(HOW) CAN WE WIN AGAINST IBM?

SITUATION

THEY HAVE SEVERAL INCOMPATIBLE FAMILIES SEGMENTED (SOMEWHAT) AT DIFFERENT CUSTOMERS:

- **360/370 WITH 3 DIFFERENT OPERATING SYSTEMS (MANY LANGUAGES)**
- **SYSTEM 34 IN TRANSITION TO NEW SYSTEM 38 (RPG II, III)**
- **A "MINI" IN SERIES 1 WITH SEVERAL OPERATING SYSTEMS (PL1, COBOL, FORTRAN, MACHINE)**
- **8100 FOR DISTRIBUTED PROCESSING (COBOL, FORTRAN, MACHINE)**
- **5100 FOR PERSONAL COMPUTING (APL, BASIC)**
- **SYSTEM 6 FOR WORD PROCESSING**

. ? FOR HOME/PERSONAL COMPUTING (?)

. ? FOR PROGRAMMABLE INTELLIGENT TERMINAL (SERIES 1)

FOCUS

0. A HOMOGENEOUS, DISTRIBUTED COMPUTING ENVIRONMENT

1. GOING TO A SINGLE, COMPATIBLE VAX AND 11 RANGE WHICH COVERS

THEM IN BASIC CAPABILITY. KEEP LOWER ENTRY PRICES SO THAT

BUYING DECISIONS ARE KEPT AT WORKER LEVEL. (THE 38 DOES HAVE

GREATER CAPABILITY)

2. DECNET AND HIGHER SPEED (BETTER) COMMUNICATIONS

3. TARGETING CONFIGURATIONS SO AS TO APPLY OUR NOW PRODUCTS

(E.G., TRAX, VMS) VERSUS THEIR FUTURES (8100 AND 38)

4. TARGETING

Subject: SOME ITEMS I WANT TO INTERJECT IN YOUR STAFF FOR DECISION

LOUNSBURY = JOHN LENG

There are two items that I hope will enter into the deliberations on the 10/20:

1. I really don't think we are getting out of the >$250K range by having a Venus at that price. The HYDRA structure will be used here to build as large a system as you want to sell. I would argue that this may be an inherently better way to do processing NOW because it will allow the user to partition work into say 2 or 3 machines, each of which will be tuned to a particular function: batch, timesharing with predominantly editing, Commercial with predominately Data Bases, etc. The goal will be to have each of the systems have access to a particular system that is theirs... but is inherently sharable. I think this will clobber the approach we have used in the past where, like IBM, we build a hugh system that has to be partitioned and tuned for all the functions of batch, interactive, real time, and transaction processing. The monitor and the system grow without bounds in terms of complexity.

2. This HYDRA structure is the key to getting our current customer base over to VAX from 10/20's. By getting them over, I don't mean migration where programs are moved on a standard basis and a user wheels out the 10/20.
Instead, the porgrams would stay in place and new ones would

mainly be done on
VAX and the production progreams with the greatestt time consumption would be
"gradually moved over" as the load on the 10/20 demands. I wrote a number of
"sample customer letters" to show how I think this would be accomplished.

There is another issue that I would like to urge you to raise to the top of
the stack: Getting Graphics Now! I want to get Si to reconsider
compatibility, and I would like to get LDP to take part of the graphics work
to implemnt . Here, we'd do the overall planningand architecture...various
groups would do different implementations. /

Mike Tomasic, ML12-2/E71

Can I please implore you to move along the lines suggested in my memo of 5/6/79 such that we capitalize on the 11/23 (with CIS), yet build toward a better long term solution. A copy of pages 2 and 3 are attached. We have some time because our products are strong and we have to go in the right direction because:

.the cost of 23 versus 24 systems really favors the 23.

.on large systems where the 24 might be warranted due to the UNIBUS options, for UNIBUS investment based users (the Technical OEMs), a 23 with an adapter will be as cost effective as the 24 when the address space is the limit.

.the competition is strong in the form of Intel and we need a bus that will compete with them.

.none of the busses--UNIBUS or the Qbus, Qbus to 128K, and especially the PAX'd Qbus are strong enough to get us into the mid 80's, let alone the '90s.

.continued investment by us or our customers will only detract from the right solution.

.we don't have the chips to ship anyway in the 24 systems.

.by the time we are building these large, 24 based systems, the 44 can be used at negligible penalty.

Let's use this opportunity to start limiting the overlap in products and the introduction of more, marginal ones.

SUBJECT: RE: 11/24

In general, I'm with you. I think what will ultimately happen is doing 24 with cis and pax for the systems groups and doing pax on the 23 either now or when we have to. My druthers is to make one the systems machine and one the components machine...not having both be

systems
machines. I walked through the analysis of alternatives with Bernie and
Stan and they were supposed to use this methodology in terms of costs,
market requirements and availability to get us to a rational position
quickly. Apparently this isn't happening fast enough. The numbers
should point out the right direction.

EMS 12-FEB-79
20:48:40 400 1
To: Bernie Lacroute, Mike Powell, Brian Croxon, Dave Rodgers, Bill Demmer
CC: Mary Jane Forbes, Ed Fauvre, OOD
From: Gordon Bell
Date: MON 12-FEB-79 20:48:40 EDT
Subject: Stopping the 11/74 and moving ahead with 11/70 multiprocessor
----
Today the Operations Committee voted to support the Commercial Product Line,
Product Management, Service and Manufacturing recommendations to stop the
11/74. The 11/70 multiprocessor will proceed ahead as planned.

I am sorry that we did not decide earlier because it would have meant that we
could have worked on products which would have gone to market. However,
given that we are not marketing the 74, there is a significant increase in
emphasis on marketing the 11/780 and I believe that this effort will have
higher payoff.

I want to thank all of you who have been involved in the

engineering of the
74 and ask that you hang in there over these next few weeks while we
structure the new engineering projects which are in a general direction of
more VAX and better network support. Although it is unclear as to the
specific project, we require significant work in the interconnection and
front ending of computers, mass storage , and in both low and high end VAX
systems including a VLSI VAX. Again, I am sorry about the decision, I think
it is basically right and that we should proceed to develop significant new
hardware.

Subject: 1990 Core Group Space Task Force

I'm on the 1990 Core Group Space Task Force. Paul should attend, as our representative on this one when Bob gets off. Also it is essential that we attend the one chaired by Smith on Manufacturing location and the one chaired by Stan, John and Julius on P/L location. Is this happening? (Please don't let DCG move from MR just as we get into Hudson.

Subject: **1990's Space Strategy and Plan: Let's Write it Down!**

To: 1990's Committee

CC: Ken Olsen, ML10-2/A50
George Chamberlain, MS/B80
OOD

Date: 11/5/79 Mon
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

BACKGROUND AND MOTIVATION

After the last OC, it became clear that we need a better way to work on space. Having reviewed the file on our 1990 strategy, I think I see the problem... namely, it isn't written down in any coherent way, and merely consists of some implicit notions that we are going to have centers spring up in different places depending on needs, deals, etc. Also it barely covers 1983! We argue violently about particular sites, buildings, etc. in a completely unstructured fashion, because there is <u>not</u> agreement on the conceptual framework or strategy. Also, it is inherently difficult because we aren't really sure what the organization will look like in 1990.

We can always change it, but first: WRITE IT DOWN!

<u>AN OUTLINE FOR THE STRATEGY AND PLAN</u>

0. Organizational design assumptions (if they appear to be important)

1. Location of population assumptions as they relate to travel, energy, cost of living and labour. Especially necessary for manufacturing part

2. Needs vs time (The emphasis will be on writing and validating a model for all the groups and company as a whole)

3. Our goals and constraints in regard to:
   - .Site types (their names, site types and sizes)
   - .Site tennants (policies as to who cohabits)
   - .Building standards

4. Plans for alternative ways to satisfy the needs versus time

5. An index of definitions

<u>CHARACTERIZING THE GOALS AND CONSTRAINTS</u>

We must decide on these in order to stop the hassle on individual plans. Here, a constraint is something that we intend to never violate, for example, no buildings greater than 600 Ksf, or start a new cluster outside of Mass, NH. Equally important are targets or goals which we expect to attain, these include statements like minimize future growth in Mass. by no new sites beyond x, y, ... z (actually list them to avoid ambiguity). In order to fully understand this, let me urge you to look at the document I used to control the design of VAX; the summary with my comments is attached.

Although I don't know what they are, I would like to get the Space group to pull these together and I would review them for consistency and applicability before the 1990 group goes over them. Let me suggest the following:

<u>Constraints</u>
All campuses (clusters) should be at least two functions and preferrably more.

Market oriented Product Lines should co-exist with their own market specific engineering, sales support, and service support.

Hardware and Software Engineering, Service Support, Market Support should cohabit for base products.

No single office buildings greater than 600 Ksf should be built.

Sales and Service (Hardware and Software) cohabit at every level and site.

All sites which are DEC built are selected on basis for at least a factor of 2 growth, and preferrably a factor of 4. Here, I assume a 12% growth in group size will handle a capacity growth of 26%. Note 12% doubles every 6 years. If we start a site at say 2/3 capacity and grow it a factor of 3 in size (or 4.5 in population) would give about 14 years of growth on a site!

<u>Goals</u>
Mfg and Eng should cohabit for process intensive designs.
Examples:

- .LSI chip design (eg. Comet chips, Fonz)
- .print part of technology
- .tape and disks
- .tape and disk heads and media

Integrate high volume and FAT plants such that the tradeoff between standard and special product is possible and measureable.

Move to more clusters (giving more freedom of functional choice).

Move to clustering of implicit divisions when all possible.

<u>CHARACTERIZING THE SITES AND TENNANTS</u>

It is important to separately characterize the types of spaces (sites) and the tennants (occupants). Let me propose these site names, by size:

1. Clusters (campuses) 1-3 Msf
2. Satellites (buildings or sites that operate to another satellite or cluster) 100-500 Ksf
3. Field sites ? Ksf

The tennant typings are:

1. Heterosite with multiple functions
2. Heterosite operating implicitly or explicitly as a division
3. Homogesite holds a single function
4. Homogesite of Manufacturing and Engineering for process intensive products
5. Homogesite for Sales and Service

<u>SPECIFIC PLANS</u>, HOW THEY MIGHT GROW AND HOW THEY RELATE TO GOALS

Location Host/Tennants size
(now) (max)

[Msf]

Subject: **Getting At a Rationale Way to Address Space**

To: George Chamberlain, MS/B80
Shel Davis, PK3-1/C21
Ed Finn, MS/B87
Ken Olsen, ML10-2/A50
Ed Schwartz, MS/F17
1990 Committee

Date: 10/31/79 Wed
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

After the latest OC, I was moved to try to think of space/location differently. We need some clearer policy statements and a better model for space. Space has been a problem because of the time varying (implicit and explicit) constraints that come up, e.g.:

1. No buildings over X sq. ft.
2. No more space in Massachusetts.
3. All people in a central site.

Proposal I:

We (1990's) should meet and decide on what are constraints (e.g. no buildings >600K sq. ft; start a new site outside of

Mass., N.H.) and what are goals (e.g. minimize the expansion in Mass.). Let's settle for now (although we can charge) just how large we want buildings and clusters. Al, could you get us a list of constraints and goals to start with?

Proposal II:

We should seperately characterize a space plan in terms of various sized sites and occupants. Thus, let me propose names/sizes for sites of:

1. Clusters (Campi) 1-3 M sq. ft.
2. Satellites 100K - 500K sq. ft.
3. Satellites of satellites?
4. Field Offices ?

Occupied by:

1. Heterosite (multiple functions)
2. Heterosite operating implicitly or explicitly as a division
3. Homogesite (single function)
4. Manufacturing/Engineering
5. Homogesite Sales and Service (SVS, SWS, Sales)

Thus we get

Heterosites

MY: OOP, MKT. Support, Finance HQ., MFG HQ, Eng. HQ, Sales HQ, P/L?
[ML, PK, PMR; no expansion]
MR: LSG Eng., Tech P/L, DCG, Terminals, (>1M sq. ft.)
MK: Commercial P/L; Comp. P/L; Commercial Eng.
(.6 Msq.ft. -> 1.8 Msq.ft.)
Hudson:(division?) Semi MFG/Eng/DCG? (500 sq.ft. -> ?

Msq.ft.)

Homogesite Satellites (SVC, Eng, GIA, etc.)

Andover Service (with MFG.)
Eng. (Spitbrook, Tewksbury)
GIA (Acton)
MFG. Eng. (Acton, WX)

Homogesite Clusters?

MFG/Eng Satellites
CX, Phoenix

Field Satellites (Sales + SVC)
MFG Satellites
Salem, WF, WM, etc.

Satellite of satellites
HK (to Phoenix) ?

Proposal III:

Let's re-look at low level intra-building standards and intra cluster windows, office sizes, etc. as they effect feeling.

SUBJECT: 2080 GOALS

GB0005/17/EMS

Let's make sure we're altogether on these before EBOD. I expect the priorities to be: reliability (and/or cost of ownership), time to market, performance/cost, enhanceability (mid-life-kickerable), performance, and manufacturing cost.

These all assume a constant development budget. Any increase in performance should not affect ttm or coo. However, any ideas for mid-life-kickers on performance could profitably affect ttm a minimum (say 1 month) because it would extend the product life. In other words, let's have performance at the original goal and get us the implicit increased reliability and decrease ttm!

Subject: **Should We Use 8086 or Z8000?**

To: Dick Clayton, Bill Demmer, Ulf Fagerquist

Date: 12 JULY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 7/26/78

As a backup in the VAX, 11, and 10 areas where we need performance to support future intelligent peripherals (Comm, A/D/A, Disk) I believe we have to examine the feasibility (competitiveness) of using either the 8086 or Z8000 (? availability) for these fixed programs. We were considering Fonz, but it's availability is getting questionable.

These programs should be written in higher level languages (e.g., PL/M)!

follow up 7/5/78

The Small Systems Report on this subject is the first insight I've seen on this subject despite the many pages written. (The many other memos on this subject only prompted me to think maybe we should have a policy of getting every boss to co-sign each time a report is issued.) The authors are to be commended for content and clarity.

The only two pages I would like are options cost (the chip counts are fine) and comparison of various sized systems made this way (both with/without the associated peripherals). I.e., where does this fit in Tomasic's product space for the low-end?

My conclusions based on the report are:

1. The F chip set looks quite competitive...we've got to hurry up, get it in the products and push the hell out of it. We may need the WCS in order to stay out of Intel's way (i.e., segment)

ourselves. The CIS + 22-bits is probably mandatory too (although the systems costs may mean we don't worry until the 65 Kbit chip is in production).

2. Both T and F are needed in order to get us internally totally to 11's (versus 8085 for logic replacement) and for cheaper systems.

3. There will be pressure to bring in the 8086 both for cost and performance reasons for things like disk controllers and KMC11 replacements -- we must resist! There has to be an <u>immediate</u> architectural planning effort to get our plan. Fernando Colon Osorio has pretty much defined the bounds of the problem. I'm encouraged the Fonz will be able to handle these jobs...and must.

4. The language problem still bothers me (see memo), nor do we have a development system!

After we get the above prices, which size the problem (opportunities/exposure) could we get an architecture plan quick to really use Fonz and industry standard peripherals effectively?

BACKGROUND

Bill and Mahendra got our terminology turned somewhat, but we still aren't organized right to get the various products.

We aren't moving rapidly or with enough focus to get a MicroVAX PC Cluster, a single system formed from a collection of single user and single function servers to provide what is fundamentally a shared, system. They're tied together using a LAN cable, and might be called a LAN-based cluster.

The CI Clusters are great as one can see in Colorado. These are really the aggregation of several, shared system to form a single system where many more users can operate together in a shared file system, using a set of computers. These might be called Close Are Net (CAN) Clusters.

LANs on Ethernet are creeping into existence as we have hopes someday to have our own, Ethernet controller for VAX. However, systems built this way are still networks of independent systems with more formal, hierarchical protocols. They're an evolution on our Wide Are Nets.

Seaboard/Seahorse is an excellent base for building specialized function clusters, providing network-wide construction, debugging, loading, etc. Clearly OEMs will use it this way for real time. This should be used for specialized servers for the MICROVAX PC CLUSTERS: file/database (being done in CX), communications (gateway to Ethernet Network of VAXen), printing (if we ever get a printer and a group to write the software). This is really a SEAcluster.

MICROVAX PC CLUSTERS is what we need. Finally it looks like we're going to get a CRT controller for Seahorse, and VC100's being defined as the first, bounded version of the MicroVAX PC. Dick Hustvedt's doing the SDA graphics architecture implementation. We still need:
0. The Person Server- Hardware's not committed yet, Dick software
1. Someone to take overall responsibility for the Cluster
2. File/DB Server- Rubinson
3. Communication Server to Ethernet- ?
4. Print Server- ? (We still don't have a Printer interface spec'd.

In doing it this way, there's a major question as to how and when we build a standalone MicroVAX PC, as the Cluster is predicated on being diskless. (These work just fine at Stanford using SUN Workstations and 750's for file servers!)

I'd like to get together and find out who's doing what, since it's beginning to look like we have the right components coming. For starters, I'd like to see someone take the responsiblity for the whole cluster and be given as many resources as possible to get the product done. This could get us a quality product most rapidly! (I have less faith that we should do it again like PRO.)

Can you folks set up a meeting to start this discussion? (or state that it's all decided?)

MESSAGE ID: 5176493601

SUBJECT: THANKS FOR ALL-IN-ONE DEMO. LET'S BE #1 IN THE OFFICE BY SALES

I thoroughly enjoyed the demo and interaction on All-In-One, and
anxiously await to use it on our own VAX. It's an impressive set of tools for the office and the basis for others to build additional tools that work together in a system.

It is most urgent to get books out on it of the form:
1. A user's manual that has the whole thing including DECmail for the heavy duty office environment for professional and secretary.
2. A tutorial on office automation where we feature it as being "this is what office automation is".
I hope that we might be able to help with the writing somehow.

It should be noted that you folks have created a second generation office automation system. Because you adhere to the principles of VAX/VMS regarding providing an extendable fully compatible environment, versus just having a set of independent tools, you have the second generation.

WE SHOULD ALL NOTE THAT A SECOND GENERATION SYSTEM IS PROBABLY NOT BUILDABLE ON ANY OF THE EARLIER SYSTEMS (eg. 370, Prime, HP)
... or for that matter, RSTS, RSX and Tops due to the difficulty of addressing and lack of common data dictionaries, etc. From my perspective, this is one of the few applications I've seen that begins to utilize VAX the way it is supposed to be.

My only concern now is getting it marketed. This is a great product to go cream the System 38, Wang and other parts of IBM with and to become number one. We must get market share while it is possible and the other folks get their products.

As Pogo said: "We've met the enemy and he is us".

STANDARDS: THE BASIS OF THIS GENERATION

Gordon Bell
Chief Technical Officer
Encore Computer Corporation

This generation is based on a compleley product fragmented industry that is stratified by levels of integration. Entrepreneurial energy is a major driving force. Short product gestation times and the rapid evolution require

formal and de facto standards. What are the goals (product targets) and constraints (the standards)? What are the roles of the various organizations at the various levels of integration?
September 2, 1980

Ian Huang
Association for Computing Machinery
1133 Pusateri Way
San Jose, CA 95121

Dear Ian Huang:

Thank you for the invitation to speak to the ACM San Francisco Peninsula Chapter. Right now I don't have firm plans to visit the Bay area in the next few months. When I do, and if we can get our schedules together, I'll let you know within the six weeks time period.

Again, thanks and I hope I can speak there some time.

Sincerely yours,

Gordon Bell

In response to your February 6 RCS message, OK. I'll send thoughts to you. I think ACS is unlikely to make it. The Telephone Company hasn't done anything right yet here. IBM'll get their first with 8100's. Let's build a compatible version for organizations who (e.g., DEC) want it, but can't get their operations committee to supply.

I still support licensing AT&T to build 11's and VAX's. It's the only way to counteract IBM.

Don't you think it's time to establish an <u>administrative</u> <u>unit</u> that worries about processes, efficiency, communications, etc. These poor sales managers are dying of trivia. Every unit (e.g., Australia) does its own programming. There are no standards of office efficiency. The secretaries in Australia are bored and generally incompetent, etc. Please assume this is being said nicely. I mean you no harm. How about giving this part to Jack Shields?

Austin, Texas 78759

Dear Admiral Inman:

I've been following the DARPA sponsored MOSIS effort at ISI with great fascination over the last four years. Last year they:

- processed over 1200 LSI and VLSI designs
- from 50 institutions
- using 10 foundries and 4 mask shops
- in 3 - 4 micron, NMOS, CMOS and CMOS-SOS technologies with

scalable 1-3 micron, double metal coming on line (4 foundries at 1 micron)
. at a prototype cost of about $3K per design, for rapid turn-around
. with a Printed Circuit Board service coming on line.

The effort is more than a brokering service for low cost, fast turn-around, chips. It has been the institution and infrastructure to establish much needed standards and intermediate checking to make VLSIzation happen (see my paper on the real Fifth Generation). In fact, the interface is so clean that several companies are using it between their designers and foundry. It is the key to a competitive semiconductor industry (since foundries can be compared), and organizations can get their (hopefully creative) designs into silicon rapidly. Until the Japanese adopt it, we have a real edge! Even so, we'll drive them crazy with so many ideas embodied in silicon.

I believe MCC could be the catalyst to help take MOSIS public beyond their current community. MOSIS is already significant and will ultimately be the coupling between designs and factories. Now, MCC could lead, make adoption go faster and provide what is likely to be its greatest benefit to member companies. I was proposing a significant standards activity to work through MCC for this coupling, but MOSIS is much better because it's arbitrated by a computer.

I hope you'll take a look at this great work. It is the first work that I've seen to build a competitive U. S. manufacturing machine.

Sincerely,

Gordon Bell
Chief Technical Officer

SUBJECT: A PROPOSED SET OF ADS FOR COMMERCIAL USERS

I've been concerned about how we might push VAX in this market, especially now that we have a 730. It really bothers me that we may miss a once in a lifetime shot to establish VAX in the office as a distributed processor before IBM gets the 38 or the low cost 370 there.

I'd like to see us run a set of ads, like the VAX ASK ANY USER
ads that when completed, forms a complete picture of our offerings.

The basic theme is: VAX OFFICE WORKER, the only computing system for the 80's because of 13, irrefutable benefits. There would be a few ads that would posit the 13 benefits and argue that they are the right ones and that we have them.

The introductory ads would be followed by 13, detailed ads that would tie together through some theme such as a testimonial, or a tutorial, or a detailed story about the 13. The purpose would be to inform and educate in a particular way.
Although I'd like to orient them to be very technical, they probably should be readable and understandable by corporate management types who aren't experts.

If we do this right, we could get an image of someone who's underplayed their hand, but is just very solid, impenetrable and patient in willing to put the products solely in user terms.

Whether it's 13 or not isn't clear, but some possiblities: best integration of office via wps/data processing/transaction processing; incredible range of compatiblity for different form starting from DM or CT and going through VAX clusters; interconnectability; applications; data management; ease of putting applications up; applications languages to get work done; interconnectability of programs to build on all work; connection with the other, more technical parts of the org who have VAXs; detailed wps; detailed tp; detailed dp; distributed dm; compatble with office environement (look at the small 730 which has 4 file cabinets worth of information in only a 1 cabinet space; flexible interconnect with LANs; ease of purchase via our many channels; customer installability (note IBM PC doesn't have this); cost/performance; etc. (These are off the top of the head, so we'd better think it out.)

Dear Bernie:

Thanks for the letter about a special issue on the PDP-8 and LINC. Although much more can be written, a lot is given in Computer Engineering, a copy of which is enclosed. This represents a product view of Digital and I'm trying to get a software version of the book.

I've sent a copy of your letter to Dick Clayton, who did the transfer of LINC to DEC, and to Wes Clark, the designer of LINC. Wes gave an excellent Museum talk on LINC from a user perspective and this could be an article. Ed DeCastro was the Project Engineer for new PDP-5 and PDP-8 and it would be good to get his story. As President of DG, I doubt if he has time to write an article, but might give a talk at the Computer Museum sometime.

I'll also circulate your "call for a paper" Digital to potential writers.

Sincerely yours,

Gordon Bell

Walter tried, but the CBI priority was higher. The Board is what matters, the Exec Committee is less important. It's easy to get 25K and we should come to the 3/8-9 meeting. Must come with a presentation (eg. slides) but it is critical to get the board members at TCM soon. Mike said he would come. They were trying to cut budgets. Politics are that CBI has 4 members on the AFIPS board. We are viewed as a potential regional museum, not an international museum.

follow up 2/7/79

Roger's concerned that we aren't pushing the 11/74mP because Mike Powell isn't interested in it.

Tandem is and will be continuing to erode our base and the 74mP is the only product to get at this market.

Is there an alternative PM who believes in and could push this aggressively?

SUBJECT: AI & EXPERT SYSTEMS: LISP, PRODUCTS, NEEDS & MARKETING

BACKGROUND AND OPPORTUNITY

From recent trips to various customer and university sites, I'm really quite excited about this burgeoning, new field. It feels to me somewhat like it must have felt when Univac installed a computer in the census department and at an insurance company! This is a radical change in computing and we must get prepared to supply systems. It will be far more revolutionary and important than personal computers in both use and impact.

Currently Xerox is the leader with Symbolics second and people wondering if we who were number one so long and who really provided the basis for the development of the field are going to sleep through the whole revolution. Right now they see IBM, HP, Appollo, the new Apple all using 68,000's as possibilities.

This is the most exciting area I've seen because it's going to be the basis for truly great innovative future products. We have an enormous opportunity. Let's not wait till the market is all formed. Let's pioneer the market and make it!

ORGANIZATION AND AI SEMINAR, WHAT ABOUT MARKETING?
Am delighted to see that we are beginning to get our act together
for base systems and applications. The 2 day seminar on the state of the art should give us all a better understanding.

We should market packages like Dendral, Molgen, Mycin, Macsyma,
Vaxima, etc. together with base products like Lisp, Ops, Prolog
on the 10/20 and VAX.

From the seminar we could focus the marketing too, to market the
existing products and get ready for new ones on VAX. The 10/20
group markets products effectively, but who'll market VAX?

OPINIONS ABOUT LISP

John McCarthy is back working on it. He believes the Common LISP effort is going to succeed and be worthwhile. He is looking at Prolog because he believes that these ideas are powerful and should be incoroporated into LISP. He also states that they need hardware support. The current Xerox and Symbolics machines are fun to use. He'd like to see less proliferation.

Ed Feigenbaum sees no way out of the 3 LISPs: InterLISP is currently it, with more support coming from Symbolics; CommonLISP should be the MACLisp follow on, and Portable Standard LISP is in use and will probably be the one that gets used on all the PC's.
This will make LISP much more available.

GETTING LISP ON VAX

I think we're doing everything possible to do this. It's vital!
Technknowledge is acquiring a Workstation for LISP that they can build on and sell, thus we ought to go all out to get their order in order to understand what it is that's needed to compete in this market. We must get this, enhance it through microcode extensions and then set about to radically cost reduce it to be not more than 20K.

CONTRACTING WITH THE GOVERNMENT TO GET STANDARD PRODUCTS

Although there's a wide range of applications in use, they tend to be all built to be used by their designers and/or experts.
Many of the systems though currently specific could be

generic.
The government agencies would like to take this work, much of which was supported by ARPA and make it into products. I think
we could get contracts to take the work and do it. I see this to
be like applications, but we can get paid to do it. The work should be done in the Palo Alto area where the experts exist and
that consultants can be found. The group could live in the lovely Mountain View facility! Harvey, Dennis, Don what you say?

PRODUCTS WE NEED INTERNALLY TODAY AND CAN SELL

A number of the products, particularly Expert Systems will be developed by a team of Experts. For example, PROSPECTOR was developed by a dozen geologists. It tells where to dig for a given mineral, and has been quite successful. Because of the
sociological aspects of the various expert systems, they are often used by other experts to gain leverage. Therefore, one market is simply going to be the proprietary package which is part of a consulting group. For example, it would probably be
pretty trivial to replace the Boston Consulting Group with such a
program. Some really critical products/applications follow.

I. ARTIFICIAL PEOPLE (AT TERMINALS) to manage the trivial interaction with various simple and complex systems is becoming clear to me as the highest priority, highest payoff program we could write. It would be written in OPS and run on everything from PC's to VAX's. The program simply logs into various systems and does the work, most of which is trivial, that a normal user would do sitting at a terminal... perhaps the strongest reason why all terminals should really be computers!

The simplest use would be login, followed by picking up and sending mail. I have accounts on 3 systems and the mail and login are different on everyone of them. The real saving is the time. All I want to say is get the mail, and send mail that's described in a list of files! The program would call up the systems in the middle of the night or whenever to do the work.

II. LLL has a knowledge based system like this that was built to run on the 11/23 systems they use as personal computers. Jerry Owens, Computer Department, Nuclear Systems Software could give us a description of it. They use it to run their large programs and to maintain a user's file systems. They also use this system to make a common interface to the myriad of systems that an individual might have to interface to. PC would use this.

III. EXPERT CAD OPERATOR- is a program that our designers of VENUS could use today. Doing a CAD run, given that some base design data has changed involves running scores of programs across a number of machines all correctly. It is more complex than simply a command language because the human user gets all the work going in parallel, and is able to cope with unforseen situations. In this case, we would get much more work out of our systems because they could be used round the clock. It would free people too.

IV. CONFIGURATION MANAGEMENT AND DESIGN- is a generic program that would be based on our programs XCON and XSEL. Virtually every industry has companies that have to deal with the assembly of large collections of pieces that form a single system. The pieces have a myriad of rules about how they can be combined and how much it costs to put them together. We've pioneered this work. Now let's get the payoff!

V. MACHINE RE-DESIGNER/RE-REALIZERS- is a program like that for VLSI scaling, takes a design in one technology, and then redesigns a given system into another technology. Rather than taking the general problem, I would like to start immediatedly in exploring the set of rules that would take a given network, say VENUS or NAUTILUS, and which will totally prepare or do the work involved in laying out the design in a new technology (MCA II's, higher density boards). Here, the user could give it lots of guidance, and as a minimum the system would prepare all the input for the new gate arrays and new boards. The payoff is >$200M! Yet, it looks doable, based on what I see in research.

APPLICATIONS ACTION

Dennis could you get some folks together to see how we could attack some of these problems. The EXPERT CAD OPERATOR needs to be put in service today and could speed up the VENUS design.

We should also get together with a technology team (Bob Glorioso, J Zeh and Alan Kotok) to see how we could carry on a feasibility study for the RE-REALIZATION/REDESIGN of VENUS.

We should also get together with a technology team (Bob Glorioso, Joe Zeh and Alan Kotok) to see how we could carry on a feasibility study for the RE-REALIZATION/REDESIGN of VENUS.

GB3.S8.40
We could advertise what we have on each system now.

The DECSYSTEM 20 would be featured since all the AI software was born there...since we designed PDP-6 to run LISP well. The 20 has LISP and Prolog, plus there are lots of applications like MACSYMA that run in production mode. Here, the 20 group could go all out to get the software in a sellable (promotable) form!

VAX
We should also push VAX in this market because a 730 can allow one to start day AI at $60K. Here, we have LISP, PROlOG AND OPS5 -- which we wrote for our own applications programs. In addition, there are applications programs like MACSYMA.

Selling AI Applications as a Business
I think we could probably sell a class of applications that are like the XCON, XSEL--that is, a program which worries about how a collection of parts (based on price, extra pieces, restrictions) are put together to become a whole. This is typical of configuring: cars, tractors, pre-fab

buildings, etc. that come from a factory.

Bottom Line
We need a product marketing person to pull these parts together across the company. This is an ideal problem for one of our marketing persons. Can we have one to go after this?
To; PATEL, ABLE, DELAGI, DENNIS O'CONNNOR CC: RAD, PSC, baskett, ed kramer, gannon

AI is going through the transition from a part of computer science to include software engineering. It's delightful that the name Knowledge Engineering has been selected, because the people are starting to behave as engineers, rather than scientists or artisans. The dichotomy (and friction) exists at Stanford, MIT (in the extreme), and CMU to the least degree. The dichotomy is between those who would only build firmly on scientific principles, and those who build because it can be done even though the building isn't well understood (i.e. it's an art). Stanford is doing probably the most complex set of applications, the graduate students at MIT occasionally produce brilliant pieces of work (eg. Winograd) which open up a new direction of research along side what were a set of hackers working on hardware and software LISPs (both the LISP Machine Company, and Symbolics people and design came from this environment), and CMU carries out a very wide range of applications and systems work. Xerox has been working in AI for many years, and has created it's own environment, Teitleman's Interlisp evolution from BBN. Martin Griss at Utah is a ray of hope on the scene, as he's building Portable Standard LISP along the lines of conventional software engineering. PSL may evolve into Common LISP. There was much concern at Stanford on Common LISP because it came from MACLISP versus Interlisp. They clearly prefer Interlisp because of the program creation and debugging environment.

THE COMPETITIVE SCENE
Martin Griss has spent the last year at HP putting PSL on their 68,000 based HP9865 workstation at HP Research. The performance is getting up to that of a 750, and with a 16 Mhz 68,000 will be a 780! If they have any smarts, they'll

market the hell out of this and get back into the universities.

Xerox has just started installing the machine they call Dandelion at ISI running Interlisp. It's unclear how well this performs, but if they are capable of getting serious about marketing such a machine, they could do quite well. They also have a high performance machine, Dorado, that's perceived to be faster than a KL.

The AI community thinks IBM's doing nothing. Judging from the past, IBM will be there when the market is. Ed Feigennbaum says Ralph Gomory says they have projects all through IBM.

Symbolics is looked at as having the most competitive hardware. Bob Kahn (ARPA) perceives the 3600 at 5-10 x a KL10. (Virtually everyone who knows, indicates that it approaches a KL in performance.) It's unclear whether the LISP Machine Company is viable.

We're regarded as a "has been", especially since we're going out of the 20 business, and only useful to wave at competitors to fire em up.

Teknowledge is finally moving to provide a standard environment on top of a number of standard LISPs so they can sell their higher order applications on whatever machine their customers want. They'd like to see a standard LISP too. Teknowledge trains people and does contract work. They've got an XCON up and running now for NCR, and will probably try to generalize and market this across a wide range of applications. Why don't we buy from them now?

NTT visited Ed Feigenbaum while I was there, and they have what is probably the largest group working on a single office automation program using AI. They've selected a number of tasks and they're all being done using Knowledge Engineering techniques.

One of the big 3 Japanese firms are building what is supposed to be the world's fastest LISP machine. If they succeed, and can manage to place these machines at say MIT, Stanford, and CMU, they can probably shut off a great deal of badly needed systems work, and get those universities to ONLY work on applications. This will start to cycle our system industry down, and get us on solely applications.

ICOT is moving rapidly to get many competitive PROLOG workstations by next summer. We continue to get good updates on their progress.

A BENCHMARK

Gordon Novak gave me the Boyer/Moore theorem proving benchmark.

2060 MACLISP	14	
2060 UCILISP	14	
2060 Interlisp	17, 46, 70	
2060 Elisp	18	
Dorado Interlisp	29	
780 PSL	34	
780 Franzlisp	39, 54, 148	
780 Interlisp	83	
HP 9836 PSL (8Mb)	67	(an 8 Mhz 68,000... watch out for 16 MHz)
(3MB)	114	
LM-2 Zetalisp	97	
Dolphin	167	(probably not a useful data point)

TAKING AN ENGINEERING APPROACH TO BUILDING COMPETITIVE LISP MACHINES

The above benchmark is simply one data point. Another benchmark could give significantly different results. I don't think we're moving nearly fast enough to understand performance or to get a product, considering the fact that there are already competitors in the marketplace and more coming. We need to mount a significant effort to understand LISP at all levels from elementary operators to different types of programs, including those which make significant file accesses, so we can characterize where our bottlenecks are and whether we need to modify the VAX ISP. Martin Griss looks like the best person to work with. He's going back to Utah, and we should get them to do this evaluation work, as he's interested in contracting with us. Eventually he may want to go into industry, but for now he wants to go back from his sabbatical year at HP to see what it's like. We should continue to work with him and woo him IF he wants to leave, and support him there... he's refreshing to see in the AI/Systems world.

A major metric which we have yet to focus on is programmer productivity. Everytime I start to discuss LISP as a language people insist that it's almost irrelevant; what really matters is the programmer environment for building systems and for supporting higher level systems that each of the various cultures now use and build on. For example, this means we must also support AGE, MRS, GLSIP, etc. probably, together with making them available with the system. Why can't we sponsor work on this? (Xerox Parc is excellent in this area, and Allen Newell could probably get it going there.)

Finally, there's simply the fact that AI applications people have virtually no interest or understanding of performance... provided their own program runs fast enough to get their work done. There's no understanding of paging, and the fact that it seems to work quite well. I watched a demo where people said their working set was 5 Mbytes run quite well on a .75 Mbyte system, with only a few disk accesses. Since every program is written in such a way to takeover ANY machine they run on, they prefer, and virtually require personal LISP machines in order to avoid intergroup fights.

Aren't we long overdue in getting started on this understanding?

THE STANFORD HEURISTIC PROGRAMMING PROJECT ON PARALLELISM IN AI MACHINE ARCHITECTURE
Ed Feigenbaum, Penny Ni, and Bruce Delagi are submitting a proposal for a 3 year project to understand parallelism in an AI application as the basis for a parallel machine

architecture. This effort would also focus on the low level operators too, so we can understand what it means to make a competitive LISP machine. They'll develop various graphs of their programs/data, as a means of understanding how higher level co-operating sequential processes can be combined.

At the end of the 3 year project, they'd have a PPA, and would be running on it to test their ideas.

Bruce is asking us to help in this project, starting with understanding the low level operators (note it corresponds to what we must do to have a competitive machine). From there, LISP would have to be modified so that it could operate in its various modes of parallelism. Because LISP has so many dialects, it's unclear that it can ever be extended to operate with multiprocessors. If this ever occurs, I suspect it'l come about as an evolution from a simple subset like PSL, or as an extension from a language that has been demonstrated to operate effectively with mP's.

Bruce should get us the most recent copies of the proposal.

John McCarthy was quite excited when I described PPA, and would like to get some work going on a LISP for it.

OTHER STANFORD WORK ON PARALLELISM
There's a great breadth of work going on at Stanford, and despite the fact that CMU's 10 years ahead because they've been in the parallelsim business so long, we must get a PPA there asap.

John Hennessy's work on SAL (Single Assignment Language) looks like the way to go to be able to explore parallel algorithms. I would guess that a parallel LISP might evolve from this direction, versus starting from one of the LISPs.

There's solid work on distributed processing project (yes they've got a SUN burst... SUN Workstation Cluster with 750's as file servers). Forest's getting them VAXen workstations for this too.

There are many users who require many, many cycles. These range from vision processing to all kinds of simulation.

OTHER EFFORTS AIMED AT SMART MEMORIES/TREE MACHINES
Columbia has a machine called non Von, which is a tree data structured memory built from chips arranged as data operators combined with memory. In effect, it's a tree structured Illiac IV (a grid of 64 data operator memory pairs... see the computer museum). Danny Hillis at MIT is building the Connection Machine which extends this by adding more switching paths between the nodes of the tree. Bruce went through a chip layout that has a number of Processor-Memory (1 Kbyte ram, 10Kbyte rom) pairs, arranged in a grid on a chip, with a fast switch permitting information to be shipped between the P-M's.

ARPA $'s AND AI
From what I can understand about what people know about AI at this time in terms of applications structure and performance, it is an incredible waste of money to build anything other than a single, instruction stream machine that can execute LISP. (Kahn, unfortunately, doesn't see the value of putting a good LISP on the Cray 1.) Furthermore, I doubt that it's possible to extend today's, dialects of LISP for general parallel processing on mP's.

It also appears to be a waste to build a machine that's especially oriented to LISP. Titan just could be the fastest machine around if there's anyway to get a LISP on it. I'd sure like Forest to get the resources to put LISP on it either internally or from ARPA... who has much money in the up and coming budgets to fight the Japanese. Sam and Mahendra, why can't you build such a team... with ARPA's $'s?
.

WHAT SHOULD WE DO?
Whether we've decided to or not, we are spending a great deal in this area, when you consider the MCC project, the support of XCON and its friends, and the fact that we're trying to come out with a VAX LISP.

We might look at this from a business perspective, but I doubt that the market numbers for an emerging market will lend any insight. Clearly, we can get part of the development bill paid, if we move.

The major money is being spent supporting XCON. Why can't we buy this out now? I think this again shows unless we sell a product competitively, someone else will come along outside an provide a better product. (The story of our CAD and virtually every process effort.) This leaves us at a strong disadvantage: we pay more to have an obsolete product.

I continue to be impressed with the progress, albeit slow, on the various application fronts. It's too bad we can't sell these (eg. XCON) when they're viable.

SUBJECT: AI -- Activity Update Near & Far

GB5.58

AI is going through the transition from a part of computer science to include software engineering. It's delightful that the name Knowledge Engineering has been selected, because the people are starting to behave as engineers, rather than scientists or artisans. The dichotomy (and friction) exists at Stanford, MIT (in the extreme), and CMU to the least degree. The dichotomy is between those who would only build firmly on scientific principles, and those who build because it can be done even though the building isn't well understood (i.e. it's an art). Stanford is doing probably the most complex set of applications, the graduate students at MIT occasionally produce brilliant pieces of work (eg. Winograd) which open up a new direction of research along side what were a set of hackers working on hardware and software LISPs (both the LISP Machine Company, and Symbolics people and design came from this environment), and CMU carries out a very wide range of applications and systems work. Xerox has been working in AI for many years, and has created it's own environment, Teitleman's Interlisp evolution from BBN. Martin Griss at Utah is a ray of hope on the scene, as he's building Portable Standard LISP along the lines of conventional software engineering. PSL may evolve into Common LISP. There was much concern at Stanford on Common LISP because it came from MACLISP versus Interlisp. They clearly prefer Interlisp because of the program creation and debugging environment.

THE COMPETITIVE SCENE

Martin Griss has spent the last year at HP putting PSL on their 68,000 based HP9865 workstation at HP Research. The performance is getting up to that of a 750, and with a 16 Mhz 68,000 will be a 780! If they have any smarts, they'll market the hell out of this and get back into the universities.

Xerox has just started installing the machine they call Dandelion at ISI running Interlisp. It's unclear how well this performs, but if they are capable of getting serious about marketing such a machine, they could do quite well. They also have a high performance machine, Dorado, that's perceived to be faster than a KL.

The AI community thinks IBM's doing nothing. Judging from the past, IBM will be there when the market is. Ed Feigennbaum says Ralph Gomory says they have projects all through IBM.

Symbolics is looked at as having the most competitive hardware. Bob Kahn (ARPA) perceives the 3600 at 5-10 x a KL10. (Virtually everyone who knows, indicates that it approaches a KL in performance.) It's unclear whether the LISP Machine Company is viable.

We're regarded as a "has been", especially since we're going out of the 20 business, and only useful to wave at competitors to fire em up.

Teknowledge is finally moving to provide a standard environment on top of a number of standard LISPs so they can sell their higher order applications on whatever machine their customers want. They'd like to see a standard LISP too. Teknowledge trains people and does contract work. They've got an XCON up and running now for NCR, and will probably try to generalize and market this across a wide range of applications. Why don't we buy from them now?

NTT visited Ed Feigenbaum while I was there, and they have what is probably the largest group working on a single office automation program using AI. They've selected a number of tasks and they're all being done using Knowledge Engineering techniques.

One of the big 3 Japanese firms are building what is supposed to be the world's fastest LISP machine. If they succeed, and can manage to place these machines at say MIT, Stanford, and CMU, they can probably shut off a great deal of badly needed systems work, and get those universities to ONLY work on applications. This will start to cycle our system industry down, and get us on solely applications.

ICOT is moving rapidly to get many competitive PROLOG workstations by next summer. We continue to get good updates on their progress.

A BENCHMARK

Gordon Novak gave me the Boyer/Moore theorem proving benchmark.

2060 MACLIS	14
2060 UCILISP	14
2060 Interlisp	17, 46, 70
2060 Elisp	18
Dorado Interlisp	29
780 PSL	34
780 Franzlisp	39, 54, 148
780 Interlisp	83
HP 9836 PSL (8Mb)	67 (an 8 Mhz 68,000... watch out for 16 MHz)
(3MB)	114

LM-2 Zetalisp 97

Dolphin 167 (probably not a useful data point)

TAKING AN ENGINEERING APPROACH TO BUILDING COMPETITIVE LISP MACHINES

The above benchmark is simply one data point. Another benchmark could give significantly different results. I don't think we're moving nearly fast enough to understand performance or to get a product, considering the fact that there are already competitors in the marketplace and more coming. We need to mount a significant effort to understand LISP at all levels from elementary operators to different types of programs, including those which make significant file accesses, so we can characterize where our bottlenecks are and whether we need to modify the VAX ISP. Martin Griss looks like the best person to work with. He's going back to Utah, and we should get them to do this evaluation work, as he's interested in contracting with us. Eventually he may want to go into industry, but for now he wants to go back from his sabbatical year at HP to see what it's like. We should continue to work with him and woo him IF he wants to leave, and support him there... he's refreshing to see in the AI/Systems world.

A major metric which we have yet to focus on is programmer productivity. Everytime I start to discuss LISP as a language people insist that it's almost irrelevant; what really matters is the programmer environment for building systems and for supporting higher level systems that each of the various cultures now use and build on. For example, this means we must also support AGE, MRS, GLSIP, etc. probably, together with making them available with the system. Why can't we sponsor work on this? (Xerox Parc is excellent in this area, and Allen Newell could probably get it going there.)

Finally, there's simply the fact that AI applications people have virtually no interest or understanding of performance... provided their own program runs fast enough to get their work done. There's no understanding of paging, and the fact that it seems to work quite well. I watched a demo where people said their working set was 5 Mbytes run quite well on a .75 Mbyte system, with only a few disk accesses. Since every program is written in such a way to takeover ANY machine they run on, they prefer, and virtually require personal LISP machines in order to avoid intergroup fights.

Aren't we long overdue in getting started on this understanding?

THE STANFORD HEURISTIC PROGRAMMING PROJECT ON PARALLELISM IN AI MACHINE ARCHITECTURE

Ed Feigenbaum, Penny Ni, and Bruce Delagi are submitting a proposal for a 3 year project to understand parallelism in an AI application as the basis for a parallel machine architecture. This effort would also focus on the low level operators too, so we can understand what it means to make a competitive LISP machine. They'll develop various graphs of their programs/data, as a means of understanding how higher level co-operating sequential processes can be combined.

At the end of the 3 year project, they'd have a PPA, and would be running on it to test their ideas.

Bruce is asking us to help in this project, starting with understanding the low level operators (note it corresponds to what we must do to have a competitive machine). From there, LISP would have to be modified so that it could operate in its various modes of parallelism. Because LISP has so many dialects, it's unclear that it can ever be extended to operate with multiprocessors. If this ever occurs, I suspect it'l come about as an evolution from a simple subset like PSL, or as an extension from a language that has been demonstrated to operate effectively with mP's.

Bruce should get us the most recent copies of the proposal.

John McCarthy was quite excited when I described PPA, and would like to get some work going on a LISP for it.

OTHER STANFORD WORK ON PARALLELISM
There's a great breadth of work going on at Stanford, and despite the fact that CMU's 10 years ahead because they've been in the parallelsim business so long, we must get a PPA there asap.

John Hennessy's work on SAL (Single Assignment Language) looks like the way to go to be able to explore parallel algorithms. I would guess that a parallel LISP might evolve from this direction, versus starting from one of the LISPs.

There's solid work on distributed processing project (yes they've got a SUN burst... SUN Workstation Cluster with 750's as file servers). Forest's getting them VAXen workstations for this too.

There are many users who require many, many cycles. These range from vision processing to all kinds of simulation.

OTHER EFFORTS AIMED AT SMART MEMORIES/TREE MACHINES
Columbia has a machine called non Von, which is a tree data structured memory built from chips arranged as data operators combined with memory. In effect, it's a tree structured

Illiac IV (a grid of 64 data operator memory pairs... see the computer museum). Danny Hillis at MIT is building the Connection Machine which extends this by adding more switching paths between the nodes of the tree. Bruce went through a chip layout that has a number of Processor-Memory (1 Kbyte ram, 10Kbyte rom) pairs, arranged in a grid on a chip, with a fast switch permitting information to be shipped between the P-M's.

ARPA $'s AND AI

From what I can understand about what people know about AI at this time in terms of applications structure and performance, it is an incredible waste of money to build anything other than a single, instruction stream machine that can execute LISP. (Kahn, unfortunately, doesn't see the value of putting a good LISP on the Cray 1.) Furthermore, I doubt that it's possible to extend today's, dialects of LISP for general parallel processing on mP's.

It also appears to be a waste to build a machine that's especially oriented to LISP. Titan just could be the fastest machine around if there's anyway to get a LISP on it. I'd sure like Forest to get the resources to put LISP on it either internally or from ARPA... who has much money in the up and coming budgets to fight the Japanese. Sam and Mahendra, why can't you build such a team... with ARPA's $'s?

WHAT SHOULD WE DO?
Whether we've decided to or not, we are spending a great deal in this area, when you consider the MCC project, the support of XCON and its friends, and the fact that we're trying to come out with a VAX LISP.

SUBJECT: AI MARKET AND PRODUCTS: LET'S GO AFTER THEM

Balzer, ISI (see also Dan Lynch) gave me the following:

KL	1		
780	.5 FranzLISP		
780	.3		ISI LISP on a database prob.
750	.9 x 780		
Dolphin	.2-.4		
Dorado	5-6 x Dolphin	180K	
LM2	.5		
3600	4 x LM2 projected	75K	

A COMPETITIVE LISP AND THE KEY APPLICATIONS GROUP
LISP has to have a focus within engineering as a base product in order to get a quality product out of the ones we're looking at. Also, we've got to have a way to get the applications, such as Macsyma to run on it. Symbolics has the license from MIT, but I can't find anyone getting applications. What about 10/20?

IMPROVING PERFORMANCE ON VAX
I'm delighted that we're having the LISP conference here on the 5th to co-ordinate getting a decent LISP and trying to standardize on say, Common LISP. I hope this takes place after many years.

Norma and Michael agreed to gather the various VAX LISPs and describe their internal structures so that the conference will be more meaningful. They also agreed to produce a proposal for a good structure for representing LISP programs so that we "speak LISP" at the meeting. This includes a proposal for enhancements to the VAX architecture so that VAX will execute LISP competitively!!!!! This will also be the basis of executing Prolog competitely too. I would like support from the VAX architecture group in this work. I'm personally sorry to have spent so much time on putting Cobol into VAX, and totally ignoring the AI languages.

The Corporate Long Range Plan last week uncovered this need, too!

June 18, 1984

Mr. Alan Shughart
Seagate Technology
360 El Pueblo Road
Scotts Valley, CA 95066

Dear Al:

I'm writing to get your support for The Computer Museum.

A first rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the computer and the image. We predict attendance of over 200,000. This world-class, international Museum should be a major attraction and asset for the computing community.

The enclosed brochure describes the Capital Campaign. I would like your financial support in this crucial phase of the project which culminates in the opening, November 12:

1. Seagate's Foundership at $2500. The money, or letter or call of intent must be in by July 1 when the founding period terminates. Or, a "core" membership in the Capital Campaign at the 4K, 8K, ... level.
2. Your own "core" support.

Perhaps most important to me as the Museum's unoffical curator, I would like your artifacts, especially at the opening of the PC gallery. The floppy and wini were major contributions to computing and to the PC, and I don't believe people appreciate or understand the importance. You clearly pioneered the standard component notion that made the PC generation possible.

Finally, I recall your speech to DEC's engineering community at Stratton Mountain Vermont when you were starting on the wini. At that time, I changed the direction of the DEC PC's to use your product, and regret the execution of the DEC PC's were so poor and untimely. Now, I would like to give a major talk at the Museum when it's open.

I'll call you next week to discuss these details.

Sincerely,

Gordon Bell

Enclosure
25 November 1984

Dr. Alexander Schure
Chancellor
New York Institute of Technology
Old Westbury, New York, 11568

Dear Dr. Schure:

The Museum finally opened on November 12.

The physical realization has turned out to be much more exciting than any plan could have communicated. The staff made a very large "stretch" to open a range of galleries. The reviews have been positive and it is easy to spend a half day in productive learning. Knowledgeable teenagers are spending their days at the Museum. The most flattering comment to date has been that it is the first American technology museum to be at European standards. Dr. Oliver Strimpel, who did the Museum's Image Gallery has just become the Associative Director and Curator. Oliver was formerly the Curator of the Mathematics Section of The Science Museum, London. The long collecting period and five year breadboard at Digital really paid off in collecting artifacts, building exhibits, doing lectures (ranging from Amdahl to Zuse) and gaining widescale support from computer people and companies.

I want to see this phase aimed at:

- putting a formal educational program in place,
- continued collecting of artifacts (whether letters, films, manuals or machines) in order to record the significant, information processing events, and
- getting broad public support from computer-knowledgeable people who want to learn more about the past and future history of computing.

The Image Gallery has turned out to be a major work and attraction. I would like to urge you to come and give a Pioneer Lecture on Computer Graphics at NYIT. We have a February to May lecture series.

Since the Museum is quite unlike the plan you saw, I hope you can visit the Museum with me on your next trip to Boston and see the transformation. The perspective you now have would also be beneficial. If you have time, I hope you could join Gwen and I for a meal.

Sincerely,

Gordon Bell

June 18, 1984

Mr. Allan Wallach
Vice President, Marketing
Massachusetts Computer Corporation
543 Great Road
Littleton, MA 01460

Dear Allan:

It was great to see you at the Museum last month. I am delighted at your enthusiastic support to help it get going. The irony of the Museum is that, with the exception of Digital, it has it's greatest support from small companies. I believe this has a parallel as to why innovation also comes from small companies. My simple explanations are: decisions are easy to make and the people have imagination, understanding and vision that seem to be totally lacking or mired in the bureaucracy in large corporations.

Gwen enjoyed the interaction with Lorrin and someone else that sounded very much like Jack Burness. They are going to do some very nice demos and interactive exhibits for the image gallery. The exhibit should be great, and I hope we can also show the complete line: Linc, 12, Minc and your machine.

I enclose The Computer Museum brochure on the Capital Campaign and I hope Masscomp can also support us at one of the "Core" levels of 4K, 8K... because we also need cash for the November 12 opening. This will also enable the company to use the various facilities including the library, artifacts and have functions in the Museum.

Right now, the founding period of the Museum is just closing, and I hope you'll become a founder. On this one, the money is needed by June 24.

Sincerely,

Gordon Bell

Digital **Interoffice Memo**

Subject: **Allegheny Airlines was Late Again; Was I Just Unlucky?**

To: Jean Haynes Date: 25 OCT 76
From: Gordon Bell
CC: Allegheny Airlines, Customer Service Representative Dept: OOD
Loc.: ML12-1
Ext.: 2236

Could you please send the CAB or Airline performance data on the difference between actual and scheduled arrival times? I'd like to know averages, standard deviation, and hopefully the shape of the distribution; also, I'll circulate these internally so that others can fly the airlines that are lucky enough to be on time.

It feels like nearly every time I've been on an Allegheny flight, it was late. Specifically, the last two Allegheny flights were afternoon flights, and the hour difference meant an extra 30 minutes in my car or 1 hour in the airport waiting to leave, since they were 3:30 p.m. arrivals.

Allegheny also has problems waiting in the airport because there are not good areas to work in (like TWA), and I'm only able to work at 50% efficiency. (I wouldn't spend the extra money to join anyway if there was such a lounge).

For now, please assume that I've been unlucky in getting on Allegheny flights, and that Allegheny is basically unlucky with schedules.

Subject: **Your memo on Engineering Allocation**

To: Ken Olsen

CC: Andy Knowles
Larry Portner
Bill Thompson

Date: 7/6/79 Fri
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

You have the basically right idea that there is a miss-allocation of engineering funds and we will attend to it. For your information, I think we do a reasonable job of the make-buy issue you pointed out in '74. We need a proposal on how to do a better job of product pricing such that the low volume, flaky products get weeded out. Since Central Engineering isn't designing them, I suggest the process (or new algorithm) should be extended to <u>all</u> products!

We, Central Engineering, have only enough resources to do only the basic high volume products. I don't believe we're ever seduced by a single PL or person - unlike the closeted situation in PL Engineering. Virtually everything we do has sufficient demand to justify it. In looking at the last 4Q sales that represents about 1.4 billion in sales and 72% of the revenue, <u>none</u> of these products would be affected by your thesis.

I believe a more fruitful area is how are the engineering projects decided on in the Product Lines and why there is no review, I see:

1. a plethora of low volume, high support software...that may be needed to get incremental sales;

2. a bunch of products that are in principle high volume ideas, but are poorly engineered, such that there is no way to get volume or cost,... but most usually are assured to be poor quality and get your customer hate letters;

3. poor product ideas that are in response to a single customer that could only be done in a product line because it is the one, special case to get the sale;

4. product line specific things that only the manager wants

5.replicated in all areas because they have the revenue stream for hobbies with no plan or review. For example, the Electronic Mail Systems include: CIS (for our own use); Andy's experiment that is outside any review; LDP for their use; and Jack Gilmore because he wants to claim all territory associated with test creation, retrieval or transmission. The irony of this is that we will end up having to make a product and to create the necessary standards. Futhermore we have <u>no</u> access to these funds.

Note, unlike Central Engineering, what we do has to get orders (from our customer P/L's) so that we can add up the costs (including manuals, etc. the ones you mention) so we can price it.

Could we get a list of the PL specific terminals for example, and compare them with the plans in terms of predicted cost, reliability, sales, support, etc. Also compare them to all Central Engineering terminals! I too am concerned about low volume products because we have a need for the high volume ones and their options (eg. modems).

MESSAGE ID: 5171520001

SUBJECT: ALPHA OMEGA...POST VN COMPUTING: PERSONS & COMMENTS?

Bruce Delagi and I led a group from CDC, Univac, and Harris to define
a research program on parallel computing for use across a large array
of problems including AI. This is a program which we believe must be
executed in order to do the basic work necessary to produce machines
to compete with those produced by the Fifth Generation Computer Program.

CALL FOR COMMENTS ON THE DRAFT PROPOSAL

Please call or EMS me for a copy of the research proposal. Bruce is
going to give a seminar at Hudson on it and we'd like to get your
comments on how the proposal can be improved either by narrowing or
widening the scope.

CALL FOR PEOPLE WHO WOULD LIKE TO WORK ON THE PROJECT

Now, we would like to carry the proposal into the next phase by having
the group who are going to carry out the work write the detailed
research proposal/plan.

If you would like to work on this, please let me know now.

Individuals are needed.

We are looking for someone to head the program. Any candidates?
(Please forward mesage as appropriate).

ALTERNATIVES FOR TERMINALS AND TERMINAL BASED COMPUTING SYSTEM ENGINEERING (AND A PROPOSAL)

(G Bell, Independence Day, 1981)

BACKGROUND

There are various reporting structure alternatives for the printing, video and computing terminals engineering organization. These groups, along with 16-bit systems, reported to Si as a former engineering manager. A recommendation for a structure is given, together with the rationale and alternatives.

In late April, Si and I proposed to the Operations Committeee that these areas be part of BOTH engineering and The Computer Products Group in a dual reporting fashion. Therefore, all the alternatives connect to Bell/Portner in some fashion.

RECOMMENDATION

Mike Gutman is now in charge of conventional, multi-user 16-bit systems.

Obtain a replacement for Si as a Product Engineering Group (PEG) manager for terminals and computers built into terminals. Have that manager organize the work for maximum product autonomy, while building on common components and architecture.

This structure permits a team formed with Si to focus on the marketing, manufacturing and engineering aspects of products.

SUMMARY

The following sections describe the recommendation:

- Si's Old Job AS Engineering Manager
- The Proposed Organization (Product Group Level View)
- Win's Four Organizational Alternatives
- Proposed Organization (Detailed)

Rationale Based On Many Organizational Design Criteria

Why Not One Of The Other Proposed Alternative Organizations?

SI's OLD JOB

Si...

16-bit Qbus hardware

Also, VT278 hardware for WPS and Retail Products

16-bit Unibus hardware subcontract to Tewksbury

VT/LA and Terminal based hardware components (monitors/kbd)

Computing Terminals (CT), both hardware/software

Technical Director and A/D coupling

Mike Gutman now has the responsiblity for our conventional, multi-user, 16-bit systems based on the Qbus and Unibus. Both the Micros and Semiconductor groups supply chips and boards for these products too. Bill Johnson subcontracts the software and Grant supplies mass storage.

The following engineering (outside this area) is also associated with terminals and table-based, personal computing systems:

CT software

Disks, subcontracted and independently funded

WPS 278 software

VT278 software for Retail Products Group

Terminals engineering who are building 2 Computing Terminals

Modems for terminals

Special semiconductors and PDP-11 microprocessors

THE PROPOSED ENGINEERING ORGANIZATION (PRODUCT GROUP LEVEL VIEW)

Bell/Portner

(Product Engineering Group, PEG)

32-bit systems

Large computer systems

[Terminals and table-based (personal) computing system]
16-bit systems (part of Si's old job)
Networks, communications and distributed systems
Software
Mass storage
Semiconductors
Power, Packaging, Physical Interconnect

Technical Director (Standards, architecture, R&D)

(Engineering Administration Staff)
Administration
Finance
Personnel
Technical Operations
Strategic Planning
Corp. Product Management
Quality and Operations Analysis

Recording Secretary

The product area, [Terminals and Computing Terminals] is the group and work being examined as to how it can be best organized.
Engineering Staff total is 20 persons... and has become basically ineffective as a team or problem solving group.

PEG has the product responsibility and is beginning to function as a team, although it runs the risk of becoming too large at its current level of 2 + 9. The members and the team are good.

WIN'S FOUR ORGANIZATIONAL ALTERNATIVES
Win suggests the following alternatives:

1. B/P manage the details of how to get Si competitive products

B/P
- 8 Current Product groups
- CT
- VT
- LA
- Technical Director
- 7 Current staff groups

2. Keep all computers together and all terminals together

B/P
- 7 Current Product Groups
- 16-bit
  - CT
- VT
- LA
- Technical Director
- 7 Current staff groups

3. Combine CT and VT in one group and LA in another group

B/P
- 8 Current Product Groups
- CT/VT Products
- LA
- Technical Director
- 7 Current staff groups

4a. One form of the Proposed Organization

B/P
- 8 Current Product Groups
- Terminals and Terminal Based Systems
  - CT
  - VT/LA
- Technical Director
- 7 Current staff groups

There are several other alternatives based on having all the engineering associated with the products that Si's group will be marketing together. I like the following one, for many reasons.

PROPOSED ORGANIZATION (DETAILED)

4b. Maximum autonomy for the various products
B/P

8 Current Product Groups
Terminals and Terminal Based Computing Systems
- CT
- VT
- LA
- VT278 (including hardware and ALL software)
- Common components (keyboards, modems, CRT's)
- Strong, Common Advanced Development and Architecture

Technical Director
7 Current staff groups

There are several variants on this, including putting all the components under one person and all the products under another. I'd like to hire the engineering manager and have him organize the product area to get the best performance for these criteria:

RATIONALE BASED ON MANY ORGANIZATIONAL DESIGN CRITERIA
The reasons alternative 4b feels right:

Bell/Portner and Other Product Engineering Self-Preservation
There are a large number of Product Engineering Groups. For the first time in several months, it looks like we have a management structure and set of managers that really work. Based on recent experience with Bernie, having an effective manager can turn around a group in a week, converting a set of warring peers into a team. Even though there are a very large number of technical issues of concern, I have confidence in the current PEG members. Having someone take over Si's job should provide the added quality we need in engineering management.

Many Engineering Areas Need Our Attention
Taking on the work that Si did is going to significantly delay our work on quality, productivity and engineering training. Also, it saps us of any spare, problem solving capability.

Technical Issues In Terminals and CT's Are Open
A strong manager will create a strong team and we really need a strong team to compete in this area. We must have at least one more strong, technical manager in order to both survive and win. Aggressiveness, new products, control of architecture and interfaces with other engineering groups are of concern. Although Avram (an entrepeneural leader) and Bill (a very good manager) are both highly qualified, the product space is very large, dynamic and most competitive. We need help here!

Protection From Me (and Passers By)
Currently the projects have little protection, or any overall management structure to say no to off the wall suggestions. All the projects in this area appear to be "flat out" trying to do work. Requests put the projects in a state of pandemonium, requiring preparation time for presentations and not work.

Strong, Autonomous Product Focus
It provides us with a very clear product by product focus, while letting us get any economy from the many common components and technology.

Separation of Terminals and Computing Terminals
If there is a transition away from dumb terminals to computing terminals, we can take advantage of it. However, both groups are retained allowing common architecture and technology.

Strong and Clean Coupling With Si's Team
Basically, the main products that Si is selling are in one group: VT, LA, CT and WPS's. This will give us the best coupling with the market for direction, while at the same time let us also drive and be decoupled technologically.

Strong and Clean Coupling With Manufacturing
VT's, LA's and CT's are manufactured within Esten's plants at Westfield, Phoenix and Albuquerque. This is all these plants build. Floppies are made at Springfield and various components are made in the far east.

Very Good Coupling For Shared Technology and Work
These products all share a lot in common, and hence within the group there could be a very strong function that we must have at critical mass. The common technology across all parts:

modems
power and packaging, including noise and radiation control
keyboards
monitors (although the LA's don't need them, VT/CT do)
use of roms for more intelligent terminals
common modules for terminals and computing terminals

including: comm., rom, some video, printers, mass store

architecture of communications to operate on non-DEC systems
architecture for use on DEC systems (badly missing now),
especially VT and VT (graphics)
human factors for much of the design, including editing
imaging based on dot matrices for fonts and graphics
common approach of servicing and customer installation
use and programming of standard VLSI

Printers have unique problems of printing, paper handling and possibly printer-only editing, if we build them.

Computing Terminals require mass storage and programming. Hence, there is the need for software both within and outside DEC.

Provides A Strong Technology Focus For All These Areas
We are late in the video area with respect to both lower cost terminals or for high resolution, one page displays. The later exist or are needed soon on WP Systems.

Minimal Amount of Interaction With Other Parts of Engineering
A single group can manage the interaction with other parts of engineering. This means all engineering will be more effective. Note, that when two groups providing the same function approach a third group about an interface, there is an inherent arbitration function (actually a fourth group) needed. Hopefully there are only these interactions:

- Common terminal architecture interface with software
- Mass storage (CT and VT)
- Semiconductors (all, and all have unique VLSI too)
- Ofis software (for both CT and VT)
- Other operating system software for CT

The Revenues In These Market Directed Products Are Similar to other product groups. Both the terminal and computing terminal revenue streams (in $B) are less than the other areas.

FY	VT	LA	CT/278	16-b	32-bit
81	.16	.16	.05	1	0.6
82	.2	.2	.06?	1.1	1.0
83	.22	.27	.13	1.2	1.5
84	.29	.3	.4	1.3	2.0

The Proposal Is Similar To Other Parts Of Engineering
While not a reason per se to reject other alternatives, I would like someone else to manage the people who manage projects. Note,

B/P(level 2)
- Mass storage (level 3)
  - CX (Level 4)
    - Big Drive Projects (level 5)
    - Controllers (level 5)
      - Specific controller project (level 6)
- ...
- Large Computers
  - Venus Program
  - 36-bit
    - Jupiter
- ...
- Terminals and Terminal Based Computing Systems

(Personals)

- CT family of products
    - CT Product Management
    - CT Hardware manager
    - CT Software
    - CT product assurance
- VT products
    - VT project
- LA family
    - LA200, etc.
- Components
    - Keyboards, monitors, etc.
- Single VT278 mogul
    - Product manager
    - Software, including WPS, RPG, etc.
    - Hardware

... etc.

Prior to Si's leaving, we seemed to be getting improved focus on products. This has to continue, but we need help to do it.

Having The 278 In The Group Is Desireable, Though Not Necessary
We still need better focus and drive around the 278, especially the WPS software. The three parts can remain separate: hardware, software (and Product Management) and WPS software. Mike Gutman should also focus full-time on PDP-11 Products!

WHY NOT ONE OF THE OTHER PROPOSED ALTERNATIVE ORGANIZATIONS?

Alternative 1
Alt. 1 adds two more direct reports, plus requires Bell-Portner to see that the various charters are established among the groups as to the plethora of components and architectures. It would require the establishment of a functional equivalent to that of the proposed organization. This function would could be in one of the three groups, and while it might be clean, we would often end up as arbiter. I don't know how to handle the advanced development and architecture that is getting us into the current trouble.

Alternative 2
Alt. 2 has nearly all the problems of 1, except that there might be something gained by having the two types of computing systems together. It could supress the focus on CT and thereby limit building the personal system. Historically, we have not been able to focus our management attention in such a way to build a personal system because the pressures are to perpetuate time shared systems. Probably the worst problem is that it puts in jeopardy the conventional 16-bit business which we must have. Mike Gutman has to focus here!

Alternative 3
While alt. 3 allows video technology to be shared across VT's and CT's, we run the risk of doing a poor job in both areas by having resources go to either area. It has problems similar to alt. 1 in that someone has to take on many common functions. Alt. 3 may be better than 1 because it groups our lagging video together.

Alternative 4a
This alternative would certainly be acceptable and let us focus on both terminals and computing terminals. Similarly, there could be a strong advanced development and architecture function which we need for all terminals. Computing terminals have unique and intense problems which are going to consume Avram for the next 3 years! It is just about as good as 4b.

September 2, 1980

Mr. Alec Peltier
Chief of Immigrant Visas
Operations Branch
American Embassy
London

ENGLAND

Dear Mr. Peltier,

On behalf of Digital Equipment Corporation, I would like to thank you for approving the recent visa for Dr. Maurice Wilkes who has now been able to join us here. Since I have known Dr. Wilkes for such a long time, it is also a great personal pleasure to be able to work with him here.

It is truly significant for us and computing here in the U.S. to have Dr. Wilkes. Wilkes has been active in computing for over three decades, making some of the great innovations. He is a Fellow of the Royal Society, a Fellow of the Institute of Electrical and Electronics Engineers, a Fellow of the British Computer Society, of which he was the first President, and a foreign associate of the U.S. National Academy of Engineering. He received the Turing Award and the Harry Goode Memorial Award, two of the highest honors in american computing. He has received honorary Doctorates from five universities in three countries, together with other honors from around the world, including recently being named as a foreign associate of the U.S. Academy of Sciences. In summary, he is a distinguished scientist and engineer of world reputation, possessing unique background and qualifications not available elsewhere.

Thank you again.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

REVIEW

Moreau, Rene, The Computer Comes of Age. Cambridge, MA M.I.T. Press, 1984, 227 pp* *.

The troubles begin in the Series Foreword where the editors state "Rene Moreau has given us a technical history that centers on problems and their solutions, stage by stage, from the beginnings of this subject until the year 1963, when the IBM Series 360 computers introduced a new age in the history of technology". The 360 was introduced in April 1964. The 360, a tremendous engineering achievement, used discrete transistor circuits packaged on ceramic substrates. The Integrated Circuit, an earlier invention, is probably the basis of the new age more than any other technology. The editors introduce two types of problems: factual inaccuracies compounded by fallacious and biased assumptions. The bottom line suggests a recall of the book and if you have the time, read on for the reasoning.

The author's first sentence in the preface is ambiguous (which Mark I) and inflammatory:

> "It is not uncommon to read that the first computer was the Mark I, or the Harvard-IBM machine, or perhaps ENIAC; it is seldom stated that the IBM Selective Sequence-Controlled Electronic Calculator (SSEC) alone can claim this distinction."

