electronic equipment production forecast is aggregated from individual forecasts for the four following principal geographic regions:

- Americas
- Japan
- Europe, Middle East, and Africa
- Asia/Pacific

Detailed discussion of these regions and their composition may be found in the Dataquest publication, *Semiconductor Application Market Definitions Guide*.

Exchange Rates

Dataquest's worldwide electronic equipment forecast aggregates data from many countries, each of which uses a currency that has a different and fluctuating exchange rate relative to the U.S. dollar. Because we compile our worldwide forecast from individual regional forecasts, we use the U.S. dollar as a common currency for comparisons and aggregation. As a rule, Dataquest calculates forecasts in local currencies and then converts them to U.S. dollars using projected average annual exchange rates. Dataquest does not forecast exchange rates per se. Instead, we calculate projected average annual exchange rates from current exchange rates. Our projections are based on estimates of the latest available monthly exchange rate at the time the forecast is developed. Table 1-1 presents the average annual exchange rates incorporated in this forecast. These rates are based on monthly exchange rates observed through October 1998. Additional information about historical exchange rates and Dataquest's method of calculating future average exchange rates may be requested through Dataquest's client inquiry service.

Forecast Methodology

When discussing semiconductor consumption, it is critical to remember that semiconductors are not end products consumed for their own sake. Instead, they are intermediate products used as inputs for electronic end products which, in turn, are eventually consumed by individuals and businesses for the services and utility they provide. Implicit in the concept of semiconductor consumption is the notion that one can specify the electronic end products in which semiconductors will be incorporated or consumed. A semiconductor forecast which does not or cannot specify this is not a forecast of semiconductor consumption. At best, it is merely a forecast of semiconductor shipments.

Dataquest's semiconductor consumption by electronic application forecast grew out of the recognition that a truly complete semiconductor forecast must specify the electronic end uses of semiconductors. However, specifying semiconductor end uses has proven far more difficult than recognizing that it must be done. Although it appears possible to specify semiconductor consumption by the variety of electronics produced, it is, in fact, virtually impossible to do this. There are simply too many different types of semiconductor devices consumed in too large a variety of electronic products.

Thailand (Baht)	31.07	42.44	41.30

Source: Dataquest (November 1998)

As a result, semiconductor consumption must invariably be estimated. This can be done in any number of ways. Previous to this forecast, Dataquest used a mathematical model to estimate semiconductor consumption by various electronic end uses. Taking Dataquest's electronic equipment production and semiconductor shipments forecasts as inputs, this model allocated estimated semiconductor shipments across forecast electronics production subject to various assumptions about the semiconductor content of electronic products. The model also imposed several balancing conditions intended to guarantee that estimated semiconductor shipments were totally and completely allocated across all forecast electronics production.

The model applied a decidedly "top-down" approach to estimating semiconductor consumption. In effect, it calculated estimates of semiconductor consumption by compelling agreement between the details of Dataquest's electronics production and semiconductor shipment forecast. As a result, Dataquest's estimates of semiconductor consumption were more an artifact of a mathematical process than truly independent estimates of semiconductor consumption. Although the model offered considerable flexibility to produce reasonable results, it was, nonetheless, limited by the validity of its semiconductor content assumptions and the balancing requirement that semiconductor consumption equal semiconductor shipments. Despite its potential drawbacks, the model provided the best estimates Dataquest could offer given a paucity of knowledge about semiconductor applications in specific electronic systems.

©1998 Dataquest

Fortunately, Dataquest has been able to greatly expand its knowledge of semiconductor uses in specific electronic systems in recent years. During past few years, Dataquest's semiconductor applications research has been concentrated on the study of semiconductor use in specific individual electronic systems. Dataquest has successfully developed models to track and forecast the production and semiconductor consumption of some 40 different individual electronic systems. These include PCs and PC motherboards, rigid disk drives (RDDs), LAN cards, modems, digital cellular phones, digital set-top boxes, and automotive navigation systems, among others. All told, the electronic systems encompassed by Dataquest's models account for roughly one-half of all electronics production and nearly two-thirds of estimated semiconductor consumption.

These models have not only allowed us to codify our knowledge about individual electronic systems but also to approach the task of estimating semiconductor consumption using a "bottom-up" forecast method. This is the method Dataquest has used for this forecast and intend to use from now on for future forecasts. The method essentially involves building up a forecast of semiconductor consumption for all electronics production by leveraging the estimates of semiconductor consumption for individual electronic systems. Specially, Dataquest uses individual systems estimates as a forecast base and augments it with estimates of semiconductor consumption for the various other electronic equipment categories it currently does not track on an individual systems basis. Precisely because the method uses well-researched knowledge about individual electronics systems that dominate semiconductor consumption, we believe it is capable of providing far better forecasts of semiconductor consumption than Dataquest's former top-down method, especially for those electronic equipment categories (such as computers) where our individual systems forecasts account for virtually all of the category.

Naturally, Dataquest's change to a new method has several important consequences. First, Dataquest has, at least temporarily, eliminated the forecasts of specific semiconductor device consumption by electronic application it used to provide. Although informative, these forecasts were largely an artifact of Dataquest's old top-down method. Recent research indicates that these forecasts were especially sensitive to the assumptions and balancing conditions of our top-down method. Unfortunately, we are still in the process of developing semiconductor device detail for many of the individual systems forecasts, which now serve as the basis for our new bottom-up method. Consequently, our systems forecasts have yet to reach the point where they can be leveraged to provide reasonable consumption forecasts for specific semiconductor devices. We hope to reinstate device consumption forecasts, as soon as they are possible, according to our new bottom-up method. In the meantime, we trust that readers will find the added electronics system detail Dataquest can now offer in its forecast adequate compensation.

