

Jim--I'm sending this to you for two reasons--to demonstrate the journal system to Maj Logan (Air Staff) and to inform you of the latest thinking within the RADC/AHI group on terminal requirements for the ISI branch.

A mix of terminals is required for ISI to use and evaluate the SRI/AHI system during FY-73. The criteria for specifying these terminals are:

They must be commercially available and have some history of adequate performance.

They must be compatible with the TIP and SRI's system with a minimum of changes.

The mix of terminals must be reasonably cost effective--ie, not everyone can make use of IMLACs.

There are four general types of users

- managers
- engineers
- administrators
- secretaries

The system will be accessed in four different modes:

- off-line via text placed on a magnetic cassette tape recorder
- on-line via a teleprinter
- on-line via an alpha numeric display
- on-line via a display with graphic capability in addition to alphanumeric capability.

The manager type user is not expected to do a lot of textual input and editing. They are expected to do a lot of scanning of other's files and display of summary information extracted from engineers' files by themselves and/or their administrators. For these reasons it is recommended that the managers be provided with a reasonably fast alphanumeric display--possibly with a hard copy output device attached to it. They would access the system in a teleprinter mode but the files would be displayed instead of printed alla Execuport.

The engineers will have varying tasks to accomplish using the system, some of which may require graphics. The IMLACs with mouse and keyset will be used for this. Indeed they are to be preferred for input and editing tasks, however they cost 3-4 times as much as the teleprinter terminals. A 2 to 1 ratio of teleprinter terminals to IMLACs is recommended. Furthermore, a 2 to 1 ratio of people to terminals is recommended (this is a conservative estimate but more can be purchased later if required). SRI has closer to a 1 to 1 ratio of people to terminals, however their use of the system is probably much heavier than ours would be.

There are only two administrative type users in the branch. One teleprinter should be adequate for updating of their files. If graphics capability is required for constructing flow charts of briefing aids they will use the IMLACs.

Each of the secretaries in the branch should have their own teleprinter terminal with a cassette recorder for off-line preparation of material. SRI indicates that the keyboard should be as close to the normal typewriter keyboard as possible to minimize retraining problems. Therefore, terminals other than Execuports will be procured for them (NCR and TI terminals are likely candidates).

With the above discussion in mind, the following terminal configuration for ISI is recommended:

User Type	numb.	Teleprinter		Display	
		Execuport	Other	IMLAC	Alphanum
MANAGER	4				3
Engineer	32	10		5	
Admin	2	1			
Secretary	4		4		
TOTALS	42	11	4	5	3
on order		5	0	3	0
to order		6	4	2	3

After reviewing some material from Bart Cox's office (via C.A. Rosen) relating to the National Science Foundation's RANN program, I entered two of the documents in XDOC.

RN = Research Applied to National Needs

The documents are:

1. Interim Description and Guidelines for Proposal Preparation, RANN, NSF, dated September 1971 -- NSF 71-21. (See XDOC -- 9169,) hardcopy only.
2. National Science Foundation, John W. Moberly, SRI Washington office, January 27, 1972. Containing budget information and analysis of NSF "market" situation. (See XDOC -- 9170,) hardcopy only.

Other documents are in Bart Cox's office.

Draft Notice of NIC TNLS Course

On (date) the Network Information Center will offer a course in our typewriter-oriented on-line system (TNLS). Most on-line services offered by the NIC over the net require some knowledge of TNLS.

1

The course is organized in sequential module according to the outline below so that student can start at any time without confusion.

2

We particularly hope students leave able to use our on-line journal and reach NIC documents on-line.

2a

In addition to TNLS we introduce briefly the form and function of the Augmentation Research Center (ARC), the NIC, and, because TNLS runs as a subsystem, the TENEX time-sharing system which runs on our PDP-10.

March 1971 TNLS Course

March 16th and 17th we held here a class in TNLS for a total of 10 people. The class lasted two days as in the past and followed the outline in (journal,9134,) with practice periods between each item.

1

The class in general ran smoothly.

2

Mil Jernigan and Jeff Peters made room and travel preparations with no visible rough spots.

2a

Dick Watson and I alternated lecturing; I was present through all the class to field questions.

2b

Dick and Beau Hardeman were present most of the time and John Melvin occasionally to field questions.