The **first** computer is something that should be left to historians to sort out in several hundred years. As a student of computer structures, it's hard to see the resemblance between SSEC (especially the one depicted by Moreau) and the modern computer described in the EDVAC report or the Manchester Mark I that Kilburn ran his first program on in June 1948.

The fetish about firsts in computing is a recurring theme that concerns me. Moreau carries firsts to the extreme. Dates have lots of errors and ambiguities, regardless of their source. Even primary contributors often quote dates when something worked in the lab or when a computer was shipped to a site, was commissioned and may have required another year of assembly and testing. Even though a computer ran a program at 10,000 instructions per second for 15 minutes, it may have been one year before it ran 10,000 instructions for 6 hours. For a commercial computer, a better test is probably the delivery of the second (or the tenth) one. I am content to let the first commercial computer title be somewhere among these machines:

- Ferranti's Mark I, identical to Manchester's Mark I, and Lavington states: "The first Ferranti Mark I was installed at Manchester University in February 1951, thereby becoming the world's first commercially available computer to be delivered".[1]
- Lyon's LEO, derived from EDSAC, ran a simple test programme for Princess Elizabeth in February 1951 according to Lavington and was running reliably by January 1952. A party to celebrate the completion of LEO I was held in December 1953.[2]

. Nancy Stern, based on interviews, states Eckert-Mauchly Computer Corporation BINAC was formally accepted by Northrup on August 22, 1949.[3] Goldstine states the BINAC was operational in August 1950. BINAC was subsequently shipped to Northrup where it underwent a series of trials.[4]

. Goldstine states UNIVAC was operational in March 1951.[5] By 1955 15 had been installed. Moreau (correctly) states it was the world's first business computer, a distinction that's now pretty much disappeared.

. Goldstine states the ERA 1101 was delivered in December 1950 to Georgia Tech. It's successors included the 1103 and 1103A.

On the first page of the introduction, Moreau argues that by late 1963, computer science had come of age. The term "computer science" was probably first argued by Newell, Perlis and Simon in a letter to Science in July 1967.

Overall, the book presents a parochial, Franco-IBM view of some early computing developments. Useful graphs are included on cost and performance of various IBM machines and technology versus time. Also, the book has a number of references to the early French literature that may be of use. For example, while clearly dealing with the period prior to 1963, the author lapses into:

> "Lady Lovelace was probably the world's first woman programmer and it is for this reason that in 1979 her name was given to a programming language, ADA, developed in France ..."(p. 17)

There is a constant stream of errors and omissions anywhere you look, for example:

Page 20. Most authorities use 1887 the year of the patent for the date of the Felt Comptometer (not 1885). And Burrough's patent was 1888, not 1886, although The Science Museum catalog notes that he was working on a machine as early as 1880.

Page 61. Engineering Research Associates, ERA (not

Electronics)

Page 91. The first paragraph is full of misinformation. It is probably very dangerous to call the SEAC the first computer to use transistors. While it may have used a few transistors in later modifications, it had no effect (that has been traced, to my knowledge) on the full-scale use of transistors in computers. Were the transistors in the SEAC added later? What were they used for? Like the "first" computer, or the "first" commercial computer, there were probably several "first" transistor machines. Let me add:

- Bell Lab's Leprachaun, 1956,
- Lincoln Lab's TX-0 (project start in 1955 and operational in 1956) to test the Philco SBT100 surface barrier transistor and a large, 64Kword memory for SAGE

. Cray's first machine at Univac that he designed for the Navy which was operational in 1957
. Siemens' 2002 and the transistorized machine (Mailufterl) built by Zemanek

The Philco story is not told well: What is the project start and what is the delivery date of the TRANSAC S-1000? The Philco 2000-210 (predecessor of the 212) and delivered in 1958 is omitted.

The statement about CDC discounting and delivering product in 1958 is unbelievable. In 1957, when both CDC and DEC were incorporated, it became clear that transistors were the next technology for computers and then the question was designing, tooling, and getting to the market with a product. What company was first by a month or so, doesn't really matter after the innovative work had been completed at Bell Labs, MIT's Lincoln Laboratory, etc.. The CDC 1604 was not available until late 1959 or early 1960, not 1958 as Moreau claims.

pp 92-102 is poorly organized for what should just be a description and commentary on three interesting machines. The omission of Atlas, which I regard as one of the few great computers, in this category is bad taste. The CDC 6600, introduced in 1964, was equally as important as Atlas and I think more important than the other three. I would hardly put the Gamma 60 in the same class as Stretch in terms of either power or influence. It was an interesting machine, but virtually unknown to everyone from engineers to historians. In writing Computer Structures, I looked at it carefully and could find no real influence on any successors. It was poorly described, hence mysterious and interesting, but naive.

pp 104-106. This page about DEC has about 15 errors. This is embarrassing since the source is given as The Computer Museum, but the Museum can find no correspondence. Usually The Museum refers authors to the book, Computer Engineering, A DEC View of Hardware Systems Design that I, Craig Mudge and John McNamara wrote in August 1978.

Digital was incorporated in 1957, not 1962 (this mistake does not even fit with his data on the following page.) PDP stands for Programmed Data Processor, not Programmed Digital Processor. The names of the machines are usually hyphenated (eg. PDP-1). I was the project engineer of the PDP-4, not, Gordon Hall. The memory capacity, computing speed and instruction format of the PDP-4 were not the same as the PDP-1 (if I could rewrite history, they should have been closer). 45 PDP-4's were built, not 65. Ken Olsen's name is spelled with an e. His brother is Stanley, not Sam. Harlan Anderson was a co-worker at Lincoln Laboratory. (There is no d in Harlan.) John McCarthy did not design the PDP-1. The first one was sold to Bolt, Beranek & Newman Inc.(not company), not built for them. John was consulting for BBN at the time, and developed his ideas for time sharing from working on the PDP-1 (another story.) One of the first papers on time sharing lists McCarthy, Boileu, Fredlein and Licklider. (It was Boilen and Fredkin, not Boileu and Fredlein or Fredkine.) The credit of the "ingenious" high speed channel was gratifying, but the author should have pointed out that this is an early, maybe the "first," of what is now called the Direct Memory Access (DMA) used in virtually all computers.

Page 106. Title The CAB 500. (Dates of project start, first delivery and machine details are missing, but the glimpse I have is a 32-bit, 16K drum machine.)

> "These [relatively cheap machines at the bottom of the manufacturer's lines such as the 1620, 1401, and PDP-1] were the minicomputers, so named to contrast them with the top-of-the-line machines."

The word, minicomputer, was coined and used in the late sixties to denote a new industry building minimal, high performance machines, using the new TTL logic. Minis were often used as components to other systems, and were NOT bottom of the line to large machines in the same company. The whole issue of upward compatibility is quite different. Ralston's Encyclopedia has several pages defining the characteristics of minicomputers and this is totally a misuse of the word. The IBM 1620 and 1401, along with earlier drum machines such as the G-15 and LGP-30, while small do not fit any definition of a minicomputer.

In the conclusions, another, contradictory claim and a clear omission:

> "the CAB 500 and IBM 1620 ... were the forerunners of today's **personal computers**".

I consider the LINC, demonstrated March 27, 1962 to be the first personal computer. It had a keyboard, scope, personal filing system with 256Kbytes, used interactively allowing a person to create, edit, compile and run programs without any off line operations. It also had a variety of analog input/outputs. It was (trans)portable, operated without air conditioning and was usually owned and used by a single individual (mostly life science researchers). About 50 were produced, but including it's successors the LINC-8 and PDP-

12, over 1,000 were built. The machines sold for about $45,000 (the price of today's workstations).

Page 108.

> "in the CAB 500 the microprograms were held on the drum along with the other programs, ... this microprogrammable machine as early as 1960 was one more proof that there was then in France an industry that, if not ahead of the Americans, at least was not significantly behind. Unfortunately, although CAB 500 had some success and about 50 were made, it disappeared with the demise of SEA."

The author fails to point out a few critical lessons of history that I can only conjecture, based on his sketchy presentation of the machine:

1. The use of techniques, such as microprogramming, depend on relative cost, size and performance of logic and memory for control. I can't understand why anyone would use microprograms that would have to be stored on a drum. This is a sure recipe for making a slow machine run very slowly. Designs (especially great ones) are measured both by the ideas omitted and included.
2. As one who has designed several computers, including the peripherals and I/O system for the PDP-1, I resent having the PDP-1 or the 1401 in the same sentence as the CAB 500, given my knowledge, based on the author's poor description of the machine. I believe an interpreter for the PDP-1 could execute CAB 500 programs faster than a real CAB 500.
3. By 1960, all machines used core memories for speed, not drums. Like other machines, CAB 500 may have been innovative, but performed very poorly. Since I don't know the cost, it is hard to understand a measure of cost-performance and hence, relative goodness. CAB 500 was obsolete before it was introduced.

Outside of the errors, a basic problem of the book that makes it questionable for any historical work is summed up on page 166:

> "PAF vanished with the CAB 500, but it had a famous descendant, BASIC, produced in 1965. Even if the authors of this language did not know of PAF, BASIC had the majority of its features."

The facts here might be correct, the interpretation I give is: "let's rewrite history as it might have been" is inexcusable, especially by a scientist. This sort of statement is likely to be rewritten by future, careless authors as: "PAF was the forerunner to BASIC", when they need a sprinkling of history in their first chapters.

BASIC had characteristics that were taken from a variety of languages, including Algol, Fortran and JOSS -- people were working on the same problems at the time. But Kemeny, Kurtz and the others at Dartmouth designed and made BASIC work. If they had taken the whole language of PAF without reference, then the story is different. The section on PAF as a descendent of Fortran does grate on the reader, in light of the lack of data. Sammet (Programming Languages) and Wexelblat (History of Programming Languages) don't mention PAF. I conclude, PAF and the CAB 500 already have their proper place in history and the world doesn't need to know anymore about them. If they were significant and overlooked then the Annals is the proper place to include and argue them.

All of this may be excused, providing grist for nitpickers, of which I am NOT one, to correct; but the conclusion is so offensive that it moved me to write what otherwise would have been a sad, but invisible review:

> "It is no exaggeration to say that there has been no fundamental development in computer science since 1963." (p. 196)

Without time sharing, microprocessors, packet-switching, artificial intelligence, 6600-style I/O computers, distributed computer systems, LANs, many algorithms, various higher level and non-procedural languages, graphical and other modern man-machine interfaces (including speech) -- all developed after 1963 -- computing would be pretty dull. And I look forward to even more fundamental developments in the future emanating from the current research and development by governments, universities, and companies.

A recall is in order. Quality Control taught us the cost of correcting errors downstream is orders of magnitude greater than their initial elimination. The book is filled with defective and missing parts and harmful to our health. It could be the cause of generations of errors, since it inaugurates a new history series and is not just another view about the evolution of the computer.

SUBJECT: RECOMMENDED ARCHITECTURE ANNOUNCEMENT

My concurrence is on the basis of whether or not we

understand
AND can demo the product.

I believe we should be able to. IF SO, let's go ahead. It's up to Ulf and Pete though.

SUBJECT: RECOMMENDED ARCHITECTURE ANNONCEMENT

Gordon,

Although it is not appropriate to announce JUPITER until sufficient performance data is available, we did receive PPC approval to announce CI20/HSC50 support for the KL10. We understand that you also recommended implementation and announcement of the KL10 ETHERNET adapter and PLUTO support. We feel that this announcement at DECUS would put us in an excellent position with our customers in spite of the absense of a JUPITER announcement.

The attached memo is the form in which we would like to make this announcement. There has been some debate regarding whether or not the CI/NI interconnect and its component pieces and protocols constitute an architecture. We would like to announce it as such. We feel that such an announcement requires your support for approval.

If you concur, Please advise and we will proceed.

Regards, Paul

SUBJECT: DIGITAL SYSTEM INTERCONNECT ARCHITECTURE

The Digital System Interconnect Architecture

The Digital System Interconnect Architecture (DSIA) is the
integration of various new Corporate components, protocols, and
architectures into a unified whole. It is the plan along whose lines
we will be introducing major new products through the '80s. The Digital
System Interconnect Architecture, as an architecture of
architectures, is actually a Meta-architecture.

The Digital System Interconnect Architecture consists of Servers,
buses to connect the servers, and protocols for server communication across
the busses. The servers are of three kinds: 1) Mass storage servers,
of which the HSC-50 is the first of a family; 2) Communications
Servers and 3) Compute Servers. The CI and Ethernet are the two busses
that connect the Servers. The CI connects mass storage and

compute servers
for high speed interprocessor communication and clustering capabilities.
The Ethernet connects compute servers and communication servers to allow
the creation of Local Area Networks.

The new Digital Storage Architecture is an outgrowth of the CI
capabilities while the Digital Network Architecture is being enhanced
to take advantage of the new capabilities provided by Ethernet
Loacl Area Networks.

The KL10 is the first Compute Server to implement the full
Digital System Interconnect Architecture. In the future there
will be new 36 and 32 bit compute servers integrated into
the Digital System Interconnect Architecture.

SUBJECT: A/O DISCUSSION WITH FERNBACH AND FEIGENBAUM

They were positive on the approach. Ed warned that if you start a program as a series of projects, you risk ever building
a large institute. I believe we can always enlarge something after it is going. In this way, we can start the program without getting the top person... and in fact can use this to lure them. No matter what, we also need a super project person
to run the LASL show. We can recruit them now within LASL, CDC, Univac, etc.

This is a program that builds off the contractor strengths and
also lets us go to other places for projects... say 6 in all.

LASL is strong in:
Supercomputers and parallelism for scientific processing... in
  fact has that charter to measure and understand all machines
large databases

graphics and image generation. This should be the basis for doing the compression work and chips.

Also, large networks and facilities.

They have less expertise in AI, VLSI design, human interfaces.

The goal would be to use AFP to explore a large, gp database and one that could encode and store images. The operation would be focused at the hardware/systems level.

STANFORD or SRI would be Prolog or AI Machines

We would still need an overall architecture effort to tie the components together, but that gets into the product issues that might be contentious in the companies.

For now, we'd run with BOD, and I'd be chairman until we get a program head for the whole thing.

Sid was happy with this. Didn't get to talk with CDC folks yet.
Will do this tomorrow.

PRELIMINARY ENGINEER STRATEGY OVERVIEW

TABLE OF CONTENTS

Chapter IV Quantitative Resources

GB2.S4.8

CHAPTER I

THE PRODUCT STRATEGY
AND TRANSITIONING TO THE FIFTH GENERATION

THE PRODUCT STRATEGY OVERVIEW

THE FIFTH GENERATION

The transition to The Fifth Computer Generation is happening. All generations changes are painful and this one could be harmful unless we recognize and ease the transition. The Fifth Generation is based on: significant 16-bit microprocessors with large memory addressing; small, low cost, 5-10 megabyte mass storage; and communication using Ethernet-type interconnection. It is marked by Personal Computers that will evolve rapidly into Personal Computer Clusters. Clusters can be used as an alternative to our departmental timeshared minicomputers, just as the mini provided an alternative to the central mainframe.

Technology continues to provide 20% per year decline in the price of computing, permitting a wide range of computing styles from a $500 "PDP-11's in a book" to "Cray 1 power" VAXs for $250,000 in 1990. Competition will be fierce as 360/370's become available at minicomputer prices and the semicomputer companies sell what was formerly mainframe power processors for zero cost and start a new industry. Digital's Product Strategy with its homogeneous architecture is aimed at being a major force in this generation.

THE PRODUCT STRATEGY

The product strategy of a homogeneous architecture is simply:

- adopting a single VAX-11/VMS architecture;
- implementing a wide price range of products covering the computing styles of **Personal (Individual) Computing, Timeshared Departmental Computing**, and **Central Computing**;
- interconnecting these in a homogeneous network, including the formation of Personal Computer Clusters; and

. building critical and unique applications.

RATIONALE FOR THE STRATEGY

The basis for a winning strategy is:

.ability to build a homogeneous, network architecture which will greatly benefit the customers, by:

. providing a wide range of price and styles for our varied customers, preserving their data, programming and training investments; and
.allowing a user to compute, dynamically, anywhere across the compatible range without conversions;

.fewer systems to support across Digital, while covering a very wide price range, as processor cost becomes a smaller part of the total system cost;
.fewer systems also imply lower costs with higher quality and greater reliability by moving further down learning curves;
.a clear internal and external mission which both aids productivity and quality;
.product uniqueness and superiority against the emerging commodity-produced mainframes in our minicomputer price band and the semicomputer company "mainframes" fueling the emerging fifth generation computer system building boom; and
. support of our customer base and transition to this new computing style.

IMPLEMENTING THE STRATEGY

Implementation includes continuing to deliver significant 8- and 10/20-based products and building the necessary coexistence hardware and software to make the transition to VAX-11/VMS. The 11, using RSX-11/M will be the basis of Personal Computing until VAX-11/VMS is implementable as a low cost Personal Computer, PC, and Personal Computer Cluster, PCC. Homogeneity must be maintained via files, language, and interconnection standards enabling customers to preserve their data and program investment. RSX-11/M aids this transition because VAX-11/VMS provides a compatible environment. Immediately we must develop unique applications on VAX-11/VMS that cannot be built on competitive 360/370's and semicomputers.

This evolutionary strategy, as ratified two years ago, is the result of the 1975 decision to build VAX-11 together with the technology push and market pull to further distribute processing via Personal Computers and our own Local Area Network.

In the last two years since its inception, the strategy has proven increasingly attractive because no competition appears to have the same focussed vision, capacity and capability.

THE TRANSITIONS

TECHNOLOGY TRANSITION

Transition based on technology evolution is continuing at 20% cost decline per year as shown in the following figure, permitting an incredibly wide range of useful computing devices to be built. The generation period of seven years and the seven generations, 55 year period from 1945 to 2000, is described in the appendix on the fifth and sixth computer technology generations. Economy of scale, also known as Grosch's law, does not hold today for any system or component except very large disks. However, there is diseconomy of scale for large systems primary memory.

From the generations graph, we can observe the following:

- .there is a wider range of useful systems, and these will be appealing to our customers, us and others; For example, in 1985 we could be selling $1,000 computing terminals with the power of the original LINC, and $600K 10/20's.
- . the wide range of useful systems will force all suppliers to be more competitive and selective as new suppliers enter on a point product basis and as the 370 becomes a commodity;
- .IBM, Fujitsu, and others are likely to offer a 4341-2 class machine in our $40,000 to $100,000 minicomputer heartland;
- .competitors, could be targetting the following (for 1985):
  - .Cray 1 power, $625K (or in 1990 for $250K);
  - . x3+ Comet power for $100K;
  - . 780 power for $40K;
  - .a sharable VAX (or big micro) in $6.25K to $16K range;
  - .a personal VAX (or big micro) for under $6.25K;
  - .a computing terminal with VT100 capability, and power of Apple II, or original LINC, for $1,000;
  - . computers in $400 to $1,000 range;
- .we have not provided aggressive enough products,

because:
. the Q and U bus form factors have constrained system cost and size;
. the 19" rack and stack, palletable form factor together with poorly packaged components, has been retained; Packaging in other, lower cost form factors enabling cardboard box shipment and customer merge is essential.
. the terminal has not been used as a package; and
. point products have been insufficiently high quality, software supported, or cost-effective. Even $200 calculators are modular with mass storage, printer, modem and display options.

TRANSITION TO DISTRIBUTED COMPUTING BASED ON NI

The Network Interconnect, NI, based on Ethernet is the Local Area Network intercommunication medium for connecting all the computers within a building or set of buildings at a single location. Because it operates at 10 Mhz., it should have a long product life and be useful for interconnecting:

.departmental and central computers to each other;
.   Personal Computers to form clusters;
.   several thousand voice channels at 2 Khz;
.   several hundred picture channels at 50 Khz;
.computer components together to form a computer; and
.functional server components in a distributed processing system. For DEC, we need to reduce the number of network possibilites that are a product of:

.   hardware systems;
.the 12 operating systems we support; and
.the desirable protocols including X.25, IBM, DECnet and other vendors.

By using the server concept on a network wide, rather than a cluster basis, each system can be connected to NI, and then build specialized servers for the network nodes. We must build the following network-wide specialized servers:

.concentrators for interconnecting dumb terminals and personal computers to all nodes of the network. This permits both concentration and switching to all nodes.

.gateways to systems using other protocols; This would be done once and not in each system requiring communication with a particular system using a particular protocol.

.repeaters and interfaces allowing various networks to communicate with one another;

.central functional servers for the network, including printing;

.real time front ends for interfacing real time control computers to the network.

TRANSITION TO PERSONAL COMPUTERS FROM MINIS AND MAINFRAMES

Personal computers are already beginning to affect the use of departmental level minicomputers and central mainframe timeshared computers in several ways:

. direct, stand alone use;

.more terminal load can be put on a given computer when personal computers are attached to it using terminal emulation, thus lessening the need for more shared computing; (The leading edge university market shows this trend.)

.interconnected clusters of personal computers are a direct alternative and provide nearly all the advantages of timeshared computers.

The concept of Personal Computers interconnected via a Local Area Network Link, like NI, forming Personal Computer Clusters and using functional servers to handle communications, files, printing and interface to people is described in a following section. The Personal Computer has enormous market appeal because it:

.potentially covers the widest range of use on a cost per terminal basis, beginning with one user;

.is personal, non-sharable, and purchasable by an individual;

.has the best response time for what we think of as trivial computation tasks such as word processing; These

highly interactive tasks require much computation and direct access to the screen for data manipulation.
.offers every capability that a dumb terminal has, including installability, yet is only slightly more expensive;
.can carry out many of the tasks that timesharing systems do; and
.can operate within a cluster to have virtually all the important attributes of a large, timeshared system.

We must get the necessary architecture for the clustered systems. Many systems have been built using this distributed server structure. Experimental systems are being planned or built by the Office Group, Laboratory Data Products, Small Systems, VMS, Research, the Computing Terminal base system and DECnet/ Distributed Systems. These systems have to have a standard interface for this level of communication so they can communicate with one another.

TRANSITION FROM CONVENTIONAL RACK AND STACK 16-BIT COMPUTERS
The transition from our current 16-bit rack and stack and Q and Unibus systems business must be made. They are not declining in price according to the technology and are being rendered uncompetitive. Also, every application involving a signficant amount of programming must evolve from the limits of the 16-bit address. The threats:

.16-bit microprocessor cards and systems which have 22-bit memory address space and supplied by both semicomputer companies and their OEMS who are building competitive systems; UNIX and other approaches to building transportable systems are aimed at establishing hardware to be a commodity.
.board and box level systems that are oriented to modern special chip i/o as supplied by the semicomputer suppliers;
.Personal Computer and Clusters, as described above;
.32-bit architectures, including the VAX architecture;
.better box-level form factors not possible with 19", FAT produced, Q- and Unibus systems; Systems must be shipped in cardboard boxes, integrated by the customer, and when broken, self-diagnosing with customer

replaceability.

TRANSITION FROM TERMINALS TO COMPUTING TERMINALS

The major transition for terminals is semantic. That is, just what is a terminal? It is clear that there will be no dumb or fixed function terminals by 1985. Every future terminal we introduce must be a computing terminal. Terminals must change in the following ways:

.larger Personal Computers are an alternative to our conventional, dumb terminals;
.all terminals introduced beginning in FY83 must be customer programmable with at least firmware ROMs and RAM buffers;
.the interconnection, whether it be U. S. or European Modem, NI, or IBM emulator, must be built into the terminal;
.decreasing memory cost will offer fully programmable screens, which in turn will automatically provide graphics; and
.higher resolution, full-page and color displays.

TRANSITION TO SOFTWARE FOR END USE VERSUS PROGRAMMER TOOLS

Although we will continue to supply software for the systems and applications programmers, we are beginning to supply tools for generic applications such as word processing. Using a computer in the office is contrary to our successful past, where we could use ourselves as the model user. Fortunately, we have offices within DEC, and must use them as a laboratory for building effective products. Specifically, we can identify these needs:

.direct use in the office, including providing the ability for OEMs, office managers, organization, and the individuals to tailor their systems;
. better human engineering at the screen and in documentation; Documents and help should be built-in.
.all products must be modifiable for use with any natural language; We sell products in all countries, and these products must operate in the mother tongue.
.applications building tools that professionals who

understand various businesses can use to write applications programs for particular professional and commercial environments.

TRANSITION IN HARDWARE DESIGN SKILLS

The transition in the way we design systems is quite radical, especially as we move into the sixth generation where our current mid range systems are placed on a single chip. At this time, we would expect constant cost mid range systems to be able to store and process voice and images and to be able to communicate with everyone at their own level. The immediate transitions for system designers includes:

.standardization and use of general purpose controllers and processors for conventional controllers; We are not using enough standard VLSI! This also implies that virtually all options are programmed in ROM (firmware), with programs that are fundamentally real time operating system applications. We are failing to recognize and manage this transition at this time.

.use of gate arrays and other LSI to lower cost of all jelly bean and non-processor logic; This requires a significant investment in CAD and designer training. Although this design approach will be used throughout the next generation, it is interim until VLSI design is understood.

.VLSI design, where processors and controllers are placed on a single chip; Currently this is so expensive, that we are not developing chips or design skills outside the Semiconductor Engineering Group to any extent. We need tools so that a basic design can be done in the same time as a PC Board layout; furthermore the PC Board layout and acquisition time must be reduced to one week. We must engage in more VLSI design as a means of cost reduction in some of our high cost peripherals (eg. the electronics constitute 1/2 the cost of the R80!).

.identification of either general purpose or special purpose computers based on VLSI for building the non-processor portion of systems to drastically reduce system cost. Processor design has been the past focus, and now we must optimize the total system cost, including maintenance (life cycle cost) and use.

PERSONAL COMPUTER CLUSTERS, PCC, ARE AN ALTERNATIVE TO TIMESHARED COMPUTERS WITH DUMB TERMINALS

We must establish the 11 as the Personal Computer standard, and build Personal Computer Clusters and Networks compatible with VAX files, and languages. We must introduce a VAX Personal Computer by 1985.

The opening statement of the August 1979 CMU Research Proposal for Personal Computers was "Timesharing is dead, to be replaced by networks of Personal Computers in the 80's". Research groups have built and are building Personal Computer Networks (PCNs) using PCs costing $20K-50K and interconnected by high speed links like the Ethernet. Xerox Research PARC, the developer of the "distributed server" architecture, is the archetype of this environment with several hundred Alto personal computers and service facilities (e.g. File Servers, Printer Servers, Network Server for interconnection to outside computers, and a Tenex Computation and File Server) interconnected over 3 Ethernet segments of several kilometers. Apollo has just introduced a PCN, based on a ring structure and using the M68000, aimed at the technical professional. Three Rivers are delivering PERQs to the CS community and Convergent Technology has announced a clustered, professional workstation. The Datapoint computer system is built using the "distributed server" structure. Apple is likely to introduce Apple-net in 1981 to interconnect their PC's, forming Personal Computer Networks (PCN's). Wang and other WPSs are organized around a co-axial ring, using file and printer servers, and distributing the processing in the terminal computer, forming a limited, single cluster (PCC). Semiconductor companies have again lowered the barrier for entry into the lower part of the computer market.

The PC has evolved from a tiny computer with a serial link to a dumb terminal (glass teletype). New PC's must have the ability to save and restore a complete screen, as the screen is mapped into the processor's primary memory, and to be able to use a screen to help the user more, in a similar fashion to the TV games. This very high speed communication will dictate a whole different Operating System philosophy for screen management. Equally important is "distributing" the operating system to clusters of PC's using the emerging high speed links such as Ethernet.

COMPUTERS ARE A NEW COMPUTER GENERATION

Personal Computers, Personal Computer Clusters, and Personal Computer Networks all form alternatives to our small, medium and large timesharing systems (TSS's) for various reasons and, therefore, we have no choice of ignoring them! The figure shows a guess at how the computing style (batch, shared, RJE, personal, PCC, PCN) has evolved and will evolve from 1950-1990.

Given that a terminal has video, keyboard, power supply, control logic in the form of a microprocessor, a package constrained by the video and keyboard, it is only slightly more expensive to increment the primary memory and add a secondary memory to get a complete computer capable of standing alone and acting as a terminal emulator.

As an example of a terminal evolving into a PC, GIGI has a ROM which gives it Microsoft BASIC capability. Although we provide no secondary memory for programs, our customers probably will. Therefore, the forces to make every terminal evolve into a personal computer are:

- constant overhead of the terminal;
- high cost of people sitting at the terminals (e.g. $20K-150K/year) relative to the terminal;
- lower primary memory cost;
- need for much more processing at the terminal and high bandwidth between the terminal and computer to get more productivity from expensive people;
- the introduction of the small floppy and now
- the small Winchester that can be packaged in the terminal.

Given that we sell a lot of dumb terminals, it is important for us to evolve them this way.

Tasks like editing require a great amount of computing power and very fast interrupt response time. It should also be noted that this kind of response is virtually impossible to deliver in very large, shared systems and gets even worse in very large computers. The issue is really latency versus throughput. There is some evidence to show that the cache miss rate goes up as the square of the processor speed. Also, the access time of large disks is not improving as rapidly as processing speed.

Just as there have been forces to establish the PC as an alternative to the dumb terminal using a terminal emulator program, the forces will continue to replace all the functions that the timeshared system provides by clustering the PC's and by having shared facilities using Ethernet. As we simply cluster the PCs, communication and file access among the machines is provided as long as all the computers are ALL turned on. This requirement leads back to asking for some shared facilities in addition to the communications link. Sharing occurs for two reasons: it is drastically cheaper or that it is necessary for communications. High performance or high quality printers, communications facilities, and large filing systems are examples of economic sharing; a filing system and communications link are examples of communications sharing. With sharing, there's also the need for privacy and higher overall reliability for shared parts.

EVOLUTION FROM TSS TO PC CLUSTERS AND NETWORKS

DEC developed Timesharing Systems (TSSs) so that everyone could "apparently" have their own computer which could be operated in an interactive, not batch fashion. We also built single user minis so everyone could have their own computer (e.g., LINC) as the first truly interactive, personal computers ... and then we put timesharing on the larger minis (e.g. TSS8, evolving to RSTS) to get the cost per terminal down. This era covers 1965 to 1980. 1980 to 1990 is likely to be a transition from the shared system to powerful PC's!

In 1977, with good microprocessors, low cost RAM, and small floppies, the Personal Computer (PC) entered the scene as an alternative to some TSS. By simply adding a terminal emulation program, a PC could operate as a dumb terminal (with some nice file access capability like the old Teletype ASR 33) and still be connected to a TSS. YET THE COST IS NOT MUCH MORE THAN A DUMB TERMINAL. WPS78 is a good example of a PC doing word processing (WP) and behaving as a terminal emulator. PC's that only stand alone and use terminal emulators will be a short lived phenomenon, covering only 1975 to 1985, because there is pressure to have PC Networks in order to minimize and localize shared facilities. This is analogous to the growth limits that departmental minis have placed on central mainframes. However, it is possible that PC's with terminal emulators could strengthen central mainframe computing and decrease departmental minis. PC's with terminal emulation and access to central systems will have wide scale home use!

PC Networks will form from economic pressure and sharing needs. Local area networks like Ethernet permit their formation. Thus, by proper design it appears that one can cover a much wider dynamic product range using this approach as compared to our TSS approach. Figure Evolve shows the evolution from Timesharing Systems to Personal Computers with dumb terminal emulation programs to PC Clusters and finally to networks of clusters PC Networks.

A TSS is composed of components that in principle can be broken apart and assigned to individual computers when forming a distributed PC cluster. A cluster is organized around the "distributed server" concept, where one or more computers reside on distinct processors and communicate with one another using a message passing mechanism via the fast, serial local area network link. The components include: the local area network link, the basic "person server", file service, print service (print queue), communications and network service. The scheduling and accounting programs, and of course, the jobs that exist for each person are distributed on the "person server" machines (i.e. the PCs ... which indeed must be capable of operating standalone!).

Each of the system structures provide alternative capabilities as shown in the following table.

TABLE: WHAT TSS, PC'S AND PC CLUSTERS OR NETWORKS PROVIDE

What	Timeshared System	Personal Computer	PC Cluster/ Net
processing	highest peak	lo-med, guaranteed	
programs size	very high peak	small to medium	= PC
filing	large	small, guaranteed (+ off line)	= PC and TSS
communication	network	term. emulation	= PC and TSS
CRT	slow response "glass Teletype"	fast response, screen oriented	= PC = PC
cost	fixed, can go to lowest$/terminal	lowest entry	f(no. of PCs)
secure	shared, public access	totally private	contained/TSS
pros	explicit costs shared programs big jobs	low entry cost "owned" by indiv. security SW publishing = low cost	ability to expand shared facilities better match to org. structure
cons facilities	shared poor response for terminals higher entry security	limited capability,	limited proc but increasing

THE PRODUCT STRATEGY

Provide a set of homogeneous distributed computing system products so a user can interface, store information and compute, without re-programming or extra work from the following computer system sizes and styles:

.as a single user, personal (micro) computer (PC) within a terminal, and evolving to PC Clusters and PC Networks;
.at a small, local shared, departmental (mini) computer system, and
. via a cluster of large central computer(s);
. with interfacing to other systems for real time processing; and
. all interconnected via NI.

VAX/VMS AND NETWORK BASE ENVIRONMENT
Achieve a single VAX-11/VMS, distributed computing architecture by 1985 (as measured by revenue) through:

.homogeneous distributed computing with varying computing styles including high availability and measured ease (economy) of use;
.building new 11 hardware to fill the product space below VAX; i.e. building a significant PC on the 11 with VAX-compatible files and languages so that user software investment is preserved when the ultimate transition from the 11 to VAX occurs;
.having a clear physical bus structure evolution and transition plan;
.and developing VAX, Personal 11, RSTS, M and M+ software for 11-VAX migration and 11 base protection.

Provide 10/20 systems that will co-exist with VAX/VMS through:

.building hardware that runs current 10 and 20 software;
. building VMS co-existence aids and using common components; and
. making market support and DEC-standard language enhancements.

Build and support the PDP-8 for WPS and small business applications until we get PC-11. Invest in application software that will be compatible with the strategy.

Ethernet (NI), which we call DECnet IV, is the backbone of our distributed processing. Aggressively breadboard; then develop it for gateways and concentrators. This forms the basis for the "server" model of computing for the network.

Provide essential IBM network interfaces and help set International standards. These include: Open-systems Interface, and page standards for text and mail.

APPLICATIONS

Provide general applications-level products that run on VMS and if possible layered on RSTS, M, 10 and 20, as a base for direct use, OEM and user programming including (in order):

.word processing, electronic mail, user typesetting and profession-based CRT-oriented calculators for the office and for professions;
.transaction processing, forms management, and data base query;
.management tools for various sized businesses; and
.general libraries, such as PERT, simulation, etc. aimed at many professions that cross many institutions (industry, government, education, home).

Provide specific profession (e.g., electronic engineering, actuarial statistician), industry (e.g., drug distributor, heavy manufacturer) and commercial products as needed by the Product Lines. Select from the wide range of possible languages a small subset for our own applications programming.

USER LEVEL COMPATIBILITY

Define, and make clear statements internally and to our users about programming for DEC distributed computing environment compatibility. Tighten DEC user interface standards for editors, forms management, application terminals, files and data bases, command languages, language dialects (e.g., BASIC), and applications languages.

DEC standards must be industry standards to get the software industry's maximum support.

HARDWARE COMPONENTS

Interconnection

Interconnection hierarchy with software compatibility:

. 0.3-19.2 Khz point to point communication line compatible for direct, dumb terminal;
.10Mhz NI for interconnection at a site and the backbone of the distributed processing structure;
.80 Mhz CI for interconnecting Hydra and 10/20/VAX Clusters (in a room).

Computer Systems

Thin out our basic computers by 11 to VAX transition and by positioning CPU and Mass Storage systems (including PC's) to be a separated at least a factor of 2.5 apart in the price bands. A low cost, high performance processor either alone or in a multiprocessor configuration should cover a system range of up to 3 bands when combined with the appropriate mass storage configurations.

Memories

Cover the wide range of needs:

. solid state modules for low end software in terminals and PC;
. range of components for Personal Computers;
.removeable and low cost disk (Aztec, small Winchesters) for entry-level shared system;
.hi-volume, mid- and hi-end disks in (R80/R81) with (backup);
. high performance controllers;
and HSC-50 controller for Hydra (evolving to file and data base service).

Computing Terminals

Terminals for everyone (in priority):

- .office environment for quality printing, electronic mail, evolving ASAP for needs (and uniqueness); and
- .professional using graphics (and/or color) evolving to handle images with target application software,
- .low cost (dumb) but with ROM programmability for special use

NI and NI-Servers for Both Shared and PC Clusters

The NI and Personal Computers permit the evolution of two kinds of structures: Distributed Processing with functional servers for our central and departmental TSS's; and the basis of PC clusters (in order):

- .intercommunication among all personal and shared systems;
- .real time service for process and experimental equipment i/o;
- . communications concentrators for dumb terminal interconnection to predominantly central sites;
- .communications gateways to IBM, X25, and non-DEC NI nodes, all levels;
- .file service at central and departmental sites for all levels, but predominantly PC's; and
- .printer service at central and departmental sites for all levels, including PC's.

Specific Personal Computer Products

- .aggressively build PC-11 for three environments:
  - .support our past, conventional O/S's on the PC-11 hardware;
  - .as part of the DEC architecture which starts standalone and evolves to a cluster; this system is compatible with a VAX subset for files and programs and implies a different, lower level interface to be successful. THE Terminal interface must evolve beyond our "glass teletype" to include multiple, concurrent windows and processes.

.establish a VAX environment for PC's (including servers) to envelope the PC-11, PC-VAX (i.e., SUVAX) and PC-VAX (Scorpio)

.build, ship, and test a SUVAX to establish PC-VAX and PCC-VAX and to begin to acquire the applications that only VAX can support; and

.aggressively schedule PC-VAX with a 2.5K - 6.25K cost (system with high resolution scope and mass storage) by 1985

Timeline of Critical Technologies

The figure on the next page describes the availability of technology and various systems versus time.

THE FIFTH AND SIXTH COMPUTER TECHNOLOGY GENERATIONS

A computer generation is identified by four concurrent factors:

.the technology on which the machine (hardware and software) is based;
. the emergence of the machine itself;
. the intended need; and
.the actual use (market)...which may turn out to be a new machine (software) defined by users

The Table of Computing Generations lists various landmarks for these factors in both the future and past generations including the three pre-computing generations. Technology generations are now roughly seven years. These generations are driven mainly by semiconductors which evolve exponentially at yearly density factors of 1.6 - 2.0 and are used for processors and primary memory. Secondary memory in the form of magnetic disks evolve nearly as rapidly with factor changes of 1.4 per year. The seventh generation is fuzzy, so for our purposes, we can look at the next two generations 1980-87 and 1987- 1995.

The seven year period between generations will continue on into the future, based primarily on technology, and machines because:

1. Historically benchmark machines and/or computing styles have emerged each seven or eight years.

The personal computer has emerged in the late fourth generation. With local area network communication, clusters and networks of PCs with specialized function servers (e.g. files, computation, communications) will create a drastically new, alternative distributed computer structure forming the fifth generation.

2. Seven years is roughly the time to get a factor of 100 in semiconductor memory density using Moore's law. (Semiconductor memories double in size every year; the number of bits/die = $2^{(t-1962)}$ for experimental circuits. Add 3 years for the circuit in production.) A more conservative model by Faggin has memory density growing at 1.6/year, thus a factor of 100 would take 10 years. The continued increase in density (at least at 1.6x) looks assured.

3. Seven years is roughly two product design and use generations for small systems. For higher cost machines (minis...super), the product periodicity is roughly seven years.

4. Every ten years drastically new use (and then product) segments occur, having at least a factor of ten lower cost. We assume the real cost reductions will continue at this 20%/year, independent of system size. (Faggin's projection is a factor of 10 cost reduction in 8 years or 25%/year. My 1975 model projected from 1972 used 21% and is given in the following table below, even though it might be appropriate to use a more rapidly decreasing rate (e.g., 25%).

TABLE OF COMPUTING GENERATIONS, WITH NEED, USE AND STRUCTURES

GENERATION	HIGH LEVEL NEED	SPECIFIC USE	COMPUTER STRUCTURE
Electro- mechanical 2 p.c. 1890	Mass production & census	accounting	Census & modernComptomet Electric calculator, Hollerith & account- ing machines
Electronic (thermonic) 1 p.c. 1930	Power, highway & communication grids	Engineering calculations & cryptography	Network analyzer, Mark I, Bell Labs calculators, ENIAC, Collosus.
Electronic (magnetic) 1 c. 1945	Defense	War-machine control via tables & real time	EDVAC, EDSAC, IAS, Whirlwind, LGP30, IBM 650, 701, 709, UNIVAC.
Transistors 2 c. 1958	Space & science	Air defense & traffic control; Engineering & science education	TX-0, IBM 7090 Atlas, Stre
Integrated Circuits 3 c. 1966	Transport flow control & welfare	Process control & social accounting, minis	PDP-8, B50 PDP-6, IBM 360, CDC 6600
LSI 4 c. 1972	Economic models & r.t. control	Interactive computing, computers for logic	Intel 4004, 8008, PDP-11 (RSTS), Cray 1
VLSI 5 c. 1980	Productivity	Office (& home) personal computing	Personal Computer Clusters; VAX Homogenets; general purpose robots
ULSI 6 c. communications ~1987	Information & program overload, energy	Knowledge-based processing	Integration into systems and video stand
Electro-	Arts, leisure,	Travel substitute	Global communicat

optical 7 c. ~1995	food & energy crisis.	& environmental management.	of vi

G Bell System Price Model (3/75)

System price ($) per byte of main memory

$= 3 \times 5 \times 8 \times .005 \times .79^{t-1972} \times$ no. of bytes

$= .6 \times .79^{t-1972} \times$ no. of bytes

<u>where</u>

3 is markup (roughly)
5 is fact that about 1/5 of system is primary

memory
8 is 8 bits/byte
.005 is cost of a bit in 1972
.79 is 21% price decline per year for memory
1972 is base year

Some system prices at various time using the GB 3/75 model:

Bytes	Use	1978	1980	1982	Example
1		.146	.091	.057	
8K	Dedicated fixed	1.2K	745	467	TRS
65K (Qbus limit)	1 user interactive	9.6K	5.9K	3.7K	A II/III
256K (Ubus limit)	n user, 1 applic.	28.3K	23.9K	14.9K	11/23
1M	Small, gp. t/s	153K	95.4K	59.8K	Comet
2M (11/70 bus limit)	Mid, gp. t/s	306K	190.8K	119.5K	VAX 780
8M	Large, gp. t/s	1,225K	763K	478K	

5\. Breadboard structures have emerged in the early part of this fifth generation that can be mass produced to fuel the sixth generation. My guess is that this will take on the form of significantly better I/O, storage, and processing of both voice and 2-d images.

6. There is implicit faith that there's an infinite market. This is clearly substantiated using the five year market data projections. A paper, "Limits of Distributed Processing" describes our computing structure environment together with the factors that may limit computing. None of the following factors look insurmountable for continued exponential change.

- technology
- VLSI design and new ideas for designs
- too many standards, especially in communications/networks
- algorithms
- ability to define and supply useful systems
- lack of applications programs (programmers)...perhaps the most serious
- ability for users to get work from systems

DISTRIBUTED PROCESSING AND LIMITS TO ITS GROWTH

A fifth generation computer, can be fabricated on a very large scale integrated circuit (VLSI). Lower cost and increased use disperses computers in a manner analogous to the ubiquitous fractional horsepower motor. Distributed processing to interconnect dispersed computers is essential in order to avoid overloading people with information transmission and translation tasks.

The factors that affect and limit distributed processing are: physical technology and design complexity, ideas for new computer structures, basic tools to build applications, networking and other standards, useful applications, algorithms, and the human interface to the end user. A hierarchical, interconnecting model for distributing processing is based on established central and group level mini-computers, and evolving, personal computers.

DISTRIBUTED PROCESSING

Distributed processing matches computer systems to information processing needs (i.e. processing, memory, switching, transmission and transduction needs) on a geographical or organizational basis, and interconnects individual computers to form a single, integrated network so that related programs can share and transmit data among the computer nodes. The objectives are:

.to allow either local autonomy or central control of the various distributed parts;
.to provide an evolving open-ended system so that the development and installation of the parts can proceed in a quasi-independent fashion;
.to allow purchase and installation of hardware, taking advantage of timely, reduced hardware cost; and
.to build on and communicate with central systems, fully dispersed group-level mini-computer systems, and emerging personal computers.

Distributed processing is inherently hierarchical based on the principles that govern human organizational structures.

In an organization, computers supplement their human, information processing counter-parts. As computers become better matched to people and organizations, and as people and organizations become more familiar with computers, an individual can interact directly with at least one computer and indirectly with group-level computers serving various functions of the organizational hierarchy. The opportunity of more egalitarian access to data provided by distributed processing may led to a change of the large organization from hierarchical to wider, functional matrix structures.

Large organizations need to interconnect the hierarchy of computers for:

.communication among computer with dumb and intelligent terminals using large, central computers;
.organization of central, group and individual sites;
a functional activity such as word processing or order processing; and
.a specialized computer-based function such as archiving, typesetting, message switching, and electronic mail.

FORCES CREATING DISTRIBUTED PROCESSING

Rapid evolution of semiconductor and magnetic recording technologies have forced computers improvements along paths of:

1. constant cost, with increased performance and productivity for evolutionary use;
2. reduced cost, with constant performance permitting new uses commensurate with the lower cost; and
3. higher cost and performance structures permitting radically new applications.

Costs for nearly all other forms of information processing are because they are labor intensive. Traditional storage, processing, and transmission in libraries and postal systems are increasingly soaring. Simple word processing computers that replace typewriters save the time-consuming process of correcting errors. When groups associated with information processing start using computers a positive feedback, learning curve effect begins further increasing computer markets and uses, and lowering costs.

The industry groups supplying these products and services include:

- .computers - mainframe, minicomputers, personal computers and computer services;
- .semiconductors - nearly all LSI components are either memory or a computer processor;
- .communications - conventional voice and data, new packet networks and associated services;
- .television and cable TV - stand-alone use with TV sets (e.g. games, home computers) and as an alternative to conventional communication;
- .office equipment - typewriters, copiers, and mechanical office equipment are increasingly electronic; and
- .control - gears, cams and levers, and mechanisms for control will become electronic, limited only by transducers and sensors.

LIMITS AND PROBLEM AREAS OF DISTRIBUTED PROCESSING

Ultimately all information processing will be computer based. Presently the speed of the evolution is limited by two factors: technical solutions to distributed processing problems and user assimilation.

Physical Technology

Semiconductors and magnetic recording technology provide the basis for cost and performance improvements. Although, extrapolations too far into the future are generally dangerous, the following technological rates of change, based on the past ten years, will continue for at least five years:

TECHNOLOGY (PERFORMANCE)	YEARLY-RATE OF CHANGE FACTOR
semiconductor memory density	2.0

semiconductors, random logic	1.4-1.6
core memory density improvement	1.3
magnetic disk recording density	1.3-1.4
magnetic tape data-rate	1.25
magnetic tape density	1.2

TECHNOLOGY (COST)	YEARLY-RATE OF CHANGE FACTOR
memory price reduction	0.7
computer system cost reduction	0.8
crt terminal cost reduction	0.85
communication cost/bit transmitted reduction	0.9
packaging (cost/vol.) and power (cost/watt)	1.0
communication line cost <u>increase</u>	1.12
paper cost <u>increase</u>	1.12

Semiconductor technology, shared among several buyers groups, eg. consumer, communications, computers, has a faster rate of improvement than other technologies. Slower evolution has occurred in magnetic recording density because there is only one user, the computer industry. Widely used, well developed technologies, such as CRT's, previously improved for the mass television market are scarcely affected by their increasing use in computers. Costs of paper and communication lines increase with inflation.

Physical transducers that sense temperature, pressure and control power flow are slow to evolve, limiting computer use in automotive applications. Even the most widely used computer equipment, such as keyboards, printing devices and communications devices, evolve slowly by comparison with semiconductors.

Complexity of Semiconductor Design

Gordon Moore of Intel, observed that the effort required to design semiconductors has doubled each 2-2/3 years since 1962, when a circuit only took 3 man months. 1979 circuits required 21 man years and 1982 circuits will take about 45 man years. While it is easy to conceive of organizing a team of 7 to complete a design in 3 years, the same time task by 15 people is difficult to imagine. Better management and design partitioning is required in order to avoid a drastic loss of productivity and quality that would increase the design effort even more. With one million circuits on a chip by 1982, new methodologies will be required to fully utilize VLSI's potential.

Because of the concern and numerous approaches being pursued, I am confident that it will only take another two semiconductor generations (six years) to solve the VLSI design complexity problem. Although we do not have a good measure of circuit complexity, a given circuit description is far less complex than the largest programs (e.g. a million bit, or 128 Kbyte program is not especially large).

Ideas About What to Build

New directions in computer structures are difficult to predict by simply looking at conventional machines. Current limiting factors point to needed innovations. Applications involving two dimensional signal processing for pictures appear to require a different processor design, and speech signal analysis requires vector processing. A general purpose processor could emerge from these alternatives for one-and two-dimensional arrays:

- arrays of conventional microprocessors;
- application specific, functional processors;
- bit array processors to operate directly on the array data structures, including arrays, or associative processing;
- processing associated with memory; and
- data flow architectures.

Basic Tools to Build Applications

Coupling knowledgeable user needs to machine development produces more capable, yet harder to understand systems: a paradox in the attempt to build highly capable and easy to use systems. The popularity of the Bell Labs UNIX System is a testimony to a single, consistent, easy to use language, that is described in a small manual. The popularity of APL and BASIC systems can be similarly explained. Although one would expect that additional capabilities (memory) would make the user interface simpler, few good examples are known. The time to build a given application using the multitude of systems/databases/languages is highly variable, indicating a continued lack of understanding of the design process.

Network and Other Standards

Because standards are evolving, the current situation of distributed processing among countries and vendor systems is a disaster. International protocol standards provided by manufacturers (Internets) and by various common carriers for Packetnets which are called by the same name, are fundamentally different and incompatible. Many standards mean no standards.

We must get beyond the simple standards required for Packetnets and Internets to define protocols for passing high level messages, such as electronic mail, among computers. Office based applications, centered around text processing, electronic mail, user typesetting, office processing, and electronic filing, all require significant user level standards. Using only lower level communications protocol standards will cause a combinational explosion of high level protocol changing gateways. This leads to added overhead, extra development, delay, incompatibility, and often, misinterpretation of messages.

In the low priority area of intra-computer architecture, the U. S. Government has standardized on the existing defacto standard, the IBM Channel, as the means of interconnecting mass storage to computers. Unfortunately this act of standardization will limit change into newer systems architectures.

Useful Applications and Distributing Them

Decisions to use the major applications centered around office automation are very complex. Justifying an application generally requires an understanding of both computer systems (beyond that provided by manufacturers) and the organizational structure of individuals and group users. Although electronic mail seems right, measurements of increased productivity, decreased paper flow, better decision-making, efficiency of communication, and the creation of excess communication are hard to make. To my knowledge, they don't exist.

Given that few measures exist to rationalize, simple stand-alone applications, justifying a distributed network becomes a work of art. Tools have only recently become available for a system manager or developer to distribute the database, processing, and intercommunications over several systems. In the specific case of distributed processing for electronic mail, the results are encouraging but a general solution has not yet emerged.

An underlying difficulty of building applications beyond the generic office automation described above exists because problems are solved by patch-work. Usually programmers with computer science (computer engineering) training and a representative of a particular discipline (eg. accounting, mechanical engineering) put a solution together to get something started. This results in sub-optimal designs. In order to use the computer as a component of systems they design, rather than as a simple tool for problem solving, computer science must take on a pure role, like physics, and each of the disciplines take the responsibility for training people and engineering the systems within its own discipline.

Algorithms

There are many cases of the adage: "It is better to work smarter rather than work harder". If always exponentially improving, technology will eventually permit solving a particular problem in a reasonable time, e.g. a 24 hour advanced weather forecast must be solved in less than 24 hours or an exponentially increasing machine population will be required. However, at a given time, algorithms limit when a problem can be solved and whether it is economically feasible.

Human Interface
The interface between the system and the final user is a barrier in the same way that a root system for building applications programs is a barrier to building applications. Adding more functions so that an application will perform better is generally accompanied by increased complexity requiring more documentation and training. The lack of standards at the user interface will limit getting the payoff inherent in a given system or set of systems, and may cause adverse user reaction. For example, word processing, electronic mail and user typesetting systems are all likely to have different syntax, semantics, manuals, training and procedures for dealing with the same text.

A DISTRIBUTED PROCESSING ENVIRONMENT
Proliferation of dispersed computing forces interconnection, hence distributed processing, so that human users don't have to become information carriers and translators between the different systems they use. Communication within and between organizations with common carrier networks is provided via an interconnected hierarchy.

Interconnecting the Components
The three types of computers in a given organization will be connected via high bandwidth links in what may appear to be a hierarchical structure. In addition, clusters may be connected on a fixed basis. The alternative interconnect possibilities are:

.ethernets or rings to interconnect all terminals and computers with specialized terminal concentrators;
.evolution of phone circuit switches using digital techniques for both voice and data;
. packetnet switching; and
.direct interconnection among the computers with routing through each computer.

Central Computers
The top most computers of the hierarchy will evolve from the current, highly central computation facilities. These

machines store most of the data and do most of the computing in today's organizations. Given the difficulty of migrating files and work from these machines, the emphasis within the centers will be interconnection among the machines within each center, creating in the short run, even larger data bases. The tight interconnection among the central computers will also permit trade-offs among cost, reliability, performance, and evolving performance, for a given application or set of applications. In order to get the economy of scale required to support the large human organizations that attend central computers, their functions will have to be specialized (e.g. front ends for handling many communications lines, and back ending for databases and archiving).

Central computing facilities will continue to be operated by large staffs whose emphasis is on knowledge of the operating systems and getting work done using highly specialized facilities such as CODASYL Databases. The casual user will be dependent on the central systems through the applications. Cost will be high for everything except the storage of very large files, where hardware provides an economy of scale. Programming costs at the center have to be the highest, because the facilities are general purpose and applications are most remote from the ultimate user. The role of central facility will be to provide:

.communications among all the other computers within the organization including gateways between various computer and telecommunications vendors;
.   archival file storage;
.unique, sharable facilities such as very high speed computers and printing devices;
.computational functions for the entire organization e.g. electronic mail;
.operation of historical programs and data bases; and
.relatively high cost computing by having to provide generality and service for the worst case.

Group Level Computers

Group level computers are based on the evolution of timeshared and real time minicomputers and cost roughly that of an additional person. Typically these machines support the single function of the group, (eg. order processing, engineering design and data base, laboratory data gathering and analysis, group word processing, single process control) running a single unattended program. Group level computers provide:

- .relatively cost effective storage of the group data base;
- .unique program(s) aligned with function of the group;
- . relatively high performance processing; and
- .cost-effective computing through sharing of a common function and specialization of work.

Personal Level Computers

Personal computers are emerging rapidly, and many believe that they will become the dominant form of computing. Since the only hardware technology for which economy of scale holds is mass storage, and given that all terminals already have embedded computers for control, it is easy to envision adding more primary memory and doing all the computation at the terminal instead of having computation done in any shared facility. A recent, Carnegie-Mellon University personal computer research proposal states:

> "The era of time-sharing is ending. Time-sharing evolved as a way to provide users with the power of a large interactive computer system at a time when such systems were too expensive to dedicate to a single individual...Recent advances in hardware open up new possibilities...high resolution color graphics, 1 mip, 16 Kword, 1 Mbyte primary memory, 100 Mbyte secondary memory, special transducers,...We would expect that by the mid-1980's such systems could be priced around $10,000."

Personal computers provide:

- . personal data bases and security;
- .more, average computing power, with better response time than shared systems;

.needed processing for the computationally intensive tasks like editing, and speech i/o;

. a program creation environment; and

.relatively higher costs than group level computing, unless the task is very specific and well-matched to the system.

Although both the novice and experienced user relish the independence that the personal computer provides, communications and support by the other levels is equally necessary. Given that we are substantially far from such distributed systems, there are surely additional problems, limits, and opportunities that are yet to be forecast.

SUBJECT: APPLE VISIT (AND WHY THEY'RE WINNING)

GB5.49

Wayne Rosing gave me a tour, and I had a nice visit with Steve Jobs.
Wayne left in the summer of 80 and Ken Okin joined him in Sept. 81 to
head the hardware. Wayne is taking over as head of the LISA division.
The whole project is roughly the age of the PRO.

LISA

Would be very proud of it (and happily trade several of our PC's,
their parents and offsprings for it). It is clearly a new generation
based on Xerox PARC's Alto and the STAR (and their designers); and
should achieve the $1B sales they project. All of the first 30 sites
who have the 300 machines have ordered more and one site has ordered

1000!

(We must do at least as well with the VAX PC's in terms of function
and performance; i.e. we simply cannot blow it again -- that is if we
can ever get a project going. We have to be good. It has to be a PC
cluster and it has to network transparently to shared VAXen.)

This version is 80 watts with Apple floppies, backplane with some
components, 3 boards (5Mhz 68,000 Processor plus bitmap video (NO
HARDWARE ASSIST) and 3 ports, 2 memory for 1Mbyte boards). There are
3 option slots (in a different place for customer access) using ZIF
connectors. An encryption chip can be plugged in. The keyboard is
simple and doesn't require an executive size desk (for the executives
who can't type or use computers anyway).

A separate box holds the 5 Mbyte Wini. Several printers are offered
-- all are capable of printing what the computer generates -- unlike
our terminals and PC's (Wayne may have learned what not to do). He's
proud of their low cost to produce Mouse that he insists trying to
make here.

We might expect an integrated version with no extra wini box and a
large file server to emerge. The current Mbyte system has lots of
ways to evolve: color, flush the disk and use a central file server,
use larger rams and bound it, use say 256 Kbytes and paging with the

68020, etc. all of which make it more competitive.

SOFTWARE

The software performance is fine, but they're shooting for x3 speed-up. They simply do not do things (eg. bottom line editing) that will cause a product to look or "feel" bad. The functions (i.e. generic applications) they provide are the key ones. They have a PERT because they built it a year ago to run the project.

The system was written in an extended Pascal except for some low level bit map operations. They have a very nice interface for 3rd party and OEM applications writers.

The mouse operates very smoothly for editing and other functions, although the keyboard can be alternatively used. (A track ball might be even better to avoid needing more desk surface.)

They apparently have a very good algorithm to scale various fonts stored in a canonical size. Work like this has been going on at Xerox. This is non-trivial and represents a real edge.

The project ran a total of 4 years under high pressure, but really

didn't get going until Wayne came on board. The engineering supposedly cost $50M, a bargain (about what we spend on DECmate, and
close to what we spend each year on PRO or on Office).

LISA Division

John Couch hired Wayne who's now going to head the division. John's
going on a brief educational leave to return to run the software business (division?). The wholly self-contained division, complete
with its own bank account, has about 300 -- with 130 engineers (note
hardware and software are together), 100+ in manufacturing start-up
and the rest in marketing. They can make about 50/day in the current
quarters, but are transferring the manufacturing to Dallas -- where
they'll be going to 150/day. Wayne believes the self-contained division enabled them to move rapidly and efficiently. Wayne's taking
all the engineers to Hawaii for a week (at a $250K cost). (DECwest
feels even more autonomous -- and competent!)

The divisional structure does the obvious: dedication to a product
and market; conflict with their sister division and incompatibility
among Apple II, III, LISA and (hopefully) MacIntosh. It's unclear
what Steve Jobs' priorities are: MacIntosh (and his technical ego)
versus Apple (and other products). For our sake hopefully Jobs wins.

They have central sales, and a central manufacturing organization is
evolving. Ken Okin is now concerned that it takes a year to get

something into "volume" production -- not unlike DEC.

Apple-Net

Wayne says it's the "thinking man's Ethernet". 128 taps operates up to 2000', over Twinex at 1Mbit using CSMA/CD. A machine can be up to 100' from the tap. The taps are completely balanced, passive and transformer coupled ala the phone system. This gives them the ultimate in ease of installation and UL.

They have single and quad taps, this makes the simple net very low

cost. The price of a machine port should be $400. They'll license Applenet. They're working on servers. They're providing Ethernet connections via 3COM. They're postured to adapt to the IBM LAN and are "buying out" the SNA interface.

JOBS (and Apple)

Steve Jobs is a young (28) impressive, aggressive, knowledgeable, charming, non-humble engineer who acknowledges few, if any mistakes. Am sure glad we have no one like him. (Ken Okin said he'd even trade me for him.) I met him at a conference on Japanese competition on the weekend.

Steve opened with a question -- "didn't I believe it was too late to
enter the PC market, given that our first three computers were so
dull?" Unphased, I said I didn't think we had an option of not being
good -- whatever that takes, and no matter how long it takes. (Now
what do we do?

The discussion ranged from "post-LISA" to why it was difficult to
engineer their own floppy (i.e. there are no motor engineers; and the
many Japanese companies have many competitive floppy projects before
choosing).

He's most proud of getting to $1B with only 4Kp, and wants to get to
$10K with only 10Kp! He thinks this will require them having 6 very
good products. (Note we have about 5 very good products/systems that
deliver perhaps 80% of the revenue. These carry average and mediocre
components and 500 poor ones.) He espouses building only the best
products and hiring only the best people and having them work in small
teams. He wants nothing to be average, and the way to do this is to
keep things small and manage by results, not large groups and
bureaucracies. This is why they're eliminating the Apple III.

They're building the "world's most automated factory," and he's
shooting for an inventory turn of 16-20 -- enough to beat the Japanese
(at 12), and to better their 7:1.

Bottom Line

LISA looks like about the first PC I really want because it offers capabilities I haven't had in circa 1965 timesharing and their RT/CPM derivatives. Yes, it makes any slides in mixed fonts and graphics at any scale. It's clear we do not have a project aimed at getting such a PC -- nor if we had such a project, it would take at least 2 years to get comparable software. The good news for us is that the 3rd party software world's working on those pieces -- to target LISA, for the 8086 and 68,000. If we move rapidly, can buy and integrate them. (Barry, your job is clear...buy and get us this capability.) It's clear to me the battle's over in the 16-bit space with the 8086 winning it since we never entered it with our protected, vanity PDP-11.

If I had to bet on VAX and MicroVAX in the 32-bit PC space against the 68000 (and its extensions for demand paging to give VAX capability) and the fact that everyone will be building applications for it, I'd want incredible odds because I don't think we even understand there is

a race, where it is or how to enter it.

Today, we're clearly irrelevant to personal computing, except to our existing customers -- where we have 100% market share of a flat and inevitably vanishing market.

SUBJECT: APPLICATIONS PRODUCTS:HOW CAN WE DO THEM?

SITUATION

We're being forced out of the basic systems business by several
factors, including the low business entry cost brought about by
assembling: Winis, monitors, micros, CP/M or UNIX, and published
software. One course is to go into applications...again!

HISTORY (Industry and at DEC-disasters)

With each new generation (1966-1972 all the minicomputer companies
formed because the barrier of requiring circuit design was lifted:
ASI, Beckman, Computer Automation, Data General, (Datacraft, Data
Machines Inc.), ESI, Foxboro, General Automation, HP, Interdata,
Jacquard Systems..., SEL, Standard Computer Corporation, etc. Not
many "made it" and outside of the 11's, no eal standards formed. I
can say that NONE of these contributed to computing, computer
engineering, or very much to its users except heartburn.

Digital's reaction in the late 60's, prior to getting the 11, was to
"go into Applications", with:

Typeset-8 (Henry Burkhardt)
CLINILAB-8

Pulse Height Analyzer (OK, but limited)
Lab-8
Industrial-8
PDP-14 (Alan Ricketts)
Dibol (for building business applications)

More recently, we added:

Word Processing (Dan Bricklin) and Office Automation
Medical
Engineering (Electrical CAD, Structural CAD, Manufacturing (Floor Control)

With the exception of Engineering Application which we bought out, these have ALL been below average.

WHY AND CAN WE LEARN?

Market Pull and the Pseudo Entrepreneur:

Unfortunately, business schools have given what might have been some bright engineers, and others the verbal, and a few analytic skills to "sound-like" entrepreneurs and "business" folks--we often also call this marketing. An instant business is simply based on buying a 1"-2" market survey report, indicating that there may be X who'll pay Y for

Z. Fixed and variable costs are assigned, a given 20% PBT is used and a 2-3 years to get the whole operation started is assumed. A good computer program could write all our business plans--because all it has to do is to appeal to our opportunistic greed.

Unfortunately:

0. Succeeding in applications requires expertise. We have only expertise in building computers!

1. The product is totally absent from the plan.

2. The market/product is inherently the most risky because it's based on having the most market surveys written about it. Possibly it's the largest of various alternatives. Most likely, in a high technology business the real market is just forming somewhere else!

3. Alternatively, it is in an area that's growing rapidly by newly formed company(s) and competent competitors with real expertise.

4. Only pseudo entreprenuers do it: the real entrepreneur wants real risk, real payoff and a real bank(er). None, are present at DEC, except relatively high personal risk. In return here's lots of money to play with.

The Application-ie. the Product and the Engineer:

The engineer is really the key to business (failure) and with the pseudo entrepreneur forms the deadly duo.

Mainstream engineering is demanding, yet paradoxically the most attractive place to be, the project is a fishbowl, peers are tough, and the expectation is perfection. Applications within DEC are non-mainstream, and hence likely to be: invisible outside the particular product/market domain; and because the peers are likely to be few and weak; and totally trusting to their market counterparts because they have little or no understanding of the product domain.
Unfortunately, there's a deadly embrace of what are likely to be two trusting, non-trustworthy souls.

CAN WE DO APPLICATIONS WITH TWO STRIKES AND A WEAK TEAM?

Probably not, based on history and on averages! The original typesetting and WPS were good and state-of-the art because of Henry Burkhart and Dan Bricklin designed and built them.

Since we're determined to keep trying, and in some sense need to

succeed, maybe there are some heuristics:

0. Adhere to "Heuristics on Building Great Products"--as written!
Our opportunistic approach is a clear loss.

1. Ignore all plans for markets that are not based on products - i.e. exactly what a product is, how it'll be used. This automatically throws out the two latest "dreams" for large markets--i.e. the PDP-1400 (the giant, vanishing Industrial Control Market...because U.S. Industry is vanishing and because modern machines are integrated with computers.) and the enormous small-business computer or small business computer market.

2. Buy it! Don't make it from scratch! In DEC's case we have a wonderfully wide spectrum of users. Somewhere, one of our computers is doing a very similar job. This is the secret of the Engineering group's success. No one else has copied their formula!

3. If it must be designed from scratch, get the best engineer who's done it before and "trust" him to lead a small team to do it. "Trust" is earned and clearly demonstrated by lucid specs and a willingness to proceed through clear milestones in an OPEN, inspected fashion. "Trust me and don't bother me (non-inspection)" are the best single indicators of an

incompetent and that project is doomed. Clearly staff the project with real engineers. I'd probably go to the SW Services organization to look for such a person and/or a product.

4. In a new area, design it carefully with some real way to test it. For example, our EMS was tested first on 10's in the ARPA net, migrated to CCA's Comet, and was next implemented on MUMPS in LDP, then applied by DIS. It's been enhanced in the field. DIBS was a similar case.

5. Find some method of using field prototype or example as a means to really define or refine a product. Ideally, use DEC as the guinea pig customer--whether it be a WPS, Mail, voice mail, typesetting, manufacturing system, business system, etc. HP calls this concept "satisfying the needs of the engineer at the next bench". They've also been successful at automating their manufacturing plants and their selling the solution--we do neither! It's very likely that in the 60K people we employee, several need and can test the system.

6. Once there's a product, find someone to help market it! This is not the chicken and egg problem. We covet many markets with no products for them. Rarely do we have great product

that go unmarketed.

BOTTOM LINE

Applications don't appear to be optional for our future products.
Unfortunately, we have no unfair advantage...in fact, everything
including our history indicates high risk.

I don't see how to win.

Any ideas?

Can we discuss at a relevant WOODS?

Subject: **Doing Applications Software in the Field (Australia)**

To: Max Burnet, John Holman, John Jones, John Leng, Si Lyle, Julius Marcus, Larry Portner, Peter Watt, Jerry Witmore	Date: 78 AUG 14 From: Gordon Bell Dept: OOD Loc.: ML12-1 Ext.: 2236

With tight funding in Australia, the VAX at the price is an ideal machine size. There are many qualified programs and programmers here and it would be nice to take advantage of the talent somehow.

John Jones has stated that we are going to be in a bind regarding offset (i.e., where we must spend a certain amount within Australia). I believe software development is a good place as there are talented ESG, EPG and LDP programmers. There are also commercial people. Since the pressure will come through GIS, maybe it all has to be done there. I strongly advocate applications programs versus compilers for our basic languages. Problem oriented languages would be the approach I'd see to spend money wisely.

John may make a proposal, as we still have time before getting the maximum pressure.

If we got such a scheme going, it would solve the problem of discounts. Universities would rather have R and D contracts than discounts, even if they amount to the same thing. They can usually finagle internally to get the contract money back to themselves in the form of cash.

There's a nice portable system called DAEMON for running FORTRAN, BASIC, or COBOL on an 11/04 on a cart at Monash University. It has card reader plus mark sense cards and gives very low cost for student jobs and for RJE to large systems. About 80 have been sold in Australia and surely at least the same number could be sold in Europe. We need a mechanism (here CSS) to get things like this marketed.

In talking with Peter Gray, N.S.W. SWS, he suggests that 6-9 mos. program commitments can be made easily. This could be a buffer in their pre-sales/warranty/PL90 resources allocation.

SUBJECT: RISKS/APPROACHES FOR APPLICATIONS IN 80'S

The Operations Committee has asked me to comment on the above. Currently we seem to be studying, developing, or marketing applications using the following:

1. General purpose, fixed function (e.g. WPS which we fully developed).

2. Generic Business as in DIBS, where the user specifies a few parameters (sold in the store). DIBS was purchased from an OEM, then tested and documented.

3. Vertical Business Applications (e.g. Distribution Control) using parameters to set the particular type and size of the business. Study place under Bill Turner.

4. Vertical fixed function, by developing an application in conjunction with a user, Dentist and Contractor packages under Store's Management.

5. Buying successful vertical packages as we did in the case of DIBS, then testing, documenting, and building training programs around them. Not beign done that I can feel.

There are also the possibilities of:

1. Low cost, mass produced highly specialized small packages developed for high volume hardware by us or a user community.

2. Very high level languages, e.g. MPG to aid productivity so as to make any of the above easier and more feasible.

Ollie, would you convene this group to assess the applicability, component costs (for definition, design, programming, documenting, testing, redesign, courseware, etc.), and risks of the above (and any other) approaches for various types of programs that we are planning to offer?

Please get the group together and then meet with me to scope the work. (Jim may want someone else to attend for him.)

SUBJECT: APPROVAL OF PAPERS FOR VARIOUS PROCEEDINGS

I am to approve two papers for submission to conferences: Ivan Dobes' on CAD associated with MCA (although there is no mention of anything associated with mca); and Bob Hannemnann's on thermal design of the package around mca.

Frankly fellows I'm really pissed because I believe this is not a good idea to publish these papers at this time. Specifically I thought we all decided after the last flap on Comet that we would not publish anything about any of our product related work
until the work came out in a product. Bob's work is especially not publishable by another criteria: the program is not working yet that does the design. Therefore, let me ask that the papers be withdrawn.