More importantly, we no longer insist that estimated semiconductor consumption equal Dataquest's forecast of semiconductor shipments. This is actually as it should be. In truth, our long-standing insistence that estimated semiconductor consumption equal forecast semiconductor shipments was more a matter of mathematical necessity for the sake of our old top-down forecast method than a reflection of market realities. There are, in fact, several reasons why semiconductor consumption as we estimate it may differ from a forecast of semiconductor shipments.

 ©1998 Dataquest

First, there can be significant slippage between semiconductor shipments and semiconductor consumption by electronics producers over short periods because of changes in the semiconductor inventories held by electronic producers. Electronics producers naturally adjust their semiconductor inventories in response to expected changes in their level of production. Although just-in-time practices are reducing the volume of inventories producers hold, the continued existence of inventories means semiconductor shipments and consumption may differ.

Second, not all semiconductor shipments are consumed by electronics producers manufacturing new electronics. Indeed, some find their way into so-called "aftermarkets" where they are eventually "consumed" by existing electronics. We exclude aftermarket activity from our estimates of semiconductor consumption. Aftermarket consumption is virtually impossible to track and in any event, and it appears small relative to the consumption generated by electronics producers.

Finally, Dataquest's estimates of both electronics production and semiconductor consumption, no doubt, suffer from errors of omission. We know that our estimates are likely to exclude at least some current semiconductor applications and most certainly exclude more than a few future applications that cannot be anticipated here and now. In our defense, we have good reason to believe these omissions are minor. Still, they represent yet another reason why estimated semiconductor consumption may differ from forecast semiconductor shipments.

That said, nonetheless, it seems reasonable to expect that estimated semiconductor consumption and forecast semiconductor shipments will closely parallel one another, especially over the long term. As already noted, semiconductors are first and foremost intermediate inputs to electronics production. As such, semiconductor shipment growth is ultimately fueled by growth in the semiconductor consumption generated by electronics production. Growth in electronics manufacturers' semiconductor consumption is, in turn, fueled by growth in both the volume and semiconductor content of electronics production. In the end, all growth in semiconductor shipments can and must be attributed to growth in one or the other of these key consumption drivers. Estimation errors aside, persistent differences between estimated semiconductor consumption growth and forecast semiconductor shipments growth prefigure a demand-supply imbalance in the semiconductor market. In the past, Dataquest's top-down research method obscured the potential semiconductor market imbalances by assuming that estimated semiconductor consumption must equal forecast semiconductor shipments. The beauty of Dataquest's new bottom-up method is that in forsaking this assumption, it can offer important insights into the future of the semiconductor market. Dataquest realizes that separate forecasts of semiconductor consumption and semiconductor shipments have the potential to create some confusion. By the same token, however, Dataquest believes that separate forecasts may actually help clarify future semiconductor market movements by revealing potential market imbalances.

Chapter 1
Introduction and Definitions

This Market Statistics report represents findings of Dataquest's primary research of China's electronic equipment manufacturers. Dataquest has selected 62 major high-volume electronic equipment manufacturers with more than 108 factories in China. These companies are top representing companies of U.S., Chinese, European, Hong Kong, Japanese, Korean, and Taiwanese capital.

In addition to Dataquest's *High-Volume Electronic Equipment Unit Production Forecast and Semiconductor Consumption: China/Hong Kong* document, this report publishes company-level information for such details as company locations, products, production units, export ratios, and retail average selling prices (ASPs). This report offers a better understanding of consumption trends by end-application market.

The 62 leading companies selected by Dataquest are as follows:

- United States
  - AST Research Inc.
  - Compaq Computer Corporation
  - IBM
  - Motorola Incorporated
  - Seagate Technology Inc.
- China
  - The Beida Founder Group
  - Beijing International Switching System Company
  - Beijing Aerospace Gold Card Company
  - Changke International Electronics Company Ltd.
  - China Electronic Info. Industry Company
  - Chongqing HuiLiDa Electronic Company
  - Dongguan Zhenglong Technology Company Ltd.
  - Fujian Malata Company Ltd.
  - Guangdong Idall Company Ltd.
  - HuaFei Color Monitor System Company Ltd.
  - HuaXu Gold Card Company
  - Huizhou Wangpai AV Electronic Company Ltd.
  - Jiangsu Shinco Electronic Group Company
  - Konka Electronic Group Company
  - LangChao Electronic Group Company
  - Legend Group

 ©1998 Dataquest

- Panda Electronics Group
- QingDao Hisense Computer Company
- Rainbow Electronic Group Company
- Shanghai Automotive Brake System Company Ltd.
- Shanghai Bell Telephone Equipment Company
- Shanghai Fudian Automotive Electronics Company Ltd.
- Shanghai Guang Dian Group Company
- Shenzhen Huawei Technology Company Ltd.
- Shenzhen Phone Star Comm. Company Ltd.
- Shenzhen Shentong Printing Equipment Co Ltd.
- Sichuan Changhong Electronic Group Company Ltd.
- Stone Group Corporation
- TCL Group Corporation
- Tontru Information Industry Group
- WeiFang HuaGuang Technology LTD Company
- Xiamen HuaQio Electronic Company
- Xiamen Xiaxin Company Ltd.
- Xian DaTang Telecom Company Ltd.