2c

The following journal items recorded preparations as they progressed (journal,9365) (journal,9457) (journal,9461)

3

The students were as follows:

4f1

When, near the beginning of the class, the students described their reasons for coming, it became apparent that several expected general introduction to the net, its protocols and organization.

5

John Melvin conducted a seminar in the net for them in parallel with the class for the first two hours of the second day.

5a

Doug visited the class during the time some of the members were separated in the ARPA Network seminar. He suggested that we might arrange a coffee break or the like so that he would have a chance to meet with members of the class.

5b

It was difficult to arrange at that moment, but I'm sure

March 1971 TNLS Course

future students would be interested and we should try to plan a brief meeting in future classes.

5b1

We are amplifying the notice of the course which will be sent over the net in the future (journal, 9752,) so we will know better what sort of program the students expect.

You Are a TNLS User

The TNLS User Group (ident TU) is a group within the NIC ident system that receives information useful to working in TNLS. It includes liaison men at each ARPA Network Site, others who use TNLS frequently, and people at ARC who have a special interest in development of TNLS. The Coordinator is Dirk van Nouhuys.

1

If you receive this journal message you are a member of the TNLS User Group.

2

For more information on NIC groups, see -- Journal, 7638,1:xb). For a list of groups see -- NIC,Locator,2e2:ct).

3

Let me take this opportunity to point out the TNLS exercise files (NIC,locator,2c:ct). They are tutorial files designed to guide practice in various features of TNLS. Some of you have used them, but were introduced to TNLS before the exercise files were set up.

Visitor Log: Robert Klinger, 24 March 1972

Robert Klinger is from the Computer Science Department at UCLA. His field is computer aided instruction, and he was particularly interested in pattern recognition. He stayed here only a few minutes but used his time aggressively and well. I have seldom seen someone who got so much feel for sitting at the console in a short time.

1

Because of his interest I spent most of my time on the content analyzer (assimilating with i in a combination of viewspecs for instance) but what he was observing was the way I worked with the system.

2

When he said he was through I asked him what he would make to teach the system. I cannot restrain myself from reporting that he quickly outlined something very close to what the TNLS exercise books would be if you had unlimited flexibility in printing; "I'd spend three months making the book and no more than an hour with each student after that."

3

He went on to talk with Dean Brown about computer aided instruction and Richard Duda about pattern recognition.

4

Beau Hardeman sat in to learn about demonstrating the system.

Visitor Log: Richard Harkness, 27 March 1972

(J9762) 30-MAR-72 9:41; Title: Author(s): Dirk H. van Nouhuys/DVN;
Distribution: James C. Norton/JCN; Sub-Collections: SRI-ARC; Clerk: PL;
Origin: <LISTER>HARKNESS.NLS;3, 30-MAR-72 9:38 PL ;

Visitor Log: Richard Harkness, 27 March 1972

Richard Harkness works for Boeing and is doing a doctoral dissertation on alternatives to air transportation. His real field is High Speed Ground Transportation and he went on from ARC to talk to the SRI groups working in High Speed Ground Transportation but he is also checking out telecommunications as an alternative to travel. 1

He had a good general knowledge of data processing. He was most interested in the ARPA Net, in things like what sort of real work and interpersonal communications could go on across it, who was on, and imps, tips, bauds, and telephone lines, both present and future. He vaguely speculated about Boeing Seattle trying to get on the net, but he does not seem to be in a position of power. 2

phoned a few weeks ago (I've lost track of the exact date). They have a 360/44 which they seem to fill is very likely to go on the Net. He had very specific questions about IMP Interfaces. He wanted to know about a UCSB-built interface -- cost, lead time, and whether the design is proprietary? His questions were answered, and he went away with what he needed at that point in time, I think.

preliminary proposal for NLS directory editor.

PRELIMINARY PROPOSAL FOR NLS DIRECTORY EDITOR.

Requirements.

NLS currently provides no directory information.

This is a handicap to the on-line user who wishes to check on the status of his files.

At the same time, a number of NLS editing commands are potentially applicable here;

for instance, deleting the name of a file from the directory could be viewed as an NLS way of "expunging" that file through EXEC.

As a step towards more powerful ways to handle our files, it is useful to define such an editing facility and the following is a crude proposal for it.

Concept of a Directory Editor.

Assume that the Directory is now maintained as an individual file by suitable communication with EXEC.