Assuming these are good papers that will benefit people who are working with gate arrays (ie our competitiors) and in the design of systems built from ceramic substrates (ie our competitors)
then let me ask some other body who is a little less irrationale than I to look at the matter. Could we get the Engineering committee to review our policy, whatever it currently is, and to
rule on this work. While it is not feasible to meet the current deadlines of these proceedings, they can be published in the next conference (assuming they are publishable). The committee might want to change the current publication policy. Is there

another paper that John Holman is concerned with?

Until the Engineering Committee reviews the policy and these papers
then let me be arbitrary and reiterate what is my probably unwritten
policy: We are not going to publish papers on product or process
that are product related until the product in question is announced.

MCArelated papers particularly bother me because the producti is so
far away in time, and I perceive all we are doing is helping IBM and
the Japanese who are already ahead of us to tune their design processes.

August 17, 1978

Dr. Yugo Araki
Koyoto Sangyo University
KYOTO. JAPAN

Dear Dr. Araki,

Reference is made to Gordon Bell's letter sent to you the first week in August.

Following is the information regarding where the TBM (Terabit Memory) can be obtained:

Zasar Syed
Systems Development Corporation
2500 Colorado Avenue
Santa Monica, Calif. 90406

Telephone Number: 213-829-7511
extension 2336

Sincerely,

Mary Jane Forbes
Secretary to Gordon
Bell

MJF:ljp

I'm honored to have this award for three reasons: First as an engineer in the tradition started by Eckert and Mauchly, second as a founder of the Digital Computer Museum, and third as an author. First, as an engineer I am very proud to have the award, and I have many others to thank for it. Like Eckert and Mauchly, I worked with and built on the work of others. Most computer innovations are not made by one person: As a writer my co-authors, especially Allen Newell, and also Dan Siewiorek, Craig Mudge, John McNamara, and John Grason need to be thanked. As a museum founder, Ken Olsen and Gwen Bell, who is now the President of the Museum Corporation, are important. And as an engineer, the first people to thank are Ken Olsen and Ben Gurley, who were responsible for conceptualizing a commercial computer, the PDP-1, based on their development of the TX-0 and TX-2. I want to acknowledge Ed DeCastro who implemented the PDP-5 and 8, Alan Kotok who worked with me on the PDP-6 for the first timesharing system. Roger Cady and Harold McFarland on carrying ideas for the 11 and although I lead the early design group on VAX, it's really Bill Strecker's work with Bill Demmer leading the development. Dave Cutler was responsible for the design and building of VMS. Many others also contributed.

As a founder of the Digital Computer Museum, this talk gives me a chance to tell you about it.

<>Entrance DCM. When I talk about the Digital Computer Museum, the image in my mind is of the American Museum of Natural History -- where twelve acres are devoted to the collection and study of the natural world. Similarly, the Computer Museum will collect and preserve all computing history for its study and interpretation. Computing is large and important enough to have its own, special, centralized Museum. Science is too large. National, corporate and local museums don't provide good comparative history.

<>Hollerith. The Digital Computer Museum is a public non-profit charitable foundation whose purpose is to preserve the history of all of information processing. That means that you and your organizations can give the Museum equipment and money and receive a full tax deduction. The Museum, in turn, is obligated to preserve artifacts. The collection not only includes computers, but also calculators, memories, links and switches, transducers, controls, and robots, that is the whole range of components that Newell and I outlined in the PMS notation. Already the collection has grown to the extent that we can claim to have the most comprehensive exhibits of the origins and evolution of computers.

<>TI exhibit. Its fitting that I'm speaking in Texas because Texas Instruments was the first outside donor giving us the heart of an ASC and really helped establish an industry wide effort.
<>Another shot. I want to invite all of you to come see the Museum, join the Association so that you can receive its quarterly report, and consider it for a depository of the important papers and artifacts of computing history. (And, by the way maybe this will help me lure Pres Eckert to come and give a Museum Lecture -- He has a standing invitation from us.

<>Computer Generations Cycle. As an author I need a deadline -- like this one. The talk is evolutionary and I hope it will be part of a biographical monograph on Computer Evolution.   Although the examples are historical, I can't claim to be a historian only a biographer. The focus in this talk is the middle of the evolutionary process, that is, the computer engineering needed to implement ideas before they become obsolete.

The revolution started by ENIAC generated this evolutionary cycle. The need for making ballistics calculations started the cycle. This generated resources that allowed a team to integrate technologies into a new machine for satisfying the need. The moment ENIAC started to calculate, it's use set the cycle off again. Users identify new things to do with computers and provide market resources for new machines. Fred Brooks makes this point clearly in THE MYTHICAL MAN-MONTH, stating, "the incompleteness and inconsistencies of our ideas become clear only during implementation." (p.15) If idea generators, and builders aren't involved in use, they won't understand the evolutionary trend enforced by feedbacks. Closing the loop results in computer evolution -- not revolutionary new machine design.

Like all cycles this one has periodicity. New technologies, needs, or uses can trigger a small spurt -- and the coincidence of all three mark a new generation and a branching of the family tree of computers.

<>Light bulbs. Technology provides the base tools from which computers are developed. Inventor's ideas are the bright lights floating between technology and society's dreams. At the dawn of a new generation a number of inventor's concepts converge into a project. Eckert and Mauchley are rightly given the major credit for ENIAC, but Atanasoff's work preceding it is recognized as influential, and their colleagues -- Burks, Sharpless, Goldstein, von Neumann and many others -- also deserve credits. With each generation, the technological floor becomes higher, the user's aspirations rise, and the gap that spurs invention is constant.

<>Generation tree. Computer generations can also be seen as a tree, starting with its roots in scientific and business calculation with ENIAC, a scientific; and UNIVAC, a business, machine. In the second generation, super computers branched from the scientific root and continue on an evolutionary path determined by Seymour Cray. At the same time early scientific and business machines merged into the class of general purpose mainframes ranging in price from 100 thousand to 10 million dollars. Although the idea of the mini, for minimal computer as in the PDP-8 was developed at Digital in the second generation, it flowered as its own branch in the third generation when IC's permitted numerous variants and companies to start. The fourth generation is marked by the branching of the micro processor on a chip. It's too early to see the fifth generation, but either it or the sixth must be identified by a means -- such as ethernet -- for all classes of computers to communicate on a network forming a computing mesh with an interlacing of branches to keep them from collapsing by their own weight.

<>Op rate. During the 400 year, ten generation period from 1600 to 2000, the technological change is roughly a factor of 10**12. Using the product of processing rate and the memory size to measure computing power, then the computer has evolved almost 20 orders of magnitude
<>toes. since stone-based, manual, single register devices for counting supplemented fingers and toes.
<>Generation is marked by. Three ingredients are needed to create a new computer generation: a steady supply of funds, a useable technology, and the machine design.
<>Babbage. Babbage only had the machine design and was destined to work alone because he had no funds.   He tried the patience of government agencies and friends by repeatedly requesting funds without producing results. He always promised the next machine that he had in his mind if only monies were available, even though the technology was not within grasp.
Two of the three is not enough. And having only one of the three -- only the machine design as Babbage had -- dooms a project to failure.

<>Stibitz. George Stibitz at Bell Labs had the funds and was working on the same type ballistics problems as Eckert and Mauchly. He was constrained by the technology of the telephone company; that is to use ... alot of telephone relays. The 1939 machine was the first calculator that could do complex arithmetic and it operated via Teletypes in an interactive fashion. In September 1940, the calculator was demonstrated at a meeting of the American Mathematical Society at Dartmouth. An interface to the teletype designed by S.B. Williams allowed attending mathematicians to transmit problems from Dartmouth for solution by the calculator in New York.

<>BTL2. Bell Labs produced four advanced versions of the machine, and by the mid-fifties this line had died out. Thus, it can be seen that a useable, but traditional technology is inadequate in forming a new generation.

<>ENIAC. ENIAC had all three: Herman Goldstine insured a steady flow of funds from the Army; a variety of technologies, including

<>tubes. vacuum tubes, teletype and card equipment for i/o; magnetic recording in the form of drums; diodes and triodes;

<>flipflop. the Eccles Jordan flip-flop; and switching algebra were available for use under the careful engineering of Pres Eckert, and a new machine design was inspired by John Mauchly.

<>SubProcess. In any machine design, a number of separate, concurrent processes give rise to decision points leading to suspension, continued development, or recycling.

<>Generating a computer structure. Seven processes interact in the evolutionary cycle of a new computer structure. The first process involves defining the problem: understanding the constraints, setting the goals, and determining the objective function of the design. Then, three mutually exclusive decision processes determine the architecture. Selecting the null architecture is calm and peaceful -- not exciting until implementation when almost insurmountable technology problems emerge; choosing an evolutionary architecture that copes with new technology or needs, is like guerrilla warfare -- a few people die on the line and some get caught in the crossfire;   but generating a new architecture means a bloody revolution.

The process of physical design for implementation is concurrent with the architectural design process.

The building process requires complete understanding so that no unplanned side effects occur. The complexity of building computers is so great that even with the greatest care side effects are free. For the lucky designers they're also positive!

The final Process, using the machine, is essential for understanding the next step in evolution and the issues that could lead to revolution. Within the context of the whole cyclical feedback, each process will be considered individually. The process of problem definition sets the constraints, goals and the objective function based on cost, performance and other measureable factors. The physical laws governing materials with respect to electromagnetic energy and heat transfer are obvious constraints. Yet engineers still try to violate them. And we never win.

<>ENIAC plugs. ENIAC was bounded by the reliability of both vacuum tubes and plugboard programming. Mauchly reasoned that even if ENIAC only ran a few minutes it would accomplish more than Bell Labs slow relay machines. It contained 18,000 vacuum tubes each with a predicted 500 hour life. If the machine had been designed using the tubes at capacity, the exponentially increasing repair time would have bootstraped the machine to its death, that is, if it ever lived. Goldstine recorded that by derating the filament and plate only three tube failures occurred per week. The actual failure rate of about one million hours was achieved only by very conservative engineering. Because of the potentially compound problems of tube failure and plugboard connections all problems were run twice to insure accuracy. Franz Alt, commenting on the 40 plugboards and extensive cabling, estimated a five percent utilization rate. Taking into account the amount of time the machine ran, ENIAC was still 25 to 50 times faster than the relay machines. The fact that such a large system ran is a tribute to conservative engineering, mostly on the part of Eckert.

<>Whirlwind. In contrast, Jay Forrester, on the Whirlwind, tackled problems at their source. Concerned with highly reliable, real time computing, he knew that the estimated tube reliability of 500 hours had to be increased by several orders of magnitude. An outside review prodded at the gradual failure mechanism of the tubes and led to marginal checking. By understanding the tube failure mechanism, the manufacturing process, and introducing marginal checking, reliability was raised to five million hours.

<>Von Neumann. In the later forties Von Neumann, determined to build IAS, put his faith in new undeveloped technology for a fast parallel memory promised by RCA. After two years of work on the Selectron tube, with vague but optimistic quarterly reports, not one had worked.

<>Selectron tube photo. Julian Bigelow reports, "No one in the IAS team was sufficiently expert in electron tube design and manufacture to be able to assist it, but in conference with Von Neumann I made an attempt to list the variables which would have to be kept under control to produce a 50% yield of successful selectron tubes, covering a range of digital capacities from the original goal of 4096 digits per tube, down through 2048, 1024, 512, etc. It appeared that...the goal of 4096 per selectron was far too ambitious, and that acceptable production yields might be far sooner attained if the goal were reduced to 128 digits per tube." This 256 bit Selectron finally became available in 1953 for Rand's Johnniac.

What did Von Neumann do for his memory? He sent an expedition to Manchester where Fred Williams had built random access memory tubes with 1,000 bits, each.

<>WW Tube Memory. Jay Forrester did the same. The two Mhz clock and 50 K ips speed using MIT adapted Williams Storage tubes cost $16,000 per month to operate. Impressive, but expensive. Searching for a better solution Jay Forrester started to investigate using magnetic cores.

<>Ceramic Core. At first they used wound magnetic tape Deltamax cores. Then beautifully made, but little understood, ceramic cores were found at Philips. According to Forrester, the manufacturers claimed that they could not be used for storage. Theoretically this was true, but it didn't stop Jay Forrester from trying ceramic cores and succeeding. Forrester commented, "This is an example of where the art was substantially ahead of the theory. Cores worked and could be made by trained ceramicists. Years later scientists understood how and why, but for many years production of ceramic cores was a materials art."

<>Forrester and Core. Forrester did not depend on outside suppliers but started his own experimental development on the core memory. MIT's University Research Corporation did not see fit to patent the core because they considered its commercial applicability would be negligible. Forrester got MIT to patent it, and to his chagrin (and probably many others) kept many patent lawyers in business for years. He stated, "The Patent effort and litigation took about 1000 times the effort of the design. It took six years to convince industry to use the core and then six years to convince them they hadn't invented it." In this case, IBM lost the suit against Forrester and MIT, but they still will not readily admit it. I was recently told that IBM invented the co-incident current core memory; An Wang and Jan Rachjman of RCA also claim invention of the core.

<>Turing. In 1958, I visited Wilkinson, who while working for Turing, designed the Pilot ACE, the prototype of English Electric's Deuce that I had been programming. I told him about a symbolic assembly program that two of us built to optimize instructions in a delay line in conjunction with a backing drum memory providing one of the first one-level memories. He asked me for a benchmark. I compared it with the results using a new program language called Fortran, which he was even more skeptical of. A matrix routine could be coded a factor of 10 faster than the current method of hand allocating, assembling and key punching programs in row binary but still a factor of 4 slower than using Fortran. He said, none of this matters, "I can write any matrix program in machine language in 15 minutes: why should we waste the machine's time in doing it?"

While, I admit that the Turing influence was extreme, after initial funding, most of us still take ourselves as the archetype user.

<>GB and average man. All of us, including myself, want to design computers and languages as if we're the average man. This proves it to you. I'm absolutely average, so I can do it and tell others how to as well. A greater pitfall than designing for yourself, is designing for a proprietary user. Paraphrasing a remark by Charles Wilson of GM: "What's good for General Motors may not be good for anyone else."

<>Photo of PDP-14. I don't know how many of you recognize the PDP-14 for controlling transfer machines. This doesn't mean we shouldn't have built a machine to solve the control problem. The designer should formulate the NEXT problem for the machine, not just the one at hand.

<>Military. The ultimate in vanity architectures are computers built for one of the world's largest organizations, the Defense Department. I've never met ANYONE who admits to being either the designer or specifier. The current Military Computer Family effort is designed to take incredible engineering resources out of circulation, guarantee high prices, and worst of all, insure obsolete equipment. Their Russian counterparts base computer designs on US commercial architectures and probably their implementations. No real benefits will come from building the MCF VANITY architecture.

<>Generating #1. While need orients designs and generates resources; as the sole constraint, exact need is detrimental to progress. Standards represent the ultimate in constraints. Getting the right standards at the right time is essential for widespread implementation. If a defacto standard exists, such as the IBM channel and Unibus, let it be. If a standard is needed, then go all out to create it so that others can avoid the hassle of having to invent in an area that will generally make work. Alternatively anarchy can reign until IBM makes an ad hoc decision, and then it can be accepted in a de facto fashion and we can all try to implement it.

The ultimate in standards is implementing a computer based on an existing architecture; this is the null architecture design process.

<>EDSAC. Maurice Wilkes, who took the 1946 summer course on the ENIAC and EDVAC at the Moore School, returned to Cambridge University and built and programmed the EDSAC. This first, full scale operational stored program computer, was based on a simplified version of the EDVAC and IAS. In 1949, only one month after EDSAC was operational, Maurice Wilkes perceived the value of a series of computers sharing the same instruction set. He stated, "When a machine was finished, and a number of subroutines were in use, the order code could not be altered without causing a good deal of trouble. There

would be almost as much capital sunk in the library of subroutines as the machine itself, and builders of new machines in the future might wish to make use of the same order code as an existing machine in order that the subroutines could be taken over without modification."

<>EDSAC or Maurice. This advice is even more applicable today than it was then and must constantly be reiterated to us all! In a recent editorial in Computer Design, the editor in chief commented: "the microprocessor revolution ... has more or less stiffled CPU architects except for those involved in mainframe and military or highly specialized system. ... the upswing in 16-bit microprocessor chips is again going to put somewhat of a crimp in architectural innovation... The real renaissance in smaller cpu architectures is just within grasp as the VLSI gate array moves into the realm of the smaller computer manufacturer ... Once again the CPU architect can return to innovations in internal cpu structures." I couldn't disagree more.

New architecture, particularly hardware architecture, should be the last resort because it is the beginning of what is fundamentally a six or seven stage work amplifier.

Given that I've introduced null architecture, building successor machines that are compatible with or built on the past, I feel duty bound to state a lesson that RCA ignored and the Japanese eventually learned.

If you copy a machine, do it exactly -- not just closely. The test has to be that the software, including all user data and files can't know the difference between the original and the copy. Furthermore, if there is a desire to attract, and then entrap, a given set of users to your machine (or language), then build it with extensions that other machines don't have, and that your users will feel duty-bound to use.

<>Fortran. When no process for standardization exists then a plethora of language dialects develop like Fortran V, stemming from Fortran IV. Similarly, the designer of the 8080 added instructions to the architecture and created the Z80, insuring two architectures, and the attendant waste, when one was adequate. At least the Z80's a superset.

On the other hand, conservative users and manufacturers want to preserve their economic and emotional investments as long as they can. Enticed by a user base, almost every company produces one too many of a given machine design.

<>Hollerith. The card which was the savior of the 1890 census became so tied to some corporations approach to computing that they could see no alternative methods for input or output. When the 80 column card was on the way out, true believers in card computing evolved a 132 column card. This too was an expensive evolution requiring new equipment. This dinosaur, a large beast created on a small bone structure (or architecture) was created just when the technology should have been let go.

<>Generating #3. The key is to know which machine is one too many, -- to question whether the bone structure will support the architecture -- and if the limits are close, don't build it. Compatibility extends life in the process of evolving an architecture.

<>abacus. The original Chinese abacus represents up to 15 in a digit with a combination of 5 and 2 beads. It is the bi-quinary system we invented several times.

<>SOROBAN. Ultimately the Japanese refined the abacus, first using 5 and 1, and then 4 and 1 beads for lower cost and

faster operation while not radically affecting the installed base.

<>soroban/calc. This 1979 calculator/soroban is ideal in several ways: low cost storage of a second number is provided; simple operations can be done traditionally and more rapidly on the soroban; users can be gradually trained on the new machine without losing any traditional computational capability; the market is larger; and a culture is preserved.

<>Core. And like the core memory, the idea is so good that many claim the invention.

<>PDP-1 and 4. One of the earliest computers I worked on was the PDP-1, an 18-bit computer, grandchild of Whirlwind and a direct descendant of the TX-0. None of us thought of using the Whirlwind ISP because we needed 2 more than the 16 bits of Whirlwind. Both Whirlwind and TX-0 had excellent system software. Then with the design of the great grandchild, PDP4, to tune the implementation exactly to the architecture saving at most 10% over the PDP-1, I introduced a further ISP and switched to two's complement. Thus, in a family tree of 4, three architectures were probably unnecessary. The world ended up being modulo 8 bits anyway, just as in the original Whirlwind. Perhaps an even greater sin was committed by Computer Controls Corporation because they changed the name PDP to DDP and added a bit to the PDP-1 to come out with the DDP 19. They only sold a half dozen.
<>12 bit. The history of 12-bit computers is similar. The architectural differences of the CDC 160, the LINC, PDP-5 and 8, the 6600 and 7600 ppu's, and those of Honeywell and SDS whose names I forget weren't significant. If we had all copied the 160 the implementations could have remained unique.

<>PDP-5. Computer architects and their implementers who did not make either exact or evolutionary copies of a predecessor machine have cost the entire industry unaccountable billions. In the second generation all that a number of our architectures provided were noncompatible versions of Whirlwind and the 160.
<>Generating #4. New architectures are needed for new forms of computing. Obsolete computers are characterized by inadequate bone structures for coping with different, more modern environments. Several companies who tried to go into business by buying up a bunch of old computer designs, had no chance of high growth. They were self-limited by existing conservative users of these machines. Growing by user base acquistion is like trying to get fat eating tapeworms.

High growth comes from the new architecture of new organizations like Apple, or converting to the VAX base at Digital. But, believe me, when you're dealing with an existing organization with a set of happy and content users, suggesting change, and implementing it, is difficult, but critical, for success.

Now that we've looked at both null architecture and architectural evolution processes, what will the architecture of a revolutionary machine look like?

<>Thomas arithmometer. At the beginning every new structure appears to be quite complex. When Thomas and successors manufactured a calculator, the machine appeared to be very complicated to scientists used to simple slide rules with two moving parts. In 1849, SCIENTIFIC AMERICAN wrote, the Thomas machine "is said to be one of the most astonishing pieces of mechanism that has ever been invented, but to our view, its complexity shows its defectability."

<>Millionaire. Subsequent manufacturers evolved the machine and continued to make and sell them into the twentieth century.

<>Deuce Drum. In 1957, when I saw a moving head drum on the DEUCE computer, I was awestruck. Two independent 16 track read and write heads were used to select 1 of 256 tracks. The control was via a potentiameter sense in an open loop fashion. The complexity was beyond my imagination. I was biassed because my program also turned out to be the best diagnostic.

<>CDC 6600 refrigerators. When Cray's 6600 was introduced in 1964, the refrigerators in each quadrant seemed to create a complex maze of plumbing. But it's really a simple and natural method after its understood. With the high power densities, a built in refrigerator is the best way to cool a computer.

<>Generating #5. The principles of design help in understanding essential versus non-essential complexity both in architecture and it's implementation.

<>Communications Poster. In 1968, Melvin Conway hypothesized that organizations are constrained to produce designs that copy the communications structures of their own organization. This tells us why n people may create an n pass compiler, or why several strong persons will partition a design into separate functional units.

<>Dupont. One of our customers conceptualized their need for interconnection as nearly total communication among nodes.

<>First level of the tree. Yet, when the network was designed the thoughts, like the organization turned to a three level tree, the first level of which is shown here.

<>IBM telecommunications tree. This explains the difference why SNA,

<>ARPA network. ARPA-net,

<>Dec net. and DEC's approach to networking is different.

<>Unibus. With the Unibus each computer component operates to a well defined protocol and can be developed and evolved independently of any other. Hierarchy is imposed by use and convention, not by structure. In this way various groups inside and outside of DEC could build components to a common protocol. This is also why the structure was copied by all micros.

<>Ethernet. Ethernet, a direct evolution of the Unibus, ties computers together in a local area without dependence on central networking functions, central power, or on a particular node.
<>IBM 360. The IBM 360 may mirror IBM. Memory is the focus for all work and the single central processor controls all significant decisions in the 360. This authoritarian top down structure has fat but not very smart subordinates doing the i/o.
<>CDC 6600. In the Cray computers, everything is oriented around a single, very high performance processor at the center. Unlike the IBM approach, the peripheral computers operate effectively autonomous.

Keep in mind that we've looked at some very good designs. Now consider what Watts, the Father of Radar said: "Designers always build the 3rd best system. The First is ideal and the Second best takes too long." Clearly guidelines are needed to avoid building the 4th best.

<>Wilkinson quote. Jim Wilkinson tells how Turing's obsession with building the highest speed machine was kept in line: "in deciding whether or not a feature should be included, the question we asked ourselves was, could we do without it?" This can be translated into Keep It Simple, Stupid.

<>Hoare quote. Tony Hoare's statement can be reduced to three design criteria: 1) exclude what you can, 2) only include what you know and 3) since a machine never diminishes over time, allow for growth - don't build to it's limits.

<>Cost per gate. Increasing memory sizes based on continually decreasing cost insure that users will demand extensible machines. Every 3 years another bit is needed to address the memory. Lack of understanding of this phenomena has been the fatal flaw in nearly every design since 1950. Most designs cannot be extended gracefully more than once.

Large committees usually violate principles of simplicity, in fact guarantee complications. A corollary of KISS, for Keep It Simple, Stupid might be coined KICC, or Kill It by Complexity and Committees. ADA, as it is proceeding; and Algol 68 are good examples of KICC.

<>Wheel of complexity. The wheel of complexity starts with naivete, or extreme simplicity, usually as a reaction to too much generality. No one of us ever wants to introduce unnecessary complexity. But one person's simplicity can be another's complexity.

<>Simplicity. For whom is it simple? The conceptualizer, or architect? The person who has to implement the machine? The person who has to write the compiler? or the ultimate user of a system? The hardware stack mechanism, the theme of various machines, is simple for only one small part of the compiler writer. For everyone else, this extreme simplicity can easily result in comlexity.

<>Bowmar & HP. Don't get me wrong, stacks are great but I believe they have limits; I've always put in hardware to support them. If stacks are the central theme of an architecture, they can a create complex implementation that runs slow. The system programmer will have a complicated problem because there's too much bound in hardware. Stacks usually have little or no effect on the ultimate user.

<>Elegance. True simplicity is pure elegance. One of our engineers says elegance occurs when Every feature contributes 2 benefits; every working part has to do double duty, insuring that excess is left out. Building architects say Less is more.

<>Comptometer Keys. Note how complement arithmetic on a Comptometer allows every digit to represent one of two numbers.   Thus, the user had to do the complementation and was reminded of it by having the digit and its complement written on the keys.

<>Comptometer Ad. A trained operator could do addition and subtraction faster than on machines with complentation mechanisms.

<>Burroughs. Burroughs original calculators that used sign magnitude were more complicated and thus more costly to maintain. Their physical elegance and simpler operation insured their appearance on bank manager's desks.

<>Burroughs copy. Burroughs then copied Comptometers to get the elegance of operation through simpler, faster and thus cheaper mechanisms.

<>Generality. The highest leveled elegance, generality, may increase complexity somewhere in the system. The best example is the general purpose stored program computer. Eckert commented on the how the stored program concept came about. Various priced memories were available such as Williams tubes, delay lines and drums. Von Neumann coined the phrase "memory hierarchy". The ENIAC team speculated that it would be very difficult to determine how much memory should be available for various kinds of data, functions and programs. This led to the notion of a common memory pool and the computer which we all know and love.

<>ENIAC. The ENIAC was elegant. Nearly all of its parts could be used for two purposes: multiple accumulators carried out arithmetic in parallel and were temporary memory; the function tables, originally used for storing constants and functions, ultimately stored sequences of a program; and the relay buffers for i/o were also fast access memory; the calculator as a whole was ready for generality, or the exploitation of elegance.

In my own case, I've gone for generality, three times but I'll only talk about the general register.

<>Table of General registers use. Strachey invented the notion of general registers for the Pegasus in 1956. In the sixties the 635 and 3600 were evolutionary 1 address, 1 accumulator machines. Then, the Univac 1107 was first with relatively general registers, and the 6600, 360 and PDP-6 all used them. The 6 provided the most generality for use. Now, nearly all machines have a large number of general registers.

<>Trickery. Three pitfalls may be associated with extreme generality: trickery, loss in performance, and impracticality. One example of trickery is the concept of operator overload by allowing redefinition of operators. Multics and the IBM 360/67 TSS were the second system reaction to CTSS, written for the 7090. In Multics' case, while it appears elegant to have files mapped into memory, thereby extending primary memory generality to yet another function, and hence increasing generality, loss of performance resulted.   The reaction to Multics done jointly at MIT and Bell Labs, and to IBM's TSS was back to simplicity with Unix at Bell Labs, and CP/CMS at IBM.

The last pitfall of increasing generality is caused by using every known idea. Stretch used and pioneered many ideas: The simpler 360 was a reaction.

Trying to use all the new ideas around in one design is often fatal. Huffman coding to have the fewest bits conflicts with simple ISP's that usually require longer strings to express a program. RISC can be carried too far if the data types the programs use aren't included. The notion of not having interrupts because they interfere with reliable software may conflict with building a real time system. Predication of multiprocessors conflict with lowest cost. Building a wholly distributed system on a local area network may conflict with cost, performance and reliablity. Very secure or very reliable systems can conflict with, easy and shared access to data.

<>PDP1. The reduced instruction set computers is a reaction to the complexity that occurs because so many data types are bound in the architecture because microcode looks so cheap. With RISC, the idea is to get back to a machine that perhaps has NO microcode, a return to the simple machine all built in hardware, like Seymour Cray always builds. It runs fast and the complexity is in the compiler and for fast machines, in the implementation.

Whether the instruction set is large or small, we should remind ourselves that an instruction set of some sort must be bound versus building the fully general purpose microprogrammed interpreter that's always looked so enticing. Recall the slowness and expense of several machines built about 1975 that allowed binding to the bit for the ultimate in generality. Papers, academic acclaim, and the talks about them reminded me of the trickery of the snake oil salesman because they could do everything. They could if you had enough money and could wait long enough. Decide exactly what's to be executed and then encode the machine to do it. It probably can not do everything well.

<>Generating #6. Let's turn our attention from design of the architecture and implementation to building, the sixth of the seven subprocesses of generating a computer. Carver Mead argues for the tall, thin man, a person who understands all parts of chip design including architecture. I'd like the individual to be even taller including the design of the operating software and then applications. If at all possible, don't separate architecture and implementation at least more than a few feet. The single designer is better still: Pascal is the sole product of Wirth.

<>7600. Cray is the only one person who architects, implements and then designs and builds the software. For the last 20 years, he has built the highest performance computers and provided a catalog of ideas to use in other computers.

Small groups are not only essential for design, but all segmentation has to be kept to minimum. The greater the division the larger the time and segmentation. This is how we get n pass compliers when one should do, separation of operating system and language, partitioning of the secondary memory into blocks, records, files, data managment, and database languages.

Segmentation may be necessary to build large systems quickly and to get the right disciplines applied to the right level. Make it work for you, otherwise the reverse is to have everyone always working with and redesigning the lower level components and not the overall system.

<>vax. In the case of VAX, DEC started with a small architecture task force consisting of the most talented people we could find who kept the architecture, documented it, built the first machine and wrote the base software for it. If this was second best to having a single individual do it, it was the only humanly feasible way to get to the market fast. The designers were all experienced in design and had all warmed up on other computers, operating systems and languages.

<4004 ad>. Ted Hoff and Bob Noyce wrote about the small team effort for first microprocessor. The 4004 was designed to be useful in a calculator, yet was not constrained to be only used to build calculators. MOS technology enabled several thousand gates to be placed on a chip. Ted's first experience was the PDP-8, and he knew the power of the minimal computer. Without this knowledge of minimal, general purpose computers, or had Ted only used a 360 or Fortran, the micro might have been invented several years later. Here, function, (the computer) follows form (the chip).

Brooks make a statement about segmenting the technical direction from adminstration. He says, a man with strong management and strong technical talent is rarely found. "Thinkers are rare; doers are rarer; thinker-doers are rarest." Musashi tells us to understand the way of the carpenter as both architect and builder.
<>Distributed. My own role is now that of a foreman carpenter or perhaps a city planner and developer. I worry about the architecture of the set of buildings and how they relate to one another, together with where the roads go. Architecture of Networks and Local Area Networks in particular are extremely important. Rome's streets, viaducts and sewers have been permanent, although great architectural changes have occurred.

Base the design on a small set of well defined components. If all the designers have done their jobs properly, then the set of components from which one builds a system will be elegant, yet complete. In this way, higher levels can be aggregated quickly because the behavior of each part is well defined. The Cray 1 was built from 2 IC types. The chips that never get completely finished are usually filled with circuit tricks, which aren't enumerated or understood.

<>Kludge. The super kludges come from committees because they usually contain no designers of any kind. Designers are typically doers and not committee goers. A large committee occasionally produces a useful design, such as Cobol, because the committee can get commitment from its constituents.

The three rules I'd like to see for people who attend committee meetings: 1. the attendees should have implemented something; 2. a proposed protocol or standard should be in operation somewhere, and; 3. the committee members are responsible for building what they design!

<>Babbage. Don't be so ego-centric that you can't borrow ideas and technology. Babbage himself freely used ideas of others. The Jacquard card-driven loom gave him inspiration for program storage sequencing machine control.

<>Jacquard loom. Jacquard only made a minor tweak on Bouchon's card controlled loom.

<>Early Computer. If the Computer Pioneers would have used each others ideas more then the computer revolution might have happened faster. The Harvard MARK I could have used relay technology and some of the design techniques developed for the Bell Labs machines; Bell Labs and ENIAC could have used some control mechanisms of MARK I avoiding the large tube counts.

<Atanasoff drum>. Having received the ideas, be gratuitous about crediting everyone who contributed. The ENIAC and Regenerative Memory patent claims of Eckert and Mauchly were so broad that they could not be enforced. Atanasoff's early capacitor drum memory, using regeneration, is the basis of most all primary memory schemes.

<>PDP-6 bit slice. Borrowing, can help avoid changing everthing at once. I learned this the hard way in designing the PDP-6 about 1964. This bit slice module is my memento. We thought we could change everything: that there would be little risk in doubling the circuit speed; or using a mechanical packaging technique placing connectors on both the front and back of the modules in order to get the requisite numbers of pins; specifying a new architecture with a megabyte address when everyone else was at most 256K; organizing a flexible structure that would permit building a large multi-processor in an evolutionary fashion so that we could build subsequent machines on the same base; presenting a straight forward interface which as a side effect probably started the whole idea of third party vendors at Stanford, and; predicating the design on timesharing -- a concept that was just being breadboarded at BBN, MIT, Stanford, and SDC.
<>PDP-6. Only 20 PDP 6s were made and several are still in service. The team stayed together and gained experience for the PDP 10. I would have hated to say to customers at the time that we were selling them an advanced development effort for our own, and others, interactive computing. Thinking of the 6 as a breadboard, probably the main mistake was not changing the packaging more to allow automatic wirewrapping. As a side effect, wirewrapping then allowed computers to be mass-produced and not handcrafted. This was one key to the minicomputer population explosion.

<>Generating #7. The cycle includes using the machine -- something I've always wanted to have more time to do.

<>Whirlwind use. Generality allows systems to be used for some different purposes than those intended. Whirlwind was built to demonstrate the SAGE air defense system, the forerunner of modern air traffic control. In addition, Whirlwind was used for at least two purposes not conceived in its design but that fell out of it: the first computer speech research and Linvill's work on digital control.

<>WW. Forrester was interested in sound engineering practices, stating, "Experimental equipment, merely for demonstration of principle and without inherent possibility of transformation to designs of value to others, does not meet the principle of systems engineering." MIT never got into the computer business -- but the Whirlwind did provide many businesses with proven designs and trained engineers.

<>WW Module. The Whirlwind modules were taken verbatim by Burroughs and by ERA for the 1101, and the machine itself was built by IBM to serve the SAGE system. ENIAC was the breadboard for the UNIVAC machines. These real, engineered efforts at universities were significant spurs to American industry, the economy, and computing.

<>WW. Forrester not only realized computers should be used but that understanding and training about a revolutionary new device requires the device. Can you conceive of universities without the computer? In 1948 that was the case. Forrester argued: "If a high speed computer capable of 1 to 20 thousand instructions per second were sitting here today, it would be nearly two years before the machines were in effective and efficient operation. ... this represents one-half of the viscious cycle in which an adequate national interest in computer training cannot be developed until the equipment is actually available." I believe this two year period should be called the Forrester constant.

The problem is still here. The 1979 Feldman report argued for funding experimental computer science equipment. Universities still need more computing power for training tomorrow's pioneers.

<>Fortran. Perhaps the overwhelming reason to use computers before you build them is that Hardware follows Software. Nearly all mechanisms that appear in computer hardware structures start with software implementations. John Backus of IBM tells the story on the introduction of floating point. He observed that many customers were running their 701s with a floating-point interpreter, slowing the machine to 50 multiplications were second. He tried to get the engineers to include floating point hardware, but they were more interested in speeding up the drum. He then created, "The most incredible design for building floating point into the 704." It involved adding four or five new registers, which was unheard of in those days. At the next meeting of the engineering design committee, he remembers, "I stood up and spent an hour describing my insane design and people listened. At the next meeting Gene Amdahl got up and said, 'Backus, you're an absolute idiot; you can build in floating point without adding any registers at all to the computer, and it will cost almost nothing, and here's how to do it.' And that's how it happened."

<>Fortran marked..

On occasion, software may follow hardware. This is rare and often wrong. The first Fortran had instructions to manipulate the sense lights, sense switches and tape of the 704. Also, the DO loop was oriented to the index register instructions. Some of these primitives have stayed with us, but most were dropped. All the algorithmic languages should have been extended to handle vectors and arrays. Had this happened, we would have these operators in machines. The Cray 1 is causing this extension so that software is following hardware.

<>Drafting. Finally, use it and describe it so it can be evolved. Go around again. Those who build machines say it's like playing Pinball.

<>Pencils. The reward of building the machine is to build the next machine. No matter how good a design is the next one can always be better as Pentel, has shown in their evolution of the homely, but important pencil.

Bill Johnson, ML3-5/H33
Bill Keating, ML12-3/A62
Larry Portner, ML12-3/A62

follow up 4/30/79

Following our discussion today, I believe it is necessary to get the above architectural effort in place quickly. This effort should connect into the corporate architecture, especially as it relates to interconnecting with other, larger computer systems. The goal will be the documentation and control of various interfaces within terminals and small systems such that they can fit within the overall Corporate Product Strategy. The need, I believe comes from pressure to have a number of point products which are both technology and market driven, while at the same time being responsive to the strategy, compatible with the past, and not requiring inordinate software to support the new features.

<u>Terminals Architecture</u>
In the terminals area, I believe the architectural control problem is roughly proportional to the number of terminals raised to the <u>fourth</u> power, but more exactly, the number of unique terminal systems is potentially:

the number of basic terminal types (e.g., LA34, VT100, VT100W) <u>times</u>
the number of specific, functional variations (implemented in either ROM software, or specific hardware such as the TU58) <u>times</u>
the number of specific hardware line interfaces (e.g., 20ma, EIA) <u>times</u>
the number of specific line protocols (e.g., ASCII, DDCMP, x25, SDLC).

Note, the hardware interfaces include all the modem, auto dial, auto answer variations, etc.

Given the situation above, there is no evidence that we have any method of handling the design, verifying the correctness of the programs and hardware, and generally responding to the potential demand that is implicit in the base. If we don't understand this yet as a problem, can I refresh our collective memories as to the nebulous system responsibility when DCG offered a buffered LA36, with integral modem and editing line interface. (In this case there wasn't even a significant line protocol involved.)

Small Systems Architecture

There is a similar, but larger, problem here surrounding options at the Qbus, it's evolution, and next generations. There are in turn variations at the various box, and packaged systems levels. Although I shudder to attempt to formulate it, I believe the potential variations are larger than the terminal variations. Can the two of you get together and formulate this?

When can I have a name?

D I G I T A L INTEROFFICE MEMORANDUM

DIST: Dick Clayton ML12-2/E71 Bruce Delagi MR2-1/M64
Sam Fuller TW/A08 Bill Johnson ML3-5/H33
Bill Keating ML12-3/A62 Larry Portner ML12-3/A62

The Archivist/Registrar processes, files and documents all papers, manuals, books, audio and video tapes, photographs and other artifactual maerials.

The collections are processed by computer company and are then separated into series based on the individual computers reproduced and then by the manuals, prospecti. These materials are stored in acid-free folders, obtained from either Conservation Resources International, Inc. in Alexandria, VA or University Products in Holyoke, MA. If the volume is too thick for one folder they are divided at a convenient point into two or three or more folders. The folders are labeled as follows:

Company name/computer name or number/any subdivision within the company/title of the material in the folder, volume # (folder number if the material is in more than one folder, e.g. I or II/
year

If the year, month, and day are needed or the material covers a span of time the date is as follows: year, month, day - month, day, year.

The box and folder numbers are not on each folder because

these collections
may not be complete and should be kept fluid. Having the box listings on a floppy permits the archivist to move the box number along the list to match any additions to or deletions from the collections. By keeping the box list up to date there should be no problem about materials not being in their proper location.

The folders are stored in acid-free boxes. The contents of each box (and folders within) are listed on floppy ARCBOX. At the beginning of each list is the following information which is listed in the abbreviation library <ar>:

COLLECTION NAME (in caps)

<id> AR + number
<na> Company name and collection name
<so> Source (if applicable)
<hw> How acquired (if applicable)
<lo> Location (range/section/shelf e.g. I/A/1)
<rf> Reference - X, XD, D, and B list numbers
<ph> Photograph catalog numbers
<at> Audio tape catalog numbers
< >

The box number is at the left margin. The first tab is the computer name
or number. A new line is begun at a different tab for each of the categories listed between //'s above. Therefore, the whole box list is in outline form. Each collection is a distinct document on the floppy. In this way anyone can access any collection directly.

The catalog numbers from X, XD, D, and B lists which applied to the Archives collections are entered in the <rf> field. The Archives catalog numbers are entered under <rf> on the above lists. These cross references will eventually allow retrieval of all information in the Museum on a given artifact.

Indexes have been developed for the current box list. One is an alphabetical list by company or collection name which includes the catalog number, the location, and the number of boxes in the collection. The other index is a numerical list by the catalog number which includes the company or collection number, the location, and the number of boxes.

In the storage room, the collections are located by Range (wall location), Section (within Range) and Shelf (e.g. I/A/1)

Periodicals are stored in acid-free boxes by Name and Volume # or Date.

AUDIO AND VIDEO TAPES

The audio tape catalog file is on the AUDTAP floppy. The fields in the catalog form can be called up with GOLD, Abbrev. at and include:

<id> AT + # + year
<na> Name of speaker
<ti> Title of the talk
<da> Date the talk was given
<se> Series (i.e. Pioneer Lecture, Bits & Bites)
<cp> Number of copies of the tape
<tr> Transcript status
<rs> What restrictions exist if any
<lo> Location
<rf> References (to other collections in the Museum)
<lt> Length of the tape or the talk
<bl> Blurb

The AT refers to Audio Tape, and VT refers to Video Tape. Nothing has been
done yet with video tapes.

Future projects include transcribing all audio tapes.

In connection with tapes are two forms sent to speakers at the Museum once the transcript has been completed:

Letter to the speaker with which is enclosed a transcript of the talk and

Permission form for the use of material in the talk in Museum publications.

March 16, 1979

Mr. Michael Sleppin
National Sales Manager
Argus International
Hopewell, New Jersey 08525

Dear Mr. Sleppin:

We received your letter dated February 9, 1979 regarding Argus equipment. It is unfortunate that the information passed on to you was taken out of context. It has been stated in the past that your equipment has design features that do not meet Digital's requirements. Digital is always seeking and looking at new technology; further, it is our policy to be fair to all suppliers.

Digital is willing, at your convenience, to plan a review of your equipment at our Acton Plant. If you wish, please contact Don Pucci, Printed Circuit Board Engineering Group, or Dick Rhodes, Capital Equipment, Purchasing Department, to discuss arranging your meeting.

Respectfully,

Gordon Bell
Vice President,
Engineering

Dr. Elliot Levinthal
Director of Defense Sciences
ARPA

cc: Bob Kahn and Bob Cooper, at ARPA (@ISI)

ARPA/LEVINTHAL GB3.S8.3

I would like to encourage ARPA to stimulate the availability of suitable, high speed circuitry such as Gallium Arsenide, HEMT of Josephson Junction. We desperately need these chips in order to build competitive, high speed machines during the foreseeable future. The Japanese Super Computer effort is directed at evaluating these three technologies, followed by a choice which would direct production at one of the circuit types. Also, I believe that the Japanese have already moved to put GaAs circuits into manufacture for their next generation supercomputers.

Ultimately, it may not be necessary to have this lower density high speed circuit type (some researchers believe that HEMT will be of the same density as CMOS) either because CMOS technology is made sufficiently fast or that we can organize large arrays of relatively high speed microprocessors to work on a single problem.

ARPA could encourage a good, supply that would serve both industrial AND military needs. Let me encourage you to select a vendor who has experience in high speed circuitry and who could be an indsutrial supplier (TI, Motorola, Fairchild, AMD, National would all be fine). I don't believe it would be worthwhile to select a standard military only house who is only interested in a cost plus supply arrangement, because I doubt if you'll ever get the chips and I know we then will have to buy chips from Japan.

Sincerely,

Gordon Bell

SUBJECT: GETTING ARPA HELP IN H/S SEMIS

Note from Elliot Levinthal

"Gordon

We (ARPA/DEC) need to find a schema that brings together the somewhat disparate goals and risk taking progrensities of

a) the computer industry
b) the commercial chip suppliers
c) the DOD system supplier
d) the DOD

The DOD cannot address directly the nation's problems as represented by the needs of a) & b). We also cannot support the needs of a) & b) in the hope that they would then respond to needs of c) & d).

We would be responsive to proposals from members of a) & b) (perhaps best jointly from a team with a member from each group) that addresses the needs of c) & d) and at the same time meets their own goal.

Elliott (Levinthal) "

I talked to John Payne from National about h.s. Rams and other ckts. They're not doing anything. Why don't we get into this area?

Elliot suggests we help by investing in Gigabit. He also suggested we contact Joe Barrera, and Dick Soshea at Harris Microwave Semi, 408-262-2222 in Milpitas as a new group who broke away with HP GaAs.

I see no U.S. high speed semiconductor work outside of IBM and BTL. Is there some? (Note the situation in high speed rams)

Subject: **Getting an Interconnect Soon/Now for**

Internetting of ARPA Contractor Computers

To: Distribution

Date: 28 NOV 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up 12/12/78

Bob Kahn at ARPA says he is tearing his hair out trying to get a good system of interconnecting their computers. All his contractors are playing in this area and he just wants a standard interconnect mostly for 10's and 11's they currently have. I said the problem of getting it is trivial. Just tell us what you want, and we will build it. He is challenged and said he'll do it. The commitment I made to start the ball was that we would send him a spec of the VAX interface. Sam, will you get him to sign the appropriate disclaimers so we can proceed ahead to get him involved?

He'd like to have something over 100 Mbits/sec. so that a large number of computers could be interconnect, but will listen to the economics and he understands the need for orderly progressions based on the introduction of technology. He is advocating using active taps with appropriate diagnostics because it gives such an orderly, well defined set of signals and the performance is highest. He cited the works at MIT by Al Vezza (360 chips with DMA to an 11) and Chaosnet (120 chips running at 8 Mbits and connected to an 11, with no DMA, using the unmodified Farber interconnects LNI?).

Forest Baskett stated that with only one chip, Zilog has a ring interconnect running at 800 Kbit using their standard SIO running a modified SDLC protocol. Their interface is apparently some form of the Farber interface tap. Here, have they solved the large number of chips to interconnect at a reasonable speed problem? Let's get Forest Baskett to help on this problem?

Note, the Japanese have a 50 Mbit, 50 Km line with no repeaters in service. The length is limited by the number of cable splices.

I want the ARPA community to buy and try our first I/C. Quick!

----Message 22 (2372 chrs) is----
Date: 7 Aug 83 15:55:33 EDT
From: gottlieb@NYU.ARPA
To: NEW-GEN@CSNET-SH
Subject: late response to initial query

Please forgive my delayed reply as I was out for the week.

Within the "high-flux" class of Ullman, one may wish to compare the machines that have multiple processors sharing a central memory (the "dancehall" architecture with all the processors on one side of the room and the memory modules on the other) with those where the processors have the own local memory and communicate via message passing. I believe that machines like the Homogeneous machine (Cube) and Jack Schwartz's original ultracomputer (shuffle-exchange) in which the memory is local and the interconnection topology is made visible to the programmer, offer higher peak performance than the current NYU Ultracomputer (dancehall) but at the cost of more difficult programming. Indeed, we were able to obtain suffle-exchange implementations of several important algorithms but when we first studied the Burroughs proposed NASF (numerical aerodynamic simulation facility - NASA's "digital wind tunnel") we concluded that such shared memory machines were easier to program. I know that this view is far from universal and that many believe that what shared memory facilitates is the creation of parallel bugs. I can only add that we have parallelized a number of medium size (up to a few thousand lines) programs and have not changed our view.

Jim Browne has remarked that there are two problems to solve in parallel processing, communication and synchronization. For some architectures one problem is much easier that the other. For example, shared memory solves communication but makes synchronization more difficult. SIMD machines like the Illiac IV have no synchronization problem but are poor for interprocessor communication.

An important question to ask is how many processors does one expect to have on a single chip (or other unit with limited I/O). If that number is large (as NON-VON postulates) then trees look favorable since 2**k processors can be placed with only four external connections. If the number is not large then the bottleneck at the root makes trees appear unatractive.

Subject: Second Question
Cc: ABell.PA@PARC-MAXC
Message-Id: <428956153.27739.hplabs@HP-VENUS>

The disscussion so far has been excellent though sometimes a bit independent of the question. Many good points and issues have been raised. Several responses illustrated the importance of first understanding the application areas before
creating the hardware and software systems to support them.

What are the applications where New-Gen computers will be used? I would like to see us create both a taxonomy of areas and specific applications. What are the characteristics
of each of these areas?

I wonder if we, as computer scientists, have too limited breadth to envision and specify many of the new applications. Is this the case? What groups of people should become

involved to illustrate the application areas to us? How do
we involve and work with these new groups?

Subject: First Question Reply
To: new-gen@CSNET-SH

I have read the comments to date, and due to their number, I
will not
make a point of agreeing with item X and disagreeing with
item Y.
The following points indicate my views on the issues raised
by the
initial question and the responses to date.

Fifth Generation Architecture Definition (I do not feel that
the
distinction between "new", "fifth", or supercomputer needs to
be
discussed, and I use the terms synonomously.)

It is sad in a sense that the Japanese coinage of the 5th
generation
term has generated so much press, since the 4th generation
will happen
also. Still the architectures of the 4th generation will
mainly be
based on the same architectural paradigm that supported the
previous 3
generations. In my view machines of this so called fifth
generation
will be fundamentally based on concurrent principles. The
problem is

that there are many forms of concurrency:

1. Spatial - I use this term to mean things which are independent
and can therefore be distributed to different physical resource sites.

2. Temporal - pipelining. In pipelined processing the stages of
the pipe are not functionally independent but the distribution is a
result of different time stages of the processing. It is certainly
true that the multiple resources are also spatially distributed as
well (and hence the defect in the terminology, but the idea hopefully
is clear).

3. Specific vs. Forall - in some concurrent models the concurrency
is obtained by having homogeneous tasking applied to some data
structure (e.g. FORALL X Do FOO) while other models specifically
indicate concurrent operation by doing something special:

a. Delaying the CONS

b. Detecting independence and taking advantage of it.

c. ....

The point is that concurrency comes in many flavors and, as has been
mentioned by many of the members of the net conference, the grain of
the parallel operations, the type, the communication, etc. are all
important. I feel however that after the first round of 5th
generation attempts, the "mature" 5th generation machines will exploit

concurrency in a variety of forms at all levels of the system.
Doing this will require a consistent incorporation of a number of currently disparite ideas about how concurrent systems can be constructed.

For example at the largest grain level, I envision future concurrent systems to look like a network connected set of special 5th generation engines. I do not see these engines being as "general purpose" as the mainframe machines of the past. The reason for concurrency at programming time can be made on a number of qualitative grounds but my contention is that at run time the use of concurrency is quantitative in its goal. General purpose implies compromise and compromise implies loss of speed. At the mid-grain level we will see the types of 5th generation multiprocessor systems (homogeneous would be my guess, but somebody is bound to try and do it the hard way too!) that have been worked on for the last 10 or 15 years. At the lowest grain we might see very specialized pipelines for doing arithmetic, control, etc. and memory systems which concurrently look for chunks of data which match the search criteria. My contention is that mature 5th generation systems will consistently exploit concurrency at many levels of granularity.

Lastly I don't think AI is intrinsically involved and in this I concur with Ullman. Certainly some of the results from the AI

community will
be incorporated in a general search for machines which a qualitatively
better from the human use point of view AND quantitatively better in
terms of MIPS, KIPS, LIPS, BIPS, FLOPS, BOPS or any other hokey metric
that anybody chooses to invent. To view AI as the sole source of the
ideas for the new generation of machines is absurd. There is a lot of
good work out there and it needs to be combined properly if there is
to be a real win. Some database people feel (for example) that Prolog
is a small grain relational database system. Ah well - enough said.

The emphasis has got to be on the system being consistent - NOT on
just the software or the hardware. The advent of the microprocessor
has taught us at least two things:

1. Significant reduction in the cost of a processor can effectively move the art of programming back to the dark ages for awhile (Dijkstra essentially said this at IFIPS '77 in Toronto).

and

2. Multiprocessors are easier to build than to program if you are lazy and don't think about things before you design them.

5th Generation Software

New programming methods, languages, operating systems, etc. are

definitely needed. Logic programming, dataflow, reduction, etc.
models proliferate and only scratch the surface in my opinion, but
these results are likely to form the basis for the 5th generation
software models. The topic that to my surprise has been missing so
far in our discussion is the problem of how program concurrency is to
be mapped onto the physical resources. I call this the resource
allocation strategy. To date, there haven't been too many distinctly
different approaches:

1. Regular data and similar topology machine - SIMD style stuff.

2. Static analysis of the program structure and a "smart compiler"
which generates the right set of load modules which end up in the
right physical spot.

3. Dynamic strategies where a first guess allocation is made and then
(usually with a great deal of overhead) things are moved later if they
are in the wrong spot.

4. Random allocation - let things just grow and hope that everything
works out somehow (unfortunately in every case that I know about in
which this strategy was used it was a failure).

The main problem is that the allocation must be done so that
communication delays don't effictively sequence otherwise concurrent
activities.

____

The goals of Fifth Generation research should be to incorporate enough
of the sensible good ideas into a consistent efficient system's
framework and to build real systems (not just unprogrammable heaters)
and get together with the applications people to continue to develop
the machine use paradigms which will guide the work to its mature
state.

Sorry for the length of this but I just got back in town and there was
a lot to read - so all this just sort of spilled out.

Cc: fahlman@CMU-CS-C.ARPA
Subject: Tasks for the new generation

There seem to be a couple of distinct conversations going on here, both useful, but probably worth identifying as separate. If we look at what we want the new generation of computers to do (and it would be pretty silly to build them before we have looked hard at this) we can either look at the overall picture that the new systems should present to the user or at the key low-level problems that have to be solved in order to get at some of tasks that we cannot handle well at present. We've had several good messages on each of these topics.

When thinking about the appearance of the new generation to the user, we see the need for extremely transparent communication (text, color pictures, voice...) with other users anywhere in the world, integrated tools with good online training and help facilities, easily sharable program modules and data bases (either through standardization of languages or through intelligent interface managers), and so on.

A lot of this can be accomplished without much innovation in hardware -- all it will take is something like the current Lisp machines with color displays, easily portable, cheap enough to be on everyone's desk, excellent worldwide networking, and huge banks of online video-disk libraries. The software is the hard part, but again nothing revolutionary is required -- just about ten more years of very hard work by good people.

All of this is just straightforward extrapolation of what is going on now in dozens of places. It is going to happen. No major revolutions are required, and the payoff is clear enough that market forces can probably drive the whole devleopment without any help. It would probably be helpful if there were some coordinating body to apply gentle pressure in the direction of standardizing things wherever that makes sense (or at least avoiding gratuitous incompatibility). It would be

also be very helpful if the necessary equipment were made available to
the most active developers (universities and small innovative software
organizations) as soon as possible -- if these people have to wait till
the hardware is cheap, they will have no opportunity to add their ideas
and software to the new generation while it is still new, and the
resulting systems will be much worse for this omission.

So that's one thing that could be meant by "new generation", and a
number of people on the list have addressed these issues. To me, this
stuff is really finishing the software for the current generation of
machines, but that's just quibbling over terminology -- the effort is
critically important, whatever we call it. I might add that at the
level being discussed above, issues such as parallelism and
inter-process connectivity should not come up. There is probably a lot
of parallelism going on in these machines, but the less the user has to
know about it, the better.

On a different level, however, I do see the need for innovative (and
therefore risky) explorations of machine archtiectures. While existing
von Neumann hardware (with a few special purpose processors for graphics
and communication) can handle most of what was described above, there
are important tasks that require more cycles than we are going to get
from such machines. One class of problems is number-crunching, and a
lot of work has gone into making that faster, giving rise to

the Crays
and HEPs and DAPs. For other tasks, these architectures seem to be
inappropriate. I've listed these in earlier messages: pixel munching,
animation, making intelligent use of a LOT of assorted knowledge,
recognizing things (images or spoken words or diseases or stock market
trends), planning, big simulations in non-continuous non-numeric
domains, and so on. We know that we're cycle-bound in these areas, but
we don't yet agree on what to do about it, or even how to characterize
where the crunch is occuring.

To me the next generation of hardware/architecture research is a matter
of identifying those places where important tasks cannot be done because
we lack the computing cycles, analyzing these tasks to see where the
computational bottleneck is, developing a good crisp theory of what has
to be done in that bottleneck and what the dependencies are, and then
applying the right kind of parallelism to get the job done. Often, we
will discover that the architecture developed for problem A is also
useful for problem B, but that should not be a requirement.

That kind of research does not have an obvious and predictable payoff,
so it is generally not done by industry. Some of the preliminary
studies can be done in universities and think-tanks, but building
prototype hardware has in the past been too expensive for such
organizations. A single computer architecture project (with

the
associated software effort) has generally tied up a major
chunk of a
university a period of several years: think of Multics,
Illiac IV,
the MIT Lisp Machine effort, C.mmp, the S1...

So it seems to me that this is where we need some sort of
national
initiative. All of the usual solutions apply: we need more
money for
this sort of exploratory construction in the universities,
more joint
projects between universities and industry (with less hassle
and
secrecy), better access to facilities for simulating high-
speed parallel
designs so that only the most interesting ones will actually
be built,
and better tools for mini-projects in computer architecture
(the
half-million-dollar six-month project, as opposed to the 5-
year
behemoth). It looks to me like the weakness of the current
U.S. R&D
system is not in producing the basic good ideas and not in
exploiting
those ideas (however expensive) once they are shown to be
right, but in
doing the risky but expensive exploration in between.

Subject: Third question

So far, we've seen discussions about specific architectures move to become discussions about principles for selecting architectures, and then discussions about the need for funds and methods to experiment with architectures and applications. People also seem to agree about the need to involve applications people (including non-computer-scientists) in the early stages of machine and environment development. So how do we do that?

How can we coordinate the creative activities of applications people, environment builders, machine architects, VLSI designers, and others, so that they can learn of and build on each other's work, and results in one disciple can build on results in the others? How can we have work on a new machine at one site interact synergistically with work on a software environment at another site, for example?

What are the barriers that are keeping this kind of interaction from happening now? What needs to be done to lower them?

(For example, why are certain people sending lots of messages in this conference and others not?)

Some of you have experienced some of the following problems recently:

* Receiving many copies of the same error message about a down machine;
* An error message coming back days or even weeks after it should;
* Failure to get mail to someone at mit-oz or mit-ai.

I'm told the first two problems have been fixed; let me know if they turn up again.

The third problem seems to be at the MI end. We have taken -oz and -ai off our distribution list. I think most of the same users can be reached at MIT-MC, but haven't confirmed this.

Overall, I think we have had excellent service and reasonable success using a relatively experimental system. Thanks for bearing with the occasional lapses.

From: kgw@Cornell
Subject: Third Question
To: NEW-GEN@Uwisc.ARPA

Cc: kgw@Cornell.ARPA

I can only describe my own experience in dealing with bringing the
relevant people together. The most important requirement is to
find computer users, computing support people, computer scientists,
computer designers, etc , who have a willingness or recognized need
to cooperate. Fortunately more and more people from all these areas
are recognizing a need to emerge from their niches and join forces.
This has made possible a number of projects I am involved in which
combine people from different areas as everyone recognizes is required.
I have a software productivity project which combines high energy
physicists and computer scientists and will add other application areas as
time goes on. Cornell is embarking on a parallel processing project
with support from both IBM and Floating Point Systems and cooperation
from scientific users, Cornell computer services, Electrical Engineering,
and ultimately the GIBBS software productivity project. Fermilab
has an 'experimental Computer Science' project that brings together
Fermilab researchers and outside computer scientists. The Common
denominator of these efforts is to bring together members of many
different disciplines, chosen because they all are needed in order
to reach the projects goals and all are willing to help. I am starting
a Theory Center at Cornell to unite all theoretical science, enginerring,

and agricultural disciplines at Cornell and provide a common
computing
support umbrella; again there is a lot of enthusiasm for this
project,
and both the GIBBS project and the Parallel proceesing
project will
be part of the Broader theory center effort. Representatives
of
Computer manufacturers and industrial computer users will be
encouraged
to participate in these efforts. The most important step
needed
to help this kind of effort nationwide is to make Computer
Networking
more widely known and accessible, with more people trained to
use
networking effectively.

From: gottlieb@NYU.ARPA
To: NEW-GEN@Uwisc.ARPA
Subject: third question

At NYU we have had "applications people" involved in the
project
(Ultracomputer) from the beginning. From very early on, we
have had a
working simulator and have run simulations of programs
selected by the
applications folks. Of course due to memory constraint (and
the
inherent slowness of simulations) we have not been able to
run the
largest programs on their full data sets for the normal
number of
cycles, but we have done realistic examples. One tenet was
that the
applications people decided what portions of the program to
omit and
how small the data could be and still be realistic.

I must add, however, that the applications people while not computer scientists, do use computers every day for their normal scientific work, which might be classified as computational science. How to involve so called naive users (i.e. sophisticated professionals who happen not to be familiar with computers) might well be more difficult.

In summary, for applications that are already heavily computerized, I believe that having a working simulator as a major part of the project is extremely helpful. It should also go without saying that the results of the simulations must be considered important to the entire project and that design decisions must be tested against these simulations.

From: ULLMAN@SU-SCORE.ARPA
Subject: Stanford projects/barriers to communication
To: new-gen@UWISC.ARPA

SYNOPSIS OF PROJECTS AT STANFORD

There are a number of projects at Stanford that are concerned with
"new generation" computing, some ongoing, some in the planning stage.
As not all the PI's are in the survey, I'll take the liberty of
summarizing them here.
1. John Hennessy is implementing a language, SAL, that has the
single-assignment property, and plans to build a memory-linked
multiprocessor that supports this language, i.e., it uses the
special properties of single-assignment languages to avoid expensive
solutions to the problem of cache consistency.
2. Joe Oliger has been working with others on campus interested in

the solution to numerical problems, in a project called CLASSIC, to develop massively parallel solutions to numerical problems.
3. Tom Binford has a project to do real-time computer vision. Well along is a chip that does very fast raster processing, for low level feature detection as well as a number of other applications.
4. Ed Feigenbaum is planning to develop a "blackboard machine," a special-purpose machine for solving signal detection problems via the "blackboard model," a data model where data is viewed simultaneously at several levels of abstraction, and cooperating processes make inferences about one level from data at various levels. I trust Ed will say more about this himself.
5. A group led by Mike Flynn is looking to begin work in emulation of massively parallel machines.
6. John McCarthy is planning the implementation of a parallel version of LISP.
7. I am contemplating development of some ideas in language design, n1ere the periodic sorting of data allows communication between processes with a cost like that of closely coupled processors, even though the processors are really loosely coupled.
8. Christos Papadimitriou, Ernst Mayr, and I plan to do some theoretical studies of the limits of parallelism, the design of parallel algorithms, and the development of realistic models of parallel computation.

To support much of this work we plan to buy commercial multiprocessing hardware, run as a shared facility for the above projects and others on campus interested in applications of multiprocessing or in systems aspects.

There is not too much written at the moment, but I shall try
to
follow up with a bibliography of Stanford publications.

QUESTION #3; BARRIERS TO COORDINATION OF RESEARCHERS

We have also been trying to deal with the fact that
supercomputer
system development is a job that requires coordination
between
many specialists. I would go much further than the several
recent
messages that support the need for applications people to sit
down with computer scientists. I'm not terribly proud of the
situation, but it appears that most CS people are rather too
specialized
to see the big picture, even forgetting about applications
that lie
outsk{de CS proper. Therefore, a group of faculty from EE
and CS have,
since March, been meeting weekly to share ideas and present
their own
views of their specialty. These people come from hardware,
software
systems, theory, network operating systems, network
protocols, numerical
analysis, robotics, and occasionally a few other specialties.

I don't want to speak for the motivation of the group's
members,
but my own motivation for encouraging this process is a
perception
that
a) Computer scientists divide into subspecialties too easily.
These subgroups develop their own notation and paradigms. I
have too many
examples where two or more groups work on the same problem
unaware of each
other's existence, not to believe that if I had a broader
outlook I would see

the problem of interspecialty noncommunication as endemic. The factionalization of what should be a unified field is a significant barrier to interaction; probably it is a barrier to progress.
b) The problem of "new generation" computing is among those where the solution depends on a xm{ facilities working together, a chain like application-area problem->algorithm->language->system support->supercomputer architecture->processor architecture. It is too easy for people to insist on working at one point in the chain, ignoring the others. The best way to avoid this problem is to have cooperating researchers each with a good view of the overall picture.

It is too early to call the Stanford group a success; I'll claim that when people from one field start solving problems in another. But there is no doubt that the sessions have been educational, and I predict that the minimum benefit will be the avoidance of unimplementable algorithms, languages that are easily implementable but admit no programs that do anything useful, and so on-- this is the generalization to the next level of detail of the previously expressed fears concerning machines that serve only has "heaters." After a slow start, there has been a degree of enthusiasm worked up, to the extent that I can recommend the experiment to other sites wishing to try "lowering the barriers."

A significant failure has been our inability to attract much interest from our colleagues in AI. Another problem is that the group has

been limited to faculty and a few others. I don't see how to
expand it to the point where it serves the needs of students
as
well as the faculty, yet allows the sort of give-and-take
that
we have found valuable.

---Jeff Ullman

To: new-gen@UWISC.ARPA

SYNOPSIS OF PROJECTS AT STANFORD

There are a number of projects at Stanford that are concerned
with
"new generation" computing, some ongoing, some in the
planning stage.
As not all the PI's are in the survey, I'll take the liberty
of
summarizing them here.
1.   John Hennessy is implementing a language, SAL, that has
the
single-assignment property, and plans to build a memory-
linked
multiprocessor that supports this language, i.e., it uses the
special properties of single-assignment languages to avoid
expensive
solutions to the problem of cache consistency.
2.   Joe Oliger has been working with others on campus
interested in
the solution to numerical problems, in a project called
CLASSIC, to
develop massively parallel solutions to numerical problems.
3. Tom Binford has a project to do real-time computer vision.

Well along is a chip that does very fast raster processing, for
low level feature detection as well as a number of other applications.

4. Ed Feigenbaum is planning to develop a "blackboard machine,"
a special-purpose machine for solving signal detection problems via
the "blackboard l," a data model where data is viewed simultaneously
at several levels of abstraction, and cooperating processes make inferences
about one level from data at various levels.
I trust Ed will say more about this himself.

5. A group led by Mike Flynn is looking to begin work in emulation
of massively parallel machines.

6. John McCarthy is planning the implementation of a parallel version of LISP.

7. I am contemplating development of some ideas in language design, where the periodic sorting of data allows communication between
processes with a cost like that of closely coupled processors, even
though the processors are really loosely coupled.

8. Christos Papadimitriou, Ernst Mayr, and I plan to do some theoretical studies of the limits of parallelism, the design of
parallel algorithms, and the development of realistic models of
parallel computation.

To support much of this work we plan to buy commercial multiprocessing
hardware, run as a shared facility for the above projects and others
on campus interested in applications of multiprocessing or in systems
aspects.

There is not too much written at the moment, but I shall try to follow up with a bibliography of Stanford publications.

QUESTION #3; BARRIERS TO COORDINATION OF RESEARCHERS

We have also been trying to deal with the fact that supercomputer system development is a job that requires coordination between many specialists. I would go much further than the several recent messages that support the need for applications people to sit down with computer scientists. I'm not terribly proud of the situation, but it appears that most CS people are rather too specialized to see the big picture, even forgetting about applications that lie outside CS proper. Therefore, a group of faculty from EE and CS have, since March, been meeting weekly to share ideas and present their own views of their specialty. These people come from hardware, software systems, theory, network operating systems, network protocols, numerical analysis, robotics, and occasionally{ a few other specialties.

I don't want to speak for the motivation of the group's members, but my own motivation for encouraging this process is a perception that
a) Computer scientists divide into subspecialties too easily. These subgroups develop their own notation and paradigms. I have too many examples where two or more groups work on the same problem unaware of each other's existence, not to believe that if I had a broader outlook I would see the problem of interspecialty noncommunication as endemic. The factionalization of what should be a unified field is a significant

barrier to interaction; probably it is a barrier to progress.
b)   The problem of "new generation" computing is among those where
the solution depends on a chain of facilities working together, a chain like
application-area problem->algorithm->language->system support->supercomputer
architecture->processor architecture. It is too easy for people to
insist on working at one point in the chain, ignoring the others.
The best way to avoid this problem is to have cooperating researchers
each with a good view of the overall picture.

It is too early to call the Stanford group a success; I'll claim that when
people from one field start solving problems in another.
But there is no doubt that the sessions have been educational,
and I predict that the minimum benefit will be the avoidance of
unimplementable algorithms, languages that are easily implementable
but admit no programs that do anything useful, and so on--this is t the next lhe
generalization to the next level of detail of the previously
expressed fears concerning machines that serve only has "heaters."
After a slow start, there has been a degree of enthusiasm oorked up,
to the extent that I can recommend the experiment to other sites
wishing to try "lowering the barriers."

A significant failure has been our inability to attract much interest
from our colleagues in AI. Another problem is that the group has
been limited to faculty and a few others. I don't see how to
expand it to the point where it serves the needs of students as

well as the faculty, yet allows the sort of give-and-take that
we have found valuable.

eff Ullman

From: Danny Cohen@USC-ISIB.ARPA
To: New-Gen@UWISC.ARPA

I apologize for joining the conference so late. I found the entries
to be very interesting and educating.   I would like to add to some
points which did not get enough attention.

*** Inter-Site Cooperation ***

In order to build significant machines which perform important tasks
we need the contribution of several discipline, such as the actual
problem area itself, algorithm analysis, software/programming,
operating systems, architecture, and VLSI.

As a matter of style, some groups start from the problem and look
for the solution and some groups traverse this route in the opposite
direction. The former risks having to face the "how do I solve my
problem?" question. Their machines are expected to be put to good
use as soon as they are assembled, or even soon as soon as

they are
partially assembled (like the Cosmic-Cube at caltech).

The latter might have to face the "now that we are done what can we
do with this programmable heater?" question. Both interesting questions.

Doing a good job requires the cooperation among several discipline.
Only few sites are able to get all of them under one roof, as Cornell
and NYU say. I dare suspect that not all of us can do that. It would
be nice if all of us could benefit from the contribution of such groups
across site boundries, such that not each and every project at every
site would have to start at square one thinking about every issue.

It would be a pity to see that a project at some site, having terrific
ideas and breakthroughs in domain A (say archifecture) fails because
of lack of some capabilities in domain B (say compilers) which is
perfectly handled in another site.

Communication, like the ARPAnet, can free us from the need to organize
projects according to geographic proximity such that each has to invent
all of its own wheels. We can do better than that. We have
done so in the past and we sure can do it again.

We should be able to share not only ideas, but also tools like programs
and cell libraries, and most important, conventions which y2future
use of various tools not developed or even defined yet. CIF has played

an essential role for the tremendous cooperation in the VLSI community
supported by ARPA in spite of it being far from perfect to the point
that every researcher has its own list of CIF flaws.

I do not advocate to impose immeadetaly premature standards
(aka bureaucrats' heaven) -- but it is never too early to start thinking
about possible coordination, interfaces (aka interchange format) and
tool sharing.
More? (Yes, No) [Yes]: {
Y

*** On large N's ***

I have the feeling (sorry, no proofs) that the transition from one processor to N processors changes in nature, not just in quantity, as N changes. Some things cease to scale linearly at some point. I believe that 64 processor system is sort of twice a 32 processor system, belonging to the same class. However, an N-thousands processor system is in another class, in which the graceful degradation issue is a cornerstone of the architecture, not just an afterthought.