- Europe
  - Ericsson
  - Nokia Corporation
  - Philips Electronics NV
  - Siemens AG
- Hong Kong
  - Vtech Holdings Ltd.
- Japan
  - Fujitsu Ltd.
  - Hitachi Ltd.
  - Matsushita Electric Industrial Company Ltd.
  - NEC Corporation
  - SANYO Electric Company Ltd.
  - Sharp Electronics Corporation
  - Sony Corporation
  - Toshiba Corporation
  - Uniden Corporation

- Korea
    - Hyundai Electronics Company Ltd.
    - LG Electronics Inc.
    - Samsung Electronics Company Ltd.
- Taiwan
    - Acer Group
    - Dataexpert Inc.
    - First International Computer Inc. (FIC)
    - Hsin Ming Electronic Company Ltd.
    - PC Chips Group

Economic Assumptions and Exchange Rates

Actual exchange rates for the major countries in Asia/Pacific are detailed in Table 1-1. The exchange rates are applied to all historical figures. Dataquest does not forecast currency fluctuations. In looking at our historical numbers, it is important to note fluctuations in currencies. The Chinese renminbi was stable in 1995 and 1996, compared to its fluctuation in 1994. The Korean won appreciated 4.49 percent in 1996. In conducting market forecasts, Dataquest uses constant exchange rates across technologies and regions.

Dataquest has included the gross domestic product forecast by the WEFA Group. As shown in Table 1-2, Asia/Pacific has the fastest-growing economies in the world. The regional expansion has been led by manufacturing, which has in turn been led by the electronics sector in Korea, Singapore, Taiwan, and, more recently, China and Malaysia. These economies have not only sustained growth since the late 1980s but have diversified their regional export markets, which has reduced dependence on North American or European consumers. The increased importance of intra-Asian trade and integration is the key reason for the long-term growth expected. It is noteworthy that China led other Asia/Pacific countries in gross domestic product (GDP) growth, and this is expected to continue until 2001.

Regional Definitions

Dataquest has revised its regional definitions effective this year. The region formerly known as "Rest of World" has been eliminated and its components have been redistributed across the remaining regions. The remaining regions, in turn, have been redefined in response to this change. Former Rest of World constituents Central America, South America, and the Caribbean have been combined with North America in a new region redefined as "Americas." The Middle East (including Israel) and Africa have been combined with Europe in the redefined region "Europe, Middle East, and Africa." The Pacific Island nations of Oceania, formerly considered Rest of World, have been included with Asia/Pacific to create a larger redefined region still called "Asia/Pacific."

 ©1998 Dataquest

Americas

- North America: Includes Canada, Mexico, and the United States (50 states)
- Central America
- South America
- Caribbean

Japan

Japan is the only single-country region.

Europe, Middle East, and Africa

Europe

Western Europe. Includes Austria, Belgium, Denmark, Eire (Ireland), Finland, France, Germany (including former East Germany), Greece, Italy, Luxembourg, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, the United Kingdom, and rest of western Europe (Andorra, Cypress, Gibraltar, Iceland, Liechtenstein, Malta, Monaco, San Marino, Turkey, and Vatican City).

Eastern Europe. Includes Albania, Bulgaria, the Czech Republic and Slovakia, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, the republics of the former Yugoslavia, and the republics of the former USSR (including Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan).

Middle East (Includes Israel)

Africa

Asia/Pacific

Includes Asia/Pacific's newly industrialized economies (NIEs) and the remainder of Asia/Pacific including Oceania. Asia/Pacific NIEs include Hong Kong, South Korea, Singapore, and Taiwan. The remainder of Asia/Pacific includes Australia, Bangladesh, Brunei, Cambodia, China, India, Indonesia, Laos, Malaysia, Maldives, Myanmar, Nepal, New Zealand, Pakistan, the Philippines, Sri Lanka, Thailand, and Vietnam, as well as the Pacific Island nations that make up Oceania.

©1998 Dataquest

Product Definitions

The products mentioned in this report will follow the following definitions.

Electronic Data Processing

Personal Computer

A personal computer is a general-purpose computer that is distinguished from other computers by its adherence to hardware and software compatibility. This compatibility drives high unit volumes of commoditylike products that do not require on-site technical support. High-performance features (such as networking, graphics, floating-point coprocessor, and a virtual multiuser/multitasking operating system) are normally optional and not integral system features. IBM/IBM-compatible and Macintosh personal computers are two platforms in this product segment. A single-user PC's resident operating system is typically DOS, OS/2, or Mac OS.

PCs have a performance ceiling that is lower in system compute performance, I/O channel speed, and disk speed than workstations; normally, standard graphics are in the 640 x 480-pixel range, and optional high-end graphics are limited, compared to workstations. Dataquest views a PC system as a single unit that includes a CPU, a monitor, and a keyboard. Furthermore, Dataquest PC shipment data does not include systems assembled from component parts purchased in electronics stores or other outlets.

Motherboard

A motherboard is a PC system board consisting of a printed circuit board with semiconductor and nonsemiconductor components that are all soldered down. The list of semiconductor components will include a minimum of core logic chipset, clock controller, real-time clock, keyboard controller, and any additional glue logic required to interface between the core logic chipset and CPU, cache memory, main memory, and expansion bus (such as PCI). The list of semiconductor components may include a graphics controller, mass storage interface, serial and parallel I/O, voltage converter, or audio controller, as long as they are soldered down.

Workstation

Dataquest classifies workstations by a composite of features, including their hardware and software features. Workstations are typically based on Pentium-class or RISC CPU architectures with a high-performance bus structure, graphics, and operating system. In general, a workstation must come standard with integrated floating-point processing, integrated networking, and a 32-bit multitasking operating system, as well as offer a configuration that has high-resolution graphics capabilities (typically 1-megapixel display). Dataquest does not determine a workstation architecture by its usage (that is, single-user, server, or multiuser).