During an NLS session we need to review our directory and we get something like this:

```
*LOAD DIRECTORY XYZ
  FILE1.NLS;9
  FILE2.NLS;3
  PROG1.CDE;7
  etc.
```

A number of editing commands can be made available at that point:

i) Deleting a file could be accomplished by a "delete" statement on that file's name. ii) changing the name of a file would be done through a replace, insert character or transpose character operation. iii) duplicating a file can be effected through a copy operation. etc.

Implications.

Such functions would result in greater convenience in many operations that we currently execute through EXEC.

However there are some dangers associated with this idea if it is carried too far.

preliminary proposal for NLS directory editor.

One of them is duplication of functions: clearly a "replace character" command on a file is a pure editing operation. But what about "Copy or "Insert"?

1c3

If we can expunge the file by deleting its name, should the user also be given the opportunity to create a new file by doing an "Insert" statement with a new name?

1c4

If we do this systematically, we can simplify a lot of the file commands, but we are also providing two ways of doing the same thing within NLS. Is that desirable?

1c5

Some trade-off exists between convenience and efficiency, and we need to define it carefully since our file operations are likely to evolve in the future.

1c6

Specific areas to be discussed.

1d

A consistent data-base system bootstraps itself. In other words every file command is applicable to the file that describes the files.

1d1

This constraint is usually recognized throughout the system.

1d2

With NLS we have a different situation; but if we decide that we want users to obtain most of their file information through EXEC, as they do now, we can still give them the convenience of editing file names (and perhaps deleting them) through NLS without jumping back to EXEC.

1d3

This is not a trivial operation; what if the user edits his version number?

1d4

On the other hand, if we decide that ALL file operations must be transparent to NLS users (and that would include storage statistics and so on) then we need three things:

1d5

- define what kind of NLS entity the directory should be.

1d6

- agree on a set of simple commands that will drive the file-oriented EXEC functions from NLS.

1d7

- identify and resolve areas of duplication and possible conflict (i.e. copy statement and update file, insert statement and null file, etc.)

1d8

Another thing to be discussed is the relationship between two directories that belong to different users.

1d9

preliminary proposal for NLS directory editor.

Do we want groups of users to share some files, as they share the Journal now ? Do we generalize that function? If so, who can edit that directory?

1d10

Do we preserve group and individual privacy? Should we define a class of "private" files that are only displayed in the directory when the person who created that file is identified as the user?

1d11

These problems are familiar ones in terms of data-base design, but at what level does the group want to approach them?

1d12

preliminary proposal for NLS directory editor.

UCSB RJE Specs

I understand you are interested in UCSB's coming rje facility, and how it will look to you. I don't have many details yet, but here is what I do have.

We are in the process of developing a Remote Job Service to offer to the Network. It will conform, as much as possible, to the standard RJS protocol as outlined at the rjs protocol meetings that have been held, and as to be detailed in future meetings and documents.

UCSB's RJS will provide the user with a HASP virtual RJE terminal, complete with operator's console, card reader, card punch, and line printer. It will interface to the user over a standard TELNET connection, and allow him to issue any of the standard, and some specialized, RJS commands. With RJS commands, the user will be able to gain information about, and have control over, his job before processing by HASP has begun and after it has completed; in between, he will be able to to accomplish the same with HASP commands.

RJS will manage the user's unit record devices for him by performing the appropriate file transfers of source decks and printed and punched output. The file transfers will be handled according to the Data and File Transfer Protocols, including such modifications as may be made to adapt them to RJS use.

UCSB RJE Specs

By March 25, there will be resident at socket 3 a file 26
system that supports that subset of the File Transfer Protocol 27
needed for RJS. It will 28
accept only 'descriptor and counts' mode, and file names of 29
fewer than 36 ascii or ebcdic alphanumeric characters. There 30
will also by that time be resident at socket 5 the RJS server 31
TELNET, exclusive of the abilities of file transfer 32
and communication with HASP. The current schedule calls 33
for completion of the project sometime in late April. 34

If you would like any further information, I would be happy 35
to hear from you. 36

Mark Krilanovich, UCSB 37
38

ps. I had planned to send this to you some time ago, 39
but what with the NIC being down and all, I didn't 40
quite get around to it. 41

Some Initial Thoughts on BRS

(J9832) 31-MAR-72 13:55; Title: Author(s): Richard W. Watson/RWW;
Distribution: Paul Rech, Dirk H. van Nouhuys, James C. Norton, J. D.
Hopper, Douglas C. Engelbart/PR DVN JCN JDH DCE; Sub-Collections:
SRI-ARC; Clerk: RWW;

Some Initial Thoughts on BRS

To BRS design team:

1

A few initial thoughts on BRS.