Applying elementary statistics to the MTBF of systems with Kilos of processors (Megas?) each of which is powerful, probably O(MIPS) or O(MFLOPS), and have enough memory 4 be interesting, probably O(Mbyte), -- yield a shockingly short time between failures.

This may suggest that logical addresses of units (i.e., which task this processor performs when) is not necessarily bound permanently to their physical addresses units (i.e., to which other processors this one is directly connected). This additional level of differed binding (logical/physical addressing) has some non-trivial "switching" cost and also several significant advantages, which for large number of processors may overweigh the switching cost.

This separation of logical addresses from the physical

addresses may
also prove important for dynamic reconfiguration of the system both
for runtime bypass of failed units and for matching algorithm structures
(hyper-cubes, trees, and other topological marvels).

*** On Parallelizing Algorithms (without paralizing them) ***

One cannot exaggerate the importance of "parallelizing" algorithms.
It turns out that it possible to "parallelize" nearly all arithmetic
algorithms and to reach the ultimate N-fold speedup. IBM's Shmuel Winograd
has proved many interesting theorems to this effect, including even the
Horner scheme, which may be the epidomy of sequentialism.

This is true in general to most of arithmetics, and obviously to most
grid oriented problems which are typically modelled by finite differences,
and -- most important -- obey some continuity/preservation principles.

parallelism may be abused in many ways. It is easy to envision a
"parallel matrix invertion algorithm" (suggested first by Finnegan)
which is based on the search of the space of all possible
matrices for the one that when multiplied by the given yields the
unit matrix. Since this search can be performed in parallel, and
since VLSI makes processors cheaper and smaller we can afford many
of them..... (How about "Search the space of arm positions and velocities
for the minimum-energy solution"? how about calculus of

variations
instead).

Subject: Fourth question

This conference has been taking place by means of a
distribution
list on the CSNET service host, which is sponsored by the
NSF.
Most of the participants are on the ARPAnet, which is
sponsored
by DARPA. Many people have reached those nets via
intracompany or
intrauniversity nets such as those at HP, PARC, IBM, CMU, and
MIT. [There have been some adventures in trying to find
people on
these nets, which points to an interesting question for
future
co-operation.]

If computer networks are going to be an important part of multi-site
cooperation for next-generation research, who is going to sponsor
them, how will they be connected, and who will have access to them? If
other facilities are to spring up for such cooperation, such as
hardware and software prototyping and simulation services, who will
pay for them? In short who is going to sponsor next-generation
research and how will the resources get where they should go? How will
work sponsored by different agencies be co-ordinated?

To: NEW-GEN@UWISC.ARPA

As a physicist woefully ignorant of computer science (I'm not even sure what the previous four computer generations were!) perhaps I can best contribute to this interchange by describing the particular application that a group of us at Columbia is addressing, the parallel computer architecture that we believe will provide a practical, cost-effective, near-term solution to our problem and the approach we have taken to acquire the needed hardware. (The work that I will describe is being done with my colleague Anthony Terrano and two graduate students, all physicists.)

i) Physics application.

We are interested in the physics of quarks and how they bind to form the more familiar protons, neutrons pi-mesons etc. that are found in the atomic nucleus. This problem can be approached numerically (using a formaulation due to Ken Wilson) by replacing space-time by a finite lattice of points, often a four-cube with as many as 16 points on a side. With a minimum of 32 real degrees of freedom per lattice site (in the form of four 3x3 unitary matrices), this is a problem with 2 million variables. Many interesting questions can be answered by averaging over an ensemble of points in this high-dimensional configuration space generated by the Metropolis method used in statistical mechanics. The interaction between these variables is nearest-neighbor and is represented as traces of products of the unitary matrices.

This is currently a very important subject in high energy physics to which the devotion of significant resources is appropriate. Estimates of the time required for a

thorough
treatment of the problem easily range as high as hundreds of "Cray-years". On a personal level, I am willing to devote a significant fraction of two or three years to the acquisition and exploitation of the resources necessary to answer some of these questons.

ii) Computer architecture.

The nearest-neighbor interactions and homogeneity of the problem suggest a synchronous grid of processors (a two-dimensional torous appears best in this case). Each processor is based on an Intel 80286/287 microprocesor and is supplemented
by a pair of fast TRW arithmetic chips controlled by a primative
microcode so that the repetitive matrix multiplication can be executed at a rate of 16 million 22-bit floating point operations per second. An array of 256 of these processors will
provide a 4 Gigaflop speed - computational power probably adequate for at least some aspects of our problem. Since each
processing element costs about $2500. and is made from off-the-shelf components our cost-effective and near-term requirements are also met.

iii) Acquisition of resources.

We quickly discovered the difficulties referred to in Question 3 and many of the previous comments regarding useful interdisplinary communication. In fact, we decided that the electrical engineering and computer science aspects of this project were sufficiently simple that it would be easier to learn by our mistakes than to develop the interdisiplinary communication necessary to avoid making them in the first place.
Likewise the possibility of persuading a computer manufacturer
to fabricate what we needed in a short time at a reasonable cost
appeared remote. Thus we set about designing and building the
system described in ii) ourselves last winter. Because of the

importance of the problem and the apparent economy of our approach, we have had no difficulty in obtaining the funding necessary to build 16 and now 64 nodes from conventional high energy physics sources.

It is too early to pronounce our efforts a success. We have a single processor working, a second built and are in the
middle of fabricating 18 more. We remain enthusiastic and optimistic about our prospects.

Although we have decided to proceed quite independently, I am certainly interested in the problems addressed in question
3. Obviously, we would be pleased to contribute to the understanding of some of the important issuses in parallel processing referred to by the other particiants. Perhaps by offering time and support to computer scientists or users in other disciplines (over an appropriate network) we could get some assistance in software development for our array - especially to use it in an asynchronous mode not really required
for our primary physics problem. Surely developing such fruitful communication would make some sort of collaborative, subsequent project more likely.

Subject: Wrap-up

Our plan was to wrap up this "teleconference" this week and use the
material submitted by then as the basis for the IEEE article. Therefore this
is the last formal request from the Moderators:

1. Please review the previous Questions (copy attached

below), and submit
any new thoughts you may have in light of the past discussion.

2. What is the most critical action that U.S. government, industry, or
acadamia should take (or should not take) with respect to these issues?

3. Do you think this Teleconference has been worthwhile? What comments
have you found most surprising, instructive, or insightful?
Do you think this discussion should be continued, in this or some
modified form, in the near future?

Paul Wallich

Alan Bell

Bert Raphae

Chuck House

==

Question 1

Whtdoes "fifth r"new" or "supercomputer" generation computing mean? What should the goals of these programs be? What will be theform of their structures, architectures, developments, et. What will the results of this research look
like after the tchnology has matured? Will there be several different effort going to occur which are heading toward

different goals ith similar names (superscientific, fifth gen, etc.)
How can each of hem be characterized and distinguished?

===

Question 2

Thsdiscussion ofr has been excellent though sometimes a bit independen of the question. Many good points and issues have beenraised. Several responses illustrated the importance of fist understanding the application areas before creating the harware and software systems to support them.

What are t{he aplcations where New-Gen computers will be used? I woul like to see us create both a taxonomy of areas and specifc applications. What are the characteristics of each of theseareas?

I wonder if we,a computer scientists, xahe too limited breadth to envison and specify many of the new applications. Is this the case What groups of people should become involved to illutrate the application areas to us? How do we involve and wrk with these new groups?

==
=

Question 3

So fr, we've sendiscussions about specific architectures move to
become discussios about principles for selecting architectures, and
then discussionsabout the need for funds and methods to experiment
with architecturs and applications. People also seem to agree about
the need to invove applications people (including non-computer-scintists) in the early stages of machine and

environment deveopment. So how do we do that?

How can we coodnte the creative activities of applications people,
environment builers, machine architects, VLSI designers, and others,
so that they canlearn of and build on each other's work, and results
in one disciple an build on results in the others? How can we have
work on a new mahine at one site interact synergistically with work
on a software enironment at another site, for example?

What are the barers that are keeping this kind of interaction from
happening now? Wat needs to be done to lower them?

(For example, wyare certain people sending lots of messages in this
conference and ohers not?)

Dear Arthur:

It was really nice to hear from you again. Enclosed are some of the Museum's Reports to give you an idea of what it's all about. As you can see, it attempts to cover all of information processing, not just computers. In this regard, I hope you can find some of your important earlier work, including that having to do solely with communications that could go in the Museum. I would hope that some of the artifacts and manuals on the switching computers would be available too.

I appreciate the fact that you are totally committed to supporting your current work from your foundation, and as such don't have any spare cash. However, I would like to encourage you and/or the company to become a founding member at this time. We now have quite an impressive list of founders and supporters and we'd clearly like your support (and artifacts) too.

As a seperate issue, I do hope you'll consider Encore as an outlet when your current work reaches the state that it can be productized.

Again, I do hope to see you in the future either in Dallas or here. I would enjoy taking you through the Museum.

Sincerely,

Gordon Bell
Chief Technical Officer

SUBJECT: ARTIFICIAL INTELLIGENCE MARKET POTENTIAL

It was our intent to have such a group charter - as a follow-on to
BJ's announcement; the only question is a month (while we get some
status info).

The only problem now is that we don't have very much of quality to
market and we don't have a good base product (eg. LISP) to build on.
There are products such as MacSyma that could be sold as add-

ons.

I wanted to have the two days open review (conference) in January
before we did this though. It's likely to be open stores, then work
on product. Suggest you talk to BJ, Dennis and Mahendra about whether
to wait the month before we make such a plan/group.

SUBJECT: ARTIFICIAL INTELLIGENCE MARKET POTENTIAL

Our manufacturing folks have been working in the area of Artificial Intelligence for the past couple of years. Lately they have become very excited about the possibilities of this marketplace being penetrated with our product families. They believe the market potential is much greater than most market areas we are currently involved in. They view the market as evolving very rapidly and unless we decide to participate now, we could miss the boat. How do we go about getting some focus on this issue?

These applications are not an obvious extension of existing market groups. One suggestion is to form a point-marketing group (my term) as we did with Andy and personal comupters. Given my understanding of the potential of this marketplace, it may be the way to go.

I'm concerned that, while we are holding and attending seminars to further our awareness, other folks will be developing   marketing plans and selling product.

Professor Joel Moses
Head of the Department
Electrical Engineering
Massachusetts Institute of Technology
Cambridge, Massachusetts 02139

Dear Joel:

I would like to recommend that Arvind be given tenure. I've enjoyed the interaction with him on various parallel computing approaches, especially dataflow. While only a few organizations are engaged in this research, he has the most balanced and promising view. Everyone believes some form of dataflow is the key to parallelism.

The Multiprocessor Emulation Facility looks quite interesting and should be built as quickly as possible! In a recent taxonomy of computer structures, Jack Schwartz at NYU lists about 55 computers. I would venture an estimate that at most 15 could be useful, if properly engineered. It's unclear how many computers will actually be built, or for that matter whether any of the useful 15 will be built. The emulation facility will hopefully provide a way of testing many of these structures.

Arvind has taken a risky approach to his own career in doing design and empirical work, i.e. along traditional engineering. I would hope MIT is still able to take such risks and support engineering-oriented research. This work is needed both in the universities and in industry, but for a researcher who doesn't have tenure it is hard because it is the long route and it means building real things. The arrangement with IBM is both important and good in this regard.

As an alumni of MIT and honorary alumni of Carnegie-Mellon, I believe the CMU environment is now much more intellectually alive because of the extensive engineering they do in parallel and AI systems. Whirlwind and Multics were built as large-scale, non-toy systems, but they occured 15 years ago. It is essential to have people who will dream and build real systems. I hope you'll keep Arvind, but in the event you don't, please let me know immediately because I'll help see that the project continues without interruption.

Ms. Sheila Grinell
Association of Science-Technology Centers
Interim Executive Director
1016 16th St., N.W.
Washington, DC 20036

Dear Sheila:

I feel especially strong on issue about what computers do (their function) is based mostly on what computers are (their structure). To this end, let me urge you to explain explicitly, implicitly or as a guiding principle, the notion of there being a small number of information processing primitives out of which all systems (including people) are built. Allen Newell and I wrote this set down in 1970 in the Computer Structures book which I'm sending you. (See Chapter 2). I assure you this extends beyond hardware to all software levels. The book update (1981) goes further and uses a Kiviat graph to measure the amount of essential information processing primitives: processing, primary memory, secondary memories, information flow (links) with people, links to other computers, and links to other processors. Mapping your 7 what they do into the PMS system:

. Calculate or compute (Pc-Mp)

. Simulate (Pc-Mp) because of their general purpose ability, one information processing system can be programmed to behave like another one (given enough time and memory).

.Simple information storage and retrieval (Mp-Pc) - mostly your examples were with small computers with <u>NO</u> secondary memory where only a few numbers were held.

.File, retrieve, and edit (Ms-secondary memory + Pc-Mp) - a file with computing attached to it.

.Link (L-communicate) with other computing or systems that transmit information electronically - eg. switch, teletype messages electronically.

. Link and control (L-Pc-Mp)

.Link to humans via human transducers (T)

. T.video to eyes (in form of pattern)

. T.audio to ears (in music, speech)

. Tactile/touch from fingers, feet, etc. to T.Keyboards, etc.

Please believe me that there are a small number of primitives out of which all systems can be built.

You might have a section entitled: "Common Ways People Use Computers as a Scapegoat" or "Computers (usually) Don't Make Errors, People Do". Describe the common stories: programmer error, input error, human support system failure. It could have cartoons, etc.

The persons who might be useful to consult with vis a vis toys and games: Wendell Doyle, Ms. Holly Doyle, and Bob Doyle. Certainly Papert and Minsky will have ideas and Papert will most likely be willing to discuss.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

Dr. Ronald Zelazo
Astronautics Corporation of America
P. O. Blox 523
Milwaukee, Wisconsin 53201-0523

Dear Dr. Zelazo:

I am writing in response to Mr. Schumann's letter to Ken Fisher of March 9, where he suggested that we might work with your Madison group building the high performance computer in regard to some sort of joint marketing arrangement.

We believe the group, formerly Vector Scientific, was doing an excellent job in the market positioning of their product in terms of cost, performance and general characteristics. We are enthusiastic about helping fine-tune such a plan including defining how it would work with other computers and the details of the operating system, etc. For example, Encore has a product that we believe would make an excellent I/O and/or memory subsystem for the Madison group. If our product could be used in this fashion, we believe many benefits would occur including a shorter time to market, less development (for example in networking), a richer product set including a variety of languages at initial introduction, etc. In short, we have a product that would be synergistic with your product.

We believe we could help Astronautics realize the full potential by being a significant sales and service outlet for selected markets that would not otherwise be reached. Since Encore is building a first rate, general purpose sales and distribution company capable of addressing both the OEM and various commercial end user markets, we would very much like to discuss being the sales and service outlet for the computer in these market segments. It is our understanding that Astronautics is in the military and aerospace market, and hence we would not have a conflict with products reaching the same customer via several channels of distribution.

We remain enthusiastic about your product and would like to discuss these opportunities with you at your earliest convenience.

Sincerely,

C Gordon Bell
Chief Technical Officer

AT&T'S ADVANCED COMMUNICATIONS SERVICE (ACS)

WHAT IS IT

- SHARED, SWITCHED DATA COMMUNICATIONS NETWORK SERVICE

WHAT ARE THE GOALS OF ACS?

- ALLOW USERS TO DERIVE GREATER UTILIZATION AND CONTROL OF ALL

  RESOURCES INVOLVED IN THEIR DATA COMMUNICATIONS SYSTEMS.

- RESPOND TO EXISTING AND EMERGING NEEDS OF A BROAD SPECTRUM OF

  DATA COMMUNICATIONS USERS FOR MORE VERSATILE, COMPREHENSIVE AND

  EFFICIENT DATA COMMUNICATIONS SERVICES.

- RESPOND TO NEEDS OF LARGE AND SMALL USERS BY OFFERING A BROAD

  GEOGRAPHIC SERVICE AND A WIDE RANGE OF ACCESS ARRANGEMENTS.

Murray A. Thompson
University of Wisconsin-Madison
Physical Sciences Laboratory
3725 Schneider Drive, Route 4
Stoughton, WI 53589

Dear Murray,

We're enclosing several pieces of information on John Atanasoff that I hope will be helpful to you. In particularly, the article by him in Brian Randell's book and the portion of the Sperry-Rand vs. Honeywell trial in which the judge evaluates the contribution of Atanasoff. We hope that these will be helpful in reaching a decision. Professor Arthur Burks, of the University of Michigan, has completed an article for the ANNALS OF COMPUTING HISTORY (that is not yet published) that further enforces the contributions that Atanasoff made. He was part of the ENIAC project and therefore was around at the time that Eckert and Mauchly were making design decisions.

Thanks for getting onto this problem.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

Enclosures: Atanasoff Information
October 21, 1980

Professor John Atanasoff
Route 2, Box M12
Monrovia, MD 21770

Dear Professor Atanasoff,

Some copies of the poster invitation for your lecture on the 11th are enclosed. We are very pleased with them and hope that you are as well.

We have received the drum from Dr. Maple and it is displayed near the entrance to the Museum. It is very nice to have it prior to the lecture and I am truly amazed by it.

Enclosed please find a simple agreement regarding our holding and displaying your breadboard replica of the Atanasoff Berry Computer. Stan Schultz should have called you by now to make arrangements to come and pick up the machine. He is the engineer who is keeping up our early machines and will also have the care and oversee cleaning and fixing up the ABC for display. Since he will pick it up personally and drive it back to Massachusetts, I am confident that it will be in good hands.

We're looking forward to seeing you on the 11th. If you would come directly to Marlboro with your son by 3:30 PM on Tuesday then there will be time prior to the 5 PM lecture, if it works out, to hold a press conference. (We will hold the hotel room at the Colonial Inn in Concord for late arrival.) The reception will then follow the lecture in the museum itself. On Wednesday we will arrange for you to see the old woolen mill where Digital has its headquarters, our semi-conductor facility in Hudson, and a tour of part of Marlboro with some chance to view the museum again. You can discuss the restoration with Stan again on Thursday. On Wednesday evening we will plan a small dinner party at our house and transportation to the airport will be arranged for Thursday.

We're looking forward to your visit.

Cordially,

Gordon Bell
Keeper, Digital Computer Museum

GB1.S7.36

Enclosures: Agreement
Poster/Invitations

Agreement between John Atanasoff and Gordon Bell, Keeper, Digital Computer Museum

The Digital Computer Museum will restore the replica of the Atanasoff-Berry Computer for display within the Museum. If, for any reason, the Museum decides not to display the A-B Computer then, we will inform John Atanasoff and either return it to him or put it in our warehouse, whatever he prefers. The Digital Computer Museum will, in no case, loan the computer to any other party or move it from the Museum without the consent of John Atanasoff. Any damage to the machine incurred on Digital premises will be replaced on the replica, using J.V. Atanasoff's drawings. At any time John Atanasoff can request the return of the machine to him at the full expense of the Digital Computer Museum.

------------------------ ------------------------

Gordon Bell, Keeper
Digital Computer Museum

John Atanasoff

Date: ____________

Date: ____________

Foreword

On 11 November, 1980 John V. Atanasoff presented his work on digital computation at a Pioneer Computer Lecture at The Computer Museum. I urged him to write a fuller account and told him I would be honored to write a foreword. This is the first real account of his work outside of his August 1940 manuscript (reprinted in Randell's book) and 1338 pages of testimony in a Federal court trial.

The paper is important because it:

.<u>is a primary source</u> and, as such, its value will only become apparent with its use by historians. It should be valuable in the understanding of how science and technology develop, in general, and how the computer was invented, specifically.

.provides insight about people and organizations. For example, the controversary on the number base pervaded organizations for many years, and he turned out to be right in selecting base 2.

.documents his inventions of many important concepts in digital computation, especially the notions of serial computation and regeneration for memory, which he called jogging. Regeneration is the basis for delay line, drum delay line, Williams tube, and charged coupled device memories.

.gives an insight into how Atanasoff himself thinks, how he approaches ideas and problems. For me, it provided an inside view of a creative and brilliant person who provided significant ideas on computation.

Now, I urge you to read it.

Gordon Bell

July 15, 1980

Professor Atanasoff
Route 2, Box M12
Monrovia, MD 21770

Dear Professor Atanasoff,

Enjoyed talking with you on the phone on the 9th and am delighted that you will be speaking on November 11.

As an aside, Gwen (my wife) who is also the assistant keeper of the Museum and I are from Prairie du Chien, Wisconsin, and Kirksville, Missouri, and it was just pleasant to hear your voice. Anyway we hope that you and your wife will come to our home for dinner on the 9th or 10th so that we can talk informally and you could meet a few other people in our computer community.

Is there any chance that you would loan your replicated machine for a few months? As an engineer, I really enjoy working on the museum because the physical computing devices can be seen and not just read about or shown in pictures. Having your replicated machine for display would truly be significant. I would be happy to have it shipped or have you bring it here and help us arrange the display, perhaps sometime in October. As a complement to the real machines I have found it informative to have photos of the original installation. If you have any other photographs or diagrams besides those in Randell's book could you please send them to us? Or, do you know if any might exist in the archives at the University of Iowa that we might obtain?

In preparation for the lecture, we need some photos of you from which we can choose to prepare a poster/invitation for the event. For your information we're sending you several museum posters, including one announcing the Forrester lecture. I look forward to receiving your short abstract from the trial decision.

Please feel free to call Gwen or me collect (617-493-2236) if you would like to talk further on any of these matters.

Sincerely yours,

C. Gordon Bell
Vice-President Engineering

Professor I. G. Ross, F.A.A.
Chairman
Australian Research Grants Committee
Department of Science
Scarborough House, Phillip,
P.O. Box 449, Woden, A.C.T. 2606

Dear Sir:

Because the proposal you asked me to review is outside my area of expertise, I will not be commenting on it.

Sincerely,

Gordon Bell
Vice President,
Engineering

SUBJECT: AUSTRALIAN VAX/VMS/DECNET INPUT

GB4.S1.5
They're afraid of the DG machine at 2 x 750. What's it do?

Also the Prime 850. Why isn't the 782 the answer?

We sure need to supply clear commercial benchmarks.

The salesmen regard DECnet as a major competitive weapon albeit nearly
a concealed one.

Pluto

They really want Pluto to do FMS and local echoing to off load VMS.
Does it? Does Pluto do load balancing across multiple network links
to same destination? (Australia doesn't have high speed lines and
they use multi-low speeds.)

Office Micro 11 vs Pluto

It really appears that Micro 11 is the best way to handle the concentrator, because with it one gets a full 11/70 capable of much
office processing and connected to Ethernet! We really have to look
at this structure as the most cost-effective form of personal computing for the office . . . the competition is both PC clusters and
low cost concentrators that will be built by the emerging Ethernet
industry!

Encryption of Files/Fields

Our commercial customers want it (eg. DES).

Could a software version benefit by a DES microcoded instruction?

MESSAGE ID:
5186857256

SUBJECT: THANKS FOR THE FINE AUSTRALIAN HOSPITALITY

GB4.S1.6

Gwen and I had a thoroughly enjoyable and productive visit during the
recent trip to the Local Area Network Conference in Sydney. We were
pleased and delighted to attend the Christmas dinner. I especially
enjoyed the interaction with you, your mates and our commercial
customers. It was great to see such enthusiasm for using VAX and

DECnet in the commercial world!

MANUFACTURING/ENGINEERING IN AUSTRALIA

The visit to CSS and viewing the statistical multiplexor convinced me again that it's worthwhile to do engineering in small groups, and that Australia could be an even bigger product producer. I met the former minister for technology in South Australia at Craig Mudge's house, and he's established an industrial park there to promote high technology. Also, Craig has a first class VLSI group who could process VLSI chips for us. Right now, I'd recommend having someone from CSS do a special chip there because he has the cost and volume structure, together with the training. Also, let me urge you to look into making Ethernet products and modifying the LA12 to become a fully protable Personal Computer.

DISTRIBUTED COMMERCIAL AND OFFICE SYSTEMS

Was impressed with how far our commercial customers had advanced. I think part of the reason for the advance is the fact there are only seven major cities, and hence a starnet will operate fine with Central and distributed processing. It's ideal for the DEC products.

FULLY DISTRIBUTED, ETHER-NETWORKED OA TESTBED

Let me urge you to make a showcase for DEC, Australia and the world in office automation and distributing processing using Digital Australia

as a testbed. Every center would be Ethernetted and all your
centers
would be interconnected by Telecom! The goal would be a
drastic
increase in productivity by having every process on line,
including
quotes using XCON and XSEL (the program that checks computer
configurations and provides quotes and space layouts).

We need an Ethernet test demo site there -- both Australia
and
the U.K. are building Ethernets today.

LARRY PORTNER LOC/MAIL STOP: ML12-1/A51

SUBJECT: FLEECE OR FAMINE AWARDS

We gotta do something. I propose we all come in a describe all the fleecing we are doing. I just got back from DECUS and could count about a dozen people from engineering who were clearly irrelavant. Each week we ought to have a contest.

There ought to be another kind of award too, which I was trying to win, but am having a bitch of a time with that has to do with productivity. I proposed to change the Journal Voucher system (all on paper, no change in computer programs, only procedure) that would free a high level secretary and/or manager and FA of about 1 day per month... this is big (about 4%). I want it done right now, and intend to propose it at the next OC even though I can't get it started or a committee or anyone in the Finance organization to take charge or help. Can you, so I could go after the anti-fleece award?

PS
Am going to trade show in Atlanta, taking the jet (filled with some of my developer friends so we can discuss the products, have a design review and compare notes on competitiors) but really can't find out how much it really costs incrementally, given we have the damn thing. Don't see how to understand or justify it or even why we have the jet. Given we have it, I intend to use it up until the point its use will tell our flyboys that they should get us another one because it is so heavily used. ... a true paradox.

SUBJECT: RE: AZTEC EMS

The intent is to organize and segment a single fixed plus removeable drive into 2 (or more) virtual drives, and separate the removeable part and not use it for any purpose other than load/unload (i.e. think of it as a low cost, tape unit). This then allows use to be segmented on a virtual drive basis the way we do now in terms of user vs. system. Thus if now an Aztec is 4 x 5 mbyte drives + the removeable part, the segmentation would be to use 3 virtual drives for the system and 1 for user. Removeability would then be at a granularity of 5 mbyte units.
Now what do you say? Will it work? How does it feel? does it solve F/R problem?

Bernard Gordon
Chief Executive Officer
Analogic
10 Centennial Drive
Centennial Park
Peabody, MA 01960

Dear Bernard,

This is to follow up our phone conversation of May 15th. The Computer Museum needs both corporate and personal level support right now in order to open on November 12 and demonstrate its capablity. Enclosed is various material, including a short letter on why the Museum.

Our goal is to have 200 companies who provide annual support between $2500 and $25,000. This will create the needed additional annual funds and insure that the museum is industry wide.

Digital is providing $600,000 annually (paying the building costs and a variety of operating costs), for the next four years. After that, The Computer Museum must be on its own. A large portion will come from visitors and other earned income, but the Museum also needs annual membership from a large number of corporations. At present, **the annual membership is $2500** (and Analogic can also become a Corporate Founder if this happens **prior to June 24.)**

$2500 annual support would insure that Analogic could use the archives, hold several membership cards for employee check out, and help us insure that such machines as the LINC and its documentation are saved. This already has directly benefited your corporation, I understand. The Museum will also make its facilities available after hours and on closed days, only to Corporate members. Gwen will be happy to prepare any documents for your contributions committee or appear before them.

On the other hand, the capital campaign to raise $10,000,000 is largely directed towards individuals. At the level of $100,000 gifts we are willing to consider a wide variety of commemorative and other opportunities to insure given exhibitions and collections. One possiblity is the "Bernard Gordon Collection and Archive of Analog-Digital Computers", that would be archived and targetted as a special exhibit. You could also make sure that the right things were saved just by creating the "shopping list" of things to go after.

We are seeking about $1.5M for the November 12 opening, of which we have commitment now for about $350K from various companies, board members and others. Mike Spock, a board member and the director of the Children's Museum, believes we will have an audience of over 240,000. Our breakeven is about 120,000 so the push now is to get the Museum open in Boston in order to really test the market. I believe we have the plan and capability to do it, provided we get the money to open. The past five years have proven that The Museum can deliver what it promises. **This is why I sollicit the $100,000 from you now.**

On my side of it, I believe that your college that teaches real engineering can be an important addition to the educational scene. However, as you know, I have left DEC (and my large salary and benefits) and Encore is not yet established. I'm in a real start up. However, I will help you raise $100,000 or more, and take some interest in the program. Now I serve on the advisory board at the Wang Institute and since hardware is much more my strength I'd be willing to work on your project after we get open. If Encore ever goes then my own giving pattern can improve.

Sincerely,

Gordon Bell

<bl>The adjustable tracer arm with vernier and adjustable pole arm allows the reading of areas in square inches to 0.01 sq. in. or .0.04 sq. cm. The range of the trace arm is 1.5-7 inches and the pole arm lenght is 6 to 13 inches. The maximum area "Pole out-side figure" is about 12 inches and "pole within figure" a 39 inch circle and 27 inch square.

<bl> "This super slide rule appears to combine features of Hannyngton's linear grid slide rule and Thacher's cylindrical calculator. It differs from the former in that there is no overlap of scales on the base cyliner and from the latter in that each grid bar contains only one scale and that these scales are half the length of the base one. The Rouleau Calculator (Item 164 in the Science Museum catalog) is another Swiss variant of the same design. There are 50 scales, 20" long each on the main cylinder (for a total scale length of 1000 inches) and the same number, 10" long each, on the sliding grid." Historical Technology Catalog 127.

<bl>The first printed trigonometrical tables. They were computed y Regiomontanus during his stay in Hungary in 1468. He had first computed a sexagesimal sine table and then realised the advantage of a decimal base and computed a decimal sine table; both tables are printed here. The tables are preceeded by Regiomontaus' essay on the construction of since tables and an essay on the computation of sines and chords by Peurbach. The work was edited bythe astronomer Johann Schoner (Adams P 2283, Zinner 1781).

<bl>Galileo seems to have invented his "compasso geometrico" also called compass of proportion or sector about 1597 and disclosed it about 1598. The first edition of this, his first book, was published in 1606 with less than 60 copies issued. it was reprinted in 1619. A second, improved edition was issued in 1640 by the same publisher of the third.

<bl>First edition, 8vo9, pp. xxxvii, 253, dedication to Telford misbound before contents, errata on verso of title, and four engraved plates tipped in at end; contemporary green vellum, gilt lettering on spine, boards warped.

Sir John MacNeill was at this stage in his career one of Telford's principal assistants, and this work is dedicated to him. The uses he sets out for t hese tables reflect the type of engineering work he was engaged on. In his preface he refers to Charles Babbage's investigations on the type of paper nad print best suited for tables. At about this time MacNeill invented device to measure the irregularities of road surfaces which anticipated a similar invention by Babbage.

The star positions given for one century, constitute the first modern reference system for the measurement of the positions of the sun, the moon, the planets, and the stars, and for many decades the Konigsberg tables were used as ephemeerrides. With their aid, all observations of the sun, moon, and planets made since 1750 at the Royal Greenwich Observatory could be reduced; and thus these observations could be used for the theories of planetary orbits.

June 18, 1984

Mr. Bob O. Evans
Vice President
International Business Machines
Old Orchard Road
Armonk, New York 10504

Dear Bob:

I'd like to thank you for all the help you've given the Museum, and especially in getting IBM to become a Corporate Founder. It is great to be able to get IBM photos and artifacts for the November opening. With good exhibits, we believe it will be possible to get attendance of over 200,000 per year. Enclosed is a new brochure on the Capital Campaign. If you have any ideas that might help get IBM support for the campaign or exhibits, I'd certainly welcome them. Also, I would like your thoughts on the key IBM inventions and systems that should be represented in the Museum. After your talk last year, I prepared my list, but I'd sure like yours.

Given the difficulty of obtaining corporate support for public institutions, it is vital to get support from individuals. I hope you'll consider becoming a "Core" supporter to the campaign.

Your talk and paper in the recent Museum Report were greatly appreciated, and gives the best "long overview" of IBM that I've seen.

Sincerely,

Gordon Bell

Enclosure

00 BURT DECGRAM ACCEPTED S 2716 O 19 27-SEP-79 11:08:15
FROM: GORDON BELL DATE: THU 27 SEP 1979 11:05 AM EST
DEPT: OOD
EXT: 223-2236
TO: KEN OLSEN
MARY JANE FORBES
MARCIA KENAH
TED JOHNSON @CLEM

SUBJECT: CHARLES BABBAGE INSTITUTE

II met with Paul Armer of CBI, their Exec. Director, about a week ago
and showed him the work on the museum, including model, etc. He asked
for my support on our giving $ to them as a corp. Contribution. I said Ken
had given money personally, and I think he meant that we not give money
from a corporation. However, they could give money to CBI and that
was up to his soliciting the Corp Cont. Committee. However, I warned
that I would not support our giving money there, because I wanted to spend
any money we had for this purpose on our own stuff and we have much need
to archive, store and display, write-up and I think I can spend the
money better than CBI and do more good for computer history. I offered
to loan them pieces, give them copies of our charts, etc. and be helpful
including publishing theses that would be suitable for our historical
book series that digital press is doing. We must collaborate with them
but I want the money... and to build on our museum.

Command >
January 21, 1980

Paul Armer
Executive Secretary
The Charles Babbage Institute
Suite 224, 701 Welch Rd.
Palo Alto, CA 94304

Dear Paul:

Right now the database for the museum is at a standstill until we get a computer installed in our library so that I can extract the data in report form but we are working hard on a number of other projects. The attributes (and values) is attahced. A listing will be sent when we get it. I am sending you a printout from the museum directory which is an interactive system on the VAX in Marlboro. In addition we have the archives indexed -- but this is rather a bulky inventory. This summer we intend to have a college student programmer expand the system and bring it up-to-date. We will alert this person to let you have any results from the efforts that are made. Do hope that this will help you at least get a feel for what we have.

My wife, Gwen, and I are working on a poster illustrating six generations of pre-computing devices. We will have a working draft in several weeks and I wonder if I could send you a copy for comments.

We have hired a museum coordinator, Jamie Parker, and are working on more exhibits for a May 8 opening to the scientific community (especially locally) and a September 22 public opening. I will send you invitations to both and do hope that you can be with us at one or both of these occasions. If you are in Boston at some other time, I would be pleased to arrange a museum tour for you.

Cordially,

Gordon Bell
Vice President,
Engineering

CC: Bill McBride, Herbert Shanzer
From: Gordon Bell
Date: THU 7-JUN-79 10:15:47 EDT
Subject: BI
----
also copy to Ward McKenzie, Rose Ann Giordano

Just had a very productive meeting with Ward and Art Campbell where I
reiterated my position to solve the PAX problem by BI versus the 11/23. In
essence, I want to go flat out for the right solution so we can beat Intel
versus doing incremental, poorer products.

Right now, we don't know for sure that we can do BI because it looks too good.

Ward and Art seem happy to wait for a month till we can make a good decision.
Could you meet with Roger and Andy prior to EBOD so we don't have to go in to
a hostile environment to make a decision in the face of little data on this
proposal?

Subject: BI TASK FORCE

RE YOUR EMS 25-APR-79

A MEETING HAS BEEN SET UP FRIDAY, MAY 4 IN MARLBORO TO DISCUSS THE ISSUES SURROUNDING THE BI. THE ATTENDEES ARE:

ROSING, PLATZ, BLACKLEDGE, LIPCON, STRECKER, AMUNDSON, SUPNICK, J. KING, FULLER (IN B.J.'S ABSENCE), MCNAMARA.

STRECKER, SUPNICK, MCNAMARA, AND I ARE IN BASIC AGREEMENT AS TO THE GENERAL DEFINITION OF THE BUS. LIPCON WANTS AN 8 BIT WIDE BUSS, THE REST OF US THINK THAT IS TO NARROW. CERTAINLY WE CAN RESOLVE THIS ISSUE EASILY.

BILL AND I THINK THE TASK FOR FRIDAY IS TO SURFACE ANY ISSUES THAT WOULD PREVENT USE OF THE BI ON NEBULA, MERCURY, HSC, L70 AND MICROVAX. SECOND, WE WANT TO ASK EVERYONE TO DO THEIR HOMEWORK FOR A WEEK LONG TASK FORCE MEETING IN ABOUT THREE WEEKS FROM NOW.

THE MAIN OBJECTIONS TO THE BI COME FROM THE HSC FOLKS. THEY SAY:

IT IS NOT DEFINED. (TRUE) IT IS TO SLOW. (NOT NECESSARILY SO, WE ARE THINKING ABOUT 10MB) IT CAUSES THEM TO CHANGE THEIR ARCH. AND PACKAGING STYLES. (TRUE, BUT THEN THE REST OF THE COMPANY CAN USE THEIR SUBSYSTEMS FOR OTHER THINGS. IF THEY ARE ON EXTENDED HEX THIS IS IMPOSSIBLE.)

PLEASE BE A LITTLE PATIENT. WE HAVE TO LIVE WITH THE DECISION WE
ARE ABOUT TO
MAKE FOR TEN YEARS. THE IMPORTANT THING IS TO RESOLVE WHAT IS THE
LEVEL OF
PARTICIPATION FROM HSC. IF THAT IS DONE, THEN I THINK WE CAN SPEC
THE BI OUT
IN A MONTH OR SO.

SENT BY WAYNE ROSING

Subject: BI

THIS MESSAGE IS FROM RALPH PLATZ.

I have been told that you believe that no action is in progress
relative to
the BACKPLANE INTERCONNECT. The contrary is true.

1) We have reviewed the initial concepts of the "Backplane
Interconnect" as
Rosing described them over the phone. (We have received no
documents.)
Blackledge from here and Strecker from Tewksbury have had a couple
of
technical discussionns on this topic. Blackledge has documented the
set ofof
issues that are of concern to us and has documented a proposal for
the BI.
Strecker is getting this document via phone connection -- (303) 576-
3811
[30,4] HSC password, filename = newbi.doc.

2) A teleconference call is sheduled for tomorrow between here and Tewksbury
so that we can discuss with the HYDRA and MERCURY groups what is commonly
acceptable and useful in a BI.

3) All day 4-May-79 is reserved for meeting with Rosing et al. in Tewksbury to
work on the BI definition.

Regards, Ralph Platz

From: Gordon Bell
Date: THU 26-APR-79 16:45:01 EDT
Subject: Backplane interconnect task force

I want to get this backplane settled down quickly. The goal I have is to use
Mercury and HSC to define it such that they use the identical backplane,
cabinet, , ps, modules for Pc, some Mp, K.ICCS, and common diagnostics for
this subset. K.disk and any bubble or ccd buffering and mass storage sw will
be unique.

I expect slip in HSC done this way, but Ibelieve the attendent commonality,
product longevity will result in a better product and cheaper and a smaller
engineering budget.

I am distyurbed at the behavior of platz and as John indicated, we want some
responsible Colorado-type design engineer in TW or wherever at the beginning
of the week to start work with the taskforce. As of now, I believ you should
regard the work on HSC as only a breadboard, but the programming,
architecture of sw etc. should remain totally intact.

I look forward to the review on Thursday and expect that this backplane and
packaging will be resolved along these lines.

Bill Demmer is responsible for the overall architecture of systems including
the interconnect and as such should be part of this loop.

Subject: BI Telcon with Platz, et. al.

We had a good conversation today and have resolved at least one way to
incorporate BI into HSC. We will keep talking daily and hope to have things
ironed out prior to Thursday.

There are other things that can be explored. (double buffered Kio) to make
things easier on the BI at the expense of more HSC redesign. We will also
explore these alternatives during the next week.

I've taken the liberty of inviting Strecker to your Thursday

meeting. Dave
Rodgers agrees Strecker and I will be the technical drivers from Tewksbury.

Have a nice day.

Preliminary Draft for Commment by Digital Engineering Community

HEURISTICS AND COMMENTS FOR BUILDING GREAT PRODUCTS

Gordon Bell, Vice President, Engineering

Product goodness is somewhat like pornography, it can't fully be described, but we're told people know it when they see it. If we can agree on heuristics about product goodness and how to achieve it - then we're clearly ahead.   Five sets of dimensions for building great products need be attended to (roughly in order of importance):

. a responsible, productive and creative engineering group;
. product and design metrics (competitiveness);
. design goals and constraints;
. product evolution, revolution and death; and
. the ability to get the product built and sold.

ENGINEERING GROUP

As a company managed primarily by engineers, groups are encouraged to form and design products. With this right, are responsibilities.

<u>The Team</u> must have:

. <u>a chief designer/chief programmer to formulate and lead</u> the resolution of the problems encountered in the design; No matter how large the project, it must be lead from a "single head". We often make two errors in leadership: having no clear technical leader/problem resolver, and abdicating to a committee.

Committees do not do design! They are never held responsible, nor are they rewarded or punished. Committees can review.

. <u>management who understand the product space and who has engineered successful products</u>; The two most important jobs are:
  . making sure that everyone knows their job; and
  . setting and reviewing work on a timely basis, ie. MBO.
. <u>team skills and resources to implement the proposal</u> so that we adhere to the cardinal rule of Digital, "He Who Proposes, Does"; A plan must include the chief designer, team, project organization and resources (eg. computers). Supporting skills and disciplines are essential in the respective product areas, eg. ergonometrics, acoustics, radiation, microprogramming, data bases, security, reliability.
. <u>an understanding of the design, design production (eg. CAD) processes, and manufacturing processes;</u> Learning curves apply to all processes! The organization must be staffed with people who understand the product, the design process (CAD and management discipline) and the production introduction process. One or two out of three isn't enough.

<u>Behaviorally</u>, the team must:
. <u>do it right the first time;</u> Being correct has the highest payoff everywhere: timeliness, quality, lack of rework, and mfg. cost.
. <u>execute the project in a timely fashion;</u> Virtually ALL of our projects are late because we start too late, don't get it done on time because some critical invention is required, take too long to get it introduced, etc. For the very long, very late projects, the failure is lack of planning, tools and organization. Finally, people burn out. This suggests we:
  . <u>limit projects to two years by a small team.</u> We often make an aggressive business plan, then hire the

team. They then find out they have neither tools nor technology to do the project.

. not predicate a project on scheduling inventions in the design, process and CAD areas. If we can't see how to do the work in 2 years, then let's not start the project! This means the product must be cut down to fit the tools, people and process. Advanced developement is to insure that we can do development.

. have a written design methodology that includes: all design processes in the form of manuals, design conventions, conflict resolution, criteria for task completion, PERT structure, etc.;

. be open and have external reviews, and clearly written product descriptions for inspection;

For new product areas, we require breadboards in addition to the above heuristics. When the product gestation time equals the generation time, a full advanced development effort is the only way to be successful.

. start small, be reviewed and grow on its demonstrated success;

. learn, in order to handle the increase in complexity that comes with technology. Until there's a formal sabbatical program, individuals would do well to consider taking the equivalent of a semester of technical courses each 10 years.

PRODUCT METRICS KNOWLEDGE includes:

. products for which there'll be no competitor;

. all product cost metrics (cost, cost of ownership, cost to operate and use);

. all product performance and cost/performance metrics; These are the goodness measures of a product and tell how easily it will be to sell, and if we have improved. Cost and performance is measured against a state-of-the-art line represented by the first shipment of a more advanced product. Alternatively, when there's no direct comparison, the time goodness is determined from the day the product could have shipped. For example, because of parts availability, Nebula and CT could have shipped two and three years ago based on component availability.

. reasons why the product will succeed against present and likely future competition; sure success in the market is to introduce a needed function (eg. 32-bit address) by which all other products have to be measured.

. major competitor products by cost, performance and functionality; This should cover the past and future five years.

. leading edge, innovative, small company products;

. productivity, quality and design process metrics for projects.

DESIGN GOALS AND CONSTRAINTS

Design constraints are generally set as various kinds of standards. These are useful because they limit the choice of often trivial design decisions, and let us deal with important free choices, the goals. Goals are vitally important because they target our uniqueness.

Poor "mind-set" standards can create poor products, even though they may have made sense at one time. The historical English measures is a good case in point. Currently, the 19" rack and the metal boxes Digital makes to fit in them, and then ship on pallets to customers, act as constraints on building cost-effective PDP-11 Systems. This historical "mind set" standard often impedes the ability to produce products that meet the 20% per year cost decline curve.

. Goals and constraints must be written down and updated from the day the project starts. Virtually every product failure and period of product floundering is a result of no clear goals and constraints since everyone has a different idea of the product.

. A product can only have a few goals and constraints. The ranking is usually: it must work and have improved cost of ownership, be the shortest time to market, highest performance and lowest cost.

We must adhere to standards which we either follow or set!

. If a standard exists, follow it or change it for all! We lost the IEEE Floating Point format. It is likely we will eventually have to support it.

. If a standard is forming go all out to set it. When formed, then follow it. We didn't make DDCMP a standard. When HDLC came, we didn't use it. The result: expensive, low performance products.

Standards can be grouped into four distinct sets:

. DEC Engineering Standards; These cover most physical structures and design practice for producibility, and assimilate critical external standards, such as UL, VDE, and FCC.

. professional society, industry and area information processing standards, from EIA, CBEMA, ECMA, ANSI, ISO etc. such as Cobol '74, Codasyl, IEEE 488;

. defacto industry wide information processing and communication standards such as IBM SNA, Visicalc;

. standards implied by the architecture of existing DEC products to insure our customer software investments are preserved include:

  . architecture of computers, terminals, mass store and communications links; Our current ISP's include 8, 11's, 10/20, VAX, 8048, 8080, 8086, 68000; VT52, VT100, keyboards, Regis; MCP; HDLC, CI, NI, SI.

  . physical interconnect busses for computers and for interconnecting them CT, Q, U, NI, CI, etc. These insure that future system products can evolve from component and computer options between generations.

  . operating system interface file commands, command language, human interface, calling sequence, screen/form management, keyboard, etc.

. <u>Products must be designed for easy translation into in any natural language since we are an international company.</u>

. <u>All products must have be customer installable and maintainable.</u>

. <u>Portability is an important goal.</u> Personal computers must be portable! We must achieve this for all systems ASAP!

WHEN TO CREATE, WHEN TO EVOLVE AND WHEN TO STOP PRODUCTS

Engineering is responsible for designing evolutionary products in our markets AND for producing products that are natural to our tradition of supplying the most interactive, cost-effective computing. If a new product such as personal computing emerges and we do not have a product, engineering has failed, independent of being asked for it!

Given all the constraints, can we ever create a new product, or is everything just an evolutionary extension of the past? If revolutionary do we know or care where product ideas come from? The important aspect about product ideas is:

- **<u>Ideas must exist to have products</u>! If we don't have ideas to redefine or extend a market, then we should not build a product.**

It is hard to determine whether something is an evolution or just an extension. The critically successful products are likely to occur the second time around. Some examples: PDP 6,KA10,KI10,KL10,2080; Tops 10,Tenex,TOPS20; PDP5,8,8S,8I/L,8E/F/M; OS8-RT11; 11/20,40,34,44; RSX-A... M, M+; TSS-8,RSTS; various versions of Fortran, Cobol and Basic follow this; LA30,36,120; VT05,50/52,100, 101 etc.; RK05,RL01/2.

- <u>A product tree MUST be maintained by each engineering group</u> showing roots, gestation time and life.

<u>Goodness and Greatness</u>

All products whether they be revolutionary, creating a new base, or evolutionary, should:

- <u>be elegant and high quality;</u> Russ Doane's working definition is: "every feature contributes two benefits", like a double pun. Quality means no excess. Elegant, high quality designs, do double duty with a minimum use of resources. Quality is also the absence of errors, by being right the first time so that it doesn't have to be inspected or redone.
- <u>offer at least a factor of two in terms of cost-effectiveness over a current product</u>; We have classic failures because a CPU cost has been minimized, only to find the total system cost has barely changed 10% and the total cost to the customer is only 5% lower! If each product is unique then we will have funds to build good

products.

. <u>be based on an idea which will offer an attribute or set of attributes that no existing products have</u>; For example, the goals and constraints for VAX included factor of two algorithm encoding and also offering ability to write a single program in multiple languages. VT100 got distinction by offering 132 columns and smooth scrolling.

. <u>build in generality, and extensibility;</u> Historically we have not been sufficiently able to predict how applications will evolve, hence generality and extensibility allow us and our customers to deal with changing needs. Extendable products also permit mid-life kickers to products. We have built several dead end products with the intent of lower product cost, only to find that no one wants the particular collection of options. In reality, even the $200 calculators offer a family of modular printer and mass storage options. For example, our 1-bit PDP-14 had no arithmetic ability, nor could it be a general purpose computer. As customers used it, ad hoc extensions were needed to count, compare, etc. and it finally evolved into a really poor, general purpose digital computer.

. <u>be a complete system, not piece parts</u>; The total system is what the user sees. A word processing system for example includes: memory, keyboard, tube, modems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes.

. <u>be a great system because the components are great;</u> We should not depend on system markups and software functionality to cover poor components and high overhead.

. <u>if we don't make it, buy it</u>; We must carefully decide what components to make versus buy. It is very hard for an organization to be competitive without competing in the marketplace, hence unless we sell it, we should buy it.

<u>Product Evolution</u>

A product family evolution is described on page 10 of Computer Engineering along the paths of lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

- <u>lower cost products require additional functionality too</u>; A lower cost product, with constant performance or constant function is risky because a new customer base and new way of marketing may be required. Some other company may, however, be successful with the concept. The PDP-8, based on new technology, was radically more successful than its higher priced predecessor, the PDP-5, because it was 2/3 the price and 6 times more performance. The PDP-8/S was a failure at 2/3 the price and 15 <u>less</u> performance than the PDP-8. There are similar stories about the LA 34, VT50/52 and PDT as replacement products.
- <u>constant cost, higher performance products are likely to be the most useful</u>; Economics of use, the marketing channel and customer base are already established and a more powerful system such as the LA120 will allow higher productivity (see Computer Engineering for the understanding and economics). In the 11's there was a successful evolution: 20, 40, 34 anChied 44. Not the 60. The 11/70 was probably our greatest success; it was billed as a mid-life kicker to the 11/45-55.

<u>Revolutionary New Product Bases</u>

- <u>A new product base,</u> such as a new ISP, physical interconnection, Operating System, approach to building Office Products, <u>must start a family tree from which significant evolution can occur.</u> The investment for a point product is so high that the product is very likely not to payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family. Point products with no follow-on will probably fail all roi tests.

<u>Product Termination</u>

- <u>A product evolution is likely to need termination after successive implementations, because new concepts in use have obsoleted its underlying structure.</u> All structures decay with evolution, and the trick is to identify the last member of a family, such as the 132 column card, and then not build it. This holds for physical components, processors, terminals, mass storage, operating systems, languages and applications. Some of the signs of product obsolescence:

- It has been extended at least once, and future extensions render it virtually unintelligible.
- Better products using other bases are available.

SELLING AND BUILDING THE PRODUCT

"Buy in" of the product can come at any time. However, if all the other rules are adhered to, there is no guarantee that it will be promoted, or that customers will find out about it and buy it. Some rules about selling it:

- it has to be producible and work, AND be useful to software; This, although seemingly trivial rule, is often overlooked when explaining why a product is good or not. If it is a piece of hardware that requires software to support it, the hardware must be available to the programmers who must support it. Software engineers approach new hardware with much caution! The often ask: is it significant? is it needed? why isn't it compatible with the past? If a hardware is viewed with distrust by software engineers it may be met with the same distrust by customers!
- a business plan with orders and marketing plans from several marketing persons and groups needs to be in place; Just as it is unwise to depend on a single opinion in engineering for design and review, it is even more important that several different groups are intending to sell the product. Individual marketers are just as fallible as unchecked engineers. This rule can and must be violated for revolutionary products!
- never build a product for a single customer, although a particular customer may be used as an archetype user; predicating a product on one sale is the one sure way to fail! Paraphrasing a remark by former GM executive Charles Wilson: if it's good for General Motors, it may only be good for GM.
- it must be done in a timely fashion according to the committed schedule, price and functions as previously described;

. <u>it must be understandable and easy to use</u>. The small size, complete hardware books were the DEC trademark that established the minicomputer. We must revive these such that a particular user never need access more than one. Simplicity must be the rule for our documentation.

What heuristics are missing? What heuristics do you disagree with?

What heuristics could be removed? reordered?

Could I please have your feedback before this becomes a final draft?

New BASIC look good. Let's get all the stuff necessary to pre-announce/demo/etc. at fall DECUS.

Gordon

Command >

BASIC CPU - SLIDE 1

GET TINY - USE IN MAKING SMART TERMINALS AND CONTROLLERS AND PROTECT

OUR FLANK FROM THE MICRO SUPPLIERS (MORE OEM'S ARE ASKING

FOR PDP-11 ISP COMPATIBILITY).

GET FONZ - PROVIDE 11/34 FUNCTIONALITY AT SIGNIFICANTLY LESS COST

WITH SLIGHTLY LESS PERFORMANCE (2 CHIP CUSTOM NMOS/LSI FOR

USE IN BOARD AND SYSTEM APPLICATION) FCS/Q379, TRANSFER

COST $60 IN FY79 GOING TO BE $30 IN FY82. PROTECTS

AGAINST SYSTEMS BUILT ON 21 BIT MICROS.

CANCEL - SINGLE MODULE, LOW COST(?), 11/04, LOW LEVEL 34

UNIFONZ REPLACEMENT USING FONZ CHIP SET--CANCEL WITH THE

ASSUMPTION THAT LOW END (NON-UNIBUS) SYSTEMS CAN MEET THE

MARKET NEED. APPEARS TO BE OEM PRODUCT ONLY SO USERS CAN

PRESERVE UNIBUS OPTION DESIGN.

GET 44 - TOP END OF 11/34 MARKET WITH GREATER FUNCTIONALITY AND

PERFORMANCE AT 11/34 COST. ALSO ADDRESSES LOW END OF

11/70 FUNCTION MARKET AT LOWER THAN 11/70 COST. PROVIDES

MORE EFFECTIVE TRAX VIA INCREASED ADDRESS SPACE & CIS.

CANCEL 48 - TOO FAR OUT (FCS 82) FOCUS PDP-11 DEVELOPMENT EFFORTS ON

11/44, 11/68, F11 AND T11.

BASIC CPU - SLIDE 2

GET 68 - MAJOR ENHANCEMENT TO 11/70 CLASS PRODUCT; USE AS HEDGE

AGAINST ANY SLIP IN COMET OR VAX AND MARKET ACCEPTANCE.

PROTECT AGAINST HOT NEW DG MACHINE (= 1.3 TO 1.6X11/74.

FCS=Q4/FY80. TRANSFER COST = 5-6K.

CANCEL MINNOW - MINNOW HARDWARE ALLOWS TOPS-20 TO BE RUN ON AN

11/68/COMET PRICE LEVEL MACHINE. MINNOW IS A BOUNDED

SYSTEM APPROACH. FOUR BOARDS IN AN RM03 TYPE CABINET.

ONE CPU, ONE DISK CONTROLLER, AND TWO 256 KWORD MEMORY

BOARDS. RL02 DISK GOING TO R80 LATER. PROTOTYPE

WORKING IN FY79, TARGETED FCS IN FY80.

CANCEL 74 - MINOR ENHANCEMENT TO 11/70 (FCS Q3/FY79). (1 TO 2 TIMES

11/70) TRANSFER COST = 15K. NEW MARKET OPPORTUNITY.

CANCELLING AVOIDS FIELD TRAINING REQUIREMENT AND NEED FOR

FIELD SPARES. DEPEND ON HYDRA 32 BIT MULTIPROCESSOR EFFORTS.

GET COMET - 65% OF STAR PERFORMANCE AT 35% THE COST BY FY80.

GET HYDRA - 32 MULTIPROCESSOR EFFORT, OPENS NEW MARKETS.

GET SUPER STAR - TWICE STAR PERFORMANCE AT 65% THE COST.

GET DOLPHIN - ENHANCE CURRENT PRICE LEVEL IN VAX SUPER STAR AND 10'S.

ALSO ENHANCES KL10 RELIABILITY FEATURES.

BASIC PRODUCT STRATEGY

Provide a set of homogeneous distributed computing system products so a user can interface, store information and compute, without re-programming or extra work in many styles and the following computer system sizes:

- .as a single user computer within a terminal;
- .at a small, local shared computer system; or
- . via a large central computer or network.

Achieve a single VAX, distributed computing architecture by 1985 (as measured by revenue)through:

- . focusing on homogeneous distributed computing with varying computing styles including high availability and ease (economy) of use as the DEC advantage;
- . building new 11 hardware to fill the product space below VAX;
- .building new 11 software products that also run on VAX; and
- . developing software for 11-VAX migration and 11 user base protection.

Provide essential standard IBM and international network interfaces.

Define, and make clear statements internally and to our users about programming for DEC compatibility.

Provide general applications-level products that run on 8, 10/20 and 11/VAX-11 above the language-level to minimize user costs, including:

- .word processing, electronic mail, and profession-based CRT-oriented calculators;
- . transaction processing and data base query;
- . general libraries, such as PERT, simulation, etc. aimed at many professions that cross many institutions (industry, government, education, home); and
- . general management libraries for various sized business.

Provide specific profession (e.g. electrical engineering, actuarial statistician) and industry (e.g. drug distributor, heavy manufacturer) products as needed via the product line groups.

Provide cost-effective 8, 10/20 systems through:

- . building hardware that runs current operating systems; and
- . making market support and DEC-standard language enhancements.

This strategy is intended to cover the full range of DEC's future products. Since technology shifts rapidly and market opportunities emerge that we don't now understand, it may be necessary to provide non-compatible, point products. These should be proposed and reviewed accordingly.

Essence and Rationale of the Strategy

The essence of the strategy is simplicity through adopting a single architecture. This simplicity is needed so that we can build the network and distributed processing structures which our customers are now demanding. The strategy is an evolutionary result of the 1975 choice to extend the 11 architecture and cover its customer base.

Given that the architecture and early customer acceptance are in place, the strategy moves to build our subsequent products on VAX, while continuing to sell 8's, 10/20's and 11's. Focus is imperative in order to avoid the redundant development efforts across base hardware and software, and to move development to fully distributed computing and to applications. The strategy also minimizes manufacturing and field start-up costs and takes advantage of the learning effect by moving to a single architecture.

The motivations for the homogeneous architecture are numerous and include the customer desires for a range of products on which to build products (in the case of OEMs) and applications (in the case of end users). Such a range in size and over time, allows planning and investment of software and it permits computers to be associated with various organizational units (eg. central group, small group, office, the person, or the home) on an "as needed" basis. Although, superficially it appears to be possible to have numerous architectures that are segmented by size and by market, the user requirements to cross both size and applications boundaries are significant. In fact, given that IBM is segmenting its products both by size and application, the main strength of the strategy is to have a single architecture with which a user can be comfortable rather than bounded by a manufacturer segmentation.

The most compelling reason for basing the strategy on the single VAX architecture, besides the technical excellence of the product is the belief that we can not build the truly distributed computing system of the 80's with heterogenous architectures. It is possible to build distributed computing networks as we do today, but the homogeneous architecture approach insures that programs may be assigned to any node, where they will give the same results. There is no need for the organizational and computation overhead signified by different manuals, separate training, recompilation of programs, and translation of data among machines in the network.

This strategy is aimed at beating the competition using our existing highly tuned minicomputer hardware and software to support and grow our existing user base. It provides us with a unique offering in the marketplace of the '80's which is likely to be based on the defacto standard IBM 360/370 architecture and the ensuing defacto architectures coming from the semiconductor companies. Since VAX is fundamentally better than either of these architectures, we must make it the standard architecture via transition from the PDP-11, which has been the standard architecture of the 70's.

The strategy is aimed at high volume through multiple channels of distribution, versus a more stable, low growth through support of an existing multi-system, customer base.

How Can We Win Against IBM?

A competive viewpoint is the most important check on strategy. Both the recently accounced IBM 8100 Distributed Processsing system and the System 38 computers are the first computers from IBM that, on the surface, look worth owning. They may be as significant as the 360 and their Selectric typewriter. The System 38 with a 48-bit virtual address is technically unique and may offer the user some very large benefits.

The 8100 is a radical departure from IBM pricing as 0.5 Megabytes of primary memory and a 60 Megabyte disk are $ 29 K. A comparable DEC product sells for several times this now. The 8100 is exactly in the price range of the systems we sell and where we make most of our revenue. It is the second product in this price range within a year; the Series 1 minicomputer family patterned after the 11/04-11/34 was the first product. On the surface, the product is low priced, with lots of capability, but it also has a new communications structure (versus the one we have used substantially unchanged since 1961). This structure permits easy peripheral and terminal interfacing for both the office and factory environment. There is an extensive range of peripherals, terminals and communications to the 360/370. Since the product is sold by DPD, the strategy seems to keep account control and to make the money on the numerous locked-in, generally overpriced terminals.

IBM will have: a 360/370 line in the $100 K to $10 M price range with lots of plug compatible competitors, several operating systems to support, a large backlog, a newly announced 8100 for Distributed Processing around the mainframe; a System 32/34/38 for Distributed Processing and as a Mainframe for small organizations; the Systems 3 to 15 for Distributed Processing; the System 1 for the would-be minicomputer buyer; the 5100-series Personal Computers for the scientist, engineer, analyst and small business; and several inevitable products for computing in the terminal. All of these are incompatible, except for a communications link and the fact that they all use the 8-bit EBCDIC byte. Products are relatively segmented to customer clauses and different languages are used to further segment and hinder application mobility. Finally, they've sold via DPD and GSD, with Office Products no doubt looking on and waiting for an entry via electronic mail and word processing.

While on the surface, the 8100 stands to be IBM's most significant product, it seems to be a serious mistake as it introduces another incompatible computer system with which customers will have to deal. This means that the making of a compatible, fully distributed processing system will be essentially impossible. However, since IBM feels it can not move very rapidly in any product space because of the installed base, product options are limited. Hence new products seem to be highly targeted at specific, new non-IBM markets in an incompatible fashion to get incremental revenue and growth.

How Can We Win Against Other Competition?

There are established competitors too, such as DG, HP and Prime. DG and Prime have very simple, single architectures and have been most profitable and have grown most rapidly. HP is converging on a single architecture around the 3000, but it will have to be extended eventually. The NOVA will also be extended. The large manufacturers (Univac, Honeywell and Burroughs) which operate with an established base are less profitable, have grown slowly and have multiple, poor architectures. Honeywell, with a simple, but adequate minicomputer architecture seems to be doing well by selling minis to its old line, mainframe base. There is no evidence that they're developing or pursuing the mainframe business actively.

There are probably more significant threats from the companies that can be easily founded to build systems into disks by using the newly announced zero-processor-cost, 16-bit microprocessors which have 22-bit address spaces and the performance of the 11/34-11/45. All of these architectures need to be extended for multiprogramming and to handle larger virtual memories. High level systems, functionally equivalent to our systems such as RSTS can be built easily and cheaply and can quite possibly target a specific existing, trained user base.

There are also the Japanese and TI which can be lumped together because of their similar behavior. Both believe in targeted, high-volume products with forward pricing. Neither have an adequate architecture. TI is strictly limited to 16-bits with almost no escape, and the Japanese are aimed at copying, using U.S. companies to distribute hardware. It's inevitable that they'll supply IBM compatible 360/370's to the Service Bureaus for distribution. This later channel of distribution is another formidable competitor.

The strategy supports very high volumes for dumb, pre-programmed (smart) and programmable (intelligent) terminals using the 11 until VAX is appropriate in terms of price and functionality. In the mid and high priced minis, the strategy is compatibility and volume, phasing as appropriate from 11 to VAX. For example, since there is not a high priced 11 after the 11/74 and the 11/44, there is a phasing to VAX (through COMET) and lower priced 11's based on 11 microprocessor implementation. The question here will be how fast we can provide high performance microprocessors using HMOS and narrower line VLSI technologies.

PRODUCTS IN 1981-82

HARDWARE COOMPONENTS

HMOS LSI, with first "test" product

Interconnection hierarchy with software compatibility
1-10 Mhz and/or 10-100 Mhz inter-computer bus ICCS
50+ Khz comm.-compatible multidrop for terminals, peripherals, and small systems;
0.3-19.2 Khz comm.-compatible for low cost terminals.

Significant competitive memories
Solid state modules for software
Low end floppies and low cost tape
Removeable and low cost disk RL04
Hi-volume mid- and hi-end disks in R80/R81 with backup

Terminals for everyone!
Low cost (dumb) and block mode (VT162)
Office environment for quality printing, electronic mail, and full-page text
Professional using graphics (and/or color) with target application software
Factory environment terminals and interface systems

HARDWARE SUBSYSTEMS

Remoteable printers, job entry, concentrators, sensor-control
Communications concentrator - Mercury
Memory (Hierarchy) Management - HSC50
for R80/R81, RL04, tape and disk cache

KERNEL SYSTEMS based on processor-disk-communications (see family tree figure)

780 replaced by Superstar (const. price >3x

performance)

780 - Memory Manager - Comm. Concentrator

780 - Multiprocessor

780 - RP/R80-81 + RL02-04

780 - RK/RL04

Comet - RP/R80-81 + RL

Hydra (Including Memory Manager - Comm. Concentrator)

Nebula - R80-81 + RL

Nebula- RL02/RL04 (higher cost, quick to market personal computer)

LSI VAX - RL04 - Graphics Terminal (personal computer)

11/74 with no hi end replacement

11/74 - multiprocessor

11/74 - RP/R80-81 + RL02-04

11/74 - RK/RL04

11/44 replaced by HMOS LSI-11 with >256 Kbytes

11/44 -
RP/R80-81 + RL

11/44 -
RL

11/23 -
Unibus Fonz RL replaced by HMOS >256 Kbyte

11/22 -
Q-Fonz RL

11/22 -
Q-Fonz - RX (floppy)

PDT Fonz - RX (floppy)

PDT Fonz - TU58

Tiny chips, replaced by HMOS tiny <256 Kbytes

SOFTWARE

Diminish the 11 software investment for mature products (RSTS, IAS, MUMPS) and provide only minor enhancements to recent 11 based products (TRAX, SCS-11, PDT Software) to extend the market life and limit the VAX transition risk. Orient new development on VAX and 20 toward IBM compatibility and explicitly invest in tools designed to permit easy customer movement between VAX and 20. DEC 20 development will be aimed at high level tools and applications support. Shift the bulk of the PDP-11 software investment to VAX, tracking VAX hardware and aggressively moving to round out commercial capability.

Develop a single VMS operating system to span the product range if technically and operationally feasible; "low end" products will mask the VMS capability for the unsophisticated users or, if efficiency demands, new code compatible at all interfaces with compilers and utilities will be developed. VMS will offer full mainframe capabilities allowing concurrent batch transaction, processing, and time-sharing, along with limited real-time.

- Provide superior data-base capabilities in the two - three year time frame.

. Focus on data access and data manipulation tools for the non-programmer, heavily based on graphics terminals.

. Provide word processing and electronic mail as applications on the general purpose VAX systems.

. Data integrity will be a feature available independent of high-availability (non-stop) operation through Hydra.

. High-availability (Hydra) will be a standard attribute of VAX systems at the customer option.

. Fire-wall funds to stimulate acquisition of cross-industry applications packages. Provide industry specific applications via internal development or acquisition. Leverage field resources by investing heavily in product quality assurance and self installing systems capacity including remote software update and diagnostic strategies.

. Move systems-level code for 11 based software (SCS-11, TRAX) to VAX compatibility mode if technically or strategically viable (under investigation now) otherwise provide user-level compatibility via native mode VMS layered products.

. Shift DECNET strategy to strong IBM interconnect and VAX binary image compatibility for distributed processing; constrain PDP-11 DECNET FUNCTIONALITY EXTENSIONS, speed up DEC 20 network capabilities.

. Converge on ease of DEC 20 to VAX movement through common language definitions, (common implementations where feasible) common user-level utilities and data conversion routines. For each new DEC 20 or VAX customer, as time progresses, make the movement between systems more attractive.

BASIC SOFTWARE - SLIDE 1

RT-11 - ROLL BACK TO AN EASY TO USE, SINGLE USER SYSTEM THAT DOESN'T REQUIRE SYSTEM BUILDING, PUT SUBSETS OF RT INTO ROM.

SCS-11 - GENERAL PURPOSE LOW END COMMERCIAL O/S FOR USE WITH 11/44 SYSTEM (AND U-FONZ)???

RSX M, M+, S - STOP M+ WORK FOR 11/74 SUPPORT, ENHANCE M O/S FOR REAL TIME MARKET NEEDS ONLY, DON'T ENHANCE M O/S FOR COMMERCIAL MARKETS, FIRST PRIORITY IS FOR REAL TIME LANGUAGE AND DATA SERVICES CAPABILITY; SECOND PRIORITY IS RELIABILITY AND EASE OF USE; DELAY OR CANCEL LANGUAGE AND DATA SERVICES INVESTMENTS ON M, M+, AND S.

TRAX-11 - CONTINUE TO ENHANCE AS A UNIQUE PRODUCT OFFERING INTO THE TRANSACTION PROCESSING MARKET. FOCUS ON BETTER APPLICATION TERMINAL CAPABILITIES; E.G., MULTIDROP.

BASIC SOFTWARE - SLIDE 2

RSTS - USE AS GENERAL PURPOSE PDP-11 TIME SHARING. ANSWER THE QUESTION THAT CURRENT RSTS USERS ARE ASKING--I.E., HOW CAN I MOVE DEVELOPMENT OF NEW APPLICATIONS TO VAX? DON'T DO DEVELOPMENT WORK THAT WILL MAKE RSTS CONVERGE WITH TRAX; E.G., DBMS, BETTER APPLICATION TERMINAL HANDLING.

IAS/RSX-D - NO O/S ENHANCEMENTS, THE ASSUMPTION IS THAT THE SYSTEM IS COMPETITIVE NEAR TERM REAL TIME AND MULTIFUNCTION MARKETS; ONLY ADD THOSE LANGUAGES AND DATA SERVICES (DBMS/RMS) THAT REQUIRE ONLY INTEGRATION AND TEST.

VMS - AGGRESSIVELY FOCUS O/S ENHANCEMENTS TO SUPPORT; (1)HYDRA NEEDS, (2) SATISFYING REAL TIME NEEDS, (3)COMMERCIAL EXTENSIONS, (4)DATA MANAGEMENT.

T10 & T20 - NO O/S ENHANCEMENTS, ONLY IMPROVED PERFORMANCE RELIABILITY

AND INTERCONNECTIVITY VIA DECNET.

Subject: **Basic Corporate Product Development Strategy**

To: OOD, OOD Direct Reports, Corporate Meeting Attendees

Date: 18 OCT 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up 11/1/78

The attached slides were presented at the corporate meeting on October 13, reflecting our main product direction. These support what the Operations Committee has decreed to be our key product development goal:

> Provide a compatible set of VAX and 11 distributed computing products so a user can compute (in a transparent fashion) in any of the following styles and sizes without reprogramming (or extra work):

.As a single user within terminal

.Small, local shared system for a group

.Large system serving several

groups

As you can see the theme is:

.Simplicity (of base hardware and software architecture)

.Distributed processing like no other vendor now, or is likely to provide (especially IBM)

. Terminals for everyone, with compatible computers placed appropriate to the task or organization

Any comments?