 ©1998 Dataquest

Once the system passes these criteria, we examine whether it is designed to be a server or a workstation (that is, if the system is marketed with graphics capabilities). If the system is designed to be a server (examples are the SPARCserver 1000 and RS/6000 POWERserver 900 series), the system is classified in Dataquest's midrange category. If it is marketed with graphics capabilities, we further classify the workstation and its server configuration (for example, SPARCstation 10 and SPARCserver10) into one of three categories: entry-level workstation, midrange workstation, and superworkstation.

Midrange Computer

The midrange product category includes all systems that fall between workstations and mainframes. These are multiuser systems that may or may not run proprietary operating systems. With the evolution of client/server computing and the systems that define this market, traditional midrange product categories are becoming obsolete. The HP 9000 and the HP 3000, Digital's VAX systems, and the IBM AS/400 line are joined by the dedicated server products from vendors such as Auspex, NetFRAME, and Tricord in the midrange product category. Office systems and proprietary turnkey computing solutions, common in Japan, are also included in the midrange category. Systems designed as servers from workstation vendors are also included here.

Midrange-class servers consist of high-end PC server systems that are manufactured and marketed by traditional PC vendors as well as system vendors. A server is a shared computer on a network that can be used for simple and complex tasks. The key distinctions between midrange-class servers and server-marketed PCs are price and the average number of CPUs included in the base system. Midrange-class servers ship with more than one CPU and generally cost more than $15,000. Examples of this segment include the Compaq ProLiant 4000, IBM PC Server 700, and the HP NetServer LM2. The midrange-class server category comprises PC servers that compete with leading symmetric multiprocessing (SMP) and scalable products marketed by dedicated server vendors.

Mainframe/Supercomputer

A supercomputer is a high-performance computer designed for numerically intensive applications; current prices range from $100,000 to $20 million. Typically, these systems run in cool rooms (with or without raised floors), and performance speeds range upward from 50 mflops. Massively parallel systems are defined as machines that have more than 32 relatively inexpensive processors linked together to act as one system.

A mainframe is a general-purpose information system with a starting price of more than $100,000; CPU bit width ranges from 32 bits to 64 bits. Physical environment can be with or without environmental controls.

Page Printer

A page printer prints one page at a time.

Serial Printer

A serial printer prints one character at a time.

 ©1998 Dataquest

Rigid Disk Drive

The rigid disk drive (RDD) industry is the collective body of companies manufacturing rotating magnetic disk drives for use in storing computer programs and data. Some products are used in noncomputer applications; those are not included in the data presented in these market statistics. A rigid disk drive stores digital information on a round platter made of polished aluminum or a ceramic material. The information is written and read from the platters by recording heads mounted on the end of an arm. The arm is positioned over the desired area of the disk by a sophisticated control circuit that guides an actuator motor's movement. The data is amplified, decoded, and transmitted to the computer by the disk drive electronic circuits. The manner in which the information is presented to the computer is determined by the interface characteristics of the disk drive. Examples of interfaces include the small computer system interface (SCSI) and the PC-AT bus, sometimes called IDE.

Optical Disk Drive

An optical disk drive (ODD) is a data storage device that uses laser technology. Its categories are as follows: CD-ROM drive, 12cm in diameter; CD-Recordable; write-once read-many (WORM) optical drive; rewritable ODD; magneto-optical (MO) multifunction, which has a hidden code read at disk spin-up time; and PC multifunction drive (WORM media that cannot be erased).

Removable Magnetic Storage

Removable magnetic storage comprises FDD and tape.

Monitors

A self-contained video display device that attaches directly to a computer and displays the contents of the computer's video memory. A monitor contains no data formatting or editing capability, nor does it contain any type of networking capability. Included are color monitors, which have interfaces capable of interpreting signals containing separate color components, normally the three primary colors red, green, and blue; and monochrome monitors, which are based on a single-color CRT. These monitors normally display in shades of white, green, or amber. They may or may not have the ability to display multiple shades of a monochromatic color.

Communications

LAN Card

A LAN card is the printed circuit board that plugs into the expansion slots of a PC, workstation, or host terminal to allow connection to a LAN. Network interface cards (NICs) are designed in accordance with either IEEE or ANSI protocol standards; the most common are Ethernet, token ring, and fiber-distributed data interface (FDDI). Workstation and host NICs are segmented only into FDDI, ATM, and others.

Fax

Facsimile machines include those with answering machines and cordless handsets.

Modem

A modem is an electronic device that provides modulation and demodulation functions for data signals transmitted over telephone lines. Modems convert digital data to analog data for transmission over leased lines or the analog public switched telephone network.

Central Office/Premise Line Card

A telecommunications switch used by public carriers.

Corded Telephone

This category includes both standard and feature phones.

PBX

Private branch exchange.

Answering Machine

Answering machines include both standalone and integrated answering machines, including any telephone terminal with an answering machine. To avoid double counting, any corded or home cordless telephone that has an integrated answering machine will be counted in the answering machine category. They are not counted again in the corded or cordless category.

Analog Cordless Telephone

Includes analog (single channel, 10-channel, 24-channel, CT-0, CT-1) cordless telephones and 900 MHz analog cordless telephones. These handsets are usually distinguished by the ability to only communicate with one base station in the home or small business. Therefore, a unit would consist of the combination of a handset and base station. The chip content in both the handset and base station should be added together on the semiconductor content line.

Digital Cordless Telephone

These are cordless handsets that can be used to roam outside the home and can communicate with a service provider's infrastructure or multiple base stations in an office environment. They are usually distinguished from cellular by only being able to communicate at pedestrian speeds. Examples of handsets are PHS, DECT, and CT-2.