1a

I write this, inspite of its negative character, as one who feels there is a need for a management system to help us keep track of where we are and where we are going. In fact I was a supporter of the concept of some kind of BRS as useful to my NIC role.

1b

However, my present view of the BRS is that it is not useful in its present form; in fact I have come to feel irritated when the BRS printout is dropped on my desk weekly. I toss them in the wastebasket immediately. Since the NIC is a buyer of many services I would be strongly motivated to use BRS if I thought it had any value, instead I have gone back to keeping my own lists of tasks needed by NIC.

1c

My own personal view of BRS and PBMS in general to date is that it is largely a failure.

1d

My own recommendation would be that you forget there is any system in existence and essentially start rethinking the problem from scratch; in fact your thinking should assume that a computer system may even not be needed.

1e

I feel that one of our problems is that we have never studied the thousands of man years of experience with management systems that have gone on in the outside world.

1f

The RADC contract offers us a chance for a fresh look and another environment to test out our ideas.

1g

We should probably not build a system which would just work for us, but should build something that has a high probability of being useful in other outside world environments.

1h

We have built something that just records a lot of stuff, is hard to rearrange and view properly, and is presently of no use to me or really anyone else I know around here (DCE has never used it and I believe has a low opinion of BRS in its present form also inspite of his feeling that some sort of management system is needed); a simple NLS file could do as well.

1i

We really need to think through who and how anyone would use a BRS and what the real needs are before charging ahead with more of the same that presently exists.

1ii

Some Initial Thoughts on BRS

Again I would strongly like to recommend that you first psychologically prepare yourselves to scrap everything that has been to date and then if after some rethinking and study of others experience, talking to RADC , studying our needs, etc there is anything we can salvage from our past work, great.

112

Sorry to be so negative about past efforts, but it scares me to think we might proceed in present directions.

113

There is a great need for a management system in complex environments and you have an opportunity to really contribute something of real value to us and others, but present directions seem confused and possibly not useful.

114

A Need for More Dictaion?

Just a note on a conversation I had with a lawyer friend of mine which may be relevant to DSS DEX PSO. We were discussing the properties of NLS as they might be useful to the law professionr and he pointed out to me that all lawyers in major law firms are immediately trained to dictate everything into a recorder rather than ever writing anything down directly as they found that there was a major increase in prroductivity of their members that way. After the initial dictation the material was typed and entered into their files without proofing. He said dictation is a difficult skill to learn, but after several months one did not want to return to other modes because of the convenience. It seems that maybe we should try more of this. What facilities do we have available for dictation?

Is TNLS too Expensive for Simple Editing?

(J9837) 3-APR-72 10:15; Title: Author(s): Richard W. Watson/RWW;
Distribution: James G. Mitchell, L. Peter Deutsch, Diane S. Kaye, Don I.
Andrews, Walter L. Bass, William S. Duvall, Mary S. Church, J. D.

Is TNLS too Expensive for Simple Editing?

The cost of simple editing in NLS

1

I just finished skimming a paper that JFV gave me on WYLBUR the Stanford text editor. WYLBUR is a simple but powerful system that probably is adequate for a large fraction of the kind of work done presently day to day here or over the Net in TNLS and even in DNLS.

1a

The thing that struck me was the claim that the cost to run WYLBUR including connect charge and CPU charge was about \$4.00/hour. My rough estimate based on DIA'S statistics is that TNLS costs close to \$20.00/hour to run.

1b

If in fact WYLBUR is as inexpensive as claimed and NLS is as expensive as I presently believe it is then we need to ask why and what are we getting for our money.

1c

One of our design goals it would seem to me should be to be able to do simple editing quite cheaply.

1d

Someday not too far away we will either get another machine or work with someone like TYMSHARE and will have to start billing people for NLS usage and will have to justify the size of our clients bills relative to systems like WYLBUR for some sets of tasks. We should know clearly why we are more expensive than potential competitive systems for classes of usage etc.