SUBJECT: 2400 BAUD SEEMS LIKE ENOUGH

For the first time since using EMS, I am over my frustration with line speed. There are some things to tune up here to make it go faster from screen to screen and to make sure a whole screen can get up if things are close. (Remove the last line with the instructions as how to move ahead...and compress the header.)

From my standpoint, I was considering giving up on EMS and getting an operator. (I submit that the secretaries are about 6 months short of rebelling because of the time it takes compared with conventional mail.) To me, the way around EMS for most people is to simply go and ask for a dump once a day and get it printed and then go and mark somehow quickly what is to be done with each document and then go in and deal with them as quickly as possible. My guess is that they are just leaving them in the system and that there are two files READ and SENT. Namely, they are using it like a TWX.

I can now see the possibility that the system can work and save time. It has to compete with me plowing through a stack of paper documents and throwing them in the waste basket...still I can type CR, (possibly Control Z), D, CR, CR pretty fast. But having the whole page come up in the same time it would take me to bring it up form a stack of papers is the key. I do find it satisfying to type D, CR, CR, CR and knowing that my pointer is removed and that no one has to file, dispose, or otherwise deal with the information that was there.

Stamford, Conn. 06905

Dear Mr. Greathouse:

Jim Cudmore gave me your request of the IOSA 9-11 June 1980. Clearly semiconductors are an important component of IOSA as they determine when and whether each of the systems you are examining can exist. It would no doubt be useful to get someone from the 8 semiconductor industry to speak at this seminar.

I regret that Jim nor I can participate in your seminar.

Sincerely yours,

Gordon Bell

SUBJECT: BEIGE BOOK REVIEW

The review was quite informative. It was an overview. Thanks.
We exchanged some views, and I'd like the following:

1. Send me informator later resolutions.

2. Action on your part

3. Minutes of the meeting with action items.

Please schedule another meeting which is in line with the original
request. Let's concentrate one hour on each technical area.

Please proceed to produce a Red and Beige Book that's in line with the
rest of Engineering.

The Red Book should contain our technology position in each area,
together with goals for next few years, and a description of where
each technology and service goal will be.

The Beige Book would have the project plans (3 years) that achieve the
strategy.

CC: Paul Bauer
From: Gordon Bell
Date: SAT 23-JUN-79 11:20:41 ED
Subject: Beige Books for R and D, EIS and Engineering Services
----
Let me be positive. The information contained in these books is probably
necessary... and should remain in them, perhaps as an appendix. I'd sure like
us to use the simpler organization charts because these take up lots of space
and I can't see them all on 1 sheet and obviously we have too much
secretarial and other capacity becuse they have to waste times putting boxes
around everyone. But that's not the issue.

There were absolutely no performance metrics. These areas are key to our
future and to our success. Our users continue to always stretch the
capabilities that are available and then bitch about the poor response ttime.

Without some performance metrics and with the high degree of central
management that is exerted here, we will have the same situation.
Furthermore, we will probably get longer and longer lklead times. I would like
each of us to go over these books so that we can help them put together
metrics that are meaningful so that we know how we are doing over time and
where we have to get to.

Let's make the next Stratton devoted to our processes.

Subject: LCG Beige Book
----

1) We are currently funding the conversion of the 10/20 APL towork under VMS. The FORTRAN 10/20 funding is to make FORTRAN 78 compatible with VMS FORTRAN.

2) There is about $700K allocated for loosely coupled systems in TOPS-20. We are also doing DECnet under TOPS-10 in order to be able to communicate with the rest of DEC's products. The long term strategy is also to have TOPS-10 part of the loosely coupled networks. The only thing that we have not funded at this point in time is the COBOL-68/74 conversion aid to COBOL 79/VMS.

3) I have asked for evaluation of the KL10 CIS proposal to find out if we should implement it or not.

4) Extended Exponent is in deed being funded by ESG as part of the commitment to Phillips. There is no way we can get out of that commitment. I was personally part of making that commitment two years ago when I was in the ESG product line.

5) We have been using extended addressing in the monitor for about a year. and we will in deed support extended addressing in MACRO-20. Extended addressing will not be used anywhere else.

6) Red Book vs. Beige Book

The model we are working under is that the Red Book sets the
strategic direction and the Beige Book is Engineering's quote on
implementing the strategy. As of today the Beige Book does not reflect
completed the Red Book strategy.
In the Interconnect area the major task I see coming up for us
is to make sure there is a corresponding commitment on the VMS side to
the coexistence Interconnect strategy.

EMS   25-JUN-79 10:50:38 250 1
To: Ulf Fagerquist, Per Hjerppe
CC: Bill Johnson
From: Gordon Bell
Date: MON 25-JUN-79 10:50:38 ED
Subject: June 5, 1979 LCG Beige Book

I'm having trouble understanding how Software Co-existence is going to occur
if there are no projects to do it. It feels like CIS, Ext. FP are still as
strong as ever. Is 30-bit address space in too? I can accept the
direction...but worry about doing about the same for less.

Follow-Up: 7/5/79

Gordon

CC: Ulf Fagerquist, Per Hjerppe, Bill Johnson, Ron Bingham
From: Dick Snyder
Date: MON 2-JUL-79 08:15:27 ED
Subject: TOPS/VMS Co-existence

What Per forgot to mention on this subject is that LCG Software Engineering
was funded $200K out of the central SE budget for coexistence/migration. We
are using the money to cause the implementation of the Data INterchange
Utility so that we can convert files back and forth between a 36 bit and 32
bit host and more importantly so that we can do record level access between a
32 and 36 bit host. The approach here is that a guy will buy a VAX to offload
his 10/20 and will want to put new applications on the VAX which will still
need to get at data files on the 10 or 20 while the 10 or 20 is still using
the files. Hence the very important need for record level access.

SUBJECT: BEIGE BOOK - WHETTED APPETITE

Was impressed by quality of Beige Books. Unfortunately they whetted appetite for just a few more numbers, which I hope

are
already available. They are:

1. Computer resources measured some way, both in terms of machines installed and projected to come in or are on order. This would be equivalent to a flow, and to a balance sheet in much the same way expenses and capital are measured. Note, it
should show how intensive we are. Also, I would like to know
the intensity of terminals for our various engineers including
those at home, and how much they use the machines. Rather than
spending a lot of time digging, show what data you have that you
use to manage this resource. If you are unhappy with what information your're using then show the metrics you would like to
use some day.

2. Mix of people into some reasonable cuts that reflect direct
engineering and overhead. This will vary with organization, but
I'd sure like to see what's happened over the last few years and
what we project in terms of direct engineers versus integrators,
managers, etc. This could be plotted on absolute and % mix basis
and should be really trivial, given the space, people and $'s you
have already.

Am anxious to have the reviews, cause I like the books.

Gordon

GB1.S6.31

I don't like to do research because I'm basically an engineer and need the closer in gratification. When I do (did) it, it was mostly because I'd convinced myself that it was just a high risk project. I like catalyzing research because I think I understand when research is needed versus straight forward engineering. My attention span is short now.

I'm sad that I stopped engineering products, but I was bored then, and the company wasn't and may not be big enough to let me go after the risky projects that I'd like to do. My interests have gotten too broad for a long project.

I like problem solving of two types: structuring very complex problems into clear, group size efforts in a taxonomic fashion; and individual sized problems where I can formulate and solve the whole problem. Computer and Human (Organizations) Information processing systems are quite similar.

Small problems (eg. a paper, speech, some product parameter, a new way to describe systems, Venus, Epip or FTA, Microvax, licensing chips) are what keep me going because one gets enough gratification to work on the big ones.

The big systems are also satisfying and include: the product strategy; restructuring product flow across the company; the engineering organization and how to make it operate at peak efficiency; computing from B.C. to 2001.

I like being a technical leader, mentor and sponsor.
I appreciate management, and would like to work with the best possible management leader and mentor in getting effective engineering management.

Everything must be written down. Ambiguity can only exist for a short time. Inner directed engineers hate the verbal.

I hate personal politicing, ie. having to get buyin on a one on one basis. I really want to be able to say "do it" because this ultimate weapon really speeds convergence. I like to fight evil, greed, obesity and incompetence, I ignore it in the world except on very rare occasions, I harass those within DEC when I see it, and I won't tolerate it in the engineering organzation.

ADMINISTRATION After substantive goals are set, then getting the resources to carry them out involves too much hassle whether it be space, equipment, personnel, or capital equipment. I don't like to be directly responsible for routine processes (eg. signing reqs, forms) and seeing that we stay on budget.

TIRING BUT NECESSARY Reviewing group effectiveness, going over people and the organization, hiring. I like the content of reviews and the contract setting, but I don't have the energy to push routine processes. Therefore I want help.

OVERALL I understand and can invent information processing systems and processes. I don't like the routine of implementing and operating the processes, but like to participate when the focus is on content and not form. Personal problem solving is an essential reward to me for managing.

I want to continue to run Engineering during these radical transitions.
I believe I understand computing and want to continue to lead us here.

B200.82 Mileage reader, Analog Calculator, 2-3 part, Integrator, Mechanical, ca 1950,
35 mm diameter; 112 mm with handle, Chrome, glass, and paper, Buy, Portobello Rd, 33 (82), D-Bells.
This mileage reader was clearly made for scientific map distance readings. On one side there are scales for 1:2000; 4000; 8000; and 10,000. On the other side the scales read 1:25,000; 50,000; 75,000; and 200,000.

B201.82 Chambon & Baye, 1 "TACHYLEMME" Table, Writable or Readable Memory, Mechanically stable,
Cyclic, Craft, ca 1880, France, 175x100x35 mm, Black, Glass, wood, sliver plate and paper, Buy, Delahar, 260 (82), D-Bells.
A calculating device with four printed cyclinders 1-9; 10-90; 100-900; and 1000-9000 so arranged that percentages for every half percent from one to six percent can be read through slits. The total of say 6,216 at 4 percent could be figured by adding the sums shown in the four rows. One was presented to the Science Museum by M. Malassis in 1936. Chambon also introduced similar "calculators" for the multiplication tables, called "Multiplicateur Enfantin".

B202.82 1 "The MP Handy Guide for Knitting and Crochet" Table, Readable or Writable Memory,
Paper, Fixed, Craft, ca 1930, England, 118x90x2 mm, Metal and paper, Stained and worn, Buy, Bermondsey market, 3 (82), D-Bells.
Indicators can keep track of rows, increase, and times. Holes on the side provide a guage for the needles. And a 4 and a half inch rule is along the bottom.

B203.82 Tavernier Gravet, 1 Mannheim slide rule, Analog Calculator,
2-3 part, slide rule, Craft, ca 1880, France, 260x28x8 mm, Boxwood with brass

cursor, Buy, Delahar, 74 (82), D-Bells.

Colonel Amedee Mannheim designed a slide rule with a cursor about 1850. Tavernier Gravet manufactured this in France and after 1880 exported a large number to England and Germany.

B204.82 1 slide rule, Analog Calculator, 2-3 part, slide rule, Craft, 9-37, 350x30x8 mm,
German silver, Slide rule and wood case engraved with owners name, Buy, Maitland, 222 (82), D-Bells.

An engineering surveyors slide rule primarily used for calculating distances.

B205.82 Dring & Fage, 1 Slide RuleGuagers slide rule, Analog `Calculator, 2-3 part,
Slide rule, Craft, England, 314x50x5 mm, Ivory, Buy, Maitland, 277 (82), D-Bells.

Two-sided revenuers rule with two sliding guages.

B206.82 Duss, 1 Slide ruleGuagers slide rule, Analog Calculator, 2-3 part, Slide Rule,
Craft, England, 315x50x5 mm, Boxwood, Buy, Bermondsey Market, 90 (82), D-Bells.

Similar to B205.

B207.82 Loftus, 1 RuleGuagers rule, Analog Calculator, Single part, Rule, Craft, England,
260x30x30 mm folded, Boxwood, Buy, Bermondsey Market, 10 (82), D-Bells.

B208.82 1 Guagers rule, Analog Calculator, Single Part, Rule, Craft, England, 260x30x30 mm
folded, Boxwood, Buy, Bermondsey Market, 10 (82), D-Bells.

B209.82 T.O. Blake Ltd., 1 Guagers cased rule, Analog Calculator, Single Part, rule, Craft,
England, 6 cylinders each 25 mm by 3 mm diameter that fit together, Boxwood with a leather case, Six rules in a fitted leather case, Buy, Bermondsey Market, 10 (82), D-Bells.

B210.82 Lyons: Barth. Vincentius, 1620, 1 "Logarithmorum canonis descriptio...Sequitur
tabula canonis logarithmorum... Mirifici logarithmorum constructio...cum annotationibus Henrici Briggii in eas, et memoratam appendice. Book, Readable or Writable Memory, Paper, Random, Two volumes in one, Craft, 1620, England, First title in red and black. Woodcut diagrams in the text and printer's device on titles. Copy of G. S. Franckenius (1592-1654) and contemporary manuscript notes in the margins are likely in his hand. First title a bit worn in outside margin., Buy, Antiquarian Scientist, 1400(82), D-MR2.

In 1614, John Napier (1550-1617) published his epochal work on the "invention of logarithms. Posthumously published was his description of the method of construction of logarithmic tables (1619). the present first continental edition of both works was based on the joint issue of them at Edinburgh in 1619, with the addition here of Henry Brigg's annotations, pp. 58-62 of the last part. Briggs (1556-1631) played an important role in further development and utilization of logarithms.

B211.82 1 "Consul" Educated Monkey, Table, Readable or Writable

Memory, Paper, Linear,
Craft, 1916, USA, 139x148 mm, Red, Yellow, Blue and Brown, Tin, Buy, Jeremy Norman and Co., 175(82), D-Bells.

B212.82 Jehu Hatfield, 1 Clock interest table, Readable or Writable Memory, Mechanically
stable, Cyclic, Craft, 1844, USA, 300x450x170 mm, wood and paper, Buy, Jeremy Norman & Co., 475(82), D-Bells.

B213.82 1 Ratchet Adder, Digital Calculator, Single Register, Ratchet, Mechanical, ca 1850,
USA, 313x313x10 mm, Brown with Black ink, Brass and Cardboard, Buy, Jeremy Norman, 360(82), D-Bells.

B214.82 C. X. Thomas de Colmar, 1 Arithmometer, 1852, Buy, Peter Delahar, 3000 (82), D-Bells.
See B3.76

B215.82 Hamilton Watch Company, 1 Map Mileage Reader, Analog Calculator, 2-3 part,
Linear measure, Mechanical, ca 1950, USA, 110x5mm 35mm diameter, Chrome, glass, paper, Model number 331, Buy, Garrison House Antiques, 25(82), D-Bells.

One-sided with two scales for centimeters and inches.

B216.82 1 Planimeter, Analog Calculator, Multiple Part, Areal Measure, Mechanical, ca 1900,
Switzerland, 28460, 220x30x40mm case, Steel instrument, Engraved with Crosby Steam Gage & Valve Co., Boston, Swiss Manufacture, Buy, Garrison House Antiques, 95 (82), D-Bells. See B49.79

B217.82 Arnof, 1 Map Mileage Reader, Analog Calculator, 2-3 part, Linear Measure, Mechanical,
ca 1935, Germany, 8x76 mm 35 mm diameter, Nickel, glass, and paper, Case and instrument, Buy, 10 (82), D-Bells.
Two sided scale with nautical miles, kilometres and statue miles on one side and centimetres to kilometres and inches to miles or versiers on the other.

B218.82 Manloves, 1 "Boucher's Calculator" Circular slide rule, Analog Calculator, 2-3 parts,
Slide rule, Craft, England, 15mm x 50mm diameter, Nickel, glass and paper, Buy, 85 (82), D-Bells.

B219.82 Stanley Rule & Level Co., 1 Coggeshall Slide Rule, Analog Calculator, 2-3 Part,
Slide Rule, Craft, USA, Model No. 12, 320x40x4 mm, Boxwood and Brass, Buy, Brimfield, 30 (82), D-Bells. See B146.81

B220.82 Hoffman, 1 Slide Rule, Analog Calculator, 2-3 Part, Slide Rule, Craft, Denmark,
Model No. 601, 147x35x4 mm, Plastic, Case and Slide Rule, Buy, Brimfield, 1 (82), D-Bells.

Distributed by R. W. Mitscher Co., Inc., Electronic & Electrical Supplies, Ellicott Square Building, Buffalo, New York.

B221.82 Addac, 1 "Addac", Digital Calculator, Single Register, Mechanical, USA, 5751,
205x135x140 mm, Black with Cream and Red Letters, Cover and calculator, Buy, Brimfield, 15 (82), D-Bells. Patent no. 1,661,605.

B222.82 NAPIER, 1 Rabdologiae., 1617, First edition, Buy, Jeremy Norman, 6010 (82), D-Bells.

B223.82 Longman, London, 1 Babbage, Charles, Passages from the life of a philosopher, First
edition, 1864, England, xii, 496 pp., Buy, Antiquarian Scientist, 500 (82), D-Bells.

Babbage (1792-1871), in his interesting autobiography,
devotes four chapters to his invention of the "difference engine'. The last four pages are a bibliography of Babbage's papers.

B224.82 1 "Trignometrie Rectiligne et Spherizue avec la construcion des tables des sinus,
des tangentes, des secantes et des logarithmes," Par M. Rivard, Professeur de Philosophie en L'Universite de Paris.Tables, Readable or Writable Memories, Paper, Random, Craft, 1750, Universite de Paris., 150x220x35mm, Leather binding, Buy, Alain Brieux, 100(82), D-Bells.

B225.82 Theodore Audel & Co., 1 Hand Book of Calculations for Engineers and firemen relating
to the steam engine, the steam boiler, pumps, shafting, etc. by N. Hawkinsbook, Readable or Writable Memories, Paper, Random, Craft, 1898, USA, 140x215x25mm, Paper, binding loose, Buy, Amherst flea market, 4 (82), D-Bells.

B226.82 Wm. Jas. Hamersley, Hartford, 1 A System of Geometry and Trigonometry with a Treatise
on Surveying in which the Principles of Rectangular Surveying without Plotting are Explained, by Abel Flint enlarged with additional tales by George Gillet, New Edition, Revised containing a new rule for correctin deviations of the compass by L. W. MeechBook, Readable or Writable Memories, Paper, Random, Craft, 1854, USA, 130x208x27mm, Leather binding, 112 pages, Buy, Museum Store, 20 (82), D-Bells.

B227.82 1 "Biomate" Circular moving nomographs, Readable or Writable Memory, Mechanically
Stable, Cyclic, 82, Japan, 110x90x12mm, Aqua and cream, plastic, Buy, 8(82), D-Bells.

B228.82 Goody Manufacturing Co., 1 "Goody Magic Multiplier Pencil Box", Readable or Writable
Memory, Paper, Cyclic, ca 1950, USA, 38dx230mm, blue and orange, paper, Buy, Amherst flea market, 2 (82), D-Bells.

B229.82 Walt Disney Productions, 1 "Mickey Math", Readable or Writable Memory, Mechanically
Stable, Linear, ca 1950, USA, 360x38x5mm, black and white, plastic, Buy, 2 (82), D-Bells.

B230.82 L. Appoullot, Saint-Birce-sous-Foret, Seine et Oise, France, 1 "Cercle a claculd"appoullot"nomograph, Readable or Writable Memory, Mechanically Stable, Cyclic, ca 1890, France, 203d mm, painted metal, case and circle, Buy, Alain Brieux, 75 (82), D-Bells.

B231.82 Wolverine, 1 "Modern Math Addition", Readable or Writable Memory, Mechanically Stable, Cyclic, ca 1950, USA, 154x180x97mm, red, metal, Buy, Museum Store, 5 (82), D-Bells.

B233.84 A. M. Maurand, 1 "Le Prompt Calculateur des arts industriels et du commerce", Readable or Writable Memory, Paper, Random, ca 1863, France, 105d x 18mm, blue, pink, yellow and green cards, Brass, glass, cardboard, brass case with glass lid, 30 cardboard tables, Buy, Peter Delehar, 480 (82), D-Bells.

B234.82 Stanley, 1 "Boucher's Calculator" Circular slide rule, Analog Calculator, 2-3 part, Slide Rule, Craft, ca 1876, England, 50dx13mm, nickel, glass, leather and stain case, calculator, Buy, Peter Delahar, 240 (82), D-Bells.

The model made by Stanley is an improvement by the addition of a third index hand on the back dial, which indicates the total movement of the front dial, so that continuous workings show a final result, either + or -, thus indicating the correct reading of the result.

B235.82 Stanley, 1 Slide rule for calculating annuities, Analog Calculator, 2-3 part, Slide Rule, 1860, England, 304x10x22mm, Boxwood, Case and sliderule, Buy, Peter Delahar, 280 (82), D-Bells.

The device was described by Benjamin Beran (1822).

B236.82 Tavernier-Gravet, Rue MAyet, 19-Paris, 1 "Regle a Eclimetre" du Colonel du Genle GoulierSlide rule with a site, Analog Calculator, 2-3 part, Slide Rule, ca 1878, France, 186, 320x50x90mm, Boxwood and a metal instrument, Case, slide rule, and instrument, Buy, Peter Delahar, 640 (82), D-Bells.

B237.82 1 "Calculator" Pascal strip, Digital Calculator, Single Register, Pascal strip, ca 1950, Germany, 85x7x138mm, gold, red, and black, metal, Buy, Amherst fleamarket, 3 (82), D-Bells.

B238.82 Sharp, 1 "ELSI MATE EL-835" Solar cell electronic calculator, Digital Calculator, 3-4 Registers, Electronic, 1982, Japan, 17095530, 54x96x3mm, metal, Buy, D-Bells.

B239.82 Panasonic, 1 "CompuVoice"Talking electronic calculator, Digital calculator, 3-4 registers, Electronic, 1982, Japan, 22300192, 75x27x143mm, metal, Gift, New York Decus, D-Bells.

B240.82 Stanley, 1 "Barnard's Coordinate Spiral Slide Rule"

Spiral Slide Rule, Analog
Calculator, 2-3 Parts, Spiral slide rule, ca 1880, England, 83dx260mm, wood, paper mache, brass, Wooden case, handle, instrument, Buy, Peter Delahar, 180 (82), D-Bells.

Similar to Fuller's, but the logarithmic scale is repeated twice and occupies in all only about one-third of the helix. The upper part of the helix carries a sine scale.

B241.82 Palatine Engineering Co. Ltd. Liverpool, 1 "Bryan's Patent Planimeter" Analog
Calculator, Multiple Part, non-linear planimeter, ca 1880, England, 70x105x405mm, Brass, Case, instrument, five cams, track made my Peter Delahar, Buy, Peter Delahar, 560 (82), D-Bells.

B242.82 Oliver, 1 "The Oliver Typewriter Model 9" 1916, USA, 405x370x250mm, khaki, metal,
Buy, 50 (82), D-Bells.

The Oliver typewriter is the only successful down-strike-from-the-side class, was invented by Rev. Thomas Oliver in 1888 and patented in the USA in 1892 and Great Brtain in 18996. The Oliver Typewriting company was founded in 1895 with Model Number 1 (on view at the Science Museum). The models appearred in the following order No. 2 (1894), No. 3 (1898), No. 5 (1907), No. 7 (1915), No. 9 (1916) and the standard Model II 'Speedster' in 1922.

The 28 type-bars, each of which resembels an inverted U, are arranged in two banks to the right and left of the printing point, so providing complete visibility of the writing, the type striking on to the vertical centre line of the platen. Each bar carries three characters, the machine printing 84 characters by double shift. The use of a bar pivoted at each end is claimed to secure and preserve accurate alignment. The bars rest one within another and, as the length of the extremities vary, the shorter type-bars are provided with heavier type-heads with the object of equalixing the impressions. The paper cylinder is fitted with three rollers, the pressure of which can be released for adjusting the paper. The register pawl can be lifted to free the roller when linving by pencil. Single or double spacing is actuated by a striking motion operated by the marginal stop.

B243.82 Ludwig Spitz & Co., 1 "TIM Time is Money" arithmometer, Digital Calculator,
3-4 register, stepped wheel, ca 1880, USA, 420x200x160 mm, black, metal, eight digits, engraved The Oskar Muller Co. New York, Buy, Peter Delahar, 220 (82), D-Bells.

B244.82 Dalton, 1 Adding and listing machine, Digital Calculator, 1-2 register, Pascal
key, USA, Black, Metal, Buy, Amherst fleamarket, 35 (82), D-Bells.

B245.82 Hitachi, 1 c-mos i c, tie clasp, 1982?, Japan, Buy, D-Bells.

B246.82 Hilliard, Gray, Little, and Wilkins, 1 "Elements of Technology" by Jacob Bigelow, M.D.,
Book, , 1829, USA, Original cloth-covered boards with original paper label, uncut. xii, 507 pp. With a large folding, engraved frontispiece + 10 engraved plates (6 folding) + 11 woodcut plates (1 folding) + many text figs. Spine somewhat worn and repaired, cloth partially faded and frayed at edges., Buy, The Antiquarian Scientist, 160(82), D-Bells.

Jacob Bigelow (1786-1879) was appointed in 1816 to the chair which Count Rumford had endowed at Harvard for the instruction of the application of the sciences to the useful arts, a first attempt to create a meeting ground for self-made inventors and academic scientists. There being no good name for such a field, Bigelow coined for it the name 'technology', which has passed into common language.

B247.82 Macmillan and Co., 1 "A treatise on the calculus of finite differences," George Boole.
Book, 1860, England, First edition., Cloth cover., Buy, The Antiquarian Scientist, 275 (82), D-Bells.

B248.82 Patrick Adie, Optician, Mathematical & Scientific Instrument Maker, Broadway Works,
Westminster, London., 1 "Eidograph" pantograph, Analog calculator, Multiple part, Drawing instrument, Mechanical, c 1860, England, 33 3/4" long with two 29" long 1/2 inch square rods, brass, instrument and large hand-dovetailed case made form mahogany, trade label, instruction set, and original key, Buy, The Antiquarian Scientist, 975(82), D-Bells.

Each of the rods, marked 'A' and 'B' slip into corresponding channels of the pulleys of the body. Here their lengths are varied and rad by verniers in the pulleys. The length of the main body rod which pivots on a central circular support, can be set and read by a vernier. The pulleys move in unison by virtue of the adjustable stell band with brass fittings coursing over them. One very large weight of brass and lead is used to balance the main rod and two smaller weights for the two side rods.

The eidograph is essentially a more preceise and versatile pantograph. Variable ratios can be set on the instrument for enlarging or reducing work. The eidograph was invented by William Wallace in 1801 based on the 17th century pantograph.

B249.82 1 protractor and T-square, analog calculator, 2-3 part, drawing instruments,
mechanical, c 1830, USA, 23 1/2" with 6" radius protractor scale, brass, Buy, The Antiquarian Scientist, 225 (82), D-Bells.

A nicely made brass t-square with an adjusting arm which allows it to be set to a particular angle as read off the protractor scale.

B250.82 1 Trigonometer, Analog Calculator, Multiple Part, Mechanical, c 1840, USA, 12"x6",
brass, Buy, The Antiquarian Scientist, 1,875(82), D-Bells.

The instrument is constructed so that a swinging arm carrying two sight vanes piots away from a stationary arm, also with two sight vanes, over an attached 90' scale with an intricate grid for reading the sine of the subtended angle by vernier directly to three places. A bubble level on the stationary arm allows horizontal or vertical reading. A ratcheted chain counter is also fixed to the stationary arm. A removable box compass can be fitted onto either arm by a neatly devised, quick action device.

The instrument was once the equipment of a Virginia surveyor and retains a fine hand-worked character with great attention to detail, such as fine knurling of the many thumb screws. Smart illustrates a similar instrument by Francis Whiteley of Standardsville, Virginia on p. 165. Both examples are elaborations of Whiteley's patent of 1836, but with the additions of the sine grid. The patent model and its type were made first, then the design with the sine grid, and finally the most advanced type with serial numbers and an added verneir on the swinging arm for reading the protractor scale as illustrated in Smart.

B251.82 Troughton, London, 1 proportional compass, Analog Calculator, 2-3 parts, drawing instruments, Mechanical, c 1800, England, 6 1/4inch long, Brass with stell points, hand-engraved, shaped sharskin case and instrument, Buy, The Antiquarian Scientist, 500(82), D-Bells.

Edward Troughton (1753-1836), the 'celebrated' English instrument maker, is well known for his very fine astrnomical and navigational instruments. In 1826, Troughton took in William Simms, and the firm flourished as Troughton 7 Simms, even after Troughton's death.

The instrument is used for enlarging or reducing a drawing with ratios marked along the slot, set by moving the screw pivot in it.

B252.82 1 planimeter, Analog Calculator, multiple parts, Mechanical, planimeter and case, Buy, Margaret Weiner Kennedy, 75(82), D-Bells.

B253.82 1 Computing Mechanisms and Linkages by Antonin Svoboda, edited by Hubert M. James, New York, Dover Publications 1965, unabridged republication of the work first published by McGraw-Hill Book Company, Inc. 1948., 1948, USA, Buy, D. Rubinstein, 5(82), D-Bells.

B254.82 1 Logic Machines and Diagrams by Martin Gardner, McGraw Hill Book Company, Inc. New York, 1958, 1958, USA, Buy, D. Rubinstein, 5(82), D-Bells.

Contents include: The Ars Magna of Ramon Lull, Logic Diagrams, A Network Diagram for Propositional Calculus, The Stanhope Demonstrator, Jevons Logic Machine, Marquand's Machine, Window Cards, Electrical Lobic Machines, The Future of Logic Machines.

B255.82 1 The Trachtenberg Speed System of Basic Mathematics translated and adapted by Ann Cutler and Rudoph McShane, Doubleday & Co., Garden City, N.Y., 1960, Buy, 5(82), D-Bells.

B256.82 1 The Japanese Abacus, its use and Theory by Takashi Kojima, Charles E. Tuttle Co., Publishers, Vermont and Japan, abacus, book, Buy, D-Bells.

B257.82 1 Faster than Thought, edited by B. V. Bowden. Sir Isaac Pitman & Sons, Ltd., London, 1953, Buy, D-Bells.

B258.82 1 Blaise Pascal "auvergnat" la famillle a l'oeuvre, Musee D'art de Clermont-Ferrant, 6 octobre - 8 novembre 1981, Buy, A Brieux, 10(82), D-Bells.

B259.83 J. Archbutt & Sons, 20 Bridge Road, Lambeth, 1 parallel rule, compass and rule, analog calculator, 2-3 part, parallel rule, craft, ca 1850, England, 44x150x2 mm, ivory, Buy, Woburn antiques show, 135(83), D-Bells.

B260.83 The Lightning Adding Machine Co. Inc., Los Angeles,

1 "The Lightning Adder"Pascal
wheel, Digital Calculator, Single Register, Pascal Wheel, Mechanical, ca 1950, USA, 350x90x45 mm, green and brown, plastic holder and metal adder, holder, mechanism, stylus, Buy, Colorado Springs, 10(83), D-Bells.

See 150.80 and 96.80.

B261.83 1 Calculating Instruments and Machines by Douglas R. Hartree, Plummer Professor of
Mathematical Physics, University of Cambridge, The University of Illinois Press, Urbana, 1949, USA, 174x260x17 mm, cloth cover, 138 pp., 68 illustrations, index, Buy, D. Rubinstein, 60 (83), D-Bells.

The first chapters are devoted to differential analyzers which were still being used and developed for computational needs. The last chapters discuss digital calculators starting with Babbage's analytical engine and including extensive discussions of ENIAC and the Harvard Mark I.

B262.83 Addiator, 1 "Arithma", Digital Calculator, Single Register, Pascal Strip, Mechanical,
ca 1935, Germany, 155x40x3 mm, Black and red, aluminum, case, stylus, instructions, and instrument, Buy, Colorado Springs, 6(83), D-Bells.

B263.83 Globe Ticket Company, 4201 Brighton Blvd, Denver, Co., 3 punch card, advertisement
on a calendar blotter, March 1960, November 1961, January 1962, USA,98x230 mm ,blotting paper, Buy, Colorado Springs, 3(83) each, D-Bells.

B264.83 1 On the Economy of Machinery and Manufactures by Charles Babbage, Esqre A.M., Charles Knight, Pall Mall East, London, Book, 1831, England, 48x208x23 mm, Red leather binding, With Edward Ryan's bookplate and inscribed by the author, "To Sir Edward Ryan from his friend, the Author", Buy, The Antiquarian Scientist, 750(83), D-Bells.

B265.83 1 Planimeter, Analog Calculator, two-three part, Planimeter, Mechanical, 290x110x20 mm,
nickel, instrument and case, Buy, Tesseract, 135(83), D-Bells.

B266.83 Automatic Adding Machine Co., New York, 1 "Golden Gem Adding Machine"Pascal strip,
Digital Calculator, Single Register, Pascal Strip, Mechanical, 1906, USA, 103x80x20 mm, red and green, metal, case and instrument, Buy, Woburn Antique Show, 15(83), D-Bells.

B267.83 The Adding Pencil Co., St. Louis, 1 The Adding Pencil, Model B, Digital Calculator,
Single Register, Pascal Wheel, Mechanical, ca 1930, USA, 10dx155 mm, Orange, Metal, Paper instruction case and pencil, Buy, Colorado Springs, 19(83), D-Bells.

B268.83 Eugene Dietzgen Co., 1 Catalogue and Price List of Eugene Dietzgen Co.book, 1912,
USA, Ninth Edition, 110x158x23 mm, green, paper, 555 pages, well-illustrated, index, Buy, Tesseract, 39(83), D-Bells.

Excellent section on slide rules and calulators, pp 216-236, and on planimeters, integrators and integraphs, pp 500-507.

B269.83 Keuffel & Esser Co., 1 Catalogue of Keuffel & Esser Co.book, 1921, USA, 36th edition,
150x227x30mm, Red, Hard bound, paper, 482 pages, index, well-illustrated, Buy, Tesseract, 34 D-Bells.
From 229-264, calcuators, slide rules, planimeters, pantographs, and integraphs are illustrated and explained.

B270.83 S.A. Main BSc, 1 Ballistic Coefficient Slide Ruleslide rule, Analog Calculator,
2-3 parts, linear slide rule, ca 1910, USA, 470x78x20 mm, yellow, Wood, paper, ivory and brass slide, hand lettered in red and black, Buy, 145, D-Bells.
Top scale is the ballistic coefficient; bottom is coefficient of form; center sliding scale has weight in pounds nad diameter in includes. Instructions: with Slide set the Diameter to the Coeff of Form; with Cursor set the value of Theta to the Weight; Read off Ballistic Coeff against Value of T. Reservse side has two sliders. Top stationery rule is ballistic coefficient. Slider has range-yards; time of flight-seconds; height of vertex - fee; angle of elevation or descent. Stationery rule has velocity reduced time in seconds. Slider has velocity and reduced elevation and reduced angle of descent. Botoom stationery rule has velocity. "Deisgned by S.A. Main, B.Sc.

B271.83 DeMarre, 1 Ballistic Slide RuleSlide Rule, Analog Calculator, 2-3 parts, Linear
Slide Rule, ca 1910, USA, 420x70x15 mm, yellow, Wood, paper, brass, Hand written lettering, Buy, 145, D-Bells.
Designed for solving DeMarre's Formula:

$$T^{7} = \frac{W^{.5}\ V}{D^{.75}} \times \frac{1}{\log^{-1}\ 3.00945}$$

Top scale has plate thickness; slider has striking velocity in foot/seconds and diameter of shot in inchdes; bottom scale has weight of shot in pounds. Sliding cursor has two more scales that are not identified.

B272.83 A Toyes, Chex Sainton, Pere et Fils, Imprimeurs du Departement, 1
Tables de Comparaison entre les Mesures Anciennes usitees dan le Departement de L'Aube, et celles qui les remplacent dans le nouveau System metrique, avec des observations sur les Mesures locales et l'explication a l'usage des Tables. Suivies du vocabulaire des nouvelles Mesures, de Notions elementaires sur le nouveau systeme. book, 1800, France, 125x200x10 mm, paper, 120 pp. sheep-backed boards, Buy, Jonathan Hill, 100, D-Bells.
May be a first edition. A rare explication of the new metric system.

B274.83 William Jones, 1 (Edmund Gunter), The Description and Use of the Sector.
The Crosse-staffe and other instruments. For such as are studious of Mathematicall practise. and Canon Triangulorum or tables of Artificiall Sines and Tangents to a Radius of 10000,0000 parts, and each minute of the Quadrant.Book, 1624, England, 135x177x40 mm, Leather and paper, First edition, 2 parts with the engraved title depicting the use of the istruments. Engraved plate of rules after the title, woodcuts in the text, signature A misbound after B, lower fore-edge corners of first few leaves worn, wormhole through some 40 leaves., Buy, Harriet Wynter Ltd,

400, D-Bells.

B275.83 Nystrom, J.W., 1 A Treatise on Screw Propellers and their Steam Engines, also A full Description of a Calculating Machine, Analog Calculator, 2-3 parts, Circular slide rule, Book, 1852, USA, Buy, Jeremy Norman, 350, D-Bells.

Plate XXXII has a drawing of Nystrom's calculating machine that he said was exhibited at the Franklin Institute Exhibition in 1849. Pages 179-229 give a complete description of the calculator.

B276.83 Saxton, E., 1 Saxton's Logs for Four-place Work. Table and TextBook, 1908, USA, 100x290x10 mm, paper, Case and book, Buy, JOe Stamps, 36, D-Bells.

B277.82 Briggs, Henry, 1 Arthmetica Logarithimicabook, 1624, England, 1st edition, Buy, Antiquarian Scientist, 1300, D-Bells.

B273.82 Newton, John, 1 Trigonometria Britanica and A Table of Logarithms to 100,000 with Artifical Sinces and Tangents Book, 1658, Buy, Antiquarian Scientist, 675, D-Bells.

B279.83Vlacq, 1 Trigonometria artificialis, Book, 1633, England, Buy, Antiquarian Scientist, 600, D-Bells.

Vlacq (1600-1667) of Gouda, the illustrious successor of Napier, lived in London and then in Paris as a bookseller and publisher, but was driven out and returned to Holland. This work contains his treatise of 52 pages on plane and spherical triangles and his table on trigonometry as well as the table of logarithms of numbers.

B280.83 Good, J., 1 Measuring made Easy: or the Description and Use of Coggeshall's Sliding Rule, Analog Calculator, 2-3 part, Book, Craft, 1744, England, 96 pages, several fold outs, Buy, The Antiquarian Scientist, 275, D-Bells.

B281.83 Speidell, Euclid, 1 Logarithmotechnia, or The Making of Numbers called Logarithms to Twenty-five Places from a Geometrical Figure with Speed, Ease and Certainty. London. London Printed by Henry Clark for the Author.Book, 1688, England, 145x192x8 mm, Leather binding, 50 pages, one worm hole through book, Buy, Antiquarian Scientist, 450, D-Bells.

B282.83 M. Thomas de Colmar, 1 Instruction pour se servir de L'arithmometre, machine a calculerBook, Digital Calculator, 3-4 registers, Book, 1852, France, Bound for A.S.A.R. Louise Marie de Bourbon, Regente des Duches de Parme et de Plaisance etc., Buy, D-Bells.

B283.78 Casio, 1 Mini Card fx-48 Scientific Calculator, Digital Calculator, 1978, Japan, 256023,
90x53x3 mm, Metal, Case, instruction book, unit conversion table, physical constants table, calculator, Buy, D-Bells.

B284.83 Commodore US*14, 1 Digital Calculator, Digital Calculator, ca 1970, USA, 11619,
195x290x75 mm, Black and White, Plastic case, transistors, Cord and calculator, Buy, 3 (83), S-Under vestibule-Bells.

B285.83 HDC Industries, 1 "Human Digital Calculator: Add'em up Finger Machine", ca 1980,
USA, 140x88x2 mm, Red and White, Cardboard, Buy, D-Bells.

B286.70 M.V. Wilkes, D. J. Wheeler, and Stanley Gill, 1 <u>Programs</u> <u>for</u> <u>and</u> <u>Electronic</u> <u>Digital</u>
<u>Computer,</u> Addison Wesley Publishing Company, 1951, USA, Second Edition, 1957, 160x233x19 mm, Paper, 238 pp, Buy, D-Bells.

B287.55 Richard Stevens Burrington, 1 <u>Handbook of Mathematical Tables and Formulas,</u> Handbook
Publishers, Inc. Sandusky, OhioBook, Memory, 1933, USA, Reprinted with corretions, 1953, .137x200x20 mm, Navy blue, Paper, 296 pp. index, Buy, D-Bells.

B288.83 Wolverine, 1 Adding MachineCalculator, Digital Calculator, Single register, Pascal
strip, ca 1935, USA, 135x225x105 mm, Red, Blue, Cream, Tin, Buy, D-Bells.
Patent 2243884

B289.79 Designsense, Inc., Atlanta, Ga., 1 "mileage minder" circular slide rule, Analog
Calculator, 2-3 parts, circular slide rule, 1979, USA, 195x108x2 mm, Black, red and white, Paper and aluminum, Instructions and instrument, Buy, Jordan Marsh, 5 (79), D-Bells.
The left rule with input of odometer start and odometer end shows miles driven. The right rul inputting midles driven and miles per gallon, shows gallons used.

B290.83 Simplex, 1 "Simplex Typewriter Model A"Typewriter, ca 1940, USA, 170x120x75 mm,
Red, yellow and blue, Tin, Box, instructions and typewriter, Buy, D-Bells.
Model A prints 36 characters, on 6 inch paper and cost $1.00; Model C, 42 characters on 7 inch paper and cost $1.50; Model D prints 68 characters both capital and small on 7 inch paper and cost $3.00; and Model E prints 72 characters capitals and small letters on 8 inch paper and cost $4. Sold as "useful where speed of pen suffices and carbon capy is not needed. They fascinate and teach children. Their Elders find them useful."

B291.83 Barron's Educational Services, Inc., Woodbury, NY, 1 "Metric Converter"Slide rule,
Analog Calculator, 2-3 parts, slide rule, USA, 212x82x2 mm, red, orange, and yellow on white, cardboard, Buy, D-Bells.

B292.83 1 Typewriter, ca 1900, Wooden case and base, steel, tin, rubber, case and machine, Buy,
Margaret Weiner Kennedy, 150 (83), D-Bells.
No maker yet this was manufactured.

B293.83 IBM, 1 plug board for 911, USA, Type 911, #121854, 290x170x30, Stainless steel,
plastic coated plugs, Board and plugs, Buy, Computer Museum, -, D-Bells.

B294.83 DEC, 1 PDP-10 Cable connector, D-Bells.

B295.83 DEC, 1 UART, 1979, 132x215x2 mm, green board, D-Bells.

B296.83 DEC, 1 Core plane, Memory, 1974, 208x265x20, D-Bells.
Late PDP-11 core plane.

B297.83 DEC, 3 modules, Transistor, 1960, USA, 43x43x170 mm, D-Bells.

B298.83 George Fisher, 1 <u>Arithmetic in the Plainest and most Consise Methods Hitherto Extant,</u>
Peter Brynberg, Londonbook, 1800, 160x96x30 mm, leather binding, Buy, 55 (83), D-Bells.

B299.80 Monroe, 1 "Monroe" calculator, Digital Calculator, 3-4 registers, ca 1950, USA,
Model LA7-160; #J716387, 190x150x280 mm, grey, Buy, 25 (80), D-Bells.

B200.82

Mileage reader, Analog Calculator, 2-3 part, Integrator, Mechanical, ca 1950, 35 mm diameter; 112 mm with handle, Chrome, glass, and paper, Buy, Portobello Rd, 33 (82), D-Bells.

This mileage reader was clearly made for scientific map distance readings. On one side there are scales for 1:2000; 4000; 8000; and 10,000. On the other side the scales read 1:25,000; 50,000; 75,000; and 200,000.

B201.82

Chambon & Baye, 1 "TACHYLEMME" Table, Writable or Readable Memory, Mechanically stable, Cyclic, Craft, ca 1880, France, 175x100x35 mm, Black, Glass, wood, sliver plate and paper, Buy, Delahar, 260 (82), D-Bells.

A calculating device with four printed cyclinders 1-9; 10-90; 100-900; and 1000-9000 so arranged that percentages for every half percent from one to six percent can be read through slits. The total of say 6,216 at 4 percent could be figured by adding the sums shown in the four rows. One was presented to the Science Museum by M. Malassis in 1936. Chambon also introduced similar "calculators" for the multiplication tables, called "Multiplicateur Enfantin".

B202.82

1 "The MP Handy Guide for Knitting and Crochet" Table, Readable or Writable Memory, Paper, Fixed, Craft, ca 1930, England, 118x90x2 mm, Metal and paper, Stained and worn, Buy, Bermondsey market, 3 (82), D-Bells.

Indicators can keep track of rows, increase, and times. Holes on the side provide a guage for the needles. And a 4 and a half inch rule is along the bottom.

B203.82

Tavernier Gravet, 1 Mannheim slide rule, Analog Calculator, 2-3 part, slide rule, Craft, ca 1880, France, 260x28x8 mm, Boxwood with brass cursor, Buy, Delahar, 74 (82), D-Bells.

Colonel Amedee Mannheim designed a slide rule with a cursor about 1850. Tavernier Gravet manufactured this in France and after 1880 exported a large number to England and Germany.

B204.82

1 slide rule, Analog Calculator, 2-3 part, slide rule, Craft, 9-37, 350x30x8 mm, German silver, Slide rule and wood case engraved with owners name, Buy, Maitland, 222 (82), D-Bells.

An engineering surveyors slide rule primarily used for calculating distances.

B205.82Dring & Fage, 1 Slide Rule, Guagers slide rule, Analog `Calculator, 2-3 part, Slide rule, Craft, England, 314x50x5 mm, Ivory, Buy, Maitland, 277 (82), D-Bells.

Two-sided revenuers rule with two sliding guages.

B206.82

Duss, 1 Slide rule, Guagers slide rule, Analog Calculator, 2-3 part, Slide Rule, Craft, England, 315x50x5 mm, Boxwood, Buy, Bermondsey Market, 90 (82), D-Bells. Similar to B205.

B207.82

Loftus, 1 Rule, Guagers rule, Analog Calculator, Single part, Rule, Craft, England, 260x30x30 mm folded, Boxwood, Buy, Bermondsey Market, 10 (82), D-Bells.

B208.82

1 Guagers rule, Analog Calculator, Single Part, Rule, Craft, England, 260x30x30 mm folded, Boxwood, Buy, Bermondsey Market, 10 (82), D-Bells.

B209.82

T.O. Blake Ltd., 1 Guagers cased rule, Analog Calculator, Single Part, rule, Craft, England, 6 cylinders each 25 mm by 3 mm diameter that fit together, Boxwood with a leather case, Six rules in a fitted leather case, Buy, Bermondsey Market, 10 (82), D-Bells.

B210.82

Lyons: Barth. Vincentius, 1620, 1 "Logarithmorum canonis descriptio...Sequitur tabula canonis logarithmorum... Mirifici logarithmorum constructio...cum annotationibus Henrici Briggii in eas, et memoratam appendice. Book, Readable or Writable Memory, Paper, Random, Two volumes in one, Craft, 1620, England, First title in red and black. Woodcut diagrams in the text and printer's device on titles. Copy of G. S. Franckenius (1592-1654) and contemporary manuscript notes in the margins are likely in his hand. First title a bit worn in outside margin., Buy, Antiquarian Scientist, 1400(82), D-MR2.

In 1614, John Napier (1550-1617) published his epochal work on the "invention of logarithms. Posthumously published was his description of the method of construction of logarithmic tables (1619). the present first continental edition of both works was based on the joint issue of them at Edinburgh in 1619, with the addition here of Henry Brigg's annotations, pp. 58-62 of the last part. Briggs (1556-1631) played an important role in further development and utilization of logarithms.

B211.82

1 "Consul" Educated Monkey, Table, Readable or Writable Memory, Paper, Linear, Craft, 1916, USA, 139x148 mm, Red, Yellow, Blue and Brown, Tin, Buy, Jeremy Norman and Co., 175(82), D-Bells.

B212.82

Jehu Hatfield, 1 Clock interest table, Readable or Writable Memory, Mechanically stable, Cyclic, Craft, 1844, USA, 300x450x170 mm, wood and paper, Buy, Jeremy Norman & Co., 475(82), D-Bells.

B213.82

1 Ratchet Adder, Digital Calculator, Single Register, Ratchet, Mechanical, ca 1850, USA, 313x313x10 mm, Brown with Black ink, Brass and Cardboard, Buy, Jeremy Norman, 360(82), D-Bells.

B214.82

C. X. Thomas de Colmar, 1 Arithmometer, 1852, Buy, Peter Delahar, 3000 (82), D-Bells. See B3.76

B215.82

Hamilton Watch Company, 1 Map Mileage Reader, Analog Calculator, 2-3 part, Linear measure, Mechanical, ca 1950, USA, 110x5mm 35mm diameter, Chrome, glass, paper, Model number 331, Buy, Garrison House Antiques, 25(82), D-Bells.

One-sided with two scales for centimeters and inches.

B216.82

1 Planimeter, Analog Calculator, Multiple Part, Areal Measure, Mechanical, ca 1900, Switzerland, 28460, 220x30x40mm case, Steel instrument, Engraved with Crosby Steam Gage & Valve Co., Boston, Swiss Manufacture, Buy, Garrison House Antiques, 95 (82), D-Bells. See B49.79

B217.82

Arnof, 1 Map Mileage Reader, Analog Calculator, 2-3 part, Linear Measure, Mechanical, ca 1935, Germany, 8x76 mm 35 mm diameter, Nickel, glass, and paper, Case and instrument, Buy, 10 (82), D-Bells.

Two sided scale with nautical miles, kilometres and statue miles on one side and centimetres to kilometres and inches to miles or versiers on the other.

B218.82

Manloves, 1 "Boucher's Calculator" Circular slide rule, Analog Calculator, 2-3 parts, Slide rule, Craft, England, 15mm x 50mm diameter, Nickel, glass and paper, Buy, 85 (82), D-Bells.

B219.82

Stanley Rule & Level Co., 1 Coggeshall Slide Rule, Analog Calculator, 2-3 Part, Slide Rule, Craft, USA, Model No. 12, 320x40x4 mm, Boxwood and Brass, Buy, Brimfield, 30 (82), D-Bells. See B146.81

B220.82

Hoffman, 1 Slide Rule, Analog Calculator, 2-3 Part, Slide Rule, Craft, Denmark, Model No. 601, 147x35x4 mm, Plastic, Case and Slide Rule, Buy, Brimfield, 1 (82), D-Bells.

Distributed by R. W. Mitscher Co., Inc., Electronic & Electrical Supplies, Ellicott Square Building, Buffalo, New York.

B221.82

Addac, 1 "Addac", Digital Calculator, Single Register, Mechanical, USA, 5751, 205x135x140 mm, Black with Cream and Red Letters, Cover and calculator, Buy, Brimfield, 15 (82), D-Bells. Patent no. 1,661,605.

B222.82

NAPIER, 1 Rabdologiae., 1617, First edition, Buy, Jeremy Norman, 6010 (82), D-Bells.

B223.82

Longman, London, 1 Babbage, Charles, Passages from the life of a philosopher, First edition, 1864, England, xii, 496 pp., Buy, Antiquarian Scientist, 500 (82), D-Bells.

Babbage (1792-1871), in his interesting autobiography, devotes four chapters to his invention of the "difference engine'. The last four pages are a bibliography of Babbage's papers.

B224.82

1 "Trignometrie Rectiligne et Spherizue avec la construcion des tables des sinus, des tangentes, des secantes et des logarithmes," Par M. Rivard, Professeur de Philosophie en L'Universite de Paris.Tables, Readable or Writable Memories, Paper, Random, Craft, 1750, Universite de Paris., 150x220x35mm, Leather binding, Buy, Alain Brieux, 100(82), D-Bells.

B225.82

Theodore Audel & Co., 1 Hand Book of Calculations for Engineers and firemen relating to the steam engine, the steam boiler, pumps, shafting, etc. by N. Hawkinsbook, Readable or Writable Memories, Paper, Random, Craft, 1898, USA, 140x215x25mm, Paper, binding loose, Buy, Amherst flea market, 4 (82), D-Bells.

B226.82

Wm. Jas. Hamersley, Hartford, 1 A System of Geometry and Trigonometry with a Treatise on Surveying in which the Principles of Rectangular Surveying without Plotting are Explained, by Abel Flint enlarged with additional tales by George Gillet, New Edition, Revised containing a new rule for correctin deviations of the compass by L. W. MeechBook, Readable or Writable Memories, Paper, Random, Craft, 1854, USA, 130x208x27mm, Leather binding, 112 pages, Buy, Museum Store, 20 (82), D-Bells.

B227.82

1 "Biomate" Circular moving nomographs, Readable or Writable Memory, Mechanically Stable, Cyclic, 82, Japan, 110x90x12mm, Aqua and cream, plastic, Buy, 8(82), D-Bells.

B228.82

Goody Manufacturing Co., 1 "Goody Magic Multiplier Pencil Box", Readable or Writable Memory, Paper, Cyclic, ca 1950, USA, 38dx230mm, blue and orange, paper, Buy, Amherst flea market, 2 (82), D-Bells.

B229.82

Walt Disney Productions, 1 "Mickey Math", Readable or Writable Memory, Mechanically Stable, Linear, ca 1950, USA, 360x38x5mm, black and white, plastic, Buy, 2 (82), D-Bells.

B230.82

L. Appoullot, Saint-Birce-sous-Foret, Seine et Oise, France, 1 "Cercle a clacul d"appoullot"nomograph, Readable or Writable Memory, Mechanically Stable, Cyclic, ca 1890, France, 203d mm, painted metal, case and circle, Buy, Alain Brieux, 75 (82), D-Bells.

B231.82

Wolverine, 1 "Modern Math Addition", Readable or Writable Memory, Mechanically Stable, Cyclic, ca 1950, USA, 154x180x97mm, red, metal, Buy, Museum Store, 5 (82), D-Bells.

B233.84

A. M. Maurand, 1 "Le Prompt Calculateur des arts industriels et du commerce", Readable or Writable Memory, Paper, Random, ca 1863, France, 105d x 18mm, blue, pink, yellow and green cards, Brass, glass, cardboard, brass case with glass lid, 30 cardboard tables, Buy, Peter Delehar, 480 (82), D-Bells.

B234.82

Stanley, 1 "Boucher's Calculator" Circular slide rule, Analog Calculator, 2-3 part, Slide Rule, Craft, ca 1876, England, 50dx13mm, nickel, glass, leather and stain case, calculator, Buy, Peter Delahar, 240 (82), D-Bells.

The model made by Stanley is an improvement by the addition of a third index hand on the back dial, which indicates the total movement of the front dial, so that continuous workings show a final result, either + or -, thus indicating the correct reading of the result.

B235.82 Stanley, 1 Slide rule for calculating annuities, Analog Calculator, 2-3 part, Slide Rule, 1860, England, 304x10x22mm, Boxwood, Case and sliderule, Buy, Peter Delahar, 280 (82), D-Bells.

The device was described by Benjamin Beran (1822).

B236.82

Tavernier-Gravet, Rue Mayet, 19-Paris, 1 "Regle a Eclimetre" du Colonel du Genle Goulier Slide rule with a site, Analog Calculator, 2-3 part, Slide Rule, ca 1878, France, 186, 320x50x90mm, Boxwood and a metal instrument, Case, slide rule, and instrument, Buy, Peter Delahar, 640 (82), D-Bells.

B237.82

1 "Calculator" Pascal strip, Digital Calculator, Single Register, Pascal strip, ca 1950, Germany, 85x7x138mm, gold, red, and black, metal, Buy, Amherst fleamarket, 3 (82), D-Bells.

Panasonic, 1 "CompuVoice"Talking electronic calculator, Digital calculator, 3-4 registers, Electronic, 1982, Japan, 22300192, 75x27x143mm, metal, Gift, New York Decus, D-Bells.

B240.82 Stanley, 1 "Barnard's Coordinate Spiral Slide Rule" Spiral Slide Rule, Analog Calculator, 2-3 Parts, Spiral slide rule, ca 1880, England, 83dx260mm, wood, paper mache, brass, Wooden case, handle, instrument, Buy, Peter Delahar, 180 (82), D-Bells.

Similar to Fuller's, but the logarithmic scale is repeated twice and occupies in all only about one-third of the helix. The upper part of the helix carries a sine scale.

B241.82

Palatine Engineering Co. Ltd. Liverpool, 1 "Bryan's Patent Planimeter" Analog Calculator, Multiple Part, non-linear planimeter, ca 1880, England, 70x105x405mm, Brass, Case, instrument, five cams, track made my Peter Delahar, Buy, Peter Delahar, 560 (82), D-Bells.

B242.82

Oliver, 1 "The Oliver Typewriter Model 9" 1916, USA, 405x370x250mm, khaki, metal, Buy, 50 (82), D-Bells.

The Oliver typewriter is the only successful down-strike-from-the-side class, was invented by Rev. Thomas Oliver in 1888 and patented in the USA in 1892 and Great Brtain in 18996. The Oliver Typewriting company was founded in 1895 with Model Number 1 (on view at the Science Museum). The models appeared in the following order No. 2 (1894), No.

3 (1898), No. 5 (1907), No. 7 (1915), No. 9 (1916) and the standard Model II 'Speedster' in 1922.

The 28 type-bars, each of which resembels an inverted U, are arranged in two banks to the right and left of the printing point, so providing complete visibility of the writing, the type striking on to the vertical centre line of the platen. Each bar carries three characters, the machine printing 84 characters by double shift. The use of a bar pivoted at each end is claimed to secure and preserve accurate alignment. The bars rest one within another and, as the length of the extremities vary, the shorter type-bars are provided with heavier type-heads with the object of equalixing the impressions. The paper cylinder is fitted with three rollers, the pressure of which can be released for adjusting the paper. The register pawl can be lifted to free the roller when linving by pencil. Single or double spacing is actuated by a striking motion operated by the marginal stop.

B243.82

Ludwig Spitz & Co., 1 "TIM Time is Money" arithmometer, Digital Calculator, 3-4 register, stepped wheel, ca 1880, USA, 420x200x160 mm, black, metal, eight digits, engraved The Oskar Muller Co. New York, Buy, Peter Delahar, 220 (82), D-Bells.

Dalton, 1 Adding and listing machine, Digital Calculator, 1-2 register, Pascal key, USA, Black, Metal, Buy, Amherst fleamarket, 35 (82), D-Bells.

B245.82Hitachi, 1 c-mos i c, tie clasp, 1982?, Japan, Buy, D-Bells.

B246.82

Hilliard, Gray, Little, and Wilkins, 1 "Elements of Technology" by Jacob Bigelow, M.D., Book, , 1829, USA, Original cloth-covered boards with original paper label, uncut. xii, 507 pp. With a large folding, engraved frontispiece + 10 engraved plates (6 folding) + 11 woodcut plates (1 folding) + many text figs. Spine somewhat worn and repaired, cloth partially faded and frayed at edges., Buy, The Antiquarian Scientist, 160(82), D-Bells.

Jacob Bigelow (1786-1879) was appointed in 1816 to the chair which Count Rumford had endowed at Harvard for the instruction of the application of the sciences to the useful arts, a first attempt to create a meeting ground for self-made inventors and academic scientists. There being no good name for such a field, Bigelow coined for it the name 'technology', which has passed into common language.

B247.82

Macmillan and Co., 1 "A treatise on the calculus of finite differences," George Boole. Book, 1860, England, First edition., Cloth cover., Buy, The Antiquarian Scientist, 275 (82), D-Bells.

B248.82

Patrick Adie, Optician, Mathematical & Scientific Instrument Maker, Broadway Works, Westminster, London., 1 "Eidograph" pantograph, Analog calculator, Multiple part, Drawing instrument, Mechanical, c 1860, England, 33 3/4" long with two 29" long 1/2 inch square rods, brass, instrument and large hand-dovetailed case made form mahogany, trade label, instruction set, and original key, Buy, The Antiquarian Scientist, 975(82), D-Bells.

Each of the rods, marked 'A' and 'B' slip into corresponding channels of the pulleys of the body. Here their lengths are varied and rad by verniers in the pulleys. The length of the main body rod which pivots on a central circular support, can be set and read by a vernier. The pulleys move in unison by virtue of the adjustable stell band with brass fittings coursing over them. One very large weight of brass and lead is used to balance the main rod and two smaller weights for the two side rods.

The eidograph is essentially a more preceise and versatile pantograph. Variable ratios can be set on the instrument for enlarging or reducing work. The eidograph was invented by William Wallace in 1801 based on the 17th century pantograph.

B249.82

1 protractor and T-square, analog calculator, 2-3 part, drawing instruments, mechanical, c 1830, USA, 23 1/2" with 6" radius protractor scale, brass, Buy, The Antiquarian Scientist, 225 (82), D-Bells.

A nicely made brass t-square with an adjusting arm which allows it to be set to a particular angle as read off the protractor scale.

B250.82

1 Trigonometer, Analog Calculator, Multiple Part, Mechanical, c 1840, USA, 12"x6", brass, Buy, The Antiquarian Scientist, 1,875(82), D-Bells.

The instrument is constructed so that a swinging arm carrying two sight vanes piots away from a stationary arm, also with two sight vanes, over an attached 90' scale with an intricate grid for reading the sine of the subtended angle by vernier directly to three places. A bubble level on the stationary arm allows horizontal or vertical reading. A ratcheted chain counter is also fixed to the stationary arm. A removable box compass can be fitted onto either arm by a neatly devised, quick action device.

The instrument was once the equipment of a Virginia surveyor and retains a fine hand-worked character with great attention to detail, such as fine knurling of the many thumb screws. Smart illustrates a similar instrument by Francis Whiteley of Standardsville, Virginia on p. 165. Both examples are elaborations of Whiteley's patent of 1836, but with the additions of the sine grid. The patent model and its type were made first, then the design with the sine grid, and finally the most advanced type with serial numbers and an added verneir on the swinging arm for reading the protractor scale as illustrated in Smart.

B251.82

Troughton, London, 1 proportional compass, Analog Calculator, 2-3 parts, drawing instruments, Mechanical, c 1800, England, 6 1/4inch long, Brass with stell points, hand-engraved, shaped sharskin case and instrument, Buy, The Antiquarian Scientist, 500(82), D-Bells.

Edward Troughton (1753-1836), the 'celebrated' English instrument maker, is well known for his very fine astrnomical and navigational instruments. In 1826, Troughton took in William Simms, and the firm flourished as Troughton 7 Simms, even after Troughton's death.

The instrument is used for enlarging or reducing a drawing with ratios marked along the slot, set by moving the screw pivot in it.

B252.82

Excellent section on slide rules and calulators, pp 216-236, and on planimeters, integrators and integraphs, pp 500-507.

B269.83

Keuffel & Esser Co., 1 Catalogue of Keuffel & Esser Co.book, 1921, USA, 36th edition, 150x227x30mm, Red, Hard bound, paper, 482 pages, index, well-illustrated, Buy, Tesseract, 34 D-Bells.

From 229-264, calculators, slide rules, planimeters, pantographs, and integraphs are illustrated and explained.

B270.83

S.A. Main BSc, 1 Ballistic Coefficient Slide Rule, Analog Calculator, 2-3 parts, linear slide rule, ca 1910, USA, 470x78x20 mm, yellow, Wood, paper, ivory and brass slide, hand lettered in red and black, Buy, 145, D-Bells.

Top scale is the ballistic coefficient; bottom is coefficient of form; center sliding scale has weight in pounds nad diameter in includes. Instructions: with Slide set the Diameter to the Coeff of Form; with Cursor set the value of Theta to the Weight; Read off Ballistic Coeff against Value of T. Reservse side has two sliders. Top stationery rule is ballistic coefficient. Slider has range-yards; time of flight-seconds; height of vertex - fee; angle of elevation or descent. Stationery rule has velocity reduced time in seconds. Slider has velocity and reduced elevation and reduced angle of descent. Botoom stationery rule has velocity. "Deisgned by S.A. Main, B.Sc.

B271.83

DeMarre, 1 Ballistic Slide RuleSlide Rule, Analog Calculator, 2-3 parts, Linear Slide Rule, ca 1910, USA, 420x70x15 mm, yellow, Wood, paper, brass, Hand written lettering, Buy, 145, D-Bells.

Designed for solving DeMarre's Formula:

$$T^{7} = \frac{W^{.5}\ V}{D^{.75}} \times \frac{1}{\log^{-1}\ 3.00945}$$

Top scale has plate thickness; slider has striking velocity in foot/seconds and diameter of shot in inchdes; bottom scale has weight of shot in pounds. Sliding cursor has two more scales that are not identified.

Keuffel & Esser Co., 1 Slide Rule, Analog Calculator, 2-3 part, Linear slide rule, ca 1930, USA, 54308, laminated wood, leather case and rule, Buy, NE Trade Show, 5, D-Bells.

B318.84

Lawrence Engineering Service, Peru, Indiana, 1 Slide Rule, Analog Calculator, 2-3 part, linear slide rule, ca 1950, USA, Paper on wood, "Waddy Hogue" written on the table side, Buy, NE Trade Show, 5, D-Bells.

slide rule on one side tables on the reverse. These include Decimal equivalents of one foot, weight metals, and ultimate strength.

B319.84

1 "Unique" Universal II Slide Rule, Analog Calculator, 2-3 parts, linear slide rule, England, plastic pinned on wood, Buy, NE Trade Show, 5, D-Bells.

B320.84

Kenyon Instrument Co., Inc., Huntington, L.I., N.Y., 1 "The Kenyon Calculator"Circular Slide Rule, Analog Calculator, 2-3 parts, Circular slide rule, 1937, USA, plastic laminate on wood, Buy, NE Trade Center, 5, D-Bells.

A nautical slide rule. The outer circule has distance and speed in land miles & miles per hour and nautical miles and knots. The inner circle has time ranging from one minute to 10 hours. The reverse side has a compass, map measure scale ratio for 1/20,000, 40,000 and 80,000. Beaufort wind scale, knots and weather bureau description.

B321.84

Keuffel and Esser, 1 "K & E Compensating Polar Planimeter with Adjustable Arms" planimeter, Analog Calculator, Multiple part, ca 1940, USA, Model 4242, Serial Number 9120, Instrument and velvet lined case, Buy, NE Trade Show, 75, D-Bells.

The adjustable tracer arm with vernier and adjustable pole arm allows the reading of areas in square inches to 0.01 sq. in. or .0.04 sq. cm. The range of the trace arm is 1.5-7 inches and the pole arm lenght is 6 to 13 inches. The maximum area "Pole out-side figure" is about 12 inches and "pole within figure" a 39 inch circle and 27 inch square.

B322.84

Keuffel & Esser co., 1 "Paragon protractor No. 1225"protractor, Drawing instrument, ca 1920, USA, nickel, mahogany case with velvet, Buy, NE Trade Center, 65, D-Bells.

The semicircular protractor has a horncenter and movable arm capable of being set at .5 degrees.

B323.84

Richmond School Furniture Co., Munci, Indiana, 1 "Junior Spelling and Number Board No. 50"Calculator, Digital Calculator, Single Register, Manual, ca 1940, USA, Red, cardboard, Buy, NE Trade Show, 20, D-Bells.

B324.84

Stanley, 1 Electronic Calculator, looks like a 16 ft stanley powerlock rule, ca 1980, USA, Buy, NE Trade Fair, 2, D-Bells.

B325.84

Contina Ag Mauren, 1 "Curta" Type II, Digital Calculator, 3 Register, Rotary, Mechanical, Liechtenstein, 513508, Instrument and Case, Buy, NE Trade Fair, 300, D-Bells.

B327.84

D'Ocagne, M., 1 Le Calcul Mecanique par L. Jacob, Paris Octave Doin et fils, Editeurs, 8, Place de L'Odeon, 8, Book, 1911, Buy, D-Bells.

B328.84

Albert Newstler A.G. Lahr i/B, 1 "Rechen-Walze System Cylindrical Slide Rule", Analog Calculator, 3-4 parts, slide rule, ca 1930, Germany, cylinder 6 1/4" diameter and 23" long, paper faced aluminum on dark oak base, Buy, Historical Technology, 629.57, D-Bells.

"This super slide rule appears to combine features of Hannyngton's linear grid slide rule and Thacher's cylindrical calculator. It differs from the former in that there is no overlap of scales on the base cyliner and from the latter in that each grid bar contains only one scale and that these scales are half the length of the base one. The Rouleau Calculator (Item 164 in the Science Museum catalog) is another Swiss variant of the same design. There are 50 scales, 20" long each on the main cylinder (for a total scale length of 1000 inches) and the same number, 10" long each, on the sliding grid." Historical Technology Catalog 127.

B329.84

Stanley, Philip E., 1 <u>Boxwood & Ivory, Stanley Traditional Rules, 1855-1975,</u> The Stanley Publishing Co., Westborough, 1984, Book, Buy, 22, D-Bells.

B330.78

de Beauclair, 1 <u>Rechnen mit Maschinen Eine Bildgeschichte der Rechentechnik,</u> Friedr Vieweg & Sohn, Braunschweig, 1968, Buy, D-Bells.

B331.85 Jevons, William Stanley, <u>The Principles of Science, a treatise on</u>

<u>logic and scitentific method,</u> London: Macmillan and Co. book, 1883, England, original brown bead-grain cloth, gilt spine lettering, 870 pp., advertisements, wood-engraved frontispiece of Jevons' 'logical piano"; Buy, Pickering and Chatto Ltd, 100, D-Bells.

Based on the first edition of 1874, this is Jevon's biggest and most celebrated book. Jevons' "logical piano', capable of performing logical operations on data fed in via the keyboard is shown in the frontispiece and described on pp. 107-114.

B332.85

Hollerith, Herman, Complete specification. Improvements in the methods of and apparatus for compiling statistics, patent application, 1889, Folio, 7 pages and 5 plates on 3 sheets; disbound in a cloth folding case, Buy, Pickering and Chatto, 1,500, D-Bells.

The original patent specification, and thus the first printed account, of the Hollerith electric tabulating machine.

B333.85

Peurbach, Georg, Tractatus Georgii Peurbachii super propositiones Ptolemaei de sinibus & chordis. 1468 - 1501, First edition, folio, 1-G4-Gr blank, small tear in E3 affecting a few figures, repaired in margin, minor waterstain, mostly marginal; a large crisp copy in antique style blindstamped calf. Buy, Pickering and Chatto, 1250, D-Bells.

The first printed trigonometrical tables. They were computed by Regiomontanus during his stay in Hungary in 1468. He had first computed a sexagesimal sine table and then realised the advantage of a decimal base and computed a decimal sine table; both tables are printed here. The tables are preceeded by Regiomontaus' essay on the construction of since tables and an essay on the computation of sines and chords by Peurbach. The work was edited bythe astronomer Johann Schoner (Adams P 2283, Zinner 1781).

B334.85

Capra, Balthasar, Vsvs et Fabrica Circini Cvivsdam Proportionis, Per quem omnia fere tum Euclidis, tum Mathematicorum omnium problemate facili negotio refoluunter, H.E. de Duccijs, Bononiae (Bologna) 1655

Italy, 1stt Ed., Modern leather binding and use, 86 pages, many text woodcuts including a full page one of the sector. Buy Historical Technology, 255, D-Bells.

The author (1580-1626) an Italian astronomer and philosopher is best known for his challenge of Galileo as the inventor of the compass of proportion or sector. This book was written in 1607 although not published until 1655 after Galileo's first disclosure about 1598.

B335.85

Galilei, Galileo, Le Operazioni del Compasso Geometrico et Militare, Terza, Paolo Frambotto, Padova, 1649, Italy, 80 pp., folding engraved plate of the sector and many text woodcut illustrations. Hard vellum binding, 3rd Edition. Buy Historical Technology, 635, D-Bells.