Analog Cellular Telephone

This includes all advanced mobile phone service (AMPS), total access communications system (TACS), and Nordic Mobile Telephone (NMT) cellular handsets, among others.

Digital Cellular Telephone

This category covers all digital cellular and broadband personal communications services (PCS) handsets, including handsets that conform to the following standards: Global System for Mobile Communications (GSM), DCS1800, PCS1900, NA-TDMA (IS-54/136), CDMA (IS-95), PDC, and Omnipoint.

©1998 Dataquest

Pager

A pager is a small, pocket-size receiver that can be activated when the pager number is dialed from a telephone. Includes both one-way and two-way pagers.

Mobile Communications Infrastructure

Two components are the base station controller (BSC) and the switch. The BSC controls the voice channels and power controls.

Consumer

Color TV

Color TVs include LCD-based and TV-VCR combinations.

VCR

VCRs do not include TV-VCR combinations.

Personal/Portable Stereo

This category includes headphone stereos, portable CDs, and boom boxes.

Digital Video Player (DVD)

Includes only DVD products that are used with a television for playback of video content. Does not include DVD products targeted at the PC market. These would be included as a subcategory of optical disk drives.

Set-Top Box: Analog

A set-top box that decodes and enables access to analog-based TV services.

Set-Top Box: Digital

Digital cable converter boxes that sit on top of TVs and act as converter devices for digital information over CATV, telephone, or wireless networks to television sets. These boxes contain a general-purpose microprocessor or a high-powered digital signal processor capable of digital transmission, reception, and decompression.

Video Game Controllers

The board with the chips on it that drives the hardware of the game player.

Transportation

Auto Stereo Systems

Includes integrated AM/FM stereo radio receivers; AM/FM radio/cassette combinations; AM/FM radio/cassette/CD combinations, and all in-car audio stereo AM/FM radio-based systems. In the future, this will include terrestrial Digital Audio Broadcast FM receivers (any estimates for DAB radios should become available for inclusion to this category as a separate line item).

 ©1998 Dataquest

Auto Engine Control Unit

Includes electronic engine control units (ECUs) for petrol (gasoline) and diesel (derv) fuel carburetor/injection engines for cars, trucks, and lorries. Electronic engine control units for petrol engine cars include electronically controlled carburetor systems, single-point injection systems, and multi-point injection systems. Also includes electronic control units where ignition control (breakerless/distributorless, or adaptive/digitally programmed) is integrated with carburetor or injection control unit. Electronic engine control units for diesel engine cars include electronically controlled direct injection systems and indirect injection (distributor) systems. (Please note: Engine control unit excludes standalone electronic ignition control units.) Manages spark or fuel injection, or both.

Antilock Brake System Control Unit

Includes electronic ABS control units for two-wheel ABS systems and four-wheel ABS systems for passenger cars. Includes electronic ABS control units for two-wheel and four-wheel ABS systems for light trucks. Includes electronic ABS control units for commercial-vehicle ABS systems for trailers/juggernauts; and electronic ABS control units for motorcycles. Includes ABS with integrated traction control systems.

Air Bag Control Unit

Includes electronic control units for single and/or dual air bag systems for driver/front passenger. Includes electronic control units for rear-seat air bag systems for rear passengers. Includes electronic control units for side-impact air bag systems for front/rear-seat passengers.

Data Sources

The historical information presented in the production data has been consolidated from a variety of sources, each of which focuses on a specific part of the market. From time to time, Dataquest conducts production surveys for specific types of electronic equipment, and the data gathered is also incorporated into the database. Other sources include the following:

- Dataquest's estimates of systems manufacturers' end-user revenue
- Trade association data
- Various government agency statistics of the countries in Asia/Pacific
- Estimates presented by knowledgeable and reliable industry spokespersons
- Published product literature and prices
- Other Dataquest research groups (including Computer Systems and Peripherals and Telecommunications)

©1998 Dataquest

Forecast Methodology

Dataquest uses a variety of forecasting techniques (both qualitative and quantitative) that vary by technology area. Dataquest follows a three-step process to forecast electronic equipment production. First, current and expected future worldwide and European macroeconomic conditions are assessed and forecast. The Dun & Bradstreet Corporation information is used to develop the macroeconomic forecasts for world's major economies, the Group of Seven (G7) countries. This forecast identifies trends in the economic health of the world's leading consumers and producers of electronic equipment. Using this forecast in conjunction with input from other Dataquest industry sources (as identified earlier), Dataquest estimates the overall business climates in which the electronic systems market will operate.

Second, Dataquest analyzes and forecasts the significant long-range trend and outlook in the various electronic systems research groups (within Dataquest). This analysis establishes a five-year trend growth path for electronic systems production.

The final step in the forecast process is to reconcile expected fluctuations in market trends so that the two do not inexplicably diverge. Dataquest anticipates that in the absence of shocks to the market, market fluctuations converge toward a long-term trend.

Because the time series data contained in this document comprises, in general, annual observations, and it is sparse in terms of the number of observations, the data generally does not satisfy the requirements of quantitative empirical techniques such as econometric or statistical time series models. Therefore, in most cases, we have used judgmental models (that is, intuitive judgments, expert opinions, and subjective probabilities) or technological models (that is, curve fitting and the use of analogous data).

Project Analyst: Kelvin Fu

Chapter 1
Introduction and Discussion

Introduction

This Market Statistics report contains Dataquest's forecast of China/Hong Kong semiconductor consumption by electronic application from 1997 to 2002. Long-time readers will note these two forecasts were previously published in separate documents. This is the first of two semiannual forecasts that Dataquest will publish this year; the second will be published this coming fall. This first forecast reflects changes in Dataquest's view of semiconductor consumption by electronic equipment in China/Hong Kong since the fall of 1997. It incorporates changes suggested by Dataquest's recently updated forecasts of electronic equipment production and semiconductor shipments.