Galileo seems to have invented his "compasso geometrico" also called compass of proportion or sector about 1597 and disclosed it about 1598. The first edition of this, his first book, was published in 1606 with less than 60 copies issued. it was reprinted in 1619. A second, improved edition was issued in 1640 by the same publisher of the third.

B336.85

Ozanum, Jacques, Usage du compas de Proprotion et de L'instrument Universel, Claude-Antoine Jambert, Fils, Paris. 1769, France, 240 pp., 12 foldout engraved plates, original leather binding, Buy, Historical Technology, 165, D-Bells

The first edition of this work was published in Paris in 1688 becoming the standard text on the sector in France. Ozanam (1640-1753) was one of the leading French mathamaticians of this time.

B337.85Fowler's Calculators Ltd., "Jubilee Magnum" Circular Slide Rule

1, Analog Calculator, 1-2 parts, circular slide rule, 1948, England, nickel plated boy with white dial face rotated under an index line. Buy, Historical Technology, 145, D-Bells.

"Designed to mark the 50th anniversay of the firm and to meet the wants of a great number of people, whose primary requirements are for a device for solving problems of muliplicaton and division in a rapid and accurate manner." The entire sacle is 79" long resulting in almost one full figure increase in accuracy over the 10" slide rule.

B338.85

T. Heath fect, Gunter type sector,1, 1720-40, England, Bright brass, restored lacquer finish, pivoted strut which fold into a slot for added support. Buy, Historical Technology, 395, D-Bells.

Thomas Heath started in business in 1714. In 1740 he made his apprentice Tycho Wing a partner and Heath & Wing remained in business until Heath's death in 1773.

Small pocket size. 120 pages, plus an index. marked up by the owner.

B367.86

Schoten, Francois, 1 Tables de Sinus, Tangents, et SecantesChez Lambert Marchant, Libraire au Marche aux Herbes, a Brusseles, Memory, 1683, Leather binding, one wormhole, Buy, Pickering and Chatto Ltd, 200, D-Bells. Pocket sized.

B368.86

MacNeill, Sir John Benjamin, 1 Tables for Calculating the Cubic Quantity of Earth Work in the Cuttings and Embankments of Canals, Railways, and Turnpike RoadsRoake and Varty, London, Memory, 1833, Buy, Pickering and Chatto, 150, D-Bells.

First edition, 8vo9, pp. xxxvii, 253, dedication to Telford misbound before contents, errata on verso of title, and four engraved plates tipped in at end; contemporary green vellum, gilt lettering on spine, boards warped.

Sir John MacNeill was at this stage in his career one of Telford's principal assistants, and this work is dedicated to him. The uses he sets out for t hese tables reflect the type of engineering work he was engaged on. In his preface he refers to Charles Babbage's investigations on the type of paper nad print best suited for tables. At about this time MacNeill invented device to measure the irregularities of road surfaces which anticipated a similar invention by Babbage.

B369.86

Bessel, Friedrich Wilhelm, 1 Tabulae Regiomontanae Reductionum Observationum Astronomicarum ab anno 1750 usque an annum 1850 cumputaiRegiomonti Prussorum, Konigsberg (now Kalinengrad), sumptibus fratrum Borntraeger, 1830, Buy, Pickering and Chatto Ltd, 350, D-Bells.

First edition, 8vo, pp. (Iv), lxiii, (i), 542, errata, verso lank; foxed; blue library buckram, from the Royal Greenwich Observatory, release stamp on end paper.

The star positions given for one century, constitute the first modern reference system for the measurement of the positions of the sun, the moon, the planets, and the stars, and for many decades the Konigsberg tables were used as ephemeerrides. With their aid, all observations of the sun, moon, and planets made since 1750 at the Royal Greenwich Observatory could be reduced; and thus these observations could be used for the theories of planetary orbits.

<bl>In 1614, John Napier (1550-1617) published his epochal work on the "invention of logarithms. Posthumously published was his description of the method of construction of logarithmic tables (1619). the present first continental edition of both works was based on the joint issue of them at Edinburgh in 1619, with the addition here of Henry Brigg's annotations, pp. 58-62 of the last part. Briggs (1556-1631) played an important role in further development and utilization of logarithms.

<bl>"The difficulty attending the acquirement of musical theory has been the principal cause of the little attention paid to it by the generality of practical students. The intention of the "harmonic Diagram" is to diminish this difficulty and to render the groundwork of the science more familiar. The diagram is a representation of the principles from which the Science of Museu is derived, the rules constituting the theory, from the apparent mutual connexion of their elements, are rendered more evident than they could be in a desultory treatise." from "An explanation of the Harmonic Diagram" invented by C. Wheatstone, Londe pp. 14-20 of his "Scientific Papers" London 1879.

<lo>D-Bells
<bl> The Oliver typewriter is the only successful down-strike-from-the-side class, was invented by Rev. Thomas Oliver in 1888 and patented in the USA in 1892 and Great Brtain in 18996. The Oliver Typewriting company was founded in 1895 with Model Number 1 (on view at the Science Museum). The models appearred in the following order No. 2 (1894), No. 3 (1898), No. 5 (1907), No. 7 (1915), No. 9 (1916) and the standard Model II 'Speedster' in 1922.

The 28 type-bars, each of which resembels an inverted U, are arranged in two banks to the right and left of the printing point, so providing complete visibility of the writing, the type striking on to the vertical centre line of the platen. Each bar carries three characters, the machine printing 84 characters by double shift. The use of a bar pivoted at each end is claimed to secure and preserve accurate alignment. The bars rest one within another and, as the length of the extremities vary, the shorter type-bars are provided with heavier type-heads with the object of

equalixing the impressions. The paper cylinder is fitted with three rollers, the pressure of which can be released for adjusting the paper. The register pawl can be lifted to free the roller when linving by pencil. Single or double spacing is actuated by a striking motion operated by the marginal stop.

<bl>Each of the rods, marked 'A' and 'B' slip into corresponding channels of the pulleys of the body. Here their lengths are varied and rad by verniers in the pulleys. The length of the main body rod which pivots on a central circular support, can be set and read by a vernier. The pulleys move in unison by virtue of the adjustable stell band with brass fittings coursing over them. One very large weight of brass and lead is used to balance the main rod and two smaller weights for the two side rods.

The eidograph is essentially a more preceise and versatile pantograph. Variable ratios can be set on the instrument for enlarging or reducing work. The eidograph was invented by William Wallace in 1801 based on the 17th century pantograph.

<bl>The Millionaire was invented in 1893 by Otto Steiger and was the first direct multiplying calculator to be commercially successful. Between 1894 and 1935, 4,655 millionaires were sold.
Use. One turn of the crank automatically multiplies the accumulator by a single digit specified by a pointer in the upper left hand corner of the machine. The pointer is reset for each digit in the multiplier until the computation is complete.

<bl>Compiled in 1781 by Charles Hutton, this is an early book of mathematical tables containing the products of the numbers 1 through 1000 by the numbers 1 through 100. It also contains squares and cubes of numbers and conversion tables for units of measurement.

One of the main problems with handcrafted books is the number of errors. On one page alone, every figures is off by one thousand. With handcrafted calculating and typesetting such problems are unavoidable. Later books of talbes were done by the Difference Machine and proved more reliable.

<bl>In 1820, Chevalier Charles X Thomas of Colmar designed and introduced the first multiplication machine made commercially available for general sale. Although it was not patented until 1851, the main features of the 1820 design remained unaltered.

The mechanism has three parts, concerned with setting, counting, and recording respectively. Any number up to 999,999 may be set by moving the pointers to the numbers 0 to 9 engraved next to the six slots on the fixed cover plate. The movement of any of these pointers slides a small pionion with ten teeth along a square axle, underneath and to the left of which is a Leibniz stepped wheel.

The Leibniz wheel, a cylinder having nine teeth of increasing length, is driven from the main shaft by means of a bevel wheel, and the small pinion is thus rotated by as many teeth as the cylinder bears in the plane corresponding to the digit set. This amount of rotation is transferred through one of a pair of bevel wheels, carried on a sleeve on the same axis, to the 'results' figure wheel on the back row on the hinged plate. This plate also carried the figure wheel recording the number of turns of the driving crank for each position of the hinged plate. The pair of bevel wheels is placed in proper gear by setting a lever at the top left-hand cover to either "Addition and Multiplication" or "Subtraction and Division." The "results" figure wheel is thereby rotated anti-clockwise or clockwise respectively.

Use. Multiplying 2432 by 598 may be performed as follows: Lift the hinged plate, turn and release the two milled knobs to bring all the figure wheels to show zero; lower the hinged plate in its position to the extreme left; set the number 2432 on the four slots on the fixed plate; set the lever on the left to "multiplication" and turn the handle eight times; lift the hinged plate, slide it one step to the right, and lower it into position; turn the handle nine times; step the plate one point to the right again and the turn the handle five times. The product 1,454,336 will then appear on the top row, and the multiplier 598 on the next row of figures.

<bl>About 1607 Edmund Gunter devised a scale that was to be the predecessor of the modern slide rule. In 1623 he published a description of this scale that is composed of two scales of the logarithms from 1 to 10 placed end to end. Although Napier conceived of the logarithm allowing multiplication or division to be accomplished by addition or subtraction, Napier relied on look up tables.

<u>Use.</u> Multiplication is carried out by using a pair of dividers to measure a distance, the multiplier, along the rule and add it to another distance, the multiplicand, forming the combined distance, the product, on the rule. The accuracy of an answer is limited by the length of the rule and the user's ability to resolve a number.

<bl>Designed in 1878 by Professor George Fuller, the logarithmic line is arranged spirally on the surface of a cylinder. The logarthmic line is in 50 turns, giving a working length of 41 feet 8 inches. All numbers of four figures either have a mark upon the scale or are midway between two marks, so that results accurate to four figures are easily obtained.

Use. By means of movable cylinders any length of spiral line may be at once transferred to any other part of the scale, and multiplications and divisions containing a series of factors can be worked with facility. Logarithms of numbers are given by means of a scale on the longer index arm together with a circular scale on the first cylinder, so that powers and roots are obtainable. The surface of the middle cylinder bears printed tables of decimal equivalents, natural sines, etc.

<bl>This instrument for directly measuring an area bounded by an irregular curve is based on an idea developed by the Bavarian engineer J M Hermann in 1814. The first commercially successful devices were made by Ernst of Paris. In 1851, John Sang of Kirkcaldy invented and made a "platometer" resembling the planimeter of Ernst.

Use. Operation is based on continuous integration. A curve is traced using the pointer, with the area read off on the dial after the complete perimeter has been traversed. As the pointer is moved the rollers that measure distance on the conical shaft calculate the product of the vertical distance times the horizontal distance. As a curve is traversed in a clockwise direction, the top area is integrated in a positive direction. On the return trip the integration is negative and the net value is provided.

<bl> The Comptometer was invented in 1887 by Dorr E Felt of Chicago and claims to be the first successful key-driven adding and calculating machine.

Use. For each digit a push button from 1 to 9 is selected which rotates a Pascal-type wheel with the corresponding number of increments. Numbers are subtracted by adding the complement (shown in smaller numbers). The carrying of tens is accomplished by power generated by the action of the keys and stored in a helical spring, which is automatically released at the proper instant to perform the carry.

Through effective marketting and training of skilled operators versed in complement arithmetic at Comptometer Schools, these machines became the workhorse of the accounting profession in the first part of the century. They never successfully advanced into the electro-mechanical era, but remained purely mechanical, two-function adding and subtracting machines.

<bl>The sector is used to solve problems of proportion and works on the principle of similar triangles. Sectors were made with a variety of scales for use in calculation by navigators, surveyors, gunners, and draughtsmen. At first sight they look like a jointed rule usually made of ivory, brass, wood, or sometimes silver. First described by both Galileo in Italy and Thomas Hood in England , the sector was in use by 1600.

Use. A pair of dividers is necessary to read the relationships on all sectors. This instrument is marked: "Chords, Sec, Lines, Tangents, tan, Ver Sine, Sines, & Num." The scale layout permits this sector to be used as a Gunter rule as well, although it is not laid out to follow any of the five editions of Gunter, but is close to the example in Stone (B18.78).

<bl>These small instruments for facilitating the multiplication and division of large numbers were invented by John Napier, laird of Merchiston in Scotland, and are described in his RABDOLOGIAE, published in 1617. He wrote that the multiplication and division of great numbers is troublesome, involving tedious expdendenditure of time, and subject to "slippery errors." His tables reduced these difficulties to simple addition and subtraction, and won immediate recognition. A set of Napier's bones are usually made of boxwood or ivory and often contained in a box or case that would fit in a pocket. A set usually contains 10 rods, plus extras representing squares and cubes.

Use. Addition is accomplished by reading the appropriate bones along the diagonal. To obtain a product of 224 x 44, the rods 2, 2, and 4 are put alongside each other, and the result is read off by combining the numbers in the fourth row -- 0/8, 0/8, 1/6 -- for the correct answer 896. This is repeated and the two products added together to give

9856. The bones are sometimes associated with an abacus to provide a store in the multiplication process.

<bl>Patented in 1881 by Edwin Thatcher, an 1884 instruction book notes, "The originary rule in use is 12 inches long, with radii of 11 and 5 1/2 inches, the divisions of which are cut by hand, copying from a machine divided plate. In the present instrument the radii are 60 and 30 feet, the divisions of which are printed directly from machine divided plates. Those plates contain over 33,000 divisions, calculated to seven places of decimals from Babbage's tables by using a common multiplier, every line being subjected to correction for error of screw and temperature variations, so that possibly every line center is within .0001 inch of its true place."

The instrument consists of a cylindrical slide, which admits of both rotary and longitudinal movement within an open metallic framework of 20 equidistant triangular bars. The bars are connected to rings at their ends which admit rotation within standards attached to the base. Upon the slide are wrapped two complete logarithmic scales, each of which is divided into 40 parts of length equal to half that of the slide. The parts follow each other in regular order around the cylinder, and the figures and divisions which constitute any part of the right are repeated on the left, one line in advance.

Use. By the rotary and longitudinal movement of the slide any of its divisions may be brought opposite to or in contact with any division on the fixed scales. The divisions on the upper lines are transferred to the slide by means of a pointer fitting over the bars, which is also convenient for retaining the position of any division on either line while the slide is being revolved into the required position. Near the commencement of each scale on the slide is a heavy black mark designed to catch the eye readily during the rapid movement of the parts.

<bl>Use. On one side, the A line on the rule and the B and C lines on the slider are each numbered twice from 1-10, reading from left to right. The fourth line E is inverted, and is so arranged that 144 is opposite 1 and 10 on the A line. So that if length in feet on E be set opposite thickness in inches on C, the volume in cubic feet is read off on B opposite width in inches on A. The B line is subdivided into tenths, while the A, C, and E lines are subdivided into fourths. On the other side of the rule are A, B and C lines with the girt line (marked D) numbered from 4-40 and bearing various gauge points. The A and D lines are subdivided into fourths. The two edges of the rule bear scales of inches divided into quarter-inches.

<bl>The HP-35 was the first hand-held scientific calculator small enough to fit in a pocket. It is something of a miniaturized version of earlier desk top scientific calculators such as the Friden. A microprocessor is programmed to carry out the calculator's functions.

Use. Functions include logarithms, exponentials, trigonometric, decimals, scientific notation, and degrees and radians are used. Reverse Polish notation replaces conventional parenthesis.

<bl>This work describes the first analog computer designed to solve algebraic equations of the n'th degree expessed in the form y = a + bx + cx2 + dx3 + . . . + qxn . It was completed in 1768 by Rowning based upon the graphical method invented by A. deSegner in 1751. In 1770 an actual machine mechanized to the second degree was presented to the Royal Society, but apparently no longer exists. Rowning's instrument consists of a number of adjustable straight bars, or "rulers," centred and combined together in such a way as to occupy progressively the various positions in accordance with deSegner's graphical construction. Movement in two directions at right angles to one another is secured by means of two pairs of racks and pinions. The curve is drawn by a pencil on the underside of a piece of pasteboard supported by two adjustable bars.

Use. Segner's method consisted in finding, by graphical construction, the values of y for various assumed values of x, plotting the curve, and reading off the values

of x at the points where the curve intersected the axis of x, thus obtaining the real roots of the equation. The impossible or imaginary roots were indicated by the points where the curve approached and receded from the axis of x, without reaching it.

<bl>This instrument for measuring the area of any plane figure was invented by Professor Jacob Amsler in 1856. It is a proportional instrument in that the unit can be changed by altering the radius of the tracing arm.
<u>Use.</u> The weighted point is fixed and the tracing pointer guided exactly once round the outline of the figure whose area is to be measured. The difference of the readings on the graduated roller before and after this operation gives the area of the figure in units dependent on the setting of the tracing arm.

<bl>A version of the classical trigonometer signed and dated "THE LOWRY MFG. CO./BOSTON, U.S.A./PAT. 1887, '92, '96". It has two four and a half inch compass bearing dials, one fixed at the end of the twenty-six inch long graduate slotted base plate, the other sliding, and each with graduated pivoted arms of 18 3/8" radius. It was intended for the analog solution of the plane triangle knowing two angles and included side, two sides and the included angle, or three sides. Thus it was useful for problems both of navigation and gunnery.

<lo>D
<bl>The German patent of W T Odhner, 1891, was acquired by Messrs Grimme, Natalis & Co, and was embodied in a machine known as the "Brunsviga." This example is a further adaptation and sits on a wood board that was part of a disappearring desk top.

Use. Although the machine performs multiplication by repeated addition as in the Thomas type, the use of the Odhner wheel instead of the Leibniz toothed wheel led to a more compact design. The Odhner wheels fit very close together on the axle on the back. A setting lever, the end of which projects through a slot in the cylindrical portion of the cover plate, forms part of each wheel. If a lever is set against any figure (1 to 9) of its slot, a corresponding

number of pins are made to project from its wheel. When the operating handle is turned, these pins gear with small toothed wheels of the product register, which in turn gear with the number wheels in front. The product register is mounted on a longitudinally movable carriage arranged in front of the machine, which carries a second counter for registering the multiplier or the quotient. The handle is turned in a clockwise direction for addition and multiplication, and counter-clockwise for subtraction and division.

<bl>The Curta is the ultimate example of the rotary mechanical calculator. Its small size requires better manufacturing technology than any other mechanical calulator. Model I had an 8 digit input setting, 6 digit counter, and 11 digit accumulator. Model II had an 11 digit setting, 8 digit counter, and 15 digit accumlator. Prior to the electronic calculator, the Curta was the only four-digit portable calculator and as such was expecially popular for use at car rallies.

<bl>The abacus is the earliest known computing device and the first hand-held calculator. It postdated the invention of the decimal system by the Egyptians circa 3000 BC. The Greeks and Romans built and used the abacus based on Hindu-Arabic numerals.
Unlike earlier notations and devices using stones and marks, the abacus utilizes positional notation, including the

representation of zeros, differences, with capabilities for multiplication and division. The Chinese abacus has beads in groups of 5 and 2, representing decimal digits. The Japanese first modified this to 5 and 1 and then 4 and 1.

<bl> This specialized rule was designed for the paper and printing industry. The A scale indicated length, B scale the breadth, and area in square inches was read off the C scale.
The D scale was used to read off translations of inches to centimeters, kilos to pounds, 480 and 500 sheet reams, and various weights of different standard paper cuts.

<bl>"Palmer's Computing Scale" patented in 1843 by Aaron Palmer was improved and produced by J.E. Fuller in 1847. This model is printed from the original Palmer plate with Fuller's name and own patent added to the engraving, done by George C. Smith, 186 Washington St., Boston. The reverse side, "Fuller's Time Telegraph" was patented by him in 1845.

Use. "Palmer's Computing Scale" was used to calculate square measures, cubic measures, timber measures, grain measures, liquid measures and interest rates from 3 percent to 10 percent on a daily and monthly basis. "Fuller's Time Telegraph" (on the reverse) was used to calculate time lapse in days or weeks between any two given dates. In concert these two measures would be useful to dealers in grain, alcohol and other commodity trading.

<bl>"Hydralculator", patent number 396,533, published by Lewis & Tylor Ltd., Gripoly Mills, Cardiff, the manufacturers of "underwriter" super fire fighting hose, for the use of their "Friends in the Fire Service."

Use. To find the quantity of water discharged for any given nozzle and a known pressure, place press on scale "b" opposite nozzle on scale "a', and read discharge through window in slide. To find height of jet for given pressure and nozzle diameter, proceed as above and read opposite arrow in center of slide, the height given on scale "d" for the appropriate nozzle.

<bl>This specialized rule is copyright 1911, The Cleveland Twist Drill Company.

Use. The rule indicated drill speeds for wrought iron, machinery steel and soft tool steel. One side shows revolutions per minute for diameters ranging from one-sixteenth to three inches for both high speed and carbon steel drills. The other side shows tap and drill sizes and the decimal equivalent for inch divisions.

<bl>The first mechanical adding machine built by the French phsycist and matehmatician, Blaise Pascal.
Use. The dials show the French monetary unit, the livre, which
was divided into 12 deniers, each subdivided into 20 sols. The essential part of the machine was its decimal carry; each toothed wheel moved forward one unit (one-tenth of a revolution on each wheel except those of deniers and sols) when the previous wheel had completed one revoltuion. Subtraction was based on complementary numbers that could be revealed by moving the strip at the top of the calculator.

<lo>D-Gordon's Office
<bl> The simplex is a small, inexpensive, home typewriter that only holds paper less than seven inches wide. U.S. patent numers 1138427, 1204912, 1521408, 1865288, 1869426, and 1957373.

Use: From the Directions for Operating in the case: "First: Hold the machine with rack side toward you. Push carriage to the left to starting point. When doing this see that dog does not catch in rack. Insert paper between rollers from the front. Put finger on key of letter desired and swing it into notch in rim of typecase near the dog: <u>Press downward to print.</u> To make a space without prining, press down on any key near to but not in the notch. To ink apply only a drop of ink to each pad with the end of a matchstick or toothpick. Be careful not to bend the pads down so far as to prevent them from springing back into position. Use only Simplex Ink which will be supplied at 10 cents per tube, cheap ink destroys the face of the type. Do not oil. If keyplate sticks take a rag moistened with vaseline and hold against underside of keys at the notch and twirl type plate around a few times. If the carriage does not move forward freely, apply a little vaseline to the carriageway where it rubs. Caution! Keep oil or vaseline away from rubber type and ink pads. Oil will swell and destroy the letters."

<bl>Part I contains Interest Tables in Rupees, Dollars, and Sterling from one-half to 12 per cent per annum. Part Ii contains tables for the conversion of rupees, into sterling and dollars; and sterling into dollars. Part III contains commission or Inland Exchange Tables; Key showing indirect exchange between England, India and China; Tables shoing the comparative rates of exchange for sight bills, and tables showing the estimated value of one pound of cotton with all charges and varying exchange rates.

In the preface to the third edition the author states, "The rapid sale of the previous Editions of the "Oriental Calculator" and the pressing demand for it, are evident proofs of the utility of this work in mercantile circles; and the production of the Third Edition is the result of the liberal patronage and support the author has been favored with."

<bl>Cyrus West Field (1819-1892) American merchant, promotor of the first Atlantic cable was botn in Stockbridge, massachusetts. In 1854, he conceivec the idea of the calbe and secured a charter to organize the England and American companies. The British and American naval ships, HMS Agamemnon and the USS Niagara were secured to lay the cable. Five attempts were made between 1857 and 58. The first message transmitted, August 16, 1858, read, "England and America are united by telegraph. Golory to God in the highest and on earth peace and good will towards men." The Queen and the President of the United States exchanged congratulations, but the cable ceased working three weeks later. It was necessary for Field to raise new funds and make new arrangements. The great Eastern succeeded in laying a calbe in 1866.

<bl>The instrument is constructed so that a swinging arm carrying two sight vanes piots away from a stationary arm, also with two sight vanes, over an attached 90' scale with an intricate grid for reading the sine of the subtended angle by vernier directly to three places. A bubble level on the stationary arm allows horizontal or vertical reading. A ratcheted chain counter is also fixed to the stationary arm. A removable box compass can be fitted onto either arm by a neatly devised, quick action device.

The instrument was once the equipment of a Virginia surveyor and retains a fine hand-worked character with great attention to detail, such as fine knurling of the many thumb screws. Smart illustrates a similar instrument by Francis Whiteley of Standardsville, Virginia on p. 165. Both examples are elaborations of Whiteley's patent of 1836, but with the additions of the sine grid. The patent model and its type were made first, then the design with the sine grid, and finally the most advanced type with serial numbers and an

added verneir on the swinging arm for reading the protractor scale as illustrated in Smart.

<bl>Edward Troughton (1753-1836), the 'celebrated' English instrument maker, is well known for his very fine astrnomical and navigational instruments. In 1826, Troughton took in William Simms, and the firm flourished as Troughton 7 Simms, even after Troughton's death.
   The instrument is used for enlarging or reducing a drawing with ratios marked along the slot, set by moving the screw pivot in it.

<bl>Top scale is the ballistic coefficient; bottom is coefficient of form; center sliding scale has weight in pounds nad diameter in includes. Instructions: with Slide set the Diameter to the Coeff of Form; with Cursor set the value of Theta to the Weight; Read off Ballistic Coeff against Value of T. Reservse side has two sliders. Top stationery rule is ballistic coefficient. Slider has range-yards; time of flight-seconds; height of vertex - fee; angle of elevation or descent. Stationery rule has velocity reduced time in seconds. Slider has velocity and reduced elevation and reduced angle of descent. Bottom stationery rule has velocity. "Designed by S.A. Main, B.Sc.

9:45 AM
July 14, 1978 - Arrived

Turned keys of el cheapo Avis Toyota over to faithful chauffeur, companion Kato (Brig) and he drove us like a mad man to Kuilima Hyatt Resort Hotel, Kahuku, Oahu, Hawaii 96731, through the pineapple fields. The time was 7 local and 1 AM (Boston). Had our fourth meal of the day and crumped out at 8. Rose at 6 (Brig at 7), had a camping breakfast, did the news, read the rest of Dan's work he sent, went swimming/snorkling (visibility poor, scenes dull), got set for visit to Kahuka Farms - a place I have some (ill-fated tax-deducted) $'s in which is supposed to raise oysters/clams, to form plankton they farm by the ton. Set for scuba this afternoon if we have the time.

Airplane ride ridded me of 1/2 the paper in my briefcase (gift to United) and obsolete book on Japan that Clayton loaned me, an outline of a paper about the future of computers (2, 5-10) in case I write it for Justice Department, and allowed reading 100+ pages of Reischauer - The Japanese. The later seem most fascinating. It was necessary to watch a movie (House Calls - Walter Mathau) to break the monotony of 11 hours of flying and now have only a little more industrial background information to read. (The Reischauer book is a "must read" for everyone whose life the Japanese impinge).

7:30 PM
We visited the Kahuka Farms Agriculture Farm where we saw plankton being harvested and many oysters growing in what used to be an airfield. The engineering problems of sea farming are enormous -- the old problem: everything corrodes. We were impressed at the progress, delighted to hear that the president now has a chief executive, who's a construction engineer, to run the place and worried about the same old issue. The dream expands faster than their ability to get the profit and make a go of it. I have no doubt that the scheme will work very well. It will, but the ability to manage the dream is the problem. I reviewed a consultant's report which was favorable; but even I, dumb engineer , could poke holes in the financial part (consistency, depreciation, maintenance). Somehow there needs to be more of a hard-ass financial person closer to this. The flaky tax situation of tax write offs for farms places an unrealistic magnet for capital -- this is wrong. It ultimately has to fly on its own. The government playing god moses again and makes for more unrealism.

The windmill I recommended he not get has run one year and fallen apart with corrosion. I recommended he not get a computer to control the water flow into the plankton. Somehow, there needs to be a first rate intellectual attached to the project who worries about the engineering (i.e., hours off (sun light)=plankton/liter, the diffusion equations for oysters, clams, prawns, etc. when fed this way.) I recommend that Rod Harrington at Purdue (the only Ag. Engineer I know) come get involved. It's a beautiful problem. (We topped morning off with two each, very fat oysters!) We ate buffet at lunch and fully stuffed ourselves after the spartan breakfast and oyster appetizers.

In the afternoon Brig and I went to another unspellable, unpronounceable, 20-minute away tour, rented scuba gear and drove back about 1/2 way and had a nice long dive. We got out of the water - he had 1200# left, I about 600. We were somewhat cold; I was tired since it was first dive in two years. The place was Bojacs in Haleiwa. It's an easy dive off the beach. No colored coral, some urchins, many of the fish of the caribbean, but lots of nice caves to swim in and out of. Took the equipment back, got our dive cards back, which they kept as equipment deposits, got an ice cream cone (reasonable quality - about Brigham's level) and then started back. Stopped at a local place (previously recommended) and had an earlier dinner -- which we shouldn't have. (We should have got our bodies to an 8+ (5 in Japan) dinner hour. We'll pay tomorrow! Shopped for fresh pineapple which we bought at slightly higher than mainland prices; got Brig some milk for breakfast. This time a pretty elegant one.

The main thing we can be thankful about is the lack of sunburn -- we got some fancy (expensive) filter water-insoluble cream. We were only in water/sun a couple of hours.

The hotel is the usual American obsenity (could be anywhere) -- a real energy pig. Lots of architecty incandesent lights, fully air conditioned even though its only 70-80, and lots of wind. (We've kept our room open) it overlooks a gorgeous cove and the noise is great as waves break on the beach.

October 23, 1979

Mr. Archie J. McGill
Vice President, Business Marketing
American Telephone and Telegraph Company
295 North Maple Avenue
Basking Ridge, New Jersey 07920

Dear Mr. McGill:

I'm sorry I wasn't able to meet you when you visited Digital several months ago in regard to ACS. However, I continue to be involved in the work here and am dedicated to making it a success. Having visited Bell Labs several times this last year, I feel a basic change in attitude toward making products available sooner. Your name continues to come up as being the driver of this change, and hence I am writing this letter about my view of Teleconferencing.

We used PMS to try it out and indeed it is useful and impressive, and the only drawback is the lack of its availability. Indeed the NET&T people asked for a quote from me to publish internally. I said:

> "We used PMS for an introductory technical conference with people we hadn't met beforehand and it worked fine. It saved a day of travel time for four people and our meeting lasted 2 1/2 hours--whereas, if it had been a trip, we'd feel obliged to have the perfunctory Parkinsonian one day meeting, dinner, etc., and would not have accomplished any more.
>
> It's unfortunate that it's so hard to get access to PMS because it is badly needed. There should be an instrument to perform all the picture and voice input-output which could be rented or purchased and easily installed in any reasonable room. AT&T could then provide the electrical path and we'd all be happy."

Here, the last paragraph is significant. Having stimulated the market through PMS, we postulated that links among our engineering sites (only 30-60 minutes away, plus one in Colorado Springs) would save us lots in terms of travel, people and lost opportunity costs. We then tried to get the service from NET&T and found what we expected, no links and no rooms...in short nothing. We are still going ahead with a microwave and satellite links, and are trying to get a local firm to engineer the video console. I still feel like this is AT&T's province/responsibility to supply the equipment and links.

Can I urge you to get several firms, say GE, RCA, Sony, Hitachi to build a standard instrument which is portable, has 3-5 cameras, accepts viewgraph and paper input, provides the voice mixing, provides the 2 screen with videotape and hard copy output and which anyone can rent or buy. I trust you would also make it available as a service like current telephones. In a similar way, the lines would be supplied either by you or by others. I think AT&T could really help us be more productive, while at the same time reducing oil imports. Any chance your organization will rise to the challenge, or will it just evolve in a totally bottom-up ad hoc fashion which will ultimately have to be standardized?

Sincerely,

Gordon Bell
Vice President of Engineering

B1.75EGLI & CO., 1 "MILLIONAIRE" Four Register, Automatic Stepped Wheel, Mechanical, 1903, Switzerland, 539, 17x52x28 cm, Brass, 6 digit, Buy, Dr. Margaret Kennedy, 500 (75), D-MR2.

The Millionaire was invented in 1893 by Otto Steiger and was the first direct multiplying calculator to be commercially successful. Between 1894 and 1935, 4,655 millionaires were sold.

Use. One turn of the crank automatically multiplies the accumulator by a single digit specified by a pointer in the upper left hand corner of the machine. The pointer is reset for each digit in the multiplier until the computation is complete.

B2.76 Hutton, Charles, 1 "Table of the Products and Numbers", Table, Fixed, Craft, 1781, England, 28x42x1 cm, paper, Buy, Historical Technology Inc., 68 (76), D-MR2.

Compiled in 1781 by Charles Hutton, this is an early book of mathematical tables containing the products of the numbers 1 through 1000 by the numbers 1 through 100. It also contains squares and cubes of numbers and conversion tables for units of measurement.

One of the main problems with handcrafted books is the number of errors. On one page alone, every figures is off by one thousand. With handcrafted calculating and typesetting such problems are unavoidable. Later books of talbes were done by the Difference Machine and proved more reliable.

B3.76Chevalier Charles Savier Thomas, 1 "Arithmometer", Three Register, Stepped Wheel, Mechanical, ca 1850, England, 1583, 10x18x58 cm, Brass, Wooden case, Buy, Peter Delahar Antiques, 376 (76), D-MR2.

In 1820, Chevalier Charles X Thomas of Colmar designed and introduced the first multiplication machine made commercially available for general sale. Although it was not patented until 1851, the main features of the 1820 design remained unaltered.

The mechanism has three parts, concerned with setting, counting, and recording respectively. Any number up to 999,999 may be set by moving the pointers to the numbers 0 to 9 engraved next to the six slots on the fixed cover plate. The movement of any of these pointers slides a small pionion with ten teeth along a square axle, underneath and to the left of which is a Leibniz stepped wheel.

The Leibniz wheel, a cylinder having nine teeth of increasing length, is driven from the main shaft by means of a bevel wheel, and the small pinion is thus rotated by as many teeth as the cylinder bears in the plane corresponding to the digit set. This amount of rotation is transferred through one of a pair of bevel wheels, carried on a sleeve on the same axis, to the 'results' figure wheel on the back row on the hinged plate. This plate also carried the figure wheel recording the number of turns of the driving crank for each position of the hinged plate. The pair of bevel wheels is placed in proper gear by setting a lever at the top left-hand cover to either "Addition and Multiplication" or "Subtraction and Division." The "results" figure wheel is thereby rotated anti-clockwise or clockwise respectively.

<u>Use.</u> Multiplying 2432 by 598 may be performed as follows: Lift the hinged plate, turn and release the two milled knobs to bring all the figure wheels to show zero; lower the hinged plate in its position to the extreme left; set the number 2432 on the four slots on the fixed plate; set the lever on the left to "multiplication" and turn the handle eight times; lift the hinged plate, slide it one step to the right, and lower it into position; turn the handle nine times; step the plate one point to the right again and the turn the handle five times. The product 1,454,336 will then appear on the top row, and the multiplier 598 on the next row of figures.

B4.76?, 1 Gunter Rule, 2-3 Part, Gunter Rule, Craft, ca 1800 England, 5x60x.5 cm, wood, Buy, Peter Delahar Antiques, 61 (76), D-MR2.

About 1607 Edmund Gunter devised a scale that was to be the predecessor of the modern slide rule. In 1623 he published a description of this scale that is composed of two scales of the logarithms from 1 to 10 placed end to end. Although Napier conceived of the logarithm allowing multiplication or division to be accomplished by addition or subtraction, Napier relied on look up tables.

Use. Multiplication is carried out by using a pair of dividers
to measure a distance, the multiplier, along the rule and add it to another distance, the multiplicand, forming the combined distance, the product, on the rule. The accuracy of an answer is limited by the length of the rule and the user's ability to resolve a number.

B5.76Stanley, 1 "Fuller's Spiral Slide Rule", Spiral, 2-3 part, Slide Rule, Craft, 1902, England, 9x9x33 cm, Cardboard, Mahogany, Brass, Screw on handle, case, Buy, Historical Technology Inc, 138 (76), D-MR2.

Designed in 1878 by Professor George Fuller, the logarithmic line is arranged spirally on the surface of a cylinder. The logarthmic line is in 50 turns, giving a working length of 41 feet 8 inches. All numbers of four figures either have a mark upon the scale or are midway between two marks, so that results accurate to four figures are easily obtained.

Use. By means of movable cylinders any length of spiral line
may be at once transferred to any other part of the scale, and multiplications and divisions containing a series of factors can be worked with facility. Logarithms of numbers are given by means of a scale on the longer index arm together with a circular scale on the first cylinder, so that powers and roots are obtainable. The surface of the middle cylinder bears printed tables of decimal equivalents, natural sines, etc.

B6.76J. Sang, 1 "Platometer" Planimeter, Multiple part, Areal Measure, Mechanical, ca 1860, England, 9x15x37 cm, Brass, Wooden case, magnifying glass, Buy, Peter Delahar Antiques, 355 (76), D-MR2.

This instrument for directly measuring an area bounded by an irregular curve is based on an idea developed by the Bavarian engineer J M Hermann in 1814. The first commercially successful devices were made by Ernst of Paris. In 1851, John Sang of Kirkcaldy invented and made a "platometer" resembling the planimeter of

Ernst.

U<u>se.</u> Operation is based on continuous integration. A curve
is traced using the pointer, with the area read off on the dial after the complete perimeter has been traversed. As the pointer is moved the rollers that measure distance on the conical shaft calculate the product of the vertical distance times the horizontal distance. As a curve is traversed in a clockwise direction, the top area is integrated in a positive direction. On the return trip the integration is negative and the net value is provided.

B7.76Burroughs, 1 "Burroughs Model 5", Two Register, Keyed Wheel, Mechanical, USA, 5-146-1088, 28x25x12 cm, Black, Metal,, Buy, City Office Equipment, 10 (76), ?.

B8.76Burroughs, 1 "Burroughs" Single Register, Keyed Wheel, Mechanical, USA, A342273, 18x25x27 cm, , Buy, City Office Equipment, 10 (76), D-MR2.

B9.76Felt & Tarrant Manufacturing Co., 1 "Comptometer", Single Register, Keyed Wheel, Mechanical, 1914, USA, 37x28x15 cm, Green, Metal, Buy, City Office Equipment Co, 10 (76), D-MR2.

The Comptometer was invented in 1887 by Dorr E Felt of Chicago and claims to be the first successful key-driven adding and calculating machine.

<u>Use.</u> For each digit a push button from 1 to 9 is selected which rotates a Pascal-type wheel with the corresponding number of increments. Numbers are subtracted by adding the complement (shown in smaller numbers). The carrying of tens is accomplished by power generated by the action of the keys and stored in a helical spring, which is automatically released at the proper instant to perform the carry.

Through effective marketting and training of skilled operators
versed in complement arithmetic at Comptometer Schools, these machines became the workhorse of the accounting

profession in the first part of the century. They never successfully advanced into the electro-mechanical era, but remained purely mechanical, two-function adding and subtracting machines.

B10.76Monroe Calculating Machine Co., 1 "Monroe Electric Calculator No. 1", Three Register, Keyed Rotary, Electro-Mechanical, USA, 336948, 38x31x24 cm, Buy, City Office Equipment, 10 (76), W-Bells.

See B1.75

B18.78Stone, Edmund, 1 "The Construction and Principal Uses Of Mathematical Instruments", Multiple part, Book, Craft, 1758, England, 34x23x4 cm, Paper, 1972 reprint Edition of 500, Buy, Historical Technology Inc, 42 (78), D-Gordon's office.

THE CONSTRUCTION AND PRINCIPAL USES OF MATHEMATICAL INSTRUMENTS. Translated from the French of M. Bion. To which are added, the construction and uses of such instruments as are omitted by M. Bion, particularly of those invented or improved by the English. 1972 reprint of the 2nd Edition of 1758 that includes a supplement containing a further account of some of the most useful mathematical instruments. A folio size book with 325 numbered pages and 30 full page plates. "This is the best English edition, of the best early 18th century book ever published on the design and use of scientific instruments." S. Moskowitz (catalog 117, fall 1978).

B19.78?, 1 Drawing Instruments, Fixed, Rule, Parallel rule, Compass, Craft, England, 20x11x4 cm, Steel & Brass, Fitted velvet & leather Case, Buy, Historical Technology Inc., 80 (78), D-Gordon's Office.

Cased English drawing instruments made in the second half of the 19th century. Brass and steel instruments, ruling pen with ivory handle; 13 separate items in lift-out tray. Small boxwood rule in space below. Rosewood veneered case and instruments in fine condition except that the large compass is missing its pivot locking nut and the brass has become a bit dull.

B20.78W.H. Harling, 1 Rolling Parallel Rule, Parallel Fixed, Rule, Craft, ca 1890, England, 4x33x8 cm, Steel, Walnut Case, Buy Historical Technology Inc., 75 (78), D-Gordon's Office.

Cased presentation of an English rolling parallel rule. Pasted to the inside cover is the presentation certificate, "Bradford Technical College Prize Awarded to Fred Inman at the Annual Examination, 1893, by order of the Lords of the Committee of Her Majesty's most honourable privy council on education."

B21.78?, 1 Navigator's Sector, 2-3 Part, Sector, Craft, England, 33x6x1 cm, Boxwood With Brass Hinge, 21 Scales On both Sides and Outside Edges, Buy, Historical Technology Inc., 465 (78), D-MR2.

The sector is used to solve problems of proportion and works on the principle of similar triangles. Sectors were made with a variety of scales for use in calculation by navigators, surveyors, gunners, and draughtsmen. At first sight they look like a jointed rule usually made of ivory, brass, wood, or sometimes silver. First described by both Galileo in Italy and Thomas Hood in England the sector was in use by 1600.

Use. A pair of dividers is necessary to read the relationships on all sectors. This instrument is marked: "Chords, Sec, Lines, Tangents, tan, Ver Sine, Sines, & Num." The scale layout permits this sector to be used as a Gunter rule as well, although it is not laid out to follow any of the five editions of Gunter, but is close to the example in Stone (B18.78).

B22.78Burroughs Adding Machine Company, 1 "Burroughs" Single Register, Keyed Wheel, Mechanical, ca 1920, USA, A335701, 15x30x25 cm, Black, Metal, Complement Arithmetic Nine Digits, Buy, City Office Equipment, 10 (78), D-Bells.

B26.79?, 1 Soroban, Single Register, Bead, Manual, 4x11x29 cm, D-MR2.

B27.79?, 1 Napier's Bones, Table, Manipulable, Craft, ca

1700, England, 8x6x2 cm, Wood, Bones and Box, Buy, Historical Technology Inc., 1732 (79), D-MR2.

These small instruments for facilitating the multiplication and division of large numbers were invented by John Napier, Laird of Merchiston in Scotland, and are described in his RABDOLOGIAE, published in 1617. He wrote that the multiplication and division of great numbers is troublesome, involving tedious expenditure of time, and subject to "slippery errors." His tables reduced these difficulties to simple addition and subtraction, and won immediate recognition. A set of Napier's bones are usually made of boxwood or ivory and often contained in a box or case that would fit in a pocket. A set usually contains 10 rods, plus extras representing squares and cubes.

Use. Addition is accomplished by reading the appropriate bones
along the diagonal. To obtain a product of 224 x 44, the rods 2, 2, and 4 are put alongside each other, and the result is read off by combining the numbers in the fourth row -- 0/8, 0/8, 1/6 -- for the correct answer 896. This is repeated and the two products added together to give 9856. The bones are sometimes associated with an abacus to provide a store in the multiplication process.

B28.79Chemical Rubber Publishing Co., 1 "Handbook of Chemistry and Physics, 31ST Ed", Fixed, Table, Mechanical, 1949, USA, 19x13x8 cm, D-MR2.

B29.77KEUFFEL & ESSER 1 "Thatcher's Calculating Instrument 4012", Spiral, 2-3 Part, Slide Rule, Craft, ca 1920, USA, 5106, 13x13x63 cm, Wood, Varnished Paper, and Brass, Instrument and Wood Case, Buy, Historical Technology Inc, 510 (77), W-Bells.

Patented in 1881 by Edwin Thatcher, an 1884 instruction book notes, "The originary rule in use is 12 inches long, with radii of 11 and 5 1/2 inches, the divisions of which are cut by hand, copying from a machine divided plate. In the present instrument the radii are 60 and 30 feet, the divisions of which are printed directly from machine divided plates. Those plates contain over

33,000 divisions, calculated to seven places of decimals from Babbage's tables by using a common multiplier, every line being subjected to correction for error of screw and temperature variations, so that possibly every line center is within .0001 inch of its true place."

The instrument consists of a cylindrical slide, which admits of both rotary and longitudinal movement within an open metallic framework of 20 equidistant triangular bars. The bars are connected to rings at their ends which admit rotation within standards attached to the base. Upon the slide are wrapped two complete logarithmic scales, each of which is divided into 40 parts of length equal to half that of the slide. The parts follow each other in regular order around the cylinder, and the figures and divisions which constitute any part of the right are repeated on the left, one line in advance.

Use. By the rotary and longitudinal movement of the slide any
of its divisions may be brought opposite to or in contact with any division on the fixed scales. The divisions on the upper lines are transferred to the slide by means of a pointer fitting over the bars, which is also convenient for retaining the position of any division on either line while the slide is being revolved into the required position. Near the commencement of each scale on the slide is a heavy black mark designed to catch the eye readily during the rapid movement of the parts.

B30.77L.&I.D., 1 Timber Calculating Slide RuleLinear, 2-3 Part, Slide Rule, Craft, ca 1800, England, 60x5x1 cm, Boxwood, Buy, Historical Technology Inc., 120 (77), D-MR2.

Use. On one side, the A line on the rule and the B and C lines on the slider are each numbered twice from 1-10, reading from left to right. The fourth line E is inverted, and is so arranged that 144 is opposite 1 and 10 on the A line. So that if length in feet on E be set opposite thickness in inches on C, the volume in cubic feet is read off on B opposite width in inches on A. The B line is subdivided into tenths, while the A, C, and E lines are subdivided into fourths. On the other side of the rule are A, B and C lines with the girt line (marked

D) numbered from 4-40 and bearing various gauge points. The A and D lines are subdivided into fourths. The two edges of the rule bear scales of inches divided into quarter-inches.

B31.79 Selective Educational Equipment Corp, 1 "SEE CALCULATOR", Single Register, Pascal Wheel, Mechanical, 1968, USA, 18x4x1 cm, , Buy, Selective Educational Equipment Corp, 3 (79), D-MR2.

A small replica of the Pascal-type adder made to illustrate the mechanism. For a descriptionn of the original Pascal machine see B150.80.

B32.52KEUFFEL & ESSER, 1 "Slide Rule 689", Linear, 2-3 part, Slide Rule, Craft, ca 1950, USA, 848689, 32x6x1 cm, Rule and Leather Case, Buy, D-MR2.

B34.79Hewlett Packard, 1 "HP-35" Pocket Calculator, Five or More Registers, Computer-controlled, IC, USA, 3x8x16 cm, Buy, D-MR2.

The HP-35 was the first hand-held scientific calculator small enough to fit in a pocket. It is something of a miniaturized version of earlier desk top scientific calculators such as the Friden. A microprocessor is programmed to carry out the calculator's functions.

Use. Functions include logarithms, exponentials, trigonometric, decimals, scientific notation, and degrees and radians are used. Reverse Polish notation replaces conventional parenthesis.

B35.79Aluminum Housewares Co. Inc., 1 "Fairgrove Adder", Single Register, Pascal wheel, Mechanical, 1975, Hong Kong, 2x5x10 cm, Plastic, Buy, 2 (79), D-Gordon's Office.

B36.79?, 1 "EXACTUS", Single Register, Pascal Strip, Mechanical, ca 1950, England, 7x11x.5 cm, D-MR2.

A linear form of the simple Pascal two function calculating device that uses complement arithmetic. See also B150.80.

Use. Addition or subtraction is carried out by dialing the
numbers starting with the least significant. A carry is performed by moving the final digit around the corner to the next linear register.

B37.79Foto-mem Inc., 1 Slide RuleLinear, 2-3 part, Slide Rule, Craft, Japan, 2x14x.5 cm, D-Gordon's Office.

B38.79Precision Adding Machine Co. Inc., 1 "Quixsum Adding Machine Model C", Single Register, Pascal Wheel, Mechanical, ca 1930, USA, 2643, 7x18x48 cm, Quixsum, Case, And Stylus, Buy, D-MR2.

The Quixsum is a good example of how the stepped wheel principle of Pascal can be used to operate any special measures, not necessarily base ten. In this case it adds English units of feet and inches. See also l50.80.

Use. To add a number to the register, the appropriate digit
is dialed. The result is displayed in a notch at the top of each wheel.

B48.79Rowning, J., 1 "Directions for Making a Machine to Solve Equations", Multiple part, Book, Mechanical, 1768, England, 22x18x2 cm, Buy, Historical Technology Inc., 95 (79), D-Gordon's Office.

This work describes the first analog computer designed to solve algebraic equations of the n'th degree expessed in the form y = a + bx + cx2 + dx3 + . . . + qxn . It was completed in 1768 by Rowning based upon the graphical method invented by A. deSegner in 1751. In 1770 an actual machine mechanized to the second degree was presented to the Royal Society, but apparently no longer exists. Rowning's instrument consists of a number of adjustable straight bars, or "rulers," centred and combined together in such a way as to occupy progressively the various positions in accordance with deSegner's graphical construction. Movement in two directions at right angles to one another is secured by means of two pairs of racks and pinions. The curve is drawn by a pencil on the underside of a piece of pasteboard supported by two adjustable bars.

Use. Segner's method consisted in finding, by graphical construction, the values of y for various assumed values of x, plotting the curve, and reading off the values of x at the points where the curve intersected the axis of x, thus obtaining the real roots of the equation. The impossible or imaginary roots were indicated by the points where the curve approached and receded from the axis of x, without reaching it.

B49.79The A. Leitz Co., 1 Planimeter Variable Ratio Polar Planimeter, Multiple part, Planimeter, Mechanical, 1900 c, Switzerland, 64567, 2x4x28 cm, German Silver and Steel, Instrument and Fitted Cloth Covered Case, Buy, Historical Technology Inc, 75 (79), D-Gordon's Office.

This instrument for measuring the area of any plane figure was invented by Professor Jacob Amsler in 1856. It is a proportional instrument in that the unit can be changed by altering the radius of the tracing arm.

Use. The weighted point is fixed and the tracing pointer guided exactly once round the outline of the figure whose area is to be measured. The difference of the readings on the graduated roller before and after this operation gives the area of the figure in units dependent on the setting of the tracing arm.

A version of the classical trigonometer signed and dated "THE LOWRY MFG. CO./BOSTON, U.S.A./PAT. 1887, '92, '96". It has two four and a half inch compass bearing dials, one fixed at the end of the twenty-six inch long graduate slotted base plate, the other sliding, and each with graduated pivoted arms of l8 3/8" radius. It was intended for the analog solution of the plane triangle knowing two angles and included side, two sides and the included angle, or three sides. Thus it was useful for problems both of navigation and gunnery.

B54.80?, 1 Navigator's Gunter Rule, 2-3 Part, Gunter Rule, Craft, ca 1800, England, 5x60x.5 cm, Darkened Boxwood, Minor Warping And Edge Chipping, Buy, Historical Technology Inc., 155 (80), D-MR2.

B80.80Trinks-brunsviga, 1 "Trinks-brunsviga" Brunsviga, Three Register, Rotary, Mechanical, ca 1940, 39329, 15x12x36 cm, Gift, Declan and Margrit Kennedy, D-Gordon's Office.

The German patent of W T Odhner, 1891, was acquired by Messrs Grimme, Natalis & Co, and was embodied in a machine known as the "Brunsviga." This example is a further adaptation and sits on a wood board that was part of a disappearring desk top.

Use. Although the machine performs multiplication by repeated
addition as in the Thomas type, the use of the Odhner wheel instead of the Leibniz toothed wheel led to a more compact design. The Odhner wheels fit very close together on the axle on the back. A setting lever, the end of which projects through a slot in the cylindrical portion of the cover plate, forms part of each wheel. If a lever is set against any figure (1 to 9) of its slot, a corresponding number of pins are made to project from its wheel. When the operating handle is turned, these pins gear with small toothed wheels of the product register, which in turn gear with the number wheels in front. The product register is mounted on a longitudinally movable carriage arranged in front of the machine, which carries a second counter for registering the multiplier or the quotient. The handle is turned in a clockwise direction

for addition and multiplication, and counter-clockwise for subtraction and division.

B81.80Bell Punch Co. Ltd., "Plus" Single Register, Keyed Wheel, Mechanical, England, A7-1783, 15x30x40 cm, Green, Metal, Model #909/C/V/504.929/A, Buy, 25 (80), D-MR2.

An electrified modification of the Comptometer. See B9.76

B82.80 C & E Layton, 1 "Tates Arithmometer", Three Register, Stepped Wheel, Mechanical, England, 1184, 10x17x58 cm, Brass and Wood, Wood Case and Brass Machine with Removable Handle, Buy, Peter Delahar Antique, 1276 (80), D-MR2.

This machine, which is of the Thomas type, embodies the modifications patented in 1884 and 1903 by S Tate, who in 1883 was the first in England to manufacture this type of calculating machine. His patents were later taken over by C and E Layton.

<u>Use.</u> See B3.76.

B83.80Metallograph Corp., 1 "Musketry Rule of 1918" Linear, 2-3 Part, Slide Rule, Craft, ca 1918, USA, 3x13 cm, Black, Metal, Neck String and Rule, Buy, Ron Hoffman, NY, 12 (80), D MR-2.

B87.79Contina Ag Mauren, 1 "Curta" Three Register, Rotary, Mechanical, Liechtenstein, 70588, 10d x12 cm, Black, Metal, Gift, Brian Randall, D-MR2.

The Curta is the ultimate example of the rotary mechanical calculator. Its small size requires better manufacturing technology than any other mechanical calulator. Model I had an 8 digit input setting, 6 digit counter, and ll digit accumulator. Model II had an 11 digit setting, 8 digit counter, and 15 digit accumlator. Prior to the electronic calculator, the Curta was the only four-digit portable calculator and as such was expecially popular for use at car rallies.

B88.80Wales the Adder Machine Co., 1 "Wales Visible Adding Machine", Two Register, Keyed Wheel, Mechanical, USA, 20x24x38 cm, Metal and Plexi Replacements for Glass, Removable Printer, Buy, City Office Equipment, 175 (80), D-MR2.

B93.80?, 1 Abacus, Single Register, Bead, Manual, China, 22x16x3 cm, Wood, 9 Digit, Removable Wooden Backboard, Buy, 50 (80), D-MR2.

The abacus is the earliest known computing device and the first hand-held calculator. It postdated the invention of the decimal system by the Egyptians circa 3000 BC. The Greeks and Romans built and used the abacus based on Hindu-Arabic numerals.

Unlike earlier notations and devices using stones and marks,
the abacus utilizes positional notation, including the representation of zeros, differences, with capabilities for multiplication and division. The Chinese abacus has beads in groups of 5 and 2, representing decimal digits. The Japanese first modified this to 5 and 1 and then 4 and 1.

B107.80 J Thomlinson Ltd Glasgow, 1 "Thomlinson's

Equivalent Paper Slide Scale" Linear, 2-3 Part, Slide Rule, Craft, ca 1940, Scotland, 8x58x1.5 cm, Brown, Wood, One Sided with Two Moving Rules, Buy, Peter Delahar, 43 (80), D-MR2.

This specialized rule was designed for the paper and printing industry. The A scale indicated length, B scale the breadth, and area in square inches was read off the C scale.

The D scale was used to read off translations of inches to centimeters, kilos to pounds, 480 and 500 sheet reams, and various weights of different standard paper cuts.

B108.80Dring and Fage, 1 "Leadbetter Slide Rule"Linear, 2-3 Part, Slide Rule, Craft, ca 1800, England, 31x3x2 cm, Brown, Boxwood, Four Sided Slide Rule with Slides on each Side, Buy, Peter Delahar, 84, D-MR2.

B109.80?, 1 Slide RuleCoggeshall, 2-3 Part, Slide Rule, Craft, ca 1800, England, 4x33x.5 cm, Boxwood and Brass, Hinged with Two Slides, Buy, Peter Delahar, 75 (80), D-MR2.

A modified Coggeshal type slide rule with one brass and one wood slide. Navigational scales including meridian, chords, latitudes, and hours are inscribed. Freeth and Co. Brimingham is overstamped.

B110.80 J.F. Fuller, 1 "Palmer's Improved By Fuller Computing Scale" Circular, 2-3 Part, Slide Rule, Craft, 1847, USA, 28x28x.5 cm, Cream and Black, Cardboard, "Fuller's Time Telegraph" is on the Reverse, Buy, Peter Delahar, 216 (80), D-MR2.

"Palmer's Computing Scale" patented in 1843 by Aaron Palmer was improved and produced by J.E. Fuller in 1847. This model is printed from the original Palmer plate with Fuller's name and own patent added to the engraving, done by George C. Smith, 186 Washington St., Boston. The reverse side, "Fuller's Time Telegraph" was patented by him in 1845.

Use. "Palmer's Computing Scale" was used to calculate square measures, cubic measures, timber measures, grain measures, liquid measures and interest rates from 3 percent to 10 percent on a daily and monthly basis. "Fuller's Time Telegraph" (on the reverse) was used to calculate time lapse in days or weeks between any two given dates. In concert these two measures would be useful to dealers in grain, alcohol and other commodity trading.

B112.80 Fowler & Co, 1 "Fowler's Textile Calculator"Circular, 2-3 Part, Slide Rule, Craft, ca 1900, England, 14398, 6.5d x.7 cm, Chrome, Glass, Paper, Two-sided Circular Rule, Buy, Maitland Antiques, Portobello Rd., 60 (80), D-MR2.

Short scale type of "Fowler's Textile Calculator" with two scales on one side. The other side holds a table equivalency for weft, looms, and reeds.

B113.80Lewis & Tylor, Limited, 1 "Hydralculator", Linear, 2-3 Part, Slide Rule, Craft, ca 1940, England, 7x19x.5 cm, Cream, Cardboard, One Rule on one Side, Case and Rule, Buy, Portobello Rd., 9 (80), D-MR2.

"Hydralculator", patent number 396,533, published by Lewis & Tylor Ltd., Gripoly Mills, Cardiff, the manufacturers of "underwriter" super fire fighting hose, for the use of their "Friends in the Fire Service."

Use. To find the quantity of water discharged for any given
nozzle and a known pressure, place press on scale "b" opposite nozzle on scale "a', and read discharge through window in slide. To find height of jet for given pressure and nozzle diameter, proceed as above and read opposite arrow in center of slide, the height given on scale "d" for the appropriate nozzle.

B114.80?, 1 "Circular Concise Slide Rule" Circular, 2-3 Part, Slide Rule, Craft, ca 1960, Japan, 8d cm, White, Plastic, No. 28; Reverse has Standard Equivalency Tables, Buy, Portobello Rd., 5 (80), D-MR2.

B115.80?, 1 Music Box, , Mechanical, 1980, Switzerland, 6.5dx5 cm, Plastic and Aluminum, Plays Jingle Bells, Buy, 6 (80), D-Gordon's Office.

B116.80Blickensderfer, 1 "Featherweight Blickensderfer", , Mechanical, ca 1900, USA, 153497, 25x30x13 cm, Aluminium, 501 Special Stamped on Base, Buy, Portobello Road, 120 (80), D-Gordon's Office.

The "Blick" was the first typewriter intended to be readily portable. It was designed by Georges Blickensderfer and patented in 1890 and first sold in 1893.

Use. Each key had three positions, upper and lower case and a
figure that positioned three levels of the printing wheel.

B117.80?, 1 Jacquard Loom Mechanism, Card-controlled, Loom, Model, Mechanical, ca 1805, France, 16x36x40 cm, Wood, Brass, and Steel, Paper Cards Added by Peter Delahar, Buy, Peter Delahar, 2040 (80), D-Gordon's Office.

B118.80L.M. Ericsson & Co., 1 Printing Telegraph Receiver, Electro-mechanical, ca 1890, Sweden, 7640, 36x42x17 cm, Brass, Wood, Bevelled Glass, Key, Brass Spool, Paper Tape, and Receiver, Buy, Arthur Middleton, 626 (80), D-Gordon's Office.

B119.80, 1 Navigator's Sector, 2-3 Part, Sector, Craft, ca 1800, England, 16x3.5x.3 cm, Ivory, Lee & Son, Portsea Engraved, Buy, Portobello Rd, 60 (80), D-Bells.

B125.80The Cleveland Twist Drill Co., 1 Circular Slide RuleCircular, 2-3 Part, Slide Rule, Craft, ca 1920, USA, 8d x.3 cm, Cream, Plastic, Printing worn off, Buy, Portobello Rd, 2 (80), D-Bells.

This specialized rule is copyright 1911, The Cleveland Twist Drill Company.

Use. The rule indicated drill speeds for wrought iron, machinery steel and soft tool steel. One side shows revolutions per minute for diameters ranging from one-sixteenth to three inches for both high speed and carbon steel drills. The other side shows tap and drill sizes and the decimal equivalent for inch divisions.

B126.80Johnson, 1 "Johnson Artifical Light Exposure Calculator", Circular, 2-3 Part, Slide Rule, Mechanical, England, 6.5d x.2 cm, Cream, Plastic, Buy, Portobello Rd, 2 (80), D-Bells.

Use. 1. Set at start. 2. Select wattage notch and dial clockwise to "stop"; 3. Repeat for distance of lamp from the subject; 4. Turn over and repeat for angel of light film speed and subject; 5. Read exposure against F/Ratio.

See

B150.81Roberto Guatelli, 1 Pascal Adder, Single Register, Pascal Wheel, Replica, Mechanical, 1645, France, Bronze, Buy, R. Guatelli, 3500 (81), D-MR2.

The first mechanical adding machine built by the French physcist and matehmatician, Blaise Pascal.

Use. The dials show the French monetary unit, the livre, which was divided into 12 deniers, each subdivided into 20 sols. The essential part of the machine was its decimal carry; each toothed wheel moved forward one unit (one-tenth of a revolution on each wheel except those of deniers and sols) when the previous wheel had completed one revoltuion. Subtraction was based on complementary numbers that could be revealed by moving the strip at the top of the calculator.

B151.81Electric Specialty Mfg Co., Cedar Rapids, Ia., 1 Telegraph Key, Transduction, Electro-mechanical, ca 1900, USA, 7x8x18.5 cm, black, metal, Buy, $15 (81), D-Bells.

B152.81SELSI, 1 Map mileage reader and compass, Analog Calcula, 2-3 part, Linear measure, Mechanical, ca 1930, Germany, 11x3.5x.5 cm, The handle also serves as a pencil. Buy, 7 (81), D-Bells.

B153.81A & W Smith, 1 Pantograph, Analog Calcula, Multiple part, Proportional planar copier, Mechanical, ca 1820, England, 59x7x5.5 cm, mahoganny case, Brass, 3 brass scales, ivory and brass roller, and pins, Buy, Peter Delahar, 400 (81), D-Bells.

"A rare type of brass pantograph," P. Delahar.

B154.81Corona Typewriter Co., Inc. Groton, N.Y., 1 "CORONA FOUR" Typewriter, TRANSDUCTION, Typewriter, Mechanical, ca 1920, USA, H201124, 26x31x11 cm, Black, case and ribbons missing, Buy, Oregon, $8 (81), D-Bells.

B155.81Burroughs, 1 "Burroughs Calculator" Adding machine, Digital Calcula, Single Register, Keyed Wheel, Mechanical, ca 1910, USA, 5-607901, 18x23x30 cm, Black and green, Metal, Stands on legs at a tilt for ease of operation. Buy, Rte 20 antique store in Wayland, 5 (81), D-Bells.

B156.80Burroughs, 1 "The Burroughs Adding and Listing

Machine" Adding Machine, Digital Calcula, Two Register, Key Punch, Mechanical, ca 1900, USA, Black, Metal with beveled glass sides, Buy, Victor, Co., 225 (80), D-MR-2.

B157.81Burroughs, 1 "The Burroughs Adding and Listing Machine" Adding Machine, Digital Calcula, Two Register, Keyed Wheel, Stand and motor, Mechanical, ca 1910, USA, Black, Metal with beveled glass, Adapted for motorized operation, Stand, motor, calculator, printer, Buy, Oregon, 75 (81), D-MR-2.

B158.81 J. Halden & Co., Ltd., 1 "HALDEN CALCULEX" Circular Slide Rule, Analog Calcula, 2-3 part, Slide rule, Craft, ca 1910, England, 6 cm diameter, Metal ring with glass discs covering paper scales, Aluminum case with velvet interior and leather covered 95 page manual only measuring 5.5 cm square, plus instrument, Buy, The Antiquarian Scientist, 90 (81), D-Bells.

Cajori in his "history of the Logarithmic Slide Rule" (1909) lists this unique instrument as No. 211 and notes the manual.

B159.81 Henry Carey Baird, Industrial Publisher, Philadelphia, 1 "A Treatise on a Box of Instruments and the Slide Rule for the Use of Guagers, Engineers, Seaman, and Students," by Thomas Kentish, Analog Calcula, 2-3 part, Book, Craft, 1864, USA, 12x18x2 cm, Original cloth cover, 228 pages with a folding plate, Buy, The Antiquarian Scientist, 50 (81), D-Bells.

The use of 2-3 part analog calculators for practical geometry, trigonometry, and logarthms are explained. Special sections deal with circles and navigational calculations.

B160.81R. & L.W. Leybourn, 1 "TRIGONOMETRIA" Logarthmic Tables, Memory, Book, Craft, 1657, England, 14x18x3.5 cm, Original leather binding, Buy, The Antiquarian Scientist, $600 (81), D-MR-2.

The original set of logarthmic tables and their explanation as made by William Oughtred, who made significant improvements on the slide rule.

B161.81HANS W. EGLI CO., 1 "MILLIONAIRE" Calculator, Digital Calcula, Four Function, Stepped Wheel, Mechanical, ca 1900, Switzerland, 272, 18x29x76 cm, wooden case, brass calculator, 8 digit, wooden stand, case, and calculator, Buy, Antiquarian Scientist, 800 (81), D-Bells.

See B1.75

B162.81Ticknor and Fields, Boston, 1 "History, Theory, and Practice of the Electric Telegraph" by George B. Prescott, Transmission, Telegraph, Book, Electro-mechanical, 1864, USA, 14x4x20cm, well-illustrated, good condition, Buy, The Antiquarian Scientist, 40 (81), D-Bells.

Contents: 1. Electrical Manifestations; 2. Propagation of Electricity; 3. Magnetism; 4. General Principles of the Electric Telegraph. 5. The Morse System. 6. The Needle System; 7. House's Printing Telegraph; 8. Bain's Electro-chemical Telegraph; 9. The Hughes System; 10. The American Printing Telegraph; 11. Horne's Electro-thermal Telegraph; 12. The Dial Telegraphs; 13. Subterranean and Submarine Lines; 14. The Atlantic Cable; 15. Progress of the Electric Telegraph; 16. Various Applications of the Electric Telegraph; 17. Construction of Telegraph Lines; 18. Atmospheric Electricity; 19. Terrestrial Magnetism; 20. Miscellaneous Matters; 21. Early Discoveries in Electro-dynamics; 22. Galvanism. Index.

B163.81 H. Dessain, Imprimeur-Libraire, Liege, 1 "Recherches sur La Telegraphie Electrique" par Michel Gloesener, Transmission, Telegraphy, Book, Electro-mechanical, 1853, Belgium, 16x23.5x1.5cm, paper back, Buy, The Antiquarian Scientist, 50 (81), D-Bells.

Beautiful fold-out plates of the needle telegraph.

B164.81Signal Electric Mfg. Co., 2 "Signal Telegraph Instrument" Telegraph Keys and Sounders, Telegraphy, Electro-mechanical, ca 1920, USA, 11x10x16 cm, Wooden base, brass, and other metals, Buy, Westford, 20 (each), D-MR2.

B165.81Simplex Typewriter Company, 1 "The New Simplex Typewriter No. 1" Typewriter, Typewriter, Mechanical, ca

1920, USA, 22x12x6 cm, red, yellow, and black, wooden base with metal, cardboard case and typewriter, BUY, Knotty Pine Antique Market, West Swanzey, NH, 15 (81), D-Gordon's Office.

The simplex is a small, inexpensive, home typewriter that only holds paper less than seven inches wide. U.S. patent numers 1138427, 1204912, 1521408, 1865288, 1869426, and 1957373.

Use: From the Directions for Operating in the case: "First:
Hold the machine with rack side toward you. Push carriage to the left to starting point. When doing this see that dog does not catch in rack. Insert paper between rollers from the front. Put finger on key of letter desired and swing it into notch in rim of typecase near the dog: <u>Press downward to print.</u> To make a space without prining, press down on any key near to but not in the notch. To ink apply only a drop of ink to each pad with the end of a matchstick or toothpick. Be careful not to bend the pads down so far as to prevent them from springing back into position. Use only Simplex Ink which will be supplied at 10 cents per tube, cheap ink destroys the face of the type. Do not oil. If keyplate sticks take a rag moistened with vaseline and hold against underside of keys at the notch and twirl type plate around a few times. If the carriage does not move forward freely, apply a little vaseline to the carriageway where it rubs. Caution! Keep oil or vaseline away from rubber type and ink pads. Oil will swell and destroy the letters."

B166.81Simlex Typewriter Co., Inc., 1 "Simplex Portable Typewriter Special Demonstrated Model S" Typewriter, Mechanical, ca 1930, USA, 24x8x16 cm, Green and red, Metal, Buy, Knotty Pine Antique Market, West Swanzey, 7 (81), D-Bells.

B173.81Burroughs, 1 "Burroughs" Adding Machine, Digital Calculator, Two Register, Keyed Wheel, Mechanical, ca 1950, USA, 8A193393, 22x37x20 cm, Green and Black, Metal, 8 digits with paper tape printing, Buy, 19 (81), D-Bells.

B174.81Felt & Tarrant Mfg Co., 1 "Comptometer", Digital Calculator, Single Register, Keyed Wheel, Mechanical, ca 1895, USA, 505, Walnut, Brass & Other Metals, Buy, Peter Delahar, 400 (81), D-MR2.

An early Comptometer with the springs showing on the upper keys. The keys are molded differently on alternative rows to give the operator a "feeling" of relative location. The walnut cabinetry and tooling was clearly a hand-made.

B175.80 Siemens Brothers & Co., London, 1 Printing

Telegraph, Links and Switches, Electro-mechanical, ca 1900, England, 12145, Wood and brass, Does not work, Buy, Portobello Rd., London, 510 (80), D-Gordon's Office.

B176.801 Sector, Analog Calcula, 2-3 Part, Sector, Craft, ca 1623, England, 9 inch; 240x50x5 mm, Brass, Buy, Peter Delahar, 2400 (1981), D-Bells.

Nine inch brass sector as described by Edmund Gunter (1581-1626) in 1623. Unsigned by probably made by Elias Allen in 1623.

B177.81Thomas Graham, 1 "The Oriental Calculator or Tables for the Calculation of Interest, Exchange & Commission" by Dorabjee Hormusjee, Book of tables, Writable or Readable Memory, Paper, Random, Craft, 1860, India, 15x23x4 cm, Green, Paper, Third Edition, Good condition, Buy, Editions, 45 (81), D-Bells.

Part I contains Interest Tables in Rupees, Dollars, and Sterling from one-half to 12 per cent per annum. Part Ii contains tables for the conversion of rupees, into sterling and dollars; and sterling into dollars. Part III contains commission or Inland Exchange Tables; Key showing indirect exchange between England, India and China; Tables shoing the comparative rates of exchange for sight bills, and tables showing the estimated value of one pound of cotton with all charges and varying exchange rates.