Long-time readers will note significant changes in the focus and format of this forecast, compared to previous forecasts. In contrast to previous forecasts, Dataquest is reporting only its 1997-to-2002 forecast. More significantly, Dataquest has greatly expanded the electronic systems detail supporting its total semiconductor consumption forecast. At the same time, Dataquest has eliminated our semiconductor device consumption forecasts by electronic application. These changes are related to a fundamental change in Dataquest's forecast methodology.

Whereas Dataquest's previous semiconductor consumption forecasts were a top-down mathematical reconciliation of its updated electronic equipment production and semiconductor shipment forecasts, the forecast presented here represents an effort to make an independently "bottom-up" estimate of the semiconductor consumption generated by Dataquest's forecast of electronics production. As such, the forecast no longer attempts to specify how Dataquest's forecast semiconductor shipments will distribute themselves across electronic applications. Instead, it attempts to estimate semiconductor consumption separately by electronic system, unconstrained by the requirement that semiconductor consumption equals semiconductor shipments. It thus leaves open the possibility that estimated semiconductor consumption may differ from estimated semiconductor shipments. Unfortunately, this is not the forum to discuss the consequences of the semiconductor demand-supply imbalance implied by persistent differences between estimated semiconductor consumption and estimated semiconductor shipments. Dataquest leaves that task for other publications.

This report's tables present data that is intended to answer the following questions:

- What is the estimated semiconductor consumption of various broad categories of electronic equipment?
- What is the estimated semiconductor consumption of the key individual electronic systems that make up these broad categories?

©1998 Dataquest

The semiconductor consumption forecasts presented here complement Dataquest's recently updated forecasts of electronic equipment production and semiconductor shipments. Dataquest's updated China/Hong Kong electronic equipment forecasts may be found in *1998 China/Hong Kong Detailed Electronic Equipment Production Forecast* (SEMI-CH-MS-9801, May 1998). A summary of these forecasts down to the individual electronic systems level appears in Appendix A. Regional forecasts of the Americas, Japan, and Europe, Middle East, and Africa may be requested through Dataquest's inquiry service. Additional regional and semiconductor device detail for this forecast may also be requested through Dataquest's inquiry service.

The tables in this document are organized as follows:

- Tables 2-1 to 2-2 summarize Dataquest's China/Hong Kong semiconductor consumption forecast.
- Tables 2-3 to 2-4 summarize Dataquest's Asia/Pacific semiconductor consumption forecast, which provides the big picture and a contrast to China/Hong Kong's forecast.
- Tables 2-5 to 2-12 detail China/Hong Kong's semiconductor consumption by individual electronic systems grouped by equipment type.

Segmentation of Semiconductor Applications

Dataquest forecasts semiconductor consumption by end-use electronic application. We divide electronic applications into six broad groups in accordance with our segmentation of electronic equipment production. These groups are, in turn, disaggregated into narrower electronic systems categories, as follows:

- Data processing
  - Computers
  - Data storage
  - Input/output devices
  - Dedicated systems
  - Other data processing
- Communications
  - Premise telecom
  - Public telecom
  - Mobile communications
  - Broadcast and studio equipment
  - Other communications
- Industrial
  - Security and energy-management systems
  - Manufacturing systems and instruments
  - Medical equipment
  - Other industrial equipment

- Consumer
  - Audio
  - Video
  - Personal electronics
  - Appliances
  - Other consumer equipment
- Military/civil aerospace
- Transportation

As part of Dataquest's forecast process, forecasts for roughly 40 individual electronic systems within these various categories and subcategories are developed. These include the following:

- Data processing
  - Mainframe/supercomputers (Computers)
  - Midrange computers (Computers)
  - Workstations (Computers)
  - PCs (Computers)
  - PC motherboards (Computers)

Readers interested in a more detailed discussion of Dataquest's applications segmentation are encouraged to consult *Semiconductor Application Market Definitions Guide* (SAMM-WW-GU-9701), which may also be requested through Dataquest's inquiry service.

Geographic Segmentation

Dataquest's worldwide electronic equipment production forecast is aggregated from individual forecasts for the following four principal geographic regions:

- Americas
- Japan
- Europe, Middle East, and Africa
- Asia/Pacific

Detailed discussion of these regions and their composition may be found in the Dataquest publication, *Semiconductor Application Market Definitions Guide* (SAMM-WW-GU-9701).

Exchange Rates

Dataquest's worldwide electronic equipment forecast aggregates data from many countries, each of which uses a currency that has a different and fluctuating exchange rate relative to the U.S. dollar. Because we compile our worldwide forecast from individual regional forecasts, we use the U.S. dollar as a common currency for comparisons and aggregation. As a rule, Dataquest calculates forecasts in local currencies and then converts them to U.S. dollars using projected average annual exchange rates. Dataquest does not forecast exchange rates per se. Instead, we calculate projected average annual exchange rates from current exchange rates. Dataquest's projections are based on estimates of the latest-available monthly exchange rate at the time the forecast is developed. Table 1-1 presents the average annual exchange rates incorporated in this forecast. These rates are based on monthly exchange rates observed through February 1998. Additional information about historical exchange rates and Dataquest's method of calculating future average exchange rates may be requested through Dataquest's client inquiry service.