In the preface to the third edition the author states, "The rapid sale of the previous Editions of the "Oriental Calculator" and the pressing demand for it, are evident proofs of the utility of this work in mercantile circles; and the production of the Third Edition is the result of the liberal patronage and support the author has been favored with."

B178.811 Counting Beads, Digital Calculator, Single Register, Bead, Manual, 37x2x44 cm, red and black beads, wood and metal, 9 rows by 10 digits, Buy, Joe Stamps, NY, 50 (81), D-Bells.

B190.81Ideas Unlimited, 1 "Horse-meter", Analog Calcula, 2-3 Part, Circular Slide Rule, Craft, 1951, USA, 135 mm diamter, Orange, gray and yellow, Paper, Buy, Colorado Springs, 1 (81), D-Bells.

"Directions for use: (1) Consult daily Racing Form for speed ratings, weights and class; (2) Figure rating for each horse in race as follows: (a) turn red dial to best speed rating in past 30 days; (b) turn blue dial to class in key race; (c) Turn yellow dial to weight difference of (a) race and today's race; (c) Add (or subtract) figures (a) (b) (c). This is horses rating. (3) Horse with at least 2 points aove rest is the choice in this race; (4) Play only if final odds are 2/1 or better; (5) Best results will be had by avoiding 2 year old, maiden, fillies and mares, stakes, hurdle, turf and steeple races and races over 1 1/8 miles."

B191.81E. & F. N. Spon, 125, Strand. London, 1 "Pocket-book of Useful Formulae & memoranda for Civil and Mechanical Engineers," by Sir Guilford L. MolesworthBook, Readable or Writable Memory, Paper, Random, Craft, 1888, England, 77x30x120 mm, Black with gold leaf edges, Paper, Buy, 3 (81), D-Bells.

Originally compiled in 1862, this is the 22nd edition of a truly pocket-sized book of formula. Although there is no table of contents, a very thorough index is provided for the 732 pages of tables.

B192.811 Section of the first Atlantic Telephone Cable, Transduction, Electro-mechanical, 1858, US, 95x18 mm diameter, Buy, 200 (81), D-Bells.

Cyrus West Field (1819-1892) American merchant, promotor of the first Atlantic cable was botn in Stockbridge, massachusetts. In 1854, he conceivec the idea of the calbe and secured a charter to organize the England and American companies. The British and American naval ships, HMS Agamemnon and the USS Niagara were secured to lay the cable. Five attempts were made between 1857 and 58. The first message transmitted, August 16, 1858, read, "England and America are united by telegraph. Golory to God in the highest and on earth peace and good will towards men." The Queen and the President of the United States exchanged congratulations, but the cable ceased working three weeks later. It was necessary for Field to raise new funds and make new arrangements. The great Eastern succeeded in laying a calbe in 1866.

B193.81A. Massim, Paris, 1 Music Box, Readable or Writable Memory, Mechanically stable, Cyclic, Mechanical, 1840, France, 30981, 343x160x120 mm, Black, Wood and brass fittings, Buy, 400 (81), D-Bells.

The music box plays six tunes; Robin Adair, the Blue Bells of Scotland, The Campbells are coming, Auld Lang Syne, Coming Through the Rye, and Bonnie Sweet Home.

B194.81 Aaron Palmer, Boston, 1 "Palmer's Pocket Scale"Circular slide rule, Analog Calculator, 2-3 part, Circular slide rule, Craft, 1845, USA, 7x95x150 mm, Paper, Buy, Moskowitz, ca 185(81), D-MR2.

Palmer's Pocket Scale with rules for its use in solving Arithmetical and Geometrical Problems preceded the large sized Fuller's scale. See B110.80.

B1.75 EGLI & CO., 1 "MILLIONAIRE" Four Register, Automatic

Stepped Wheel, Mechanical, 1903, Switzerland, 539, 17x52x28 cm, Brass, 6 digit, Buy, Dr. Margaret Kennedy, 500 (75), D-MR2.

The Millionaire was invented in 1893 by Otto Steiger and

was the first direct multiplying calculator to be commercially successful. Between 1894 and 1935, 4,655 millionaires were sold.

Use. One turn of the crank automatically multiplies

the accumulator by a single digit specified by a pointer in the upper left hand corner of the machine. The pointer is reset for each digit in the multiplier until the computation is complete.

B2.76 Hutton, Charles, 1 "Table of the Products and Numbers",

Table, Fixed, Craft, 1781, England, 28x42x1 cm, paper, Buy, Historical Technology Inc., 68 (76), D-MR2.

Compiled in 1781 by Charles Hutton, this is an early book of mathematical tables containing the products of the numbers 1 through 1000 by the numbers 1 through 100. It also contains squares and cubes of numbers and conversion tables for units of measurement.

One of the main problems with handcrafted books is the

number of errors. On one page alone, every figures is off by one thousand. With handcrafted calculating and typesetting such problems are unavoidable. Later books of talbes were done by the Difference Machine and proved more reliable.

B3.76 Chevalier Charles Savier Thomas, 1 "Arithmometer", Three Register, Stepped Wheel, Mechanical, ca 1850, England, 1583, 10x18x58 cm, Brass, Wooden case, Buy, Peter Delahar Antiques, 376 (76), D-MR2.

In 1820, Chevalier Charles X Thomas of Colmar designed and introduced the first multiplication machine made commercially available for general sale. Although it was not patented until 1851, the main features of the 1820 design remained unaltered.

The mechanism has three parts, concerned with setting, counting, and recording respectively. Any number up to 999,999 may be set by moving the pointers to the numbers 0 to 9 engraved next to the six slots on the fixed cover plate. The movement of any of these pointers slides a small pionion with ten teeth along a square axle, underneath and to the left of which is a Leibniz stepped wheel.

The Leibniz wheel, a cylinder having nine teeth of increasing length, is driven from the main shaft by means of a bevel wheel, and the small pinion is thus rotated by as many teeth as the cylinder bears in the plane corresponding to the digit set. This amount of rotation is transferred through one of a pair of bevel wheels, carried on a sleeve on the same axis, to the 'results' figure wheel on the back row on the hinged plate. This plate also carried the figure wheel recording the number of turns of the driving crank for each position of the hinged plate. The pair of bevel wheels is placed in proper gear by setting a lever at the top left-hand cover to either "Addition and Multiplication" or "Subtraction and Division." The "results" figure wheel is thereby rotated anti-clockwise or clockwise respectively.

Use. Multiplying 2432 by 598 may be performed as follows: Lift the hinged plate, turn and release the two milled knobs to bring all the figure wheels to show zero; lower the hinged plate in its position to the extreme left; set the number 2432 on the four slots on the fixed plate; set the lever on the left to "multiplication" and turn the handle eight times; lift the hinged plate, slide it one step to the right, and lower it into position; turn the handle nine times; step the plate one point to the right again and the turn the handle five times. The product 1,454,336 will then appear on the top row, and the multiplier 598 on the next row of figures.

B4.76 ?, 1 Gunter Rule, 2-3 Part, Gunter Rule, Craft, ca 1800

England, 5x60x.5 cm, wood, Buy, Peter Delahar Antiques, 61 (76), D-MR2.

About 1607 Edmund Gunter devised a scale that was to be the predecessor of the modern slide rule. In 1623 he published a description of this scale that is composed of two scales of the logarithms from 1 to 10 placed end to end. Although Napier conceived of the logarithm allowing multiplication or division to be accomplished by addition or subtraction, Napier relied on look up tables.

Use. Multiplication is carried out by using a pair of dividers to measure a distance, the multiplier, along the rule and add it to another distance, the multiplicand, forming the combined distance, the product, on the rule. The accuracy of an answer is limited by the length of the rule and the user's ability to resolve a number.

B5.76 Stanley, 1 "Fuller's Spiral Slide Rule", Spiral, 2-3 part,

Slide Rule, Craft, 1902, England, 9x9x33 cm, Cardboard, Mahogany, Brass, Screw on handle, case, Buy, Historical Technology Inc, 138 (76), D-MR2.

Designed in 1878 by Professor George Fuller, the logarithmic line is arranged spirally on the surface of a cylinder. The logarthmic line is in 50 turns, giving a working length of 41 feet 8 inches. All numbers of four figures either have a mark upon the scale or are midway between two marks, so that results accurate to four figures are easily obtained.

Use. By means of movable cylinders any length of spiral

line may be at once transferred to any other part of the scale, and multiplications and divisions containing a series of factors can be worked with facility. Logarithms of numbers are given by means of a scale on the longer index arm together with a circular scale on the first cylinder, so that powers and roots are obtainable. The surface of the middle cylinder bears printed tables of decimal equivalents, natural sines, etc.

B6.76 J. Sang, 1 "Platometer" Planimeter, Multiple part, Areal

Measure, Mechanical, ca 1860, England, 9x15x37 cm, Brass, Wooden case, magnifying glass, Buy, Peter Delahar Antiques, 355 (76), D-MR2.

This instrument for directly measuring an area bounded by an irregular curve is based on an idea developed by the Bavarian engineer J M Hermann in 1814. The first commercially successful devices were made by Ernst of Paris. In 1851, John Sang of Kirkcaldy invented and made a "platometer" resembling the planimeter of Ernst.

Use. Operation is based on continuous integration.

A curve is traced using the pointer, with the area read off on the dial after the complete perimeter has been traversed. As the pointer is moved the rollers that measure distance on the conical shaft calculate the product of the vertical distance times the horizontal distance. As a curve is traversed in a clockwise direction, the top area is integrated in a positive direction. On the return trip the integration is negative and the net value is provided.

B7.76 Burroughs, 1 "Burroughs Model 5", Two Register, Keyed Wheel,

Mechanical, USA, 5-146-1088, 28x25x12 cm, Black, Metal,, Buy, City Office Equipment, 10 (76), ?.

B8.76 Burroughs, 1 "Burroughs" Single Register, Keyed Wheel,

Mechanical, USA, A342273, 18x25x27 cm, , Buy, City Office Equipment, 10 (76), D-MR2.

B9.76 Felt & Tarrant Manufacturing Co., 1 "Comptometer", Single Register, Keyed Wheel, Mechanical, 1914, USA, 37x28x15 cm, Green, Metal, Buy, City Office Equipment Co, 10 (76), D-MR2.

The Comptometer was invented in 1887 by Dorr E Felt of Chicago and claims to be the first successful key-driven adding and calculating machine.

Use. For each digit a push button from 1 to 9 is selected which rotates a Pascal-type wheel with the corresponding number of increments. Numbers are subtracted by adding the complement (shown in smaller numbers). The carrying of tens is accomplished by power generated by the action of the keys and stored in a helical spring, which is automatically released at the proper instant to perform the carry.

Through effective marketting and training of skilled operators versed in complement arithmetic at Comptometer Schools, these machines became the workhorse of the accounting profession in the first part of the century. They never successfully advanced into the electro-mechanical era, but remained purely mechanical, two-function adding and subtracting machines.

B18.78 Stone, Edmund, 1 "The Construction and

Principal Uses Of Mathematical Instruments", Multiple part, Book, Craft, 1758, England, 34x23x4 cm, Paper, 1972 reprint Edition of 500, Buy, Historical Technology Inc, 42 (78), D-Gordon's office.

THE CONSTRUCTION AND PRINCIPAL USES OF MATHEMATICAL INSTRUMENTS. Translated from the French of M. Bion. To which are added, the construction and uses of such instruments as are omitted by M. Bion, particularly of those invented or improved by the English. 1972 reprint of the 2nd Edition of 1758 that includes a supplement containing a further account of some of the most useful mathematical instruments. A folio size book with 325 numbered pages and 30 full page plates. "This is the best English edition, of the best early l8th century book ever published on the design and use of scientific instruments." S. Moskowitz (catalog 117, fall 1978).

B19.78 ?, 1 Drawing Instruments, Fixed, Rule,

Parallel rule, Compass, Craft, England, 20x11x4 cm, Steel & Brass, Fitted velvet & leather Case, Buy, Historical Technology Inc., 80 (78), D-Gordon's Office.

Cased English drawing instruments made in the second half of the l9th century. Brass and steel instruments, ruling pen with ivory handle; l3 separate items in lift-out tray. Small boxwood rule in space below. Rosewood veneered case and instruments in fine condition except that the large compass is missing its pivot locking nut and the brass has become a bit dull.

B20.78 W.H. Harling, 1 Rolling Parallel Rule, Parallel Fixed, Rule, Craft, ca 1890, England, 4x33x8 cm, Steel, Walnut Case, Buy Historical Technology Inc., 75 (78), D-Gordon's Office.

Cased presentation of an English rolling parallel rule. Pasted to the inside cover is the presentation certificate, "Bradford Technical College Prize Awarded to Fred Inman at the Annual Examination, 1893, by order of the Lords of the Committee of Her Majesty's most honourable privy council on education."

B21.78 ?, 1 Navigator's Sector, 2-3 Part, Sector, Craft,

England, 33x6x1 cm, Boxwood With Brass Hinge, 21 Scales On both Sides and Outside Edges, Buy, Historical Technology Inc., 465 (78), D-MR2.

The sector is used to solve problems of proportion and works on the principle of similar triangles. Sectors were made with a variety of scales for use in calculation by navigators, surveyors, gunners, and draughtsmen. At first sight they look like a jointed rule usually made of ivory, brass, wood, or sometimes silver. First described by both Galileo in Italy and Thomas Hood in England the sector was in use by 1600.

Use. A pair of dividers is necessary to read the

relationships on all sectors. This instrument is marked: "Chords, Sec, Lines, Tangents, tan, Ver Sine, Sines, & Num." The scale layout permits this sector to be used as a Gunter rule as well, although it is not laid out to follow any of the five editions of Gunter, but is close to the example in Stone (B18.78).

B22.78 Burroughs Adding Machine Company, 1 "Burroughs"

Single Register, Keyed Wheel, Mechanical, ca 1920, USA, A335701, 15x30x25 cm, Black, Metal, Complement Arithmetic Nine Digits, Buy, City Office Equipment, 10 (78), D-Bells.

B26.79 ?, 1 Soroban, Single Register, Bead, Manual, 4x11x29 cm, D-MR2.

B27.79 ?, 1 Napier's Bones, Table, Manipulable, Craft, ca 1700, England, 8x6x2 cm, Wood, Bones and Box, Buy, Historical Technology Inc., 1732 (79), D-MR2.

These small instruments for facilitating the multiplication and division of large numbers were invented by John Napier, Laird of Merchiston in Scotland, and are described in his RABDOLOGIAE, published in 1617. He wrote that the multiplication and division of great numbers is troublesome, involving tedious expenditure of time, and subject to "slippery errors." His tables reduced these difficulties to simple addition and subtraction, and won immediate recognition. A set of Napier's bones are usually made of boxwood or ivory and often contained in a box or case that would fit in a pocket. A set usually contains 10 rods, plus extras representing squares and cubes.

<u>Use.</u> Addition is accomplished by reading the appropriate bones along the diagonal. To obtain a product of 224 x 44, the rods 2, 2, and 4 are put alongside each other, and the result is read off by combining the numbers in the fourth row -- 0/8, 0/8, 1/6 -- for the correct answer 896. This is repeated and the two products added together to give 9856. The bones are sometimes associated with an abacus to provide a store in the multiplication process.

B28.79 Chemical Rubber Publishing Co., 1 "Handbook of Chemistry and Physics, 31ST Ed", Fixed, Table, Mechanical, 1949, USA, 19x13x8 cm, D-MR2.

B29.77 KEUFFEL & ESSER 1 "Thatcher's Calculating Instrument 4012", Spiral, 2-3 Part, Slide Rule, Craft, ca 1920, USA, 5106, 13x13x63 cm, Wood, Varnished Paper, and Brass, Instrument and Wood Case, Buy, Historical Technology Inc, 510 (77), W-Bells.

Patented in 1881 by Edwin Thatcher, an 1884 instruction book notes, "The originary rule in use is 12 inches long, with radii of 11 and 5 l/2 inches, the divisions of which are cut by hand, copying from a machine divided plate. In the present instrument the radii are 60 and 30 feet, the divisions of which are printed directly from machine divided plates. Those plates contain over 33,000 divisions, calculated to seven places of decimals from Babbage's tables by using a common multiplier, every line being subjected to correction for error of screw and temperature variations, so that possibly every line center is within .0001 inch of its true place."

The instrument consists of a cylindrical slide, which admits of both rotary and longitudinal movement within an open metallic framework of 20 equidistant triangular bars. The bars are connected to rings at their ends which admit rotation within standards attached to the base. Upon the slide are wrapped two complete logarithmic scales, each of which is divided into 40 parts of length equal to half that of the slide. The parts follow each other in regular order around the cylinder, and the figures and divisions which constitute any part of the right are repeated on the left, one line in advance.

<u>Use.</u> By the rotary and longitudinal movement of the slide any of its divisions may be brought opposite to or in contact with any division on the fixed scales. The divisions on the upper lines are transferred to the slide by means of a pointer fitting over the bars, which is also convenient for retaining the position of any division on either line while the slide is being revolved into the required position. Near the commencement of each scale on the slide is a heavy black mark designed to catch the eye readily during the rapid movement of the parts.

B30.77 L.&I.D., 1 Timber Calculating Slide RuleLinear, 2-3 Part, Slide Rule, Craft, ca 1800, England, 60x5x1 cm, Boxwood, Buy, Historical Technology Inc., 120 (77), D-MR2.

Use. On one side, the A line on the rule and the B and C lines on the slider are each numbered twice from 1-10, reading from left to right. The fourth line E is inverted, and is so arranged that 144 is opposite 1 and 10 on the A line. So that if length in feet on E be set opposite thickness in inches on C, the volume in cubic feet is read off on B opposite width in inches on A. The B line is subdivided into tenths, while the A, C, and E lines are subdivided into fourths. On the other side of the rule are A, B and C lines with the girt line (marked D) numbered from 4-40 and bearing various gauge points. The A and D lines are subdivided into fourths. The two edges of the rule bear scales of inches divided into quarter-inches.

B31.79 Selective Educational Equipment Corp, 1 "SEE CALCULATOR", Single Register, Pascal Wheel, Mechanical, 1968, USA, 18x4x1 cm, , Buy, Selective Educational Equipment Corp, 3 (79), D-MR2.

A small replica of the Pascal-type adder made to illustrate the mechanism. For a descriptionn of the original Pascal machine see B150.80.

B32.52 KEUFFEL & ESSER, 1 "Slide Rule 689", Linear, 2-3 part, Slide Rule, Craft, ca 1950, USA, 848689, 32x6x1 cm, Rule and Leather Case, Buy, D-MR2.

B33 Casio, 1 "Casio Mini Card Calculator" Five or More Registers, Computer-controlled, IC, Japan, 5x8 cm, Calculator and Case, Buy, D-MR2.

B34.79 Hewlett Packard, 1 "HP-35" Pocket Calculator, Five or More Registers, Computer-controlled, IC, USA, 3x8x16 cm, Buy, D-MR2.

The HP-35 was the first hand-held scientific calculator small enough to fit in a pocket. It is something of a miniaturized version of earlier desk top scientific calculators such as the Friden. A microprocessor is programmed to carry out the calculator's functions.

Use. Functions include logarithms, exponentials, trigonometric, decimals, scientific notation, and degrees and radians are used. Reverse Polish notation replaces conventional parenthesis.

B35.79 Aluminum Housewares Co. Inc., 1 "Fairgrove Adder", Single Register, Pascal wheel, Mechanical, 1975, Hong Kong, 2x5x10 cm, Plastic, Buy, 2 (79), D-Gordon's Office.

B36.79 ?, 1 "EXACTUS", Single Register, Pascal Strip, Mechanical, ca 1950, England, 7x11x.5 cm, D-MR2.

A linear form of the simple Pascal two function calculating device that uses complement arithmetic. See also B150.80.

Use. Addition or subtraction is carried out by dialing the numbers starting with the least significant. A carry is performed by moving the final digit around the corner to the next linear register.

B37.79 Foto-mem Inc., 1 Slide RuleLinear, 2-3 part, Slide Rule, Craft, Japan, 2x14x.5 cm, D-Gordon's Office.

B38.79 Precision Adding Machine Co. Inc., 1 "Quixsum Adding Machine Model C", Single Register, Pascal Wheel, Mechanical, ca 1930, USA, 2643, 7x18x48 cm, Quixsum, Case, And Stylus, Buy, D-MR2.

The Quixsum is a good example of how the stepped wheel principle of Pascal can be used to operate any special measures, not necessarily base ten. In this case it adds English units of feet and inches. See also l50.80.

Use. To add a number to the register, the appropriate digit is dialed. The result is displayed in a notch at the top of each wheel.

B39.79 Yanasa, Tokei, Keiki Co. Ltd., 1 "Geigy Pedometer", Single register, Escapement ratchet, Mechanical, Japan, 3d x1 cm, D-Gordon's Office.

B48.79 Rowning, J., 1 "Directions for Making a Machine to Solve Equations", Multiple part, Book, Mechanical, 1768, England, 22x18x2 cm, Buy, Historical Technology Inc., 95 (79), D-Gordon's Office.

This work describes the first analog computer designed to solve algebraic equations of the n'th degree expessed in the form y = a + bx + cx2 + dx3 + . . . + qxn . It was completed in 1768 by Rowning based upon the graphical method invented by A. deSegner in 1751. In 1770 an actual machine mechanized to the second degree was presented to the Royal Society, but apparently no longer exists. Rowning's instrument consists of a number of adjustable straight bars, or "rulers," centred and combined together in such a way as to occupy progressively the various positions in accordance with deSegner's graphical construction. Movement in two directions at right angles to one another is secured by means of two pairs of racks and pinions. The curve is drawn by a pencil on the underside of a piece of pasteboard supported by two adjustable bars.

Use. Segner's method consisted in finding, by graphical construction, the values of y for various assumed values of x, plotting the curve, and reading off the values of x at the points where the curve intersected the axis of x, thus obtaining the real roots of the equation.   The impossible or imaginary roots were indicated by the points where the curve approached and receded from the axis of x, without reaching it.

B49.79 The A. Leitz Co., 1 Planimeter Variable Ratio Polar Planimeter, Multiple part, Planimeter, Mechanical, 1900 c, Switzerland, 64567, 2x4x28 cm, German Silver and Steel, Instrument and Fitted Cloth Covered Case, Buy, Historical Technology Inc, 75 (79), D-Gordon's Office.

This instrument for measuring the area of any plane figure was invented by Professor Jacob Amsler in 1856. It is a proportional instrument in that the unit can be changed by altering the radius of the tracing arm.

Use. The weighted point is fixed and the tracing pointer guided exactly once round the outline of the figure whose area is to be measured. The difference of the readings on the graduated roller before and after this operation gives the area of the figure in units dependent on the setting of the tracing arm.

B53.80 Lowry Mfg. Co., 1 "Lowry-bowyer Telemeter", Multiple Part, Mechanical, ca 1900, USA, 15x78x7 cm, Aluminum and Wood, Instrument, Mahongany Base, Cover Buy, Historical Technology, Inc., 195 (80), D-Gordon's Office.

A version of the classical trigonometer signed and dated "THE LOWRY MFG. CO./BOSTON, U.S.A./PAT. 1887, '92, '96". It has two four and a half inch compass bearing dials, one fixed at the end of the twenty-six inch long graduate slotted base plate, the other sliding, and each with graduated pivoted arms of l8 3/8" radius. It was intended for the analog solution of the plane triangle knowing two angles and included side, two sides and the included angle, or three sides. Thus it was useful for problems both of navigation and gunnery.

B54.80 ?, 1 Navigator's Gunter Rule, 2-3 Part, Gunter Rule, Craft, ca 1800, England, 5x60x.5 cm, Darkened Boxwood, Minor Warping And Edge Chipping, Buy, Historical Technology Inc., 155 (80), D-MR2.

See B4.76

B55.80 Dring & Fage, 1 Inland Revenue Slide Rule, Four-sided, 2-3 part, Slide Rule, Craft, 1825, England, 60x5x1 cm, Boxwood, One ink Stain, Buy, Historical Technology Inc., 215 (80), D-MR2.

The rule is specially arranged for the use of excise officers and maltsters in gauging computations. Slide rules for this purpose were first devised by Thomas Everard in 1683, and modified by Vero, Leadbetter and others. In this example, four scales appear on one side and the other side is blank.

B80.80 Trinks-brunsviga, 1 "Trinks-brunsviga" Brunsviga, Three Register, Rotary, Mechanical, ca 1940, 39329, 15x12x36 cm, Gift, Declan and Margrit Kennedy, D-Gordon's Office.

The German patent of W T Odhner, 1891, was acquired by Messrs Grimme, Natalis & Co, and was embodied in a machine known as the "Brunsviga." This example is a further adaptation and sits on a wood board that was part of a disappearring desk top.

Use. Although the machine performs multiplication by repeated addition as in the Thomas type, the use of the Odhner wheel instead of the Leibniz toothed wheel led to a more compact design. The Odhner wheels fit very close together on the axle on the back. A setting lever, the end of which projects through a slot in the cylindrical portion of the cover plate, forms part of each wheel. If a lever is set against any figure (1 to 9) of its slot, a corresponding number of pins are made to project from its wheel. When the operating handle is turned, these pins gear with small toothed wheels of the product register, which in turn gear with the number wheels in front. The product register is mounted on a longitudinally movable carriage arranged in front of the machine, which carries a second counter for registering the multiplier or the quotient. The handle is turned in a clockwise direction for addition and multiplication, and counter-clockwise for subtraction and division.

B81.80 Bell Punch Co. Ltd., "Plus" Single Register, Keyed Wheel, Mechanical, England, A7-1783, 15x30x40 cm, Green, Metal, Model #909/C/V/504.929/A, Buy, 25 (80), D-MR2.

B93.80 ?, 1 Abacus, Single Register, Bead, Manual, China, 22x16x3 cm, Wood, 9 Digit, Removable Wooden Backboard, Buy, 50 (80), D-MR2.

The abacus is the earliest known computing device and the first hand-held calculator. It postdated the invention of the decimal system by the Egyptians circa 3000 BC. The Greeks and Romans built and used the abacus based on Hindu-Arabic numerals.

Unlike earlier notations and devices using stones and marks, the abacus utilizes positional notation, including the representation of zeros, differences, with capabilities for multiplication and division. The Chinese abacus has beads in groups of 5 and 2, representing decimal digits. The Japanese first modified this to 5 and 1 and then 4 and 1.

B94.80 ?, 1 Soroban, Single Register, Bead, Manual, 10x2x40 cm, Wood and Bamboo, 21 Digits, Buy, 22 (80), D-Bells.

B95.80 ?, 1 Abacus, Single Register, Bead, Manual, Taiwan, 2x4x6 cm, Green, Marble and Brass, 9 Digit, Abacus on Marble with Instruction Booklet, Buy, 7 (80), D-Gordon's Office.

B96.80 Reliable Typewriter and Adding Machine Corp., 1 "Addometer" Single Register, Pascal Wheel, Mechanical, USA, 1x5x30 cm, Dark Gray, Metal and Fiber, Fiber Case and Instruction Booklet, Buy, 14 (80), D-Bells.

See Bl50.80.

B97.80 KEUFFEL AND ESSER, 1 "E.A. Sperry's Calculator"Circular, 2-3 part, Slide Rule, Craft, USA, S650, 6d x2 cm, Pocket Watch Style, Buy, 42 (80), D-Bells.

B98.80 ?, 1 Navigator's Gunter Rule, 2-3 part, Gunter Rule, Craft, 2x15 cm, Cream, Ivory, Buy, 60 (80), D-Bells.

See B4.76

B99.80 Stanley Rule & Level Co., 1 Timber Slide RuleLinear, 2-3 Part, Slide Rule, Craft, USA, 4x30 cm, Brass and Warranted Box Wood, Buy, 38 (80), D-MR2.

See B30.77

B100.80Stanley Rule & Level Co., 1 Timber Slide RuleLinear, 2-3 Part, Slide Rule, Craft, USA, 4x30 cm, Brass and Warranted Boxwood, Cracked, Warped and Stained, Buy, 21 (80), D-Bells.

See B30.77

B101.80MARX, 1 "Junior Typewriter", Toy, Mechanical, USA, 28x13x18 cm, Gray and Blue, Tin, Bent & Rusty, Buy, 12 (80), D-Gordon's office.

B102.80?, 1 Navigator's Sector, 2-3 Part, Sector, Craft, 4x16 cm, Cream, Ivory and Brass, Chipped, Buy, 89 (80), D-Bells.

See B21.78

B103.80Welch, 1 Teaching Slide RuleLinear, 2-3 Part, Slide Rule, Display, Craft, USA, 2x23x125 cm, Black, Masonite, With Hangers, Buy, 30 (80), W-Bells.

B104.80T.S. & J.D. Negus, 1 Parallel Rule, Fixed, Rule, Craft, 8x45 cm, Brass, Inscribed with Degrees Buy, The Packet Boat, Boston, 40 (80), D-MR2.

105.80 , 1 Rolling Parallel Rule, Fixed, Rule, Mechanical, 6x46x2.5 cm, Brass, Patt. No. 160100, Wooden Case and Instrument, Buy, The Packet Boat, Boston, 90 (80), W-Bells.

B106.80, 1 Drawing Instruments, Fixed, Compass, Parallel Rule, Scale, Craft, ca 1850, England, 16x7x2.5 cm, Green, Shagreen Case, Brass, Steel, Ivory, Silver & Ebony, Fitted Case, 8 Instruments, Rule, Sector & Parallel Rule, Buy, Arthur Middleton, London, 648 (80), D-MR2.

B107.80J Thomlinson Ltd Glasgow, 1 "Thomlinson's Equivalent Paper Slide Scale" Linear, 2-3 Part, Slide Rule, Craft, ca 1940, Scotland, 8x58x1.5 cm, Brown, Wood, One Sided with Two Moving Rules, Buy, Peter Delahar, 43 (80), D-MR2.

This specialized rule was designed for the paper and printing industry. The A scale indicated length, B scale the breadth, and area in square inches was read off the C scale.

The D scale was used to read off translations of inches to centimeters, kilos to pounds, 480 and 500 sheet reams, and various weights of different standard paper cuts.

B108.80Dring and Fage, 1 "Leadbetter Slide Rule"Linear, 2-3 Part, Slide Rule, Craft, ca 1800, England, 31x3x2 cm, Brown, Boxwood, Four Sided Slide Rule with Slides on each Side, Buy, Peter Delahar, 84, D-MR2.

B109.80?, 1 Slide RuleCoggeshall, 2-3 Part, Slide Rule, Craft, ca 1800, England, 4x33x.5 cm, Boxwood and Brass, Hinged with Two Slides, Buy, Peter Delahar, 75 (80), D-MR2.

A modified Coggeshal type slide rule with one brass and one wood slide. Navigational scales including meridian, chords, latitudes, and hours are inscribed. Freeth and Co. Brimingham is overstamped.

B110.80J.F. Fuller, 1 "Palmer's Improved By Fuller Computing Scale" Circular, 2-3 Part, Slide Rule, Craft, 1847, USA, 28x28x.5 cm, Cream and Black, Cardboard, "Fuller's Time Telegraph" is on the Reverse, Buy, Peter Delahar, 216 (80), D-MR2.

"Palmer's Computing Scale" patented in 1843 by Aaron Palmer was improved and produced by J.E. Fuller in 1847. This model is printed from the original Palmer plate with Fuller's name and own patent added to the engraving, done by George C. Smith, 186 Washington St., Boston. The reverse side, "Fuller's Time Telegraph" was patented by him in 1845.

Use. "Palmer's Computing Scale" was used to calculate square measures, cubic measures, timber measures, grain measures, liquid measures and interest rates from 3 percent to 10 percent on a daily and monthly basis. "Fuller's Time Telegraph" (on the reverse) was used to calculate time lapse in days or weeks between any two given dates. In concert these two measures would be useful to dealers in grain, alcohol and other commodity trading.

B112.80Fowler & Co, 1 "Fowler's Textile Calculator"Circular, 2-3 Part, Slide Rule, Craft, ca 1900, England, 14398, 6.5d x.7 cm, Chrome, Glass, Paper, Two-sided Circular Rule, Buy, Maitland Antiques, Portobello Rd., 60 (80), D-MR2.

Short scale type of "Fowler's Textile Calculator" with two scales on one side. The other side holds a table equivalency for weft, looms, and reeds.

B113.80Lewis & Tylor, Limited, 1 "Hydralculator", Linear, 2-3 Part, Slide Rule, Craft, ca 1940, England, 7x19x.5 cm, Cream, Cardboard, One Rule on one Side, Case and Rule, Buy, Portobello Rd., 9 (80), D-MR2.

"Hydralculator", patent number 396,533, published by Lewis & Tylor Ltd., Gripoly Mills, Cardiff, the manufacturers of "underwriter" super fire fighting hose, for the use of their "Friends in the Fire Service."

Use. To find the quantity of water discharged for any given nozzle and a known pressure, place press on scale "b" opposite nozzle on scale "a', and read discharge through window in slide. To find height of jet for given pressure and nozzle diameter, proceed as above and read opposite arrow in center of slide, the height given on scale "d" for the appropriate nozzle.

B114.80?, 1 "Circular Concise Slide Rule" Circular, 2-3 Part, Slide Rule, Craft, ca 1960, Japan, 8d cm, White, Plastic, No. 28; Reverse has Standard Equivalency Tables, Buy, Portobello Rd., 5 (80), D-MR2.

B115.80?, 1 Music Box, , Mechanical, 1980, Switzerland, 6.5dx5 cm, Plastic and Aluminum, Plays Jingle Bells, Buy, 6 (80), D-Gordon's Office.

B116.80Blickensderfer, 1 "Featherweight Blickensderfer", , Mechanical, ca 1900, USA, 153497, 25x30x13 cm, Aluminium, 501 Special Stamped on Base, Buy, Portobello Road, 120 (80), D-Gordon's Office.

The "Blick" was the first typewriter intended to be readily portable. It was designed by Georges Blickensderfer and patented in 1890 and first sold in 1893.

Use. Each key had three positions, upper and lower case and a figure that positioned three levels of the printing wheel.

B117.80?, 1 Jacquard Loom Mechanism, Card-controlled, Loom, Model, Mechanical, ca 1805, France, 16x36x40 cm, Wood, Brass, and Steel, Paper Cards Added by Peter Delahar, Buy, Peter Delahar, 2040 (80), D-Gordon's Office.

B118.80L.M. Ericsson & Co., 1 Printing Telegraph Receiver, Electro-mechanical, ca 1890, Sweden, 7640, 36x42x17 cm, Brass, Wood, Bevelled Glass, Key, Brass Spool, Paper Tape, and Receiver, Buy, Arthur Middleton, 626 (80), D-Gordon's Office.

B119.80, 1 Navigator's Sector, 2-3 Part, Sector, Craft, ca 1800, England, 16x3.5x.3 cm, Ivory, Lee & Son, Portsea Engraved, Buy, Portobello Rd, 60 (80), D-Bells.

See B21.78

B120.80C.W. Dizey, New Bond St London, 1 Proportional Rule and Protractor, Fixed, Rule, Protractor, Craft, ca 1890, England, 4.3x15.2x.2 cm, Ivory, Buy, Bermondsey Market, 24 (80), D-Bells.

A protractor and architect's proportions are inscribed on one side; engineer's scale and vernier on the other.

B121.80United Chemical Engraving Co. Ltd., 1 Proportional Rule and Protractor, Fixed, Rule, Craft, 1932, England, 5917, 15x5x.2 cm, Cream, Plastic, Inscribed D.A.E. Carter, Buy, 5 (80), D-Bells.

Protractor and table with set scales at l/20,000, 100,000, and 250,000 inscribed on one side. The other side has scales of one half inch and one inch to the mile, a scale of 1/20,000 in meters and listing of metric equivalents.

B122.801 Parallel Rule, Fixed, Rule, Craft, ca 1890, England, 3.5x15x.2 cm, Ebony and Brass, Buy, Maitland Antiques, 10 (80), D-MR2.

B123.80R. Waddington, Coventry, 1 Lord's CalculatorCircular, 2-3 Part, Slide Rule, Craft, England, 7d x1.5 cm, Chrome and Glass, Buy, Maitland Antiques, 48 (80), D-Bells.

B124.80Fowler's (calculators) Ltd Sale, 1 "Fowler's Calculator"Circular, 2-3 Part, Slide Rule, Craft, ca 1920, England, 6d x1 cm, Chrome, Glass and Paper, Long Scale Calculator, Buy, Maitland Antiques, 60 (80), D-Bells.

B125.80The Cleveland Twist Drill Co., 1 Circular Slide RuleCircular, 2-3 Part, Slide Rule, Craft, ca 1920, USA, 8d x.3 cm, Cream, Plastic, Printing worn off, Buy, Portobello Rd, 2 (80), D-Bells.

This specialized rule is copyright 1911, The Cleveland Twist Drill Company.

Use. The rule indicated drill speeds for wrought iron, machinery steel and soft tool steel. One side shows revolutions per minute for diameters ranging from one-sixteenth to three inches for both high speed and carbon steel drills. The other side shows tap and drill sizes and the decimal equivalent for inch divisions.

B126.80Johnson, 1 "Johnson Artifical Light Exposure Calculator", Circular, 2-3 Part, Slide Rule, Mechanical, England, 6.5d x.2 cm, Cream, Plastic, Buy, Portobello Rd, 2 (80), D-Bells.

Use. 1. Set at start. 2. Select wattage notch and dial clockwise to "stop"; 3. Repeat for distance of lamp from the subject; 4. Turn over and repeat for angel of light film speed and subject; 5. Read exposure against F/Ratio.

B127.80Thorens, 1 Musical Disk, Mechanical, 1980, Switzerland, 11d x.1 cm, Black and Yellow, Tin, Buy, 1 (80), D-Gordon's Office.

B128.80Morris, 1 "Morris's Measuring Instrument", 2-3 Part, Linear Measure, Mechanical, England, 5.5d x1 cm, Metal, Paper, Cloth, Glass, Case and Instrument, Buy, Maitland Antiques, 60 (80), D-Bells.

B129.80Tacro Inc., 1 Map Measure and Compass, 2-3 Part, Linear Measure, Mechanical, Germany, 7x3.5x.5 cm, Chrome, Paper, Glass, D-Bells.

B130.801 Drawing Instruments, Fixed, Drawing Instruments, Craft, ca 1900, England, 6x16x2.5 cm, Black Case, Brass, Steel, Wood, Cardboard, 7 Instruments and Case, Buy, Bermondsey Market, 72 (80), D-Bells.

B131.80ADDI-COSMOS, 1 "B.U.G Calculator", Single Register, Pascal Strip, Mechanical, 5223, 4.5x20.5x4 cm, Brass, Steel, Wood, fabric, Instrument and Case, Buy, Portobello Rd, $288 (80), D-MR2.

132.80 1 Drawing Instruments, Fixed, Drawing Instruments, Craft, England, 7x15x2 cm case, Wood, Fabric, Brass, Steel, 4 Instruments and Wood Case, Buy, 34 (80), W-Bells.

B133.801 Drawing Instruments, Fixed, Drawing Instruments, Craft, England, 10x19x4 cm box, Wood, Brass, Velvet, 10 Instruments and Case, Buy, 140 (80), W-Bells.

B134.801 Pantograph, Multiple part, Proportional Recorder, Mechanical, ca 1850, England, 85x15x8 cm Case, Brass and Wood, Engraved, J. Davis Cheltenham, Instrument and Case, Buy, Arthur Middleton, 275 (80), W-Bells.

B135.80Odhner, 1 "Original Odhner"Odhner, Three Register, Rotary, Mechanical, ca 1920, England, 239-868452, Grey, Metal, Buy, Bermondsey Market, 50 (80), D-Bells.

B136.81W. Egli, 1 "Millionaire", Four Register, Automatic Stepped Wheel, Mechanical, ca 1920, Switzerland, 4493, Brass, Electrified Eight-digit Model, Stand, Motor, and Calculator, Buy, Historical Technology, 840 (81), D-MR2.

See B1.75

B137.81American Can Company, 1 "American Adding Machine", Two Register, Mechanical, ca 1920, USA, 31850, Black, Metal, Digits worn, Buy, D. Stillings/BRIEUX, 125 (81), D-MR2.

Essentially a Pascal-like single register machine, only the digits are grooved and stay in place showing the entry (a second register) until they are cleared.

B138.811 Scale and Ruled CompassDrawing Instrument, Fixed, Scale and Compass, Craft, USA, 3x12 cm, Metal, "W.B.Pierce Co. Civil Engineers", Buy, 10 (81), D-Bells.

B139.80W. Mount and T. Page, at the Postern on Tower-hill, I. J. Good, "Measuring Made Easy: Or the Description and Use of Coggeshall's Sliding Rule, much Enlarg'd by J. Atkinson, Sen. London."Coggeshall 2-3 Part, Slide Rule, Book, Craft, 1744, England, 10x16x1 cm, Paper and Leather, 96 Pages with 2 folding Engraved Plates. Portion of Spine lacking but still tight, without fly leaves., Buy, The Antiquarian Scientist, 121 (80), D-Bells.

Taylor (1966) lists John Good (1706-33) as a mathematical teacher and notes a 1751 edition of this work edited by Atkinson, A maker of slide rules. The first plate illustrates Coggeshall's Sliding rule.

B140.80Depose H.C., 1 Map Mileage Reader, 2-3 Part, Linear Measure, Mechanical, USA, 12x3.5dx.5 cm, Metal, Paper and Glass, Buy, 35 (81), D-Bells.

B141.801 Counting Beads, Single Register, Bead, Manual, USA, 27x19.5x1 cm, Red, Black, and Green Beads, Wood and Metal, Paint worn off beads, beads missing on top, Buy, 9 (81), D-Bells.

B142.81Bennett, 1 Typewriter, Mechanical, USA, 27x12x4 cm, Black with Yellow Letters, Metal, Case and Typewriter, Buy, 40 (81), D-Bells.

Very compact with three positions for the keys and a wheel device. Small sized ribbon and removable carraige.

B143.81Bunzel Mfg, Vienna, 1 Thomas Arithmometer, Three Register, Stepped Wheel, Mechanical, ca 1910, Austria, distributed by Dietzgen, USA, Wood, Metal, Case, Arithmometer, Digits, Buy, Historical Technology, 840 (81), D-Bells.

See B3.76.

B147.81Richardson and Co., Middleton, Co., 1 Coggeshall Timber Slide Rule, 2-3 Part, Slide Rule, Craft, USA, 4x31.5x.3 cm, Boxwood, Brass, and Steel, Buy, NE Trade Fair, 20 (81), D-Bells.

B148.811 Spelling and Counting Board, Single Register, Bead, Toy, Craft, ca 1950, USA, 23d x 2 cm, red, Plastic and Wood, Buy, Lincoln City, Ore., 2 (81), D-Bells.

B149.811 "BABY CALCULATOR", Single Register, Pascal Strip, Mechanical, USA, 14.5x7.5x.7 cm, Black, Gold and Red, Metal, Buy, Lincoln City, Ore, 8 (81), D-Bells.

See

B150.81Roberto Guatelli, 1 Pascal Adder, Single Register, Pascal Wheel, Replica, Mechanical, 1645, France, Bronze, Buy, R. Guatelli, 3500 (81), D-MR2.

The first mechanical adding machine built by the French physcist and matehmatician, Blaise Pascal.

Use. The dials show the French monetary unit, the livre, which was divided into 12 deniers, each subdivided into 20 sols. The essential part of the machine was its decimal carry; each toothed wheel moved forward one unit (one-tenth of a revolution on each wheel except those of deniers and sols) when the previous wheel had completed one revoltuion. Subtraction was based on complementary numbers that could be revealed by moving the strip at the top of the calculator.

B151.81Electric Specialty Mfg Co., Cedar Rapids, Ia., 1 Telegraph Key, Transduction, Electro-mechanical, ca 1900, USA, 7x8x18.5 cm, black, metal, Buy, $15 (81), D-Bells.

B152.81SELSI, 1 Map mileage reader and compass, Analog Calcula, 2-3 part, Linear measure, Mechanical, ca 1930, Germany, 11x3.5x.5 cm, The handle also serves as a pencil. Buy, 7 (81), D-Bells.

B153.81A & W Smith, 1 Pantograph, Analog Calcula, Multiple part, Proportional planar copier, Mechanical, ca 1820, England, 59x7x5.5 cm, mahoganny case, Brass, 3 brass scales, ivory and brass roller, and pins, Buy, Peter Delahar, 400 (81), D-Bells.

"A rare type of brass pantograph," P. Delahar.

B154.81Corona Typewriter Co., Inc. Groton, N.Y., 1 "CORONA FOUR" Typewriter, TRANSDUCTION, Typewriter, Mechanical, ca 1920, USA, H201124, 26x31x11 cm, Black, case and ribbons missing, Buy, Oregon, $8 (81), D-Bells.

B155.81Burroughs, 1 "Burroughs Calculator" Adding machine, Digital Calcula, Single Register, Keyed Wheel, Mechanical, ca 1910, USA, 5-607901, 18x23x30 cm, Black and green, Metal, Stands on legs at a tilt for ease of operation. Buy, Rte 20 antique store in Wayland, 5 (81), D-Bells.

B156.80Burroughs, 1 "The Burroughs Adding and Listing Machine" Adding Machine, Digital Calcula, Two Register, Key Punch, Mechanical, ca 1900, USA, Black, Metal with beveled glass sides, Buy, Victor, Co., 225 (80), D-MR-2.

B157.81Burroughs, 1 "The Burroughs Adding and Listing Machine" Adding Machine, Digital Calcula, Two Register, Keyed Wheel, Stand and motor, Mechanical, ca 1910, USA, Black, Metal with beveled glass, Adapted for motorized operation, Stand, motor, calculator, printer, Buy, Oregon, 75 (81), D-MR-2.

B158.81 J. Halden & Co., Ltd., 1 "HALDEN CALCULEX" Circular Slide Rule, Analog Calcula, 2-3 part, Slide rule, Craft, ca 1910, England, 6 cm diameter, Metal ring with glass discs covering paper scales, Aluminum case with velvet interior and leather covered 95 page manual only measuring 5.5 cm square, plus instrument, Buy, The Antiquarian Scientist, 90 (81), D-Bells.

Cajori in his "history of the Logarithmic Slide Rule" (1909) lists this unique instrument as No. 211 and notes the manual.

B159.81Henry Carey Baird, Industrial Publisher, Philadelphia, 1 "A Treatise on a Box of Instruments and the Slide Rule for the Use of Guagers, Engineers, Seaman, and Students," by Thomas Kentish, Analog Calcula, 2-3 part, Book, Craft, 1864, USA, 12x18x2 cm, Original cloth cover, 228 pages with a folding plate, Buy, The Antiquarian Scientist, 50 (81), D-Bells.

The use of 2-3 part analog calculators for practical geometry, trigonometry, and logarthms are explained. Special sections deal with circles and navigational calculations.

B160.81R. & L.W. Leybourn, 1 "TRIGONOMETRIA" Logarthmic Tables, Memory, Book, Craft, 1657, England, 14x18x3.5 cm, Original leather binding, Buy, The Antiquarian Scientist, $600 (81), D-MR-2.

The original set of logarthmic tables and their explanation as made by William Oughtred, who made significant improvements on the slide rule.

B161.81HANS W. EGLI CO., 1 "MILLIONAIRE" Calculator, Digital Calcula, Four Function, Stepped Wheel, Mechanical, ca 1900, Switzerland, 272, 18x29x76 cm, wooden case, brass calculator, 8 digit, wooden stand, case, and calculator, Buy, Antiquarian Scientist, 800 (81), D-Bells.

See B1.75

B162.81Ticknor and Fields, Boston, 1 "History, Theory, and Practice of the Electric Telegraph" by George B. Prescott, Transmission, Telegraph, Book, Electro-mechanical, 1864, USA, 14x4x20cm, well-illustrated, good condition, Buy, The Antiquarian Scientist, 40 (81), D-Bells.

Contents: 1. Electrical Manifestations; 2. Propagation of Electricity; 3. Magnetism; 4. General Principles of the Electric Telegraph. 5. The Morse System. 6. The Needle System; 7. House's Printing Telegraph; 8. Bain's Electro-chemical Telegraph; 9. The Hughes System; 10. The American Printing Telegraph; 11. Horne's Electro-thermal Telegraph; 12. The Dial Telegraphs; 13. Subterranean and Submarine Lines; 14. The Atlantic Cable; 15. Progress of the Electric Telegraph; 16. Various Applications of the Electric Telegraph; 17. Construction of Telegraph Lines; 18. Atmospheric Electricity; 19. Terrestrial Magnetism; 20. Miscellaneous Matters; 21. Early Discoveries in Electro-dynamics; 22. Galvanism. Index.

B163.81 H. Dessain, Imprimeur-Libraire, Liege, 1 "Recherches sur La Telegraphie Electrique" par Michel Gloesener, Transmission, Telegraphy, Book, Electro-mechanical, 1853, Belgium, 16x23.5x1.5cm, paper back, Buy, The Antiquarian Scientist, 50 (81), D-Bells.

Beautiful fold-out plates of the needle telegraph.

B164.81 Signal Electric Mfg. Co., 2 "Signal Telegraph Instrument" Telegraph Keys and Sounders, Telegraphy, Electro-mechanical, ca 1920, USA, 11x10x16 cm, Wooden base, brass, and other metals, Buy, Westford, 20 (each), D-MR2.

B165.81Simplex Typewriter Company, 1 "The New Simplex Typewriter No. 1" Typewriter, Typewriter, Mechanical, ca 1920, USA, 22x12x6 cm, red, yellow, and black, wooden base with metal, cardboard case and typewriter, BUY, Knotty Pine Antique Market, West Swanzey, NH, 15 (81), D-Gordon's Office.

The simplex is a small, inexpensive, home typewriter that only holds paper less than seven inches wide. U.S. patent numers 1138427, 1204912, 1521408, 1865288, 1869426, and 1957373.

Use: From the Directions for Operating in the case: "First: Hold the machine with rack side toward you. Push carriage to the left to starting point. When doing this see that dog does not catch in rack. Insert paper between rollers from the front. Put finger on key of letter desired and swing it into notch in rim of typecase near the dog: <u>Press downward to print.</u> To make a space without prining, press down on any key near to but not in the notch. To ink apply only a drop of ink to each pad with the end of a matchstick or toothpick. Be careful not to bend the pads down so far as to prevent them from springing back into position. Use only Simplex Ink which will be supplied at 10 cents per tube, cheap ink destroys the face of the type. Do not oil. If keyplate sticks take a rag moistened with vaseline and hold against underside of keys at the notch and twirl type plate around a few times. If the carriage does not move forward freely, apply a little vaseline to the carriageway where it rubs. Caution! Keep oil or vaseline away from rubber type and ink pads. Oil will swell and destroy the letters."

B166.81Simlex Typewriter Co., Inc., 1 "Simplex Portable Typewriter Special Demonstrated Model S" Typewriter, Mechanical, ca 1930, USA, 24x8x16 cm, Green and red, Metal, Buy, Knotty Pine Antique Market, West Swanzey, 7 (81), D-Bells.

See B165.81.

B167.81Wolverine Supply and Manufacturing Co., 1 "Adding Machine", Digital Calcula, Single Register, Pascal Strip, Mechanical, ca 1950, USA, 10x15x23 cm, Red, blue, and cream, Tin, Buy, Knotty Pine Antique Market, 10 (81), D-MR2.

B168.811 Navigator's Sector, Analog Calcula, 2-3 Part, Sector, Craft, ca 1880, USA, 3.5x16x.3 cm, wood, BUY, Knotty Pine Antique Market, W. Swanzey, 10 (81), D-Bells.

B169.811 Navigator's Sector, Analog Calcula, 2-3 Part, Sector, Craft, ca 1880, USA, 3.5x16x.3 cm, Wood, Buy, Amherst Outdoor Antique Market, 18 (81), D-Bells.

B170.811 Coggeshall Slide Rule, Analog Calcula, 2-3 Part, Slide Rule, Craft, ca 1850, USA, 4x33x.5 cm, Wood and Brass, No makers name, wood cracked, shows signs of real wear, Buy, Knotty Pine Antique Market, West Swanzey, NH, 15 (81), D-Bells.

B171.81Pickett & Eckel, Inc., 1 Slide Rule, Analog Calculator, 2-3 Part, Log-log, Craft, 1960, USA, 405171, 31x6x3 cm, Yellow, Aluminum and Plexi, Box, Case, instruction pamphlet, and guarantee, Buy, Westford flea market, 6 (81), D-Bells.

B172.811 Abacus, Digital Calculator, Single Register, Bead, Manual, 29x14x2.5 cm, Wood, 13 digit, Buy, Amherst outdoor antique market, 10 (81), D-Bells.

B173.81Burroughs, 1 "Burroughs" Adding Machine, Digital Calculator, Two Register, Keyed Wheel, Mechanical, ca 1950, USA, 8A193393, 22x37x20 cm, Green and Black, Metal, 8 digits with paper tape printing, Buy, 19 (81), D-Bells.

B174.81Felt & Tarrant Mfg Co., 1 "Comptometer", Digital Calculatpr, Single Register, Keyed Wheel, Mechanical, ca 1895, USA, 505, Walnut, Brass & Other Metals, Buy, Peter Delahar, 400 (81), D-MR2.

An early Comptometer with the springs showing on the upper keys. The keys are molded differently on alternative rows to give the operator a "feeling" of relative location. The walnut cabinetry and tooling was clearly a hand-made.

B175.80Siemens Brothers & Co., London, 1 Printing Telegraph, Links and Switches, Electro-mechanical, ca 1900, England, 12145, Wood and brass, Does not work, Buy, Portobello Rd., London, 510 (80), D-Gordon's Office.

B176.801 Sector, Analog Calcula, 2-3 Part, Sector, Craft, ca 1623, England, 9 inch; 240x50x5 mm, Brass, Buy, Peter Delahar, 2400 (1981), D-Bells.

Nine inch brass sector as described by Edmund Gunter (1581-1626) in 1623. Unsigned by probably made by Elias Allen in 1623.

B177.81Thomas Graham, 1 "The Oriental Calculator or Tables for the Calculation of Interest, Exchange & Commission" by Dorabjee Hormusjee, Book of tables, Writable or Readable Memory, Paper, Random, Craft, 1860, India, 15x23x4 cm, Green, Paper, Third Edition, Good condition, Buy, Editions, 45 (81), D-Bells.

Part I contains Interest Tables in Rupees, Dollars, and Sterling from one-half to 12 per cent per annum. Part Ii contains tables for the conversion of rupees, into sterling and dollars; and sterling into dollars. Part III contains commission or Inland Exchange Tables; Key showing indirect exchange between England, India and China; Tables shoing the comparative rates of exchange for sight bills, and tables showing the estimated value of one pound of cotton with all charges and varying exchange rates.

In the preface to the third edition the author states, "The rapid sale of the previous Editions of the "Oriental Calculator" and the pressing demand for it, are evident proofs of the utility of this work in mercantile circles; and the production of the Third Edition is the result of the liberal patronage and support the author has been favored with."

B178.811 Counting Beads, Digital Calculator, Single Register, Bead, Manual, 37x2x44 cm, red and black beads, wood and metal, 9 rows by 10 digits, Buy, Joe Stamps, NY, 50 (81), D-Bells.

Interesting directions regarding complementary numbers and the use of the simple machine for multiplication.

B188.811 "Precise"Adding Machine, Digital Calcula, Single Register, Pascal Strip, Mechanical, ca 1910, USA, 105x120x175 mm, Silver and Bronze, Metal, Stylus and calculator, Buy, 25 (81), D-Bells.

B189.81A W Faber, 1 Slide Rule, Analog Calcula, 2-3 Part, Slide Rule, Craft, ca 1935, Germany, 98350, 33x9x270 mm, Ivory, Ivory bonded to wood, Inch and centimeter scales are on opposite sides, Leather case and rule, Buy, D-Bells.

B190.81Ideas Unlimited, 1 "Horse-meter", Analog Calcula, 2-3 Part, Circular Slide Rule, Craft, 1951, USA, 135 mm diamter, Orange, gray and yellow, Paper, Buy, Colorado Springs, 1 (81), D-Bells.

"Directions for use: (1) Consult daily Racing Form for speed ratings, weights and class; (2) Figure rating for each horse in race as follows: (a) turn red dial to best speed rating in past 30 days; (b) turn blue dial to class in key race; (c) Turn yellow dial to weight difference of (a) race and today's race; (c) Add (or subtract) figures (a) (b) (c). This is horses rating. (3) Horse with at least 2 points aove rest is the choice in this race; (4) Play only if final odds are 2/1 or better; (5) Best results will be had by avoiding 2 year old, maiden, fillies and mares, stakes, hurdle, turf and steeple races and races over 1 1/8 miles."

B191.81E. & F. N. Spon, 125, Strand. London, 1 "Pocket-book of Useful Formulae & memoranda for Civil and Mechanical Engineers," by Sir Guilford L. MolesworthBook, Readable or Writable Memory, Paper, Random, Craft, 1888, England, 77x30x120 mm, Black with gold leaf edges, Paper, Buy, 3 (81), D-Bells.

Originally compiled in 1862, this is the 22nd edition of a truly pocket-sized book of formula. Although there is no table of contents, a very thorough index is provided for the 732 pages of tables.

B192.811 Section of the first Atlantic Telephone Cable, Transduction, Electro-mechanical, 1858, US, 95x18 mm diameter, Buy, 200 (81), D-Bells.

Cyrus West Field (1819-1892) American merchant, promotor of the first Atlantic cable was botn in Stockbridge, massachusetts. In 1854, he conceivec the idea of the calbe and secured a charter to organize the England and American companies. The British and American naval ships, HMS Agamemnon and the USS Niagara were secured to lay the cable. Five attempts were made between 1857 and 58. The first message transmitted, August 16, 1858, read, "England and America are united by telegraph. Golory to God in the highest and on earth peace and good will towards men." The Queen and the President of the United States exchanged congratulations, but the cable ceased working three weeks later. It was necessary for Field to raise new funds and make new arrangements. The great Eastern succeeded in laying a calbe in 1866.

B193.81A. Massim, Paris, 1 Music Box, Readable or Writable Memory, Mechanically stable, Cyclic, Mechanical, 1840, France, 30981, 343x160x120 mm, Black, Wood and brass fittings, Buy, 400 (81), D-Bells.

The music box plays six tunes; Robin Adair, the Blue Bells of Scotland, The Campbells are coming, Auld Lang Syne, Coming Through the Rye, and Bonnie Sweet Home.

B194.81Aaron Palmer, Boston, 1 "Palmer's Pocket Scale"Circular slide rule, Analog Calculator, 2-3 part, Circular slide rule, Craft, 1845, USA, 7x95x150 mm, Paper, Buy, Moskowitz, ca 185(81), D-MR2.

Palmer's Pocket Scale with rules for its use in solving Arithmetical and Geometrical Problems preceded the large sized Fuller's scale. See B110.80.

B195.81 1 Excise slide rule, Moskowitz, 375(81), complete on getting catalog

<u>July</u> <u>16</u>th - Arrive Tokyo

My seat mate from Honolulu, Anthony Geber, Director of Economic Policy, Bureau of East Asian Affairs (State Dept., 202-632-9690) illicited some argument from me. (He opened.) We exchanged business cards (I'm practicing for Japan) as it's the only time I've carried cards. (This, according to Reischauer, is the thing to do.) At any rate, his concern is simply that Americans are too lazy to compete. Also it's too hard for us to go after their small markets. Mine is more fundamental -- Japan's growth versus return on investment; the availability of capital; Japan's trade barriers and language/cultural barriers; and the way the Japanese focus on winning in trade -- all serve to scare the hell out of me. Throw in our waste, vis a vis energy, too. I also attribute our regard for science over engineering and engineering over manufacturing as key. The fact that we no longer build, but use tape recorders (especially videotape), radios, TV, high quality cameras (we only built a few - Kodak 35), small cars, is cause for concern.

<u>July</u> <u>17</u>th - DEC Office + Keio University

Here we lie, watching the news (in English) after a day of running around like mad. Our host, Yu Hata, picked us up at 9:00 AM, took us to the DEC office, gave us a one hour briefing on computers in Japan (a brief history), and then I gave a two hour seminar on DEC products and engineering organization. There was an hour of questions on everything from 50 hertz 100 volt power to multiprocessors. It's clear we have inadequate planning of products for this market. Engineering makes its plans clear. Who's got the responsibility? (GIA-Janzen, CSS-Holman/Martin/Watanabe, the VT100 product here - Halio, or DEC Japan or some P/L for character sets?) This is a mess! For starters, I say GIA had better drive this issue!

We went to a nearby hotel and had to have an international style lunch (versus Japanese) because the Japanese part was full. I intend to assimilate everything -- just like the Japanese, so the food is paramount.

We left at 1:00 PM for a ride to Keio University (CMU affiliate) where I gave a talk on minicomputer architecture, which prompted lots of questions. We left at 5:00 after interaction and a view of their predominantly batch 11/06. Professor Toroko is an assistant professor in hardware. We were shown around by Professor Nori Doi. They would very much like to visit DEC. There was interest in architecture, as they wanted to build a large multiprocessor. Funding is tight as they're a private university with no NSF, ARPA or real industrial support. The main professor wasn't there.

Toroko gave me some papers which I'm sending internally, and Doi gave me a paper on the Fortran they built for the 11/08 patterned after Waterloo's WATFIV. On the return, Hata finished his lesson on the Japanese computer industry vis a vis the 3rd pair of groups (Fujitsu - Hitachi, who make 370 compatible), (NEC - Toshika, who're looking for a mini in Honeywell and used to be with GE) and (Mitsubishi - Oki). Univac (Nippon) is a dominant supplier somehow, based on Mitsui's earlier impetus! (Sept. 76 Datamation explains this quicker and better. The article is attached.)

We were dropped off at the Okura Hotel, I wandered around checking out the baths, water, etc. and finally settled on a swim indoors with a sauna. This let me shed a kilogram quick plus earn dinner. We went to a nearby restaurant Hata recommended and got a reasonable meal for only $30 each. It was quite good, not great, but we muddled through as I almost drank the tempura sauce versus wait for food to dip it in. We returned at about 8:30 and I called Don Frost about our visit tomorrow to NEC. I'm set to see the Director plus the technical management. Since I have a strategy to get a large share of the market, I wanted to check it out. Don said I, objective technocrat, should try it out with them! Basically the theme is: Buy any or all of DEC hardware/software; use it as a standard (just as Fujitsu-Hitachi do with the 370); sell in any/all Japanese/world markets and build a huge 11-based computer business! The Ministry of Trade/Industry (MITI), who controls all, should absolutely love it. The only trick is to get them to invent the idea!

July 18th - NEC

We had enjoyable talks/visits with NEC. The main purpose was to assure them we'd support them in their effort with the distributed system for the IRS (NTAA) using our machines (DECnet, 11/70, IAS). This was needed because they may view us as a source of technology (DECnet, minicomputers, interactive systems). Actually, technologically they're quite advanced, but probably in the wrong direction as their machines are ECL-based. The high ends are a takeoff of the Honeywell ceramic modules. They've been affiliated with Honeywell for 10 years, and next year the affiliation will be reviewed again. (Honeywell doesn't offer them anything.) The high-end is 635 based; the mid is on some earlier (2000?); and the low is on their earlier machines. Their office machines (100-series) are based on their version of the 8080 -- note it's an upward-compatible (one-way) version!

Their factories (computer and TV) were immaculate. People seem to move around faster than in ours, with more to do. The designs and quality of workmanship were quite beautiful. They commented on our reputation for quality and reliability -- which I think we have ... but we have to get these better. It's the one sure way to **sell** in Japan. They like quality/reliability (probably our other customers do too).

I had visited a TV factory; it's like I expected. They make 1,500/day - 300K/year. They have to make subassemblies because of U.S. import quotas. Their 5 Japanese competitors for U.S. market now have U.S. factories, which means the issue of Japanese products (TV) is solely a capital, manufacturing and design issue -- not high labor, for example. Again, I remember buying and giving away a large Zenith portable color and replacing it with a Sony color! (The Zenith replaced an old GE B/W which was never particularly good.) So in essence, I believe our ability to compete with the Japanese is:

1. A product design: quality/functionality (they adore knobby gadgets just like we do)/reliability.

2. Ability to manufacture it cheaply (and in volume).

As long as we don't forget this, we have a market. When we do forget, we'll be a distributor, just like GE and Zenith! (Incidentally, I recall that as engineers we felt sorry for the 100 TV engineers on Zenith's research group...why didn't they design better products? Why not a tape recorder? No American company produces a VTR (yet it was a U.S. invention). This gets back to emphasis of research (science) vs engineering vs manufacturing. I hope we're doing the right thing by pushing more on engineering and manufacturing (to a lesser degree) versus research at DEC.

In the afternoon I met with a number of their people from

Central Research. They're largely American trained, where the cost is lower and training is supported by U.S. government. One was trained on MIT Multics. We had no trouble in communicating! My earlier frustration that they wouldn't talk wasn't true. I did have to control the flow, otherwise they'd clean me out of information! The affiliation with CMU turns out to be good, because I can merely quote work there and stay out of DEC's work. The central (non-product specific) R&D is 100 people versus 50 for us...or they have 4 x the R&D per NOR since they have roughly 750M in sales!

They're building a very high speed COBOL engine, multiprocessor (just as we're fascinated by them for production reasons), and doing a mass store subsystem. It's hard to compare us because they're more into batch. They build bigger machines, but they'll soon learn as they build Honeywell's Level 6 mini under license. I sense they have a fairly muddy strategy, building product-by-product as ideas seem to be good. (With our high end VAX/10/20 machine, I think will be a long way to having a <u>clearer</u> product strategy -- although we'll have more products!) A person from R&D was amazed at VAX, and what it had, what it cost...he said all those ideas came from large machines. Surprise! I said this in a paper in 1971 on minis!

Speaking of ideas. The Japanese (and we) have about the same regard for ideas...they're useless until applied. Once applied, fair game to be modified, taken, etc., within the limits of the law and morality (e.g. patents). I think we need to state as a policy that we do want patent protection on ideas whenever possible, and that we'll take ideas from any source subject to moral/legal constraints! Here's what struck me:

1. The semi-automatic wiring machine that Stocky designed wasn't patented. We gave it away to be manufactured locally. It was manufactured here as a <u>copy</u> by a Japanese firm. (I suspect they've improved it and maybe we should look into purchasing them here.)

2. Their low cost Teleprinter was adapted from Extel.

3. Their high speed laser

printer was mainly IBM based using some Honeywell ideas.

4. The CML logic on ceramic modules came from Honeywell - although they made them manufacturable.

5. They use Gardner-Denver wirewrap machines and Universal inserters.

6. Manufacturing tools seem to be adapted from Macrodata, Universal, Teradyne (the wirewrap/backplane tester).

7. Their printer came from Versetec, though in a different package!

8. Their Fax machines probably have similar origins!

9. Their new Spinwriter is an adaptation of Interdata's carousel - I have some printout samples. The quality may not be high enough for word processing use. They're stressing reliability, speed (to c/s) and quality!

10. Cables/connectors come from the U.S. (maybe under license).

11. There are copies of the Tektronix scopes.

On the other hand, aside from our development and dedication to interactive and real time computing, many ideas of our products came from someplace outside (e.g., DECtape, 3M tape, cassette tape, the RK05, the DECwriters, the CRT's, the cache) various CPU implementation organizations, APL, BASIC, COBOL, FORTRAN, wirewrap, various LSI and manufacturing tools). We did contribute to computer structures more. In many ways we resemble them.

In the evening we had dinner at a posh, continental style restaurant with Dr. Ishii and Mr. Kitamura of NEC. I reaffirmed our support to them to make the NTAA (IRS) project a success...without this MITI will clobber us and our name will be mud. This is merely a reaffirmation of the Operations Committee decision requested by Marcus, GIA, and DEC-Japan.

Ishii was relatively speechless when I laid out the proposition that they standardize on 11's and drop the manufacture of the Honeywell Level 6. This gets them a mini right now, without continued investment, and they can backward integrate as they see fit. This theme for the GIA nationalistic companies is the right way to approach the marketplace. Somehow, we have to convince them that we're sincere and believe it to be the way to get into computers. This "sales approach" isn't widely understood/used. We need to formalize it. Japan would be the ideal place to start.

In the afternoon we went to the NEC computer factory and I talked with a number of very bright people from their central research lab. Fortunately they don't understand minis .... or they put on a good act (they had xerox copies of our VAX documents). Research has 100 people for a company half our size (4 x the effort). We saw a TV factory complete with multi-height rack burn-in (which we should use for disks).

<u>July 19</u>th - Fujitsu

We visited the central lab of Fujitsu at Kawosaki (Mr. Kurosaki and Mr. Sato), and then went to Numazau near Mt. Fuji where the computers were built. Fujitsu is the most computer oriented of all the companies because their founder, who died a few years ago, built one of the first relay computers. They ran the relay machine for me at Numazau while it calculated several common functions. They're not especially profitable, but they make beautiful computers and have the necessary technology. We saw their newly announced M200 (1.3 - 1.5 x 3033) multiprocessor using a dual cross-point for reliability. It appears superior to both Amdahl V7 and IBM (neither of which believe in multiprocessors (on M200).

Yu Hata and I could have easily had an argument on the relationship between Amdahl and Fujitsu. My view is simple: at IBM, Amdahl had developed a significant set of ideas on how to build 360's/370's. He left there and further enhanced the ideas in the circuits, design aids, packaging, small components assembly and testing areas. He got into financing trouble and Fujitsu bought a significant amount in return for the technology. Fujitsu put up the capital for the factory and made the assembly line work - no trivial feat because there's so much small assembly work. Fujitsu's first machine was not better than Amdahl's, but they took a longer term view (they are not that profit oriented) and produced better design aids and semiconductors, etc., so that their circuit M200 will probably beat Amdahl's V7.

The workmanship and detailed engineering is really fantastic. They have a very good master-slice (gate arrays) and fast (8 nsec) RAMs. In the terminal work, they have an anechoic chamber to get noise level down. They have some color CRT's and a floppy based intelligent terminal and are working on high level forms languages to make them easier to use. Of course, their disks are reverse engineered copies of IBM's.

Overall, Fujitsu seems the most frightening because of their dedication to quality, and winning. They have the strongest engineering and so far haven't been interested in mini's (PANA FACOM is their brand - a joint venture of PANASONIC (Mitsubishi) and Fujitsu). Also, given their disinterest in profit, they'll be doubly hard to beat.

Probably more important, Amdahl understands IBM mentality and how they strategize. This clearly influences Fujitsu and MITI. In fact, I believe Amdahl influenced MITI, at least indirectly, to build the plug compatible systems!

In visiting the Fujitsu factory, we saw one of the floors of the factory was devoted to programming. They had set up something that was very much like an assembly line for programmers. I would love to have our programmers look at this kind of environment because, in effect, there was really a sea of programmers. Probably the most impressive part was that they had a great number of line printers all backed up to a conveyor; and as each line printer finished its output, it was cut and stacked. It was cut into the appropriate pile; the pile was put on the conveyor; and the conveyor ran it off. The whole thing appeared on a carousel so that in fact all the programming listings were delivered stacked automatically. Of course, there were no individual offices for the programmers, only a sea of desks.

I guess the other thing that was impressive about the Fujitsu factory was the very clean atmosphere. The custom of removing shoes is very helpful; this is done on entry to computer rooms, temples and tea rooms. It was the cleanest of all the computer companies that we saw. This really pays off when dealing with the large number of contacts, the small coaxial cable, and the way the multi-terminal integrated circuits are sorted at that point under the board.