Forecast Methodology

When discussing semiconductor consumption, it is critical to remember that semiconductors are not end products consumed for their own sake. Instead, they are intermediate products used as electronic end-products inputs that, in turn, are eventually consumed by individuals and businesses for the services and utility they provide. Implicit in the concept of semiconductor consumption is the notion that one can specify the electronic end products in which semiconductors will be incorporated or consumed. A semiconductor forecast that does not or can not specify this aspect is not a forecast of semiconductor consumption. At best, it is merely a forecast of semiconductor shipments.

Dataquest's semiconductor consumption by electronic application forecast grew out of the recognition that a truly complete semiconductor forecast must specify the electronic end uses of semiconductors. However, specifying semiconductor end uses has proved far more difficult than recognizing that it must be done. Although it appears possible to specify semiconductor consumption by the variety of electronics produced, it is, in fact, virtually impossible to do this. There are simply too many different types of semiconductor devices consumed in too large a variety of electronic products. As a result, semiconductor consumption must invariably be estimated. This can be done in any number of ways. Previous to this forecast, Dataquest used a mathematical model to estimate semiconductor consumption by various electronic end uses. Taking Dataquest's electronic equipment production and semiconductor shipments forecasts as inputs, this model allocated estimated semiconductor shipments across forecast electronics production subject to various assumptions about the semiconductor content of electronic products. The model also imposed several balancing conditions intended to guarantee that estimated semiconductor shipments were totally and completely allocated across all forecast electronics production.

The model applied a decidedly top-down approach to estimating semiconductor consumption. In effect, it calculated estimates of semiconductor consumption by compelling agreement between the details of Dataquest's electronics production and semiconductor shipments forecast. As a result, Dataquest's estimates of semiconductor consumption were more an artifact of a mathematical process than truly independent estimates of semiconductor consumption. Although the model offered considerable flexibility to produce reasonable results, it was, nonetheless, limited by the validity of its semiconductor content assumptions and the balancing requirement that semiconductor consumption equal semiconductor shipments. Despite its potential drawbacks, the model provided the best estimates Dataquest could offer, given a paucity of knowledge about semiconductor applications in specific electronic systems.

Fortunately, Dataquest has been able to expand greatly its knowledge of semiconductor uses in specific electronic systems in recent years. During the past several years, Dataquest's semiconductor applications research has been concentrated on the study of semiconductor use in specific individual electronic systems. We have successfully developed models to track and forecast the production and semiconductor consumption of some 40 different individual electronic systems.

 ©1998 Dataquest

These include PCs and PC motherboards, rigid disk drives, LAN cards, modems, digital cellular phones, digital set-top boxes, and automotive navigation systems, among others. All told, the electronic systems encompassed by Dataquest's models account for roughly one-half of all electronics production and nearly two-thirds of estimated semiconductor consumption.

These models have not only allowed us to codify our knowledge about individual electronic systems but also to approach the task of estimating semiconductor consumption using a bottom-up forecast method. This is the method Dataquest has used for this forecast and intends to use from now on for future forecasts. The method essentially involves building up a semiconductor consumption forecast for all electronics production by leveraging our semiconductor consumption estimates for individual electronic systems. Dataquest uses individual systems estimates as a forecast base and augments it with semiconductor consumption estimates for the various other electronic equipment categories that are currently tracked on an individual systems basis. Precisely because the method uses well-researched knowledge about individual electronics systems that dominate semiconductor consumption, we believe it is capable of providing far better semiconductor consumption forecasts than our former top-down method, especially for those electronic equipment categories, such as computers, in which our individual systems forecasts account for virtually all of the category.

Naturally, Dataquest's switch to a new method has several important consequences. First, we have, at least temporarily, eliminated the specific semiconductor device consumption forecasts by electronic application we used to provide. Although informative, these forecasts were largely an artifact of our old top-down method. Recent research indicates these forecasts were especially sensitive to the assumptions and balancing conditions of our top-down method. Unfortunately, we are still in the process of developing semiconductor device detail for many of the individual systems forecasts that now serve as the basis for our new bottom-up method. Consequently, Dataquest's systems forecasts have yet to reach the point where they can be leveraged to provide reasonable consumption forecasts for specific semiconductor devices. We hope to reinstate device consumption forecasts as soon as they are possible, according to our new bottom-up method. In the mean time, we trust that readers will find the added electronics system detail we can now offer in our forecast an adequate compensation.

More importantly, Dataquest no longer insists that estimated semiconductor consumption equal semiconductor shipment forecast. This is actually as it should be. In truth, our long-standing insistence that estimated semiconductor consumption equal forecast semiconductor shipments, was more a matter of mathematical necessity for the sake of our old top-down forecast method than a reflection of market realities. There are, in fact, several reasons why semiconductor consumption, as we estimate it, may differ from a semiconductor shipment forecast. First, there can be significant slippage between semiconductor shipments and semiconductor consumption by electronics producers over short periods because of semiconductor inventory changes held by electronic producers.

Electronics producers naturally adjust their semiconductor inventories in response to expected changes in their production level. Although "just-in-time" practices are reducing the inventory volume producers hold, the continued existence of inventories means semiconductor shipments and consumption may differ.

Second, not all semiconductor shipments are consumed by electronics producers manufacturing new electronics. Indeed, some find their way into so-called "aftermarkets" where they are eventually "consumed" by existing electronics. Dataquest excludes aftermarket activity from its semiconductor consumption estimates. Aftermarket consumption is virtually impossible to track, and in any event, appears small relative to the consumption generated by electronics producers. Finally, Dataquest's estimates of both electronics production and semiconductor consumption no doubt suffer from errors of omission. We know our estimates are likely to exclude at least some current semiconductor applications and most certainly exclude more than a few future applications that cannot be anticipated here and now. In Dataquest's defense, there is a good reason to believe that these omissions are minor. Still, they represent yet another reason why estimated semiconductor consumption may differ from forecast semiconductor shipments.

Nonetheless, it seems reasonable to expect that estimated semiconductor consumption and forecast semiconductor shipments will closely parallel one another, especially over the long term. As already noted, semiconductors are first and foremost intermediate inputs to electronic equipment production. As such, semiconductor shipment growth is ultimately fueled by the semiconductor consumption growth generated by electronics production. Electronics producers' semiconductor consumption growth is, in turn, fueled by growth in both the volume and semiconductor content of electronics production. In the end, all growth in semiconductor shipments can and must be attributed to growth in one or the other of these key consumption drivers.

Estimation errors aside, persistent differences between estimated semiconductor consumption growth and forecast semiconductor shipments growth prefigure a demand-supply imbalance in the semiconductor market. In the past, Dataquest's top-down method obscured potential semiconductor market imbalances by assuming that estimated semiconductor consumption must equal forecast semiconductor shipments. The beauty of Dataquest's new bottom-up method is that in forsaking this assumption, Dataquest can offer important insights into the future of the semiconductor market. We realize separate forecasts of semiconductor consumption and semiconductor shipments have the potential to create some confusion. By the same token, however, we believe separate forecasts may actually help clarify future semiconductor market movements by revealing potential market imbalances.

Project Analysts: Kelvin Fu and Daniel Heyler

Chapter 2
Semiconductor Consumption Forecasts

Tables 2-1 to 2-12 present Dataquest's forecast of China/Hong Kong's semiconductor consumption by electronic application.

Chapter 1
Final 1997 Asia/Pacific Semiconductor Market Share

Introduction

This document contains detailed information on Dataquest's view of the semiconductor market. Included in this document are 1996 and 1997 market share rankings.

Asia/Pacific market share estimates combine data from many countries, each of which has a different and fluctuating exchange rate. Estimates of non-U.S. market consumption or revenue are based on the average exchange rate for the given year. The section titled "Exchange Rates" gives more information on these average rates. As a rule, Dataquest's estimates are calculated in local currencies and then converted to U.S. dollars.

More detailed data on this market may be requested through Dataquest's client inquiry service. Qualitative analysis of this data is provided in Dataquest Perspectives.

Segmentation and Definitions

A detailed explanation of device segmentation and related definitions is contained in *Semiconductor Market Definitions, 1997* (SCND-WW-GU-9801).

Market Share Methodology

Dataquest uses both primary and secondary sources to produce market statistics data. In the fourth quarter of each year, Dataquest surveys all major participants within each industry. Selected companies are resurveyed during the first quarter of the following year to verify final annual results. This primary research is supplemented with additional primary research and secondary research to verify market size, shipment totals, and pricing information. Sources of data used by Dataquest include the following:

- Information published by major industry participants
- Estimates made by knowledgeable and reliable industry spokespersons
- Government data or trade association data (such as WSTS, MITI, and U.S. DOC)
- Published product literature and price lists
- Interviews with knowledgeable manufacturers, distributors, and users
- Relevant economic data
- Information and data from online and CD-ROM data banks
- Articles in both the general and trade press
- Reports from financial analysts
- End-user surveys

©1998 Dataquest

Dataquest believes that the estimates presented in this document are the most accurate and meaningful statistics available.

Despite the care taken in gathering, analyzing, and categorizing the data in a meaningful way, careful attention must be paid to the definitions and assumptions used when interpreting the estimates presented in this document. Various companies, government agencies, and trade associations may use slightly different definitions of product categories and regional groupings, or they may include different companies in their summaries. These differences should be kept in mind when making comparisons between data and numbers provided by Dataquest and those provided by other sources.

Notes on Market Share

In the process of conducting data collection and preparing market statistics information, Dataquest will sometimes consolidate or revise a particular company, model, series, or industry's numbers. In this section, we explain any such changes contained within this document for your reference.

Notes to Market Share Tables

- All rank tables in this document include only the top 30 semiconductor companies' revenue into the Asia/Pacific region. The total Asia/Pacific market in 1996 was U.S.$29,735 billion and included many more than those 30 companies.
- "Other Asia" refers to Asia/Pacific countries excluding Korea, China, Hong Kong, Singapore, and Taiwan.
- Cyrix was acquired by National Semiconductor in 1997.
- National Semiconductor divested itself of Fairchild in 1997.
- National Semiconductor's 1997 revenue includes all of Cyrix's 1997 revenue and part of Fairchild's calendar first quarter revenue.
- Power Innovations was formed through the acquisition of the Power Semiconductor interests of Texas Instruments.
- Melexis was formerly known as Elex.
- Micronas acquired ITT in 1997.
- The following companies were added to the market share database in 1997:
  - Fairchild
  - Vitesse
  - TriQuint
  - Power Innovations
  - Robert Bosch
  - Stanley

- Toko is now tracked in other Japanese companies.
- IBM's 1996 revenue was restated in 1997.
- Singapore revenue includes "as to" billings, some of which are re-exported from Singapore.

Exchange Rates

Dataquest uses an average annual exchange rate in converting revenue to U.S. dollar amounts. Table 1-1 outlines these rates for 1996 through 1997.

Table 1-1
Exchange Rates

	1996	1997
China (Renminbi/U.S.$)	8.34	8.32
Hong Kong (Dollar/U.S.$)	7.73	7.75
Singapore (Dollar/U.S.$)	1.41	1.99
South Korea (Won/U.S.$)	805.16	954.14
Taiwan (Dollar/U.S.$)	27.47	28.79