The Fujitsu M190 and M200 computers also used color CRT's for controlling the computers. KIVIAT graphs are displayed on the consoles so that one can get an idea of what's happening to the various resources. They are used in real time display in the Fujitsu computers.

July 20th - Electro Technical Lab and University of Tokyo

We visited Dr. Nishino and Dr. Mori of the Electro Technical Lab, which is run by MITI. This is a Central Research group responsible for computer research (the nearest equivalent of ARPA). The lab in a sense looked like many government labs - a series of dusty old equipment with experiments, which can be put into service for visiting dignitaries; some good and some bad work; and a bunch of reasonably intense Ph.D's. I gave a talk on the VAX design and it illicited a number of interesting questions. They're doing a large number of computer structures related work, several projects on multiprocessors and on microprogramming, and various things on language translation. On Dr. Nishino's desk was a well worn copy of the Quantam Sciences forecast on office automation. I asked to see stuff on Word Processing but the stuff I saw was not particularly useful or impressive.

The ETL does have one interesting virtue in that it does very little hardware building. In fact, its main function is to fund various industry groups to do design for a lot of the Japanese minicomputers. Anyway the one that is the equivalent to the DG mini looked exactly like the DG framework, except the workmanship on the console was much better than Data General's.

We went to the Tokyo Hilton and fortunately had Tempura, which is sort of batter fried fish, shrimp, and vegetables (probably the easiest thing for Westerners to accept and digest). It was about our second Japanese meal, because all the other meals were given to us assuming that we could not eat Japansese food. We had sandwiches (with bread crusts removed, delicately made and presented) at the various companies and had continental food when we went out (especially the elegant NEC meal which was heavily influenced by French cooking).

In the afternoon we went over to the University of Tokyo where I gave a lecture on minicomputer architecture in a very formally decorated room (held about thirty). They apologized for the small crowd because it was vacation. I was with Professor Ashida and Professor Inose, both of whom had spent a great deal of time at BTL. Inose is the father of the time sort algorithms for ESS No. 4 time division multiplex switching, which he did about twenty years ago. The talk was supposed to take one and a half hours with a half hour of questions, but ended up taking about one hour with roughly forty-five minutes of questions. We went to Professor Inose's office, were formally received, and discussed various types of things. The two professors had to leave because they had a dinner meeting of some sort.

We were then shown around the large Hitachi machines by one of the students. It was the Hitachi 8800 and he lamented the fact that Hitachi now was making IBM compatible computers, which he considered inferior to the ones they had currently made. Their other line is almost IBM compatible, derived from the Spectre 70 unit, but has special supervisory call instructions which makes them incompatible. We looked around the computer, which is really a monstrous machine because it was made out of MECL 10K, I believe; but the machine was water cooled.

There was a four processor system, three fast processors and a slower processor. The load was not very heavy. We went over to look at the system resources and I ran a BASIC and FORTRAN program. The BASIC null program really bombed out so I have a feeling the null program took a good deal of time showing that they had some kind of interpretive compiler. The FORTRAN produced good quality code and ran very rapidly.

We left there about 6:00 PM for dinner with Yu Hata, his wife and Don Frost at Yu Hata's son's apartment. We spent a thoroughly enjoyable evening looking at his airplanes. Because he is an avid photographer, he got into building model airplanes for aerial reconnaissance photos. He also built some helicopters. All of this was indeed incredibly impressive. The airplanes are very detailed and take something in the area of six months to one year to build.

<u>July</u> <u>21</u>st - Sony

We were picked up early at the hotel, checked out, and went to the Sony Corporation Central Research Lab where we were given a brief introduction to what Sony is working on. Other than that I was able to get no information from the Central Research Lab group. I asked about what was going on in the Systems Research Group, but the only thing we saw was a Sony TV tube (used for Graphics) for which I have the specifications.

They also demonstrated with characters but the interlace problem created incredible flickers. I asked about buying monitors but they said I would have to see Mr. Iwama. Having gotten no information from the Central Research Lab, we then went to Sony's Atsugi plant, where we saw the video tape recorder being made. In contrast to the NEC TV plant, the Sony plant did not do any burn in of parts but in fact used testing to ensure that the product worked when they were all put together.

A large number of the parts were done outside this plant and subassemblies were brought back for fabrication. In all the plants that we saw only about half of the work is done inside. The rest is done by subassembly or contract labor. In the factory only 40% of the 1,100 people were workers. Of course, this was reasonably high considering that in that factory about 250 out of the 1,100 were in the engineering group. This is where they made so many semis.

The semiconductor part used three micron channel width for NMOS.

They were the first in Japan to use the Bell Lab license of the transistor, and Mr. Iwama, the President and technical person at the top, insisted that a large number of engineers be hired to do semiconductors and, in fact, he backed Dr. Esaki.

Sony has an electron beam mask maker, which they got from Japan Electric Corporation, which is a copy of the American electron beam mask maker. We saw one of the AM 2900 ion implanters. It was just the fourth or fifth installed there. They pride themselves in owning a great number of the key semiconductor patents and, in fact, have a 10,000 volt transistor patent which is very key to making all solid state TV sets.

We left the factory in time to have lunch with Mr. Iwama, who of course took us to a hotel where we had a western meal; but before this, we looked at three very interesting video recorder projects all of which we have become interested in.

The MAVICARD recorder, which I have brief information on and a carousel version that allows up to five other cards to be loaded automatically, is a scanned device and the card holds up to one hundred images. There was a small video disk which held ten seconds of video on a frame by frame basis, and could be used in freeze frame applications. That system will be introduced this year for sports teaching. I am asking Yu Hata to go ahead and get information on these products. The third device was a small tape recorder, a tiny video disk about three inches in diameter that can store only a few frames of video.

All these products I find extremely intriguing, and all we have to do is figure out how to couple them to DIGITAL recording. Iwama talked about the various forms of pulse code formulation for audio and video (they have got to get into it). We would automatically end up with tape and disks that will allow us to use the video technology in computers.

They make it a point in their advertising of trying to stay away from anything that other people are doing. One can see by their various products and images, just what their approach to life is. Their motto is, "research makes the day".

After lunch with Mr. Iwama, we drove to the train station where we got on the bullet train for Kyoto arriving in Osaka at about 7:15 PM. We were met by the software specialist and were taken to the Osaka Hotel where DEC Japan, Osaka Branch, were having their end-of-the-year party. There were about 75 people there. Don Frost gave a good speech calling for plenty of openness and then I followed up by saying how glad I was to be in Japan, about how impressed I was with the Japanese, and our need for quality.

We finally got back to Kyoto and the Tawaraya, an old-style Japanese Inn, at 11:00 or so. I was glad to lay on a mattress that was flat on the floor and very comfortable, after having lay too soft in Tokyo.

<u>July 22nd and 23rd</u> - Sightseeing at Kyoto and Nara

We had breakfast, Japanese style, in our room at about 8:30 AM and then Gen Narui and Miss Tomioka came for us to go sight-seeing. In Tokyo we had home-made coffee and fruit in the room to gain time, decrease interaction, write, and it's awfully cheap.

In the morning we went to the summer detached palace of the Emperor Shugakuin outside of Kyoto, which included many temples, houses and rice paddies in an extremely beautiful setting. We were very fortunate to get there, and because I was a visiting "dignitary", we were allowed to go. I was glad that neither Yu Hata nor Gen Narui had seen the palace so it was a treat for all of us. Miss Tomioko was in a traditional, elaborate, beautiful Kimono and kept being stopped by U.S. photographers at each site.

We took off on a tour, which was about a two mile walk in reasonably warm climate, up and down the hill in an almost Greek-like setting. Then we left for Arashi-Tei, a restaurant I think attached to a hotel that overlooked the Hozu River. We had a typical Japanese, probably nine course, luncheon starting off with beer because we were so thirsty after the walk. After lunch we went up the Hozu River and rode the boat down for about 10 miles back to the landing of the restaurant.

Off we went to visit the Nijo-Jo castle in the center of Kyoto.

This was a castle of the Shogun, built to impress the Emperor to put him in business. However, neither of them spent that much time in Kyoto because they both lived in Tokyo. The castle was, of course, extremely impressive with moats all made of wood and bamboo.

We came back to the Tawaraya, cleaned up a bit, and went out to dinner at a very nice restaurant. It is hard to remember which is the most memorable part of it, given that there were so many courses. After dinner we went down the main street of Kyoto looking for various souvenirs.

I spent most of my time looking for a knife, having been intrigued with the possibility of slicing vegetables very thin which is one of the specialties of the Japanese salads. I found one, got a few other odds and ends as presents, some more ideas for presents, and returned to the Hotel about 9:00 or so, quite ready to konk out so I could go the next day.

On Sunday morning we were trying to sleep late, given that we were going to take off at 9:30, but our maid/attendant unfortunately decided that we should get up about the same time as the day before and we were out by about 8:30. We met Gen and Miss Tomioka at the railway station and caught the 10:00 o'clock express train to Nara. The train is run by a private company and was extremely comfortable and cool, as are all the Japanese trains. We all got to the Todaiji Temple at about 10:30.

We went on to visit the Taishi Shrine at the same location, walked around, and had a fairly heavy nine-course lunch at an old inn called Tonochaya. We were off by 2:00 and went to visit both the Toshodaiji Temple and the Yakushaji Temple. These were high points of our trip. We were met by a lady who is on the staff there. Miss Tomioka knows her very well and we had an incredible walk through the various temples. The latter temple was probably most impressive because a fire had destroyed the west temple and they are building a new one. We were able to talk to the engineer who is in charge of the new construction. He showed us around and we ended up going into the construction of the temple. It is made of wood with no metal and is about 30 - 40 meters tall. We also went to the site where the wood was being prefabricated. This is being done by a bunch of scholars and an old carpenter. The whole temple is, of course, designed to last 1,000 years and, with the care they are taking, should easily accomplish this. There are about twenty carpenters working on the building. It is thought it will take about three years, or about sixty man years of work, to complete this temple.

The superstructure of the building is built around a wood pole and the temporary structure is made of steel and is quite permanent. After we got through climbing around, we were taken up in another temple that houses some of the Buddhas. All these temples, of course, house Buddhas of various sizes and shapes. The first one houses the world's largest Buddha made of 12th century bronze.

We were presented with various photographs, gifts, good luck charms, and goods to help us on our way. We had tea and cakes with one of the monks at the temple before we left at about 5:15. We got the 5:30 from the station near the temple, transferred to the express at Nara, were back to Kyoto by six, and had dinner at seven.

The five of us had dinner at the Tawaraya -- eleven courses. It was a magnificent dinner starting with raw fish, vegetables, and soup. Along about the eighth course we were served with a very heavy tempura as batter-fried shrimp, vegetables, potatoes, and fish. I was hoping things would be over, but in came the next course, which featured the hibachi. Everybody had steak and various vegetables. Somehow I managed to get through that course, but skipped the next two because it is probably thought bad luck to have an even number of courses. We were all presented with small hibachis. We finished dinner at about quarter of nine which is not necessarily typical, because for some reason, even though food is very lovely and things are in small servings, the Japanese eat very fast. While I am here I am trying to eat slower than normal, otherwise we would finish the meal in probably an hour. I do enjoy the food and the time spent very sociably.

<u>July</u> <u>24</u>th - Talks at Kyoto, Osaka, and Kyoto Sanyo University

I gave lectures at Kyoto and Osaka Universities and had dinner with people from Kyoto Sanyo University. (The tape is apparently lost in the Sydney secretarial pools).

July 25th - NEC

We visited NEC in Kyushu, which is on the island of Okinawa, a place where NEC makes almost 80% of its semiconductors. It is there because of the labor force and because of the supply of water. They make about 5 million pieces a month, 60 million per year (at 80%, this would give the total NEC IC's at 75 million per year). If each is selling for maybe $3.00, because they have a large amount of LSI, NEC's total sales would be at about a quarter billion dollars (which is what we think they are).

Mr. Iwao, Chief Engineer, took us around. He is actually the operator of the plant and is interested in high volume manufacturing. The brochure I took back has all of this annotated. They started there in September 1969, with only 400 million yen capital, or at today's prices, about $2,000,000. They employ about 1,750 people there -- 1,250 are direct laborers. They operate two shifts -- 5:30 AM to 1:45 PM, and then the second up to 10:30.

Their history there is one of starting out to do semiconductors for NEC's NTT telephone business, so they have a fundamental interest in quality. Subsequently when they got into the NMOS PMOS calculator, cash register, and computer business, they changed the emphasis to volume, which they have now. In doing this, they never left their concern for quality.

All products are burned in. The NTT products are sometimes burned in for as much as a week, and some products are only burned in half a day. Eight percent of NEC's total sales go outside. It is building as much as 15 to 20% of these sales for export. Probably a larger amount is to the United States, although we don't know. They are making all PMOS 4 calculators and cash registers, and NMOS computer memories, including the 4K plus 16K RAM. They are doing a lot of CMOS for watches, calculators and radio equipment. In addition this NEC plant makes the BIPOLAR CML logic for the high speed computers based on the Honeywell CML logic.

We initially had concern whether we could visit there and they reluctantly agreed to let us. The person who took us around was not that keen on having us, but was certainly cordial after we arrived. They try to keep their labor force flat. They have taken all of their plating and marking equipment for the two in-line packs to local shops outside. They start with silicon wafers, go through test, then ship. They have a very nice process chart. In fact, virtually like every Japanese company, we were handed a brochure that clearly described their whole process. In this case there are 15 steps. The 16th is shipment, which is by air in specialized containers. From a semiconductor standpoint, they used the 4" wafer on one line in a large two-story building (240 x 40 meters) -- they have about 4 lines and at the one end is the new 4 inch line.

In a small building they have the bipolar line which is low volume for all of the processing areas. The second floor is the pellitization through testing processes, exlcuding the part that is done outside.

Mr. Iwao wanted to know how this compared to TI and to INTEL. I could not tell him (probably because I don't understand semiconductors that well). Frankly I was quite impressed simply because of the incredible cleanliness and the well designed layout they have.

Again, the pressure of the Japanese custom of taking shoes off (leaving them at the door) to enter a building is really helpful to a semiconductor processor, because it means that you don't carry a lot of dirt around. All of the areas that were part of the factory were marked in terms of class. The workers and the back of the equipment was class F and then everything else was in class C. They had class B and class A rooms. They end up with a failure rate of 1% at burn in, so that they have a very high overall volume rate at customer acceptance.

They own mask making equipment in Tokyo, which is an EB machine. All of the work done by the design and manufacturing production equipment design is done in Tokyo.

NEC has processed SOS wafers, but is not interested in it because of the low volume, low yield, high cost nature of it. They are also looking at and made (it is not clear how) JIL parts apparently for the NTT. (NTT wants it.) Unlike many of the other semiconductor companies, especially Sony, NEC believes that it must bring all of the manufacturing equipment along. It has formed a wholly owned subsidiary tester company called ANDO. Of course, being very patriotic to Japan and themselves, they use the NEC M4 minicomputer, which is a conversion of the Varian machines. The manufacturing complaint, about the difficulty of maintenance of the tester, is traditional with every manufacturing group I have heard.

The 4 inch line is one area that we weren't allowed to see. In fact, he studiously avoided us looking at their wafer lines although there were windows into all of the other lines. In the case of the new 4NC wafer line, there were no windows and no hint as to what was inside. He did say, however, they use automatic aligners, and that through the process up to diffusion, everything was handled as a continuous process. I would guess they have as highly an automated function as TI's we saw several years ago. Diffusion, and some of the other processes, are batch in production. He longs to have the whole thing be a continuous process.

I was incredibly impressed with the fact that there were graphs of everything everywhere and I suspect even some graphs on semi-log paper somewhere. The graphs were used to plot everything against everything else, so that they really knew what their process was doing and the output. In the case of the secret process I asked about, he said that it had considerable computer control and the main reason for doing this was to know what the various steps of the process were doing and what the productivity was. As a manager, since he is not given that much control over his own destiny, he is very concerned about productivity. He does move some of the simple parts outside, but also is concerned with automating as much as possible, and keeping the cost of all the labor force flat while maintaining the various steep increases in volume. He did not say when the 65K/RAM would be built but they are being produced now in Tokyo.

Susan Wood
Better Business Bureau, Inc.
150 Tremont Street
Boston, MA 02111

Dear Susan:

In answer to your letter of April 15, the $721.93 was the cost to repair the body damage when the car was broken into and to replace the radio. Pass & Weiss was unwilling to bear this expense. Since they agreed to take responsibility for the car overnight and did not put the car in a protected lot, I feel they must pay the $721.93.

Please help me get the $721.93 from them because it is their fault for not taking proper care of it, while at the same time agreeing to hold it.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

cc: Mr. Pass, Pass & Weiss
F. W. Doerr

IDEALOGY
0. Overall, the ONLY way to work is under the pressure of conflict versus teamwork. DEC is simply not a fun place to work as a result. Virtually ALL focus is on INTERNAL, NOT EXTERNAL competition.

1. Short term versus Quality. Invariably responding to revenue problems with poor products cause more poor products wchich get there too late to solve the revenue problems, and get us (especially software) that has to be maintained forever. (eg. various collage of crappy, incompatible, unextendable, commercial products. They're too late when they get there to compete with the ibm and japanese pc world. They could either/both be on vax and rainbow... but not our past. Sell what we got.

2. Quality overall! VERSUS QUANTITY!
The issue is knowing when to stop the software and finally the hardware development and finally the marketing on a product family. The 8, 11 and Pro all are clearly dead from software viewpoint, but should be developed carefully in hardware. With the operation of the software on the Rainbow for WPS, the 8 hardware can be put to bed, if we go balls out with the software! Can we decide?

A careful review would have let us NOT sell the PRO, and probably we would have stopped it before announcement. (Now, we have to sell it and get out of it.)

We do n (=3) poor products versus 1 good one ala IBM. Nearly all the projects violate my heuristics based on history and common sense. We now have 3 barefoot, children to feed and not enough food for them. Only one is worth feeding anyway.

3. On how to compete and how to have impact. They go together. For example, our semiconductor design performance doesn't face a competitive market. I don't believe they'll ever make it without this external focus. IF not, then WHY BOTHER TO HAVE A SEMICONDUCTOR ENGINEERING GROUP? The same is true with disks, I believe. Software too. Namely, we should do NO commercial applications because it can be bought and will be better. Clearly the 11 is irrelevant in terms of being either adequate for modern software (especially business) versus the 8086 etc. family.

Impact (and profit) usually comes with market share. I see no way to do anything but to milk VAX and 11 out of the market, but we shouldn't be investing much there if we're going to do buyout machines (68K and 286) and compete with the workstations folks and PC folks.

4. Importance of Toem/coem reseller channels. These are essential as IBM learned from us and have to be nurtured. Why we ever thought otherwise in light of the data is inexcusable!

STYLES

0. We aren't able to focus on critical problems because the problems are defined, but instead everyone is building defenses. For example, the PRO defense against Ken's attack mask the critical issues. We did not look into this, and as a result, we still have no product. Legions are devoted solely to interpretation and defense management.

1. Focus is always on trying to build multiple, internally competitive teams. This requires cunning, devisiveness, and

is ultimately fairly destructive. For the extreme, read Soul of a New Machine for an account of our trainees. Yes, we have to have competitive projects. We needn't market them all. We needn't allocate the same. We need to be explicit and open.

2. Listening. The 11 is insignificant now, it could/should have occupied the space that the 8086 now occupies. History is about to repeat for VAX and MicroVAX. I happen to believe this is going to go down in the annals as another mismanagement. We're stuck with a flat growth, when it should be exponential and we should be setting the standards for the next generation of computing.

3. Mentoring/teaching is non-existent. Demise is almost certain depending on the inverse of the distance. The emphasis is never on how much a group or manager has learned, but on how poor they are, and how to construct something that will operate around them. Usually, this is another group. Instead of fixing (teaching) a group or manager, their IQ is measured, they're declared dumb. A new group is espablished that usually just makes another set of mistakes. The new commercial group and computer may be a case in point. The things that need doing have NEVER been written down per se so we can see which ones should be fixed across ALL groups. My general impression is that the commercial computer is a great idea: namely it's just a good computer that we ALL want and should have. Why not train the groups who are supposed to do their jobs? By having twice as many computers, we have a lot fewer good ones. We simply don't have the engineering resources to do twice the products at half the quality.

4. General problem solving is devisive, not mentoring and teaching. On simple problems, like having a different monitor, these should be done in exactly the same way as present. Make a breadboard and show it's the right way. On breadboard is more powerful than a 1000 people or 1000 pages of business plan, proposals, etc.

On problems like the low end interconnect which are beyond a few breadboards the entire organization should be off solving the problem as rapidly as possible. Note that there's no way to plug in the new terminals to the computers because this was worked only with the terminals people. This is simple, management etiquette. For example, collect ALL the memos and data on the subject, formulate the issues as well as possible, get the RESPONSIBLE managers together (in this one, me too) and get the problem(s) defined before we start building very much other than random breadboards. Assign the work and get all the good people behind it rather than protecting themselves and trying to prove it wrong.

BOTH Scorpio/BI and the low end swithing should be done this way. They are too important to simply operate in a teasing mode. This is devisive in Scorpio, and will cause us to do something done if TWO schemes are needed... and I expect they are.

PERSONAL
0. Feel the issue is personal competition, and showing my errors rather than help. Eg. Ethernet.

1. HAD NO SUPPORT OR NECESSARY REVIEW OF THE PRODUCT STRATEGY. Admittedly this was beyond the scope of oprational times, but it should be the most important thing to review and help on.

The strategy (DEC E Environment) can virtually not be mismanaged now, unless enough critical resources leave. Clusters, NI (and Omninet gateways I hope), the Seahorses and Workstations are virtually there. I don't think they could have been if Ken had been involved the way he is in the low end.

The Servers strategy is outlined and can be done. The PC Workstations are all set. We do have the talent, and the only issue is to apply it.

2. Role model has been negative. Everytime I use the style, I lose. The large number of losses we've incurred at the Operations Committee of people who should have been good for something, versus good for nothing is really troublesome.

3. I FEEL tolerated and expendable, NOT critical except to be

useful in the short run stock price and to organize a current critical project. Based on the history of others, I'm concerned about getting into a mode where I'm part of the tortured people who should have been fired (out of kindness) and ultimately leave in a coffin attached to a gold colored, plastic parachute.

4. The last change to diminish my role has meant that I don't have access to make the critical changes. The falling between the cracks of the PRO occurred because Avram thought he was safe from MY review, and Ken never did the review or took the responsiblity that I thought he was taking with Avram. We wouldn't have done the bus, and my plan to get the software on the Qbus (note the original Qbus controller for the CRT) wasn't followed as we got swept up in new boxes and connectors. This allowed Avram to build the largest empire.

There are critical changes required in Commercial (wasn't part of the recent product woods review, nor did I give an opinion). My opinion now, after meeting with the groups is pretty bad. Julie, as a marketing folk in engineer's clothing will put ALL possible half-assed products out. Furthermore, we should be marketing the DDP stuff!

5. Engineering badly needs leadership beyond the box level. I simply don't feel good about my support to get things done and what's expected of me.

6. When the public denigtration is made: "When Gordon's good he's very, very good and ... " it gives no basis, to work or lead from. In general, I have been rendered pretty impotent.

POWER PARADOX

The administrative management has been off loaded with Jack, but with it the technical leadership goes too because the critical information needed in leading the products comes with the administration and review of projects. Administration means following up to see that the critical projects are going. The technical folks STILL hold me responsible for leadership of products, and I'm having a difficult time in making this happen because Jack and I haven't yet been able to work out a formula to share the work.

BOTTOM LINE

I feel that Ken wants to lead engineering, have Jack manage the details, and me help when I can be useful or align with the instantaneous direction. I too have a very strong vision of what the products should be building based on the future of the industry and what the "E" should look and feel like. Mostly, I'm having trouble getting this done because Jack has two bosses.

I don't have the physical constitution, to argue (fight) on the basis of power versus knowledge, nor have Ken and I figured out a way to share the leadership. Therefore, Flight is the only way out unless I can tolerate the above leadership and seeing the product vision be eroded and destroyed.

IMPRESSIONS ON HOW WE AND THE JAPANESE ARE CONVERTING U.S. INDUSTRY INTO DISTRIBUTORS

Gordon Bell, Vice President of Engineering
Digital Equipment Corporation, Maynard, Mass.; and
Professor of Computer Science and Electrical Engineering (on leave)
Carnegie-Mellon University; Pittsburgh, Pa.

The island of Japan, with few natural resources and over 100 million people, virtually dominates world production of manufactured goods, including the components and processes to make these goods. Every Japanese knows that exports are vital to survival. Also ingrained is the understanding that savings and living within one's own means support the ability to manufacture and export. In contrast, the notion of balanced budgets, savings and manufacturing have gradually disappeared from U. S. culture.

For example, the United States still holds a dominant position in the production of computers and semiconductors, but the Japanese plan to dominate these industries. Unwittingly, U.S. industry, government and society continue to aid the Japanese. Forty odd reasons are given to support this conjecture, each one providing a lesson.

The Japanese have progressed from domination of low-technology simple commodities to complex manufactured goods. The progression has been from textiles, steel, radios, sewing machines, typewriters, quality cameras/optics, watches, small cars, television sets, tape recorders, video tape recorders, calculators and on to state-of-the-art semiconductors and computers. Their current position in semiconductors and semiconductor-making equipment indicates they are well on their plan to dominate this manufacturing as a base for the continued and future market domination of electronics and computers. High-technology industry is increasingly being concentrated in Japan while the Japanese-owned low skill textile and television factories are being located in the U.S.

Dataquest describes how the Japanese go about systematically to dominate a market. Appendix 1 describes the four, detailed phases: initial development of a domestic industry, establishment of an export base, significant market penetration in foreign markets and final market exploitation.

BASIC STRATEGY, AND TACTICS FOR DOMINATION

Japanese industry and government operate as a team reinforcing strategy and tactics with appropriate levels of competition. Unlike many companies and countries that have tried and failed, they successfully planned and built a mainframe computer industry.

The Ministry of International Trade and Industry (MITI), with autocratic power, helps to amalgamate strategies within industry groups creating an organization commonly referred to as "Japan Inc." Because there is no direct control, I prefer not to use the term "Japan Inc." but to name the phenomena "The Japan Club" since there's a structure for the essential competition at the market level. For example, MITI identified and encouraged early importing of minicomputers, including those from Digital Equipment Corporation, as a competitive "straw horse" to build their own industry. One of DEC's interactive data base systems, MUMPS, was sold in Japan for end-user applications. On seeing several lost sales, MITI funded the development of MUMPS on a Japanese minicomputer. In mid 1978, a Japanese researcher asked me, through an academic channel, for the internal architecture of MUMPS in order to study its structure from a so-called computer science viewpoint. We expect to catch MUMPS from Japan soon.

The U.S. has no equivalent of MITI to protect major corporations as national resources. In contrast, U.S. corporations are looked on as adversaries to the national interest. IBM, already under attack from Japanese competition, is also under the gun from most U.S. government departments. Together they seem intent on destroying IBM, leaving it and others as distributors for Japanese products.

The strategy of MITI and the Japanese companies to win dominance of the computer industry is clearly evidenced, but it is not understood by U.S. government and industry. In keeping with the priority, MITI is both very strong and attracts competent people. The Japanese companies, while maintaining competition in limited domains, both plan and talk with one another. For example, Fujitsu and Hitachi have developed IBM plug-compatible machines. Coupling individual, competing companies for technological acculturation in this fashion is an important management technique to assimilate technology quickly.

The U.S. Department of Commerce and the U.S. Labor Department, in contrast to MITI, have neither a plan nor the personnel to help maintain U.S. dominance in high-technology fields important to the future of the country's economy and security. Furthermore, these two adversary departments are adversary to U.S. business. Trade trips to Japan by Secretary Kreps only emphasize our lack of understanding of the Japanese capability to use trade to introduce technology into their society. Our trade deficits cannot be turned around by hand-shaking missions, but demand a strategic and tactical plan based on understanding. Our political system is devoid of planning and accountability of government departments; even if the Secretary of Commerce could plan, her short tenure is inadequate to solve this problem. Once a new administration appears, any policies, plans and commitments are reset to zero!

Japanese tactics focus on the centrality of work and loyality to a company. A company screens each new employee carefully because when it hires an individual it takes on a lifetime commitment. The security promotes risk-taking, a phenomena generally unknown in large U.S. corporations. The team spirit is engendered as the various members learn how to get along with each other.

Quality control is in the hands of the workers. Although data is kept centrally, the analysis, corrective action and responsibility for manufacturing and quality rests with the employees concerned. Quality control is generally centralized and the organization of work often does not lead to self-esteem in the U.S. organization. Such participative management provides a key to the devotion to the workplace and sense of value achieved through work. The incompetent workers become the wards of the organization rather than wards of the state. Pride, family tradition, and because everyone is working, nonwork is socially unacceptable, embedding the importance of work into the fabric of society. A similar effect is observed in the U.S. during periods of high unemployment. At this time non-work is approved since others are unemployed.

In the U.S., the freedom of the individual has superseded work as a goal. The employee mobility is high and as a result companies screen very little as the short tenure is assumed. One recent semiconductor company ad claimed that no interviews were required at all. Turn-over and unemployment here are high with levels of consumption also rising so that some Japanese observers have concluded that the Japanese live to work and the Americans need to work to live. The measurable results are simply that the relative per capita productivity in manufacturing industries of Japan is now almost twice that of the U.S! Also, the sales per employee of a Japanese electronics corporation is about $100K, versus $45K for the U.S.

The Japanese government has been able to nurture both large and small companies while the U.S. government agencies seem to alienate the large and aren't effective at supporting the small ones. Much work in Japan is done in small subassembly operations. Competitive small shops keep the cost down by removing it from the large, hard to manage hierarchical organizations.

USING ACCULTURATED DESIGN AS THE BASIS TO DOMINATE

For centuries Japan has acculturated customs, but mostly it adopts and adapts technology. In the 16th century, for example they began manufacturing gunpowder a scant 18 months after the Portuguese brought it to Japan. Shortly thereafter they were banned. Any idea or product has always been fair game for adoption and improvement. Product and process evolution are merged in a long term view of achieving market domination. They orient the processes competitively considering quality, volume for growth, and flexibility to allow for the fast turn-around needed to maintain full-production capacity in a shifting market.

All the Japanese computer manufactuers have acquired their technology within the past ten years by dealing with U.S. manufacturers either as a joint venture or under license, including: Fujitsu (Amdahl/Siemens) and Hitachi (RCA); NEC (Honeywell, GE, Varian) and Toshiba (Honeywell, GE, Interdata); Mitsubishi (Xerox) and Oki (with Univac joint venture); Yokogawa (HP); and Nippon Minicomputer (DG). In all cases, the Japanese have improved the technology in terms of perceived quality, performance and manufacturability.

The agreement between Fujitsu and Amdahl Corporation, though still at an early stage, provides a good example of the classic Japanese computer acculturation process. In the late 1960's, Gene Amdahl, then head of IBM's San Jose Advanced System Development Laboratory, explored the basic technology for high-performance IBM computers. When he failed to interest IBM in building high performance machines, he formed Amdahl Corporation to develop the technology. When he needed more capital Fujitsu bought an interest and acquired the manufacturing rights to, and became the manufacturer for the Amdahl line. Fujitsu was also able to use the same technology to design and manufacture computers for the Japanese market. In only one computer generation, at the beginning of 1978, both Amdahl and Fujitsu announced their latest computers based on the Fujitsu-Amdahl circuits and packaging. Now, Fujitsu appears to have a machine with higher performance and reliability (the M200) than either Amdahl or IBM have so far announced. Fujitsu has produced a machine based on multiprocessing which provides users with new capabilities; furthermore they can buy more processors rather than trade-in when increased computation is needed.

In addition, Japanese computer manufacturers have a complete line of peripherals and test and manufacturing equipment that is based on counter-parts invented in the U.S. The designs range from "reverse engineered", to look-alike copies, to radically improved products based on Japanese inventions. With "reverse engineering" a product is dissected with micrometers, special gauges, etc. and made compatible in nearly every respect. The Japanese make only products for export to the U.S. market that do not violate patents. Tektronix look-alike scopes and reverse engineered IBM disks are common. In 15 months, Nippon Peripherals Limited produced a disk that was mechanically identical to the IBM 3340. From comparing the two drives, one might conclude that they were made from the same drawings.

PRODUCT DESIGN BASED ON NEED, QUALITY AND THE LONG-TERM

Traditional top-down marketing is characterized by expensive, thick market surveys that extrapolate history in a self-perpetuating fashion. Here, the goal is to fill various revenue gaps that develop. Using a market survey approach the U.S. continues to build heavy, gas-consuming cars, because the marketing managers can only think in terms of what has sold in the past. Freed from this approach, the Japanese have been able to look at the real needs, and they have appropriately adapted existing ideas. High-level corporate marketing does not design the products; engineers design according to needs using a bottom-up approach and based on technology.

Japanese companies, with long-term goals and commitments, similarly are not forced to depend on a short-term marketing approach. NEC, Fujitsu and Hitachi, unlike Xerox, GE, Westinghouse, and RCA, have all persisted with computer manufacturing and after years of investment have established successful products. Their long-range thinking from the outset allowed them to invest in long lasting quality.

Japanese companies focus on highly sophisticated quality products rather than ultra-high quantity, low-quality throw-away merchandise. The differences are characterized by comparing Seiko versus Timex watches and comparing Minolta or Nikon versus Kodak or Polaroid cameras. Japanese styling is often technical and gadget oriented, typified by multi-knob hi-fi sets and complex watches. It may be impossible for them to design a product like the Polaroid One-Step Camera because of the differences in picture quality. The emphasis is on an educated consumer who will value his purchase.

Concern for quality and long-term values leads the Japanese to build products that have a long lifecycle. Even their auto industry constrained by Detroit's yearly new model concept is now getting very high ratings for durability and serviceability. Accounting models lead to emphasizing production of long lived versus throw-away goods.

PRODUCTS RESULT FROM UNDERSTANDING AND MANAGING A COMPLETE PROCESS

The successful production of competitive performance products in high technology industries depends on understanding a complete process that includes basic research, going through applied research and advanced development, to product development. In addition, a parallel and equally complex process is required to design and build the process that manufactures such products. After a new product is introduced, it may then be necessary to modify and enhance it to adapt it to the real or changing market, and finally to eliminate it when it is no longer effective.

The Japanese need invest little in basic and applied research because they are effectively coupling the U.S. laboratories into their advanced development. In contrast, aside from the direct hiring of students and researchers, there is very little flow of ideas from our public laboratories into our own industry. As Carver Mead of Cal Tech points out, "I like the Japanese. They listen. Also unlike American industry, they're willing to build from our ideas." The university laboratories at Stanford, MIT, Carnegie-Mellon, the University of Illinois, receiving significant ($20-30M/year) Advanced Research Projects Agency (ARPA) funding for Computer Science, have post-doctoral Japanese visitors. The university and industrial laboratories of Japan are headed and staffed by researchers who've spent their research years in key American laboratories (e.g., MIT Multics). In contrast there is no Japanese training of U.S. engineers and scientists; furthermore, the flow of ideas is minimal.

Most recently, Japan has offered to spend one billion dollars in the U.S. for research, predominately for energy conversion. By accepting these funds, the Japanese can be even more effectively coupled to U.S. research and can "learn" to research, just as they've learned manufacturing, design and advanced development. The scientific community is anxious for more funds, independent of where they come from or what the consequences are. Of the large companies with research laboratories, the Japanese emphasis is on advanced development where the output is a testable prototype, often of a potential product. In contrast, U.S. corporate laboratories hide behind the veil of science where the output is vague and untestable. The quality of these laboratories is high versus many comparable large U.S. companies where research is to ease the corporate conscience instead of providing new development. Although such corporate research laboratories (e.g., GE, Motorola, RCA, Westinghouse and Zenith) were significant in the early development of television, the U.S. television industry has declined with few recent local advances.

MITI funds and manages other laboratories and corporations to carry out research that is oriented toward getting experience that will eventually produce products. Funding specific, as opposed to having a captive laboratory, not only provides a system of checks and balances, but also provides an incentive. Many of our government laboratories were initially set up for specific missions, and although the missions were completed, the laboratories continue to exist. Since they no longer have a real goal, or mission, negligible new work is done. The dust is blown off the equipment for visitors and the same demonstration is run year after year. A buyer-seller relationship, in which an independent organization, such as a university, manages the lab and takes responsibility for results can minimize this "dusty lab" syndrome. Moreover, funding for specific projects can bring together diverse groups and promote technical interchange.

The Japanese orientation is toward engineering for trade rather than being strongly science-based. Since the rest of the world provides research, why should they bother? This comes about because of their need to manufacture products and their total dependence on the export of manufactured goods. Since our basic federal research funding for computing comes through the NSF, ARPA, and the armed services, the emphasis is on science and research. Their funding comes through MITI and from various corporations, and hence the orientation is on international trade.

The trade drive causes a strong emphasis on manufacturing, not just product design. In addition to the product engineering process there is a comparable and equally important process responsible for the development and operation of manufacturing. This discipline has been nearly eliminated from U.S. universities as it has moved from the engineering to the management school. There is a decided emphasis on manufacturing processes in Japan as people are rotated among the various processes and disciplines, making it equally desirable to be in all functions.

Everyone associated with science, engineering and manufacturing understands basic learning and demand curves and they are quantity (and growth) oriented, subject to the quality-first constraint. Knowledge of the learning curves (i.e., increases in the combined number of units produced cause a reduction in manufacturing cost) is everywhere. Fred Bucy comments on Japanese competition in TI's 1978 Annual Report: "...the big difference is that TI is the first major non-Japanese company they have run into that understands and uses the learning curve". The Japanese are willing to sell outside Japan at a lower exported price (dump) and lose money often by selling below cost for the short term (see also Appendix 1) in order to buy market share. This practice is illegal for both U.S. and Japanese companies. Although the Japanese pretend that their products are not competitive because the yen is so strong, they are consciously ignoring our dependency as a distributor now in many industries.

As a corollary to learning curves and market domination, it's necessary and they are willing to give up profit for growth. For example, RCA is now a rug maker (or distributor), car rentor, publisher, television component distributor; it hardly resembles the electronics company that pioneered television. It's difficult to put the whole blame on RCA management because they are constrained by the economic and business temperament of the U.S. environment. Whereas there is extreme pressure on our business for profit and return on investment, these factors are less important to the Japanese companies. Sony is only moderately profitable, Fujitsu does relatively poorly financially and NEC or Hitachi computer divisions may even lose money. None of these companies would compete for capital in the U.S. stock market where return-on-investment is the key criterion. Japanese companies are buying market share and this is clearly more acceptable to the U.S. investors than for GE, Xerox and RCA who left the computer business. They can buy the business through "dumping" and why not if there is long term reward?

JAPANESE DOMINATION IS PREDICATED ON OUR GREED AND VALUES`

As we watched the first few industries of textiles and steel become dominated by the Japanese, we unsympathetically stated that these industries were tired, the workforce was lazy, and the management was incompetent, unimaginative and unaggressive about getting capital. Certainly, there is no fondness for the automotive and petroleum industries and it seems fitting to import our cars as a lesson to our own U.S.

manufacturers. Now, however, the domination of <u>all</u> manufacturing is becoming so clear that we must look deeper at the causes.

The domination can only happen with consenting buyers in the U.S. It is these buyers, called distributors, including tired, old, former manufacturers that are to blame, not the Japanese. Our values appear to be too short term and too basic. We really must understand that the following, simple, long-term consequence is <u>complete</u> economic domination.

<u>The (Unstable) Three Island System - Or How and Why We Will Be Dominated</u>

Since it's not clear that continued consumption, with no corresponding export means, let's look at what is the ultimate, singularly stable point simply. A system of three inhabited islands, all of which have adequate food, water, shelter and land, points out the dilemma:

#1.supplies energy; consumes negligible manufactured goods;

#2. supplies manufactured goods (is supplied raw materials from several small islands it owns, and from discarded goods of island 3); and consumes energy;

#3.consumes energy and manufactured goods; supplies information.

Given that information is generally treated as a waste commodity of zero value, there is no stable state for the system <u>until</u> islands 1 and 2 absorb island 3. Or conversely using any monetary system, island 3's paper or tokens will always be worthless. That is, islands 1 and 2 currency values will be out of balance with island 3, until 1 and 2 "own" island 3.

Through greed and short-term values, <u>the Japanese and</u> their counterpart <u>American</u> <u>buyers have systematically transformed American business from inventor-manufacturer-distributor to</u> simply <u>distributorships</u>. This transformation is in complete keeping with the goals of American business as reported in business magazines and the teachings of modern business schools. The goal and reward of American industry are clear: return on investment and profit. Secondary measures, such as market share, are occasionally used. Only a few corporations consider no lay-offs and full-employment to be important; as such, a clear, adversely separation has formed between management and labor. Following only the profit-based goals, subject to no other constraints, leads U.S. industry directly to distributorships for Japanese products. This strategy requires no investment, no planning, and no risk. All a company has to do to be successful is to buy the right product from Japan and then resell it.

This merely confirms the classic definition of a capitalist as someone who'll make and sell the rope to hang himself. However, in this case the capitalist is reselling someone else's rope because he is too lazy to design and make his own rope.

The essence of distributorships is completely counter to the principles that made American industry initially great. The new principle is simply that with no work and no capital, anyone (everyone) can do nothing and succeed. All that's important is to find a supplier who'll put up the capital, design, and manufacture products that we can distribute. In computing, the trend has also started: Itel is buying Japanese-manufactured IBM 370-compatible computers. Thus we expect Itel to have good financial metrics and be a good investment. It will also cause a high net flow of dollars from the U.S. as it becomes more successful.

American business, of course, is only slightly at fault because the U.S. non-business communities (politicians in government, consumers, and academics) have introduced and strongly support heavy borrowing, beyond income. These thwart an environment conducive to manufacturing. Both the per capita rate and amount of savings for both individuals and corporations in Japan is twice that of their U. S. counterparts! For example, the retirement system in Japan is actuarially sound. Of course, the Japanese government operates a balanced budget and taxation supports savings. Furthermore, as a society, they understand themselves simply as an island that must have a favorable balance of trade.

There's no way a manufacturer can re-enter a lost business once he has becomes a distributor. The spirit, and capability to catch-up and manufacture are gone. Society and the investment structure are all aimed at continuing a status quo. Radio, television, hi-fi, and video recorder products are all built using key U.S. developed ideas and patents, yet are no longer built by U.S. manufacturers. Again, we can blame the Japanese, but someone in the distributors had to choose to buy the products rather than design and build competitive products. In the case of Motorola, the television division was purchased by Matsushita in 1974 and included both manufacturing and distribution. By 1976, the U.S. plant was reduced by 2/3, but the distribution network was left intact.

We (U.S.) have a higher regard for business training versus engineering and technical training. In the U.S. many engineers regard the MBA degree as necessary for a career in industry. The Japanese do not yet have many business schools; therefore, instead of MBAs, engineering master's degrees are sought. This makes the Japanese better engineers for the same educational investment. Also, the management of manufacturing organizations are the better equipped to understand technology and products.

By having more people just concerned with distribution, we are becoming a nation of shopkeepers. The emphasis is simply to keep stores open longer and to find new ways to distribute Japanese manufactured goods. Not only does this further stimulate consumption, but it takes people from the primary production work force and makes us merely an island of consumers with no material means of support.

THE JAPANESE HAVE PRIORITIES AND SUPPORT FOR TRADE

At a government/society level the Japanese appear to have their act together. The Japanese seem to have a clear, crisp ranking of goals and priorities. For starters, the Japanese know their goals and priorities, whereas nearly all our goals that begin simple become entangled as special interest groups enter the fray. Some issues that compete for priority include: human rights versus equal rights; full employment versus inflation and balance of payments; environment versus region versus country; capital versus labor; and consumer protection versus business protection.

Because of the need to manufacture and export, <u>the Japanese educational system supports engineering and technology</u>, <u>while we support lawyers and</u> other <u>semantic accountants</u>. There are fewer lawyers per person by a factor of two than in the U.S. The Japanese emphasis (priority) is on physical output. The increasingly large number of U.S. lawyers: consumes productive and creative output of workers; creates a self-perpetuating, non-productive body; detracts from persons who would otherwise enter productive occupations; and tends to build an even larger governing body. With an increased emphasis on legal training, our output is measured by intergroup contracts, policies, laws, rules, regulations and other forms of bickering among semantic accountants.

As a simple explanation, <u>more money is available in Japan for investment to enable them to manufacture (for their island) because of lower taxes</u>. This clearly affects their ability to invest in industry.

<u>Their government spending for military is nearly nonexistent</u>. Although there are prototypes from our military spending, they seem small and are by-products. In the case of research for semiconductors and computers the benefit though impressive might have been as great, given a different goal (e.g., energy self-sufficiency).

<u>The Japanese don't have the federal research over-expenditures, epitomized by NASA and NIH</u>. In the event of results, the Japanese will capitalize on our research for their manufacture and export. The NASA goals, for example, appear to be vague now that they've stopped providing the world with exciting space shots and television pictures from the moon, and the immediate needs for this research is unclear to most of us.

National health research seems equally vague. This research appears to increase health care costs, through a number of secondary effects. By contrast the Japanese spend one-half of what we do per capita for health care and medical research. They can capitalize on our research, but since they have a longer lifespan, it is not clear what we gain with the extra expenditures. In effect, Japan's lack of spending in medicine goes to investments which result in full, lifetime employment which is probably the best solution to personal health.

<u>The Japanese believe computers are fundamental for the long term</u> and they are prepared to invest in them and wait for return. Non only are machines used in all products they build for export, but they save labor too. Labor is both precious and expensive in Japan: there are only about one hundred

million people and two percent unemployment. They're considering raising retirement from 60 to 65 to get the extra productivity. They must have computers to raise productivity; computers are vital to their continued domination of manufacturing. As a separate research area, robots are an important component of manufacturing domination. While much of the pioneering work was done in the U.S., the continued work to make robotics practical takes place in Japan. By contrast, in Australia where there is increasing unemployment, there's a belief that computers must be eliminated. Australia buys nearly all Japanese products, produces less and less, and the small Australian automotive industry of GM- and Ford-based large cars is rapidly declining under the stress of small, mass-produced Japanese cars.

THE JAPANESE SOLUTION TO OUR BALANCE OF PAYMENTS PROBLEM: SELL (IN JAPAN)

Can we solve our balance of payments problem by selling to Japan? Selling to Japan is the answer our government and industry want and willingly, but foolishly, look to. However, the Japanese rhetoric is only for our gullible government and academic communities and the naive business people. Furthermore the trade missions are only stocked with powerless, non-responsible, short-lived politicians whose main purposes include visiting Japan and being able to say something to the folks back home. For example, when state trade envoys visit Japan with the expectation of selling high technology goods, they succeed in selling only a few prototypes. The real sales will come in 5-10 years when these products are resold in volume to the U.S!

There has not been, nor will there be any serious trading of American products with Japan. The distributor/trading network entirely thwarts such an effort! The results are clear and we must face them.

<u>Japan is a closed society and market</u>. As the most powerful, homogeneous culture in the world it has a long history of being closed. There is no counter-evidence that an open market exists. The <u>language is a code to</u> further <u>segment</u>. Although business people do learn the language in crash courses, the language is relatively useless without the societal understanding. We only teach Japanese minimally on the West Coast of the U.S. On the other hand the technically trained Japanese have several years of English language training.

Even though there are major cultural differences among Japan and other far eastern countries (e.g., China, Taiwan, Korea) there is closer proximity among them than with western countries. This closeness is especially advantageous in finding additional sources of especially low cost labor.

The <u>tariffs support the establishment of any industries</u> they target. Although the semiconductor and computer import duties have been "advertised" to be on a parity with the U.S. they aren't there yet, but this matters little since their industry is strong enough to withstand imports. Still prices of U.S. produced computing machines are cheaper. In semiconductors the rationale for high tariffs has been protection of infant industries, yet outside of Texas Instruments and Western Electric, Japanese companies have been manufacturing longer than all other U. S. corporations. As evidenced in other industries, this is a come-on to further strengthen the Japanese manufacturers for export competition by having them compete in a token way with the few imports and thereby gain ideas to sharpen their exports.

For example, in the early seventies the Japanese encouraged U.S. minicomputer imports, although there were high tariffs. These occurred and now there is a significant Japanese minicomputer industry. For example, the basic structure of Fujitsu's minicomputer is quite similar to the DEC PDP-11.

Because of the closed nature of society and the emphasis on personal relationships, it is difficult, perhaps impossible to have significant Japanese sales. There are no significant examples to the contrary. "Doing business" together appears to be done over a long time period and is almost ritualistic. This means that it's essentially impossible to have an effective international company as we know it. A foreign manager is clearly tabu and sales are limited to one-shot deals with trading companies. There is no trading except as joint ventures. A foreign-owned company with controlling equity is so rare that it is an effective unwritten law.

JAPANESE HIGH LABOR COST, LIMITED POPULATION, FULL EMPLOYMENT AND FEW NATURAL RESOURCES, CREATES IMPORTANT BY-PRODUCTS TO FURTHER HELP TRADE

Japanese transportation and meetings run on time and at full capacity. Roughly twice as much as in the U.S. can be accomplished per day in Japan, especially those requiring meetings. The cordial, formal protocols help meetings proceed rapidly.

There's measurement of and pressure for efficiency. That is, the work-out/work-in ratio is high. For example, taxis have a driver-operated back door opener so that passengers can load/unload faster. The notion of efficiency seems to be taught to all and factories measure, graph and display key results. Concepts like fuel efficiency versus speed, weight and pollution are difficult concepts for Americans to understand, yet the Japanese "feel" them.

Given a notion of efficiency, there's real concern for saving physical resources too. At the computation center, printing isn't automatic; it's queued and must be requested separately. Lights, always florescent for high efficiency, are off when not in use. Of course small cars, taxis, a good train/subway are other indicators. The cars have mandatory bells that ring when the car is going over 100 Kmh! None of these artifacts for efficiency exist in the U.S.

Contrary to our "feelings", they are working the environment issue by less consumption, for example. This will indirectly make more money and resources available for production at lower costs. For example, cars don't pollute. U.S. environmental people at conferences in Japan are politely ignored while taking their basically boondoggle-oriented conference registration fees paid for by the U.S. government research establishment.

There is a range of basically human and personal concerns which encourage and support productivity. The result is a longer life span in the face of stress on productivity. While the subways and high density trains jostle people pretty badly, and there's no segmented smoker areas (and many smoke), there's great concern for the feelings, privacy and treatment of individuals. On arrival and departure at every organization, one is given moist cloths and refreshments. Taxis and buildings are air-conditioned. The hotels, though very expensive, provide privacy, ambiance and excellent food and service. For example, one expects a cloth cover over the telephone to enable it to fit the room decor. There are Japanese baths, and these are great too!

They are compulsively clean. In an indirect way, this really helps the manufacturing of small, precise goods including cameras, semiconductors, high-speed computers and disk memories.

There's orderly queueing at each server. The Japanese appear to be the world's best self-queuers. Queued systems of this type have higher through-put and make the best use of resources. One might suspect there is lower general hostility arising from competing for a finite resource when queueing.

Inventions are to labor-saving devices. There are countless gadgets to save scarce labor. Computation center line printers have paper cutters and conveyors in order to bring printing back to a single station. There are no computer operators and people to serve the users! This direct use of facilities not only costs less, but provides better service and throughput.

Conclusions

We must be impressed with the intense drive coupled with the technical, manufacturing and marketing acumen of the Japanese. This drive and ability, coupled with many factors of our society, has enabled the Japanese to systematically plan and dominate every U.S. market that they've attempted. Although there's been a "feeling" that the market domination is limited to low technology, there is evidence that nothing is immune.

However, despite a desire to blame the Japanese for dominating our manufacturing, it comes about because there are U.S. buyers and distributors for their goods. Distributors come about because of the intense emphasis we have on profit and return-on-investment. By only distributing and not designing and manufacturing the investment is negligible, giving a high return-on-investment.

The intent of the paper is to describe variously "how" this market/product domination is carried out. Like any good Japanese product, the ideas within the paper have been taken liberally from many sources -- mostly without credit. It should be self evident that, we (the U.S.) have a problem. Each of us, whether we be part of industry, government, or academia, can now address the issues we're responsible for. There's no real need for another fact-finding trip to Japan to further define the problem. Japan is clearly not a place to search for the solution.

Many solutions are required. Freezing the current level of government size spending and non-productive people (e.g., lawyers) would be fine first starts. Living within our collective energy budget is also needed. Rather than engaging in a trade war the following mechanism could simply address the trade deficit:

> No company can import and distribute a foreign product without arranging an equal export credit. That is, a company; such as Itel who buys and resells Japanese computers can get agricultural products to sell or it could export its own services in an equal amount. The trade balance has to be the distributor's problem -- not that of the President, or the Secretary of Commerce or Congress.

Appendix 1. A Chronology of Systematic Domination*

I. "Development of a domestic Japanese industry. The Japanese industry is developed and grows rapidly. The major aspects that mark this development include:

(a) Market control. Imports limited essentially to zero. Only a few major manufacturers are permitted. Prices remain significantly higher in Japan than in other competitive markets.

(b) Borrowed technology. The Japanese borrow heavily from foreign technology, including a large number of purchased licenses and patent rights, and wholesale reverse engineering.

(c) Vertical integration of most manufacturing.

(d) Major investments. Major investments are made in modern plant, equipment and technology, both for the final product and throughout the vertical chain of manufacturing. Continued research, development and plant investment expenses are made.

II. Establishing an export market base.

(a) The establishment of world-wide sales organizations.

(b) Researching and understanding of the foreign markets.

(c) Establishment of a reputation for quality and reasonable prices.

(d) A limited focus, especially in those markets less attractive to domestic manufacturers.

III. Major market penetration. Major market penetration occurs usually during an economic downturn in Japan. Previous efforts by the industry have set the stage for them to be successful in this endeavor. It is marked by the following considerations:

(a) Cooperation among the Japanese companies with respect to models, prices, and markets.

(b) Focus at the mainstream of the foreign market.

(c) High inventories because of poor markets in Japan, i.e., an export push at any cost is necessary and expedient.

(d) Extremely low prices to the mass market to gain market share rapidly, i.e., a knock-out punch to the domestic manufacturers. Modern plants, reasonable costs, an established export organization, and good reputation set the stage for success.

At this time, marketing muscle is established. Not only was the export market share large, but the domestic market remained closed. It should be pointed out that this major market penetration had been made by a combination of factors, as outlined. The greater marketing muscle allows the Japanese manufacturers to profit from their long investment.

IV. Market exploitation. This period is marked by higher prices -- often higher than domestic manufactured models. However, the higher prices are often more than offset by perceived higher quality, both real and imagined. There is also continued cooperation on prices and markets, as well as continued limitations on imports to the Japanese market."

IMPRESSIONS ON HOW WE AND THE JAPANESE ARE CONVERTING U.S. INDUSTRY INTO DISTRIBUTORS

Gordon Bell, Vice President of Engineering
Digital Equipment Corporation, Maynard, Mass.; and
Professor of Computer Science and Electrical Engineering (on leave)
Carnegie-Mellon University; Pittsburgh, Pa.

The island of Japan, with few natural resources and over 100 million people, virtually dominates world production of manufactured goods, including the components and processes to make these goods. Every Japanese knows that exports are vital to survival. Also ingrained is the understanding that savings and living within one's own means support the ability to manufacture and export. In contrast, the notion of balanced budgets, savings and manufacturing have gradually disappeared from U. S. culture.

For example, the United States still holds a dominant position in the production of computers and semiconductors, but the Japanese plan to dominate these industries. Unwittingly, U.S. industry, government and society continue to aid the Japanese. Forty odd reasons are given to support this conjecture, each one providing a lesson.

The Japanese have progressed from domination of low-technology simple commodities to complex manufactured goods. The progression has been from textiles, steel, radios, sewing machines, typewriters, quality cameras/optics, watches, small cars, television sets, tape recorders, video tape recorders, calculators and on to state-of-the-art semiconductors and computers. Their current position in semiconductors and semiconductor-making equipment indicates they are well on their plan to dominate this manufacturing as a base for the continued and future market domination of electronics and computers. High-technology industry is increasingly being concentrated in Japan while the Japanese-owned low skill textile and television factories are being located in the U.S.

Dataquest describes how the Japanese go about systematically to dominate a market. Appendix 1 describes the four, detailed phases: initial development of a domestic industry, establishment of an export base, significant market penetration in foreign markets and final market exploitation.

BASIC STRATEGY, AND TACTICS FOR DOMINATION

<u>Japanese industry and government operate as a team</u> reinforcing strategy and tactics with appropriate levels of competition. Unlike many companies and countries that have tried and failed, they successfully planned and built a mainframe computer industry.

The Ministry of International Trade and Industry (<u>MITI</u>), <u>with autocratic power</u>, <u>helps to amalgamate strategies within industry groups creating an organization commonly referred to as "Japan Inc</u>." Because there is no direct control, I prefer not to use the term "Japan Inc." but to name the phenomena "The Japan Club" since there's a structure for the essential competition at the market level. For example, MITI identified and encouraged early importing of minicomputers, including those from Digital Equipment Corporation, as a competitive "straw horse" to build their own industry. One of DEC's interactive data base systems, MUMPS, was sold in Japan for end-user applications. On seeing several lost sales, MITI funded the development of MUMPS on a Japanese minicomputer. In mid 1978, a Japanese researcher asked me, through an academic channel, for the internal architecture of MUMPS in order to study its structure from a so-called computer science viewpoint. We expect to catch MUMPS from Japan soon.

<u>The U.S. has no equivalent of MITI to protect major corporations as</u> national <u>resources</u>. In contrast, U.S. corporations are looked on as adversaries to the national interest. IBM, already under attack from Japanese competition, is also under the gun from most U.S. government departments. Together they seem intent on destroying IBM, leaving it and others as distributors for Japanese products.

<u>The strategy of MITI and the Japanese</u> companies <u>to win dominance of the computer industry is clearly evidenced</u>, but it is not understood by U.S. government and industry. In keeping with the priority, MITI is both very strong and attracts competent people. The Japanese companies, while maintaining competition in limited domains, both plan and talk with one another. For example, Fujitsu and Hitachi have developed IBM plug-compatible machines. Coupling individual, competing companies for

technological acculturation in this fashion is an important management technique to assimilate technology quickly.

The U.S. Department of Commerce and the U.S. Labor Department, in contrast to MITI, have neither a plan nor the personnel to help maintain U.S. dominance in high-technology fields important to the future of the country's economy and security. Furthermore, these two adversary departments are adversary to U.S. business. Trade trips to Japan by Secretary Kreps only emphasize our lack of understanding of the Japanese capability to use trade to introduce technology into their society. Our trade deficits cannot be turned around by hand-shaking missions, but demand a strategic and tactical plan based on understanding. Our political system is devoid of planning and accountability of government departments; even if the Secretary of Commerce could plan, her short tenure is inadequate to solve this problem. Once a new administration appears, any policies, plans and commitments are reset to zero!

Japanese tactics focus on the centrality of work and loyality to a company. A company screens each new employee carefully because when it hires an individual it takes on a lifetime commitment. The security promotes risk-taking, a phenomena generally unknown in large U.S. corporations. The team spirit is engendered as the various members learn how to get along with each other.

Quality control is in the hands of the workers. Although data is kept centrally, the analysis, corrective action and responsibility for manufacturing and quality rests with the employees concerned. Quality control is generally centralized and the organization of work often does not lead to self-esteem in the U.S. organization. Such participative management provides a key to the devotion to the workplace and sense of value achieved through work. The incompetent workers become the wards of the organization rather than wards of the state. Pride, family tradition, and because everyone is working, nonwork is socially unacceptable, embedding the importance of work into the fabric of society. A similar effect is observed in the U.S. during periods of high unemployment. At this time non-work is approved since others are unemployed.

In the U.S., the freedom of the individual has superseded work as a goal. The employee mobility is high and as a result companies screen very little as the short tenure is assumed. One recent semiconductor company ad claimed that no interviews were required at all. Turn-over and unemployment here are high with levels of consumption also rising so that some Japanese observers have concluded that the Japanese live to work and the Americans need to work to live. The measurable results are simply that the relative per capita productivity in manufacturing industries of Japan is now almost twice that of the U.S! Also, the sales per employee of a Japanese electronics corporation is about $100K, versus $45K for the U.S.

The Japanese government has been able to nurture both large and small companies while the U.S. government agencies seem to alienate the large and aren't effective at supporting the small ones. Much work in Japan is done in small subassembly operations. Competitive small shops keep the cost down by removing it from the large, hard to manage hierarchical organizations.

USING ACCULTURATED DESIGN AS THE BASIS TO DOMINATE

For centuries Japan has acculturated customs, but mostly it adopts and adapts technology. In the 16th century, for example they began manufacturing gunpowder a scant 18 months after the Portuguese brought it to Japan. Shortly thereafter they were banned. Any idea or product has always been fair game for adoption and improvement. Product and process evolution are merged in a long term view of achieving market domination. They orient the processes competitively considering quality, volume for growth, and flexibility to allow for the fast turn-around needed to maintain full-production capacity in a shifting market.

All the Japanese computer manufactuers have acquired their technology within the past ten years by dealing with U.S. manufacturers either as a joint venture or under license, including: Fujitsu (Amdahl/Siemens) and Hitachi (RCA); NEC (Honeywell, GE, Varian) and Toshiba (Honeywell, GE, Interdata); Mitsubishi (Xerox) and Oki (with Univac joint venture); Yokogawa (HP); and Nippon Minicomputer (DG). In all cases, the Japanese have improved the technology in terms of perceived quality, performance and manufacturability.

The agreement between Fujitsu and Amdahl Corporation, though still at an early stage, provides a good example of the classic Japanese computer acculturation process. In the late 1960's, Gene Amdahl, then head of IBM's San Jose Advanced System Development Laboratory, explored the basic technology for high-performance IBM computers. When he failed to interest IBM in building high performance machines, he formed Amdahl Corporation to develop the technology. When he needed more capital Fujitsu bought an interest and acquired the manufacturing rights to, and became the manufacturer for the Amdahl line. Fujitsu was also able to use the same technology to design and manufacture computers for the Japanese market. In only one computer generation, at the beginning of 1978, both Amdahl and Fujitsu announced their latest computers based on the Fujitsu-Amdahl circuits and packaging. Now, Fujitsu appears to have a machine with higher performance and reliability (the M200) than either Amdahl or IBM have so far announced. Fujitsu has produced a machine based on multiprocessing which provides users with new capabilities; furthermore they can buy more processors rather than trade-in when increased computation is needed.

In addition, Japanese computer manufacturers have a complete line of peripherals and test and manufacturing equipment that is based on counter-parts invented in the U.S. The designs range from "reverse engineered", to look-alike copies, to radically improved products based on Japanese inventions. With "reverse engineering" a product is dissected with micrometers, special gauges, etc. and made compatible in nearly every respect. The Japanese make only products for export to the U.S. market that do not violate patents. Tektronix look-alike scopes and reverse engineered IBM disks are common. In 15 months, Nippon Peripherals Limited produced a disk that was mechanically identical to the IBM 3340. From comparing the two drives, one might conclude that they were made from the same drawings.

PRODUCT DESIGN BASED ON NEED, QUALITY AND THE LONG-TERM

Traditional top-down marketing is characterized by expensive, thick market surveys that extrapolate history in a self-perpetuating fashion. Here, the goal is to fill various revenue gaps that develop. Using a market survey approach the U.S. continues to build heavy, gas-consuming cars, because the marketing managers can only think in terms of what has sold in the past. Freed from this approach, the Japanese have been able to look at the real needs, and they have appropriately adapted existing ideas. High-level corporate marketing does not design the products; engineers design according to needs using a bottom-up approach and based on technology.

Japanese companies, with long-term goals and commitments, similarly are not forced to depend on a short-term marketing approach. NEC, Fujitsu and Hitachi, unlike Xerox, GE, Westinghouse, and RCA, have all persisted with computer manufacturing and after years of investment have established successful products. Their long-range thinking from the outset allowed them to invest in long lasting quality.

Japanese companies focus on highly sophisticated quality products rather than ultra-high quantity, low-quality throw-away merchandise. The differences are characterized by comparing Seiko versus Timex watches and comparing Minolta or Nikon versus Kodak or Polaroid cameras. Japanese styling is often technical and gadget oriented, typified by multi-knob hi-fi sets and complex watches. It may be impossible for them to design a product like the Polaroid One-Step Camera because of the differences in picture quality. The emphasis is on an educated consumer who will value his purchase.

Concern for quality and long-term values leads the Japanese to build products that have a long lifecycle. Even their auto industry constrained by Detroit's yearly new model concept is now getting very high ratings for durability and serviceability. Accounting models lead to emphasizing production of long lived versus throw-away goods.

PRODUCTS RESULT FROM UNDERSTANDING AND MANAGING A COMPLETE PROCESS

The successful production of competitive performance products in high technology industries depends on understanding a complete process that includes basic research, going through applied research and advanced development, to product development. In addition, a parallel and equally complex process is required to design and build the process that manufactures such products. After a new product is introduced, it may then be necessary to modify and enhance it to adapt it to the real or changing market, and finally to eliminate it when it is no longer effective.

The Japanese need invest little in basic and applied research because they are effectively coupling the U.S. laboratories into their advanced development. In contrast, aside from the direct hiring of students and researchers, there is very little flow of ideas from our public laboratories into our own industry. As Carver Mead of Cal Tech points out, "I like the Japanese. They listen. Also unlike American industry, they're willing to build from our ideas." The university laboratories at Stanford, MIT, Carnegie-Mellon, the University of Illinois, receiving significant ($20-30M/year) Advanced Research Projects Agency (ARPA) funding for Computer Science, have post-doctoral Japanese visitors. The university and industrial laboratories of Japan are headed and staffed by researchers who've spent their research years in key American laboratories (e.g., MIT Multics). In contrast there is no Japanese training of U.S. engineers and scientists; furthermore, the flow of ideas is minimal.

Most recently, Japan has offered to spend one billion dollars in the U.S. for research, predominately for energy conversion. By accepting these funds, the Japanese can be even more effectively coupled to U.S. research and can "learn" to research, just as they've learned manufacturing, design and advanced development. The scientific community is anxious for more funds, independent of where they come from or what the consequences are. Of the large companies with research laboratories, the Japanese emphasis is on advanced development where the output is a testable prototype, often of a potential product. In contrast, U.S. corporate laboratories hide behind the veil of science where the output is vague and untestable. The quality of these laboratories is high versus many comparable large U.S. companies where research is to ease the corporate conscience instead of providing new development. Although such corporate research laboratories (e.g., GE, Motorola, RCA, Westinghouse and Zenith) were significant in the early development of television, the U.S. television industry has declined with few recent local advances.

MITI funds and manages other laboratories and corporations to carry out research that is oriented toward getting experience that will eventually produce products. Funding specific, as opposed to having a captive laboratory, not only provides a system of checks and balances, but also provides an incentive. Many of our government laboratories were initially set up for specific missions, and although the missions were completed, the laboratories continue to exist. Since they no longer have a real goal, or mission, negligible new work is done. The dust is blown off the equipment for visitors and the same demonstration is run year after year. A buyer-seller relationship, in which an independent organization, such as a university, manages the lab and takes responsibility for results can minimize this "dusty lab" syndrome. Moreover, funding for specific projects can bring together diverse groups and promote technical interchange.

The Japanese orientation is toward engineering for trade rather than being strongly science-based. Since the rest of the world provides research, why should they bother? This comes about because of their need to manufacture products and their total dependence on the export of manufactured goods. Since our basic federal research funding for computing comes through the NSF, ARPA, and the armed services, the emphasis is on science and research.

Their funding comes through MITI and from various corporations, and hence the orientation is on international trade.

The trade drive causes a strong emphasis on manufacturing, not just product design. In addition to the product engineering process there is a comparable and equally important process responsible for the development and operation of manufacturing. This discipline has been nearly eliminated from U.S. universities as it has moved from the engineering to the management school. There is a decided emphasis on manufacturing processes in Japan as people are rotated among the various processes and disciplines, making it equally desirable to be in all functions.

Everyone associated with science, engineering and manufacturing understands basic learning and demand curves and they are quantity (and growth) oriented, subject to the quality-first constraint. Knowledge of the learning curves (i.e., increases in the combined number of units produced cause a reduction in manufacturing cost) is everywhere. Fred Bucy comments on Japanese competition in TI's 1978 Annual Report: "...the big difference is that TI is the first major non-Japanese company they have run into that understands and uses the learning curve". The Japanese are willing to sell outside Japan at a lower exported price (dump) and lose money often by selling below cost for the short term (see also Appendix 1) in order to buy market share. This practice is illegal for both U.S. and Japanese companies. Although the Japanese pretend that their products are not competitive because the yen is so strong, they are consciously ignoring our dependency as a distributor now in many industries.

As a corollary to learning curves and market domination, it's necessary and they are willing to give up profit for growth. For example, RCA is now a rug maker (or distributor), car rentor, publisher, television component distributor; it hardly resembles the electronics company that pioneered television. It's difficult to put the whole blame on RCA management because they are constrained by the economic and business temperament of the U.S. environment. Whereas there is extreme pressure on our business for profit and return on investment, these factors are less important to the Japanese companies. Sony is only moderately profitable, Fujitsu does relatively poorly financially and NEC or Hitachi computer divisions may even lose money. None of these companies would compete for capital in the U.S. stock market where return-on-investment is the key criterion. Japanese companies are buying market share and this is clearly more acceptable to the U.S. investors than for GE, Xerox and RCA who left the computer business. They can buy the business through "dumping" and why not if there is long term reward?

JAPANESE DOMINATION IS PREDICATED ON OUR GREED AND VALUES`

As we watched the first few industries of textiles and steel become dominated by the Japanese, we unsympathetically stated that these industries were tired, the workforce was lazy, and the management was incompetent, unimaginative and unaggressive about getting capital. Certainly, there is no fondness for the automotive and petroleum industries and it seems fitting to import our cars as a lesson to our own U.S. manufacturers. Now, however, the domination of all manufacturing is becoming so clear that we must look deeper at the causes.

The domination can only happen with consenting buyers in the U.S. It is these buyers, called distributors, including tired, old, former manufacturers that are to blame, not the Japanese. Our values appear to be too short term and too basic. We really must understand that the following, simple, long-term consequence is complete economic domination.

The (Unstable) Three Island System - Or How and Why We Will Be Dominated

Since it's not clear that continued consumption, with no corresponding export means, let's look at what is the ultimate, singularly stable point simply. A system of three inhabited islands, all of which have adequate food, water, shelter and land, points out the dilemma:

#1. supplies energy; consumes negligible manufactured goods;

#2. supplies manufactured goods (is supplied raw materials from several small islands it owns, and from discarded goods of island 3); and consumes energy;

#3. consumes energy and manufactured goods; supplies information.

Given that information is generally treated as a waste commodity of zero value, there is no stable state for the system until islands 1 and 2 absorb island 3. Or conversely using any monetary system, island 3's paper or tokens will always be worthless. That is, islands 1 and 2 currency values will be out of balance with island 3, until 1 and 2 "own" island 3.

Through greed and short-term values, the Japanese and their counterpart American buyers have systematically transformed American business from inventor-manufacturer-distributor to simply distributorships. This transformation is in complete keeping with the goals of American business as reported in business magazines and the teachings of modern business schools. The goal and reward of American industry are clear: return on investment and profit. Secondary measures, such as market share, are occasionally used. Only a few corporations consider no lay-offs and full-employment to be important; as such, a clear, adversely separation has formed between management and labor. Following only the profit-based goals, subject to no other constraints, leads U.S. industry directly to distributorships for Japanese products. This strategy requires no investment, no planning, and no risk. All a company has to do to be successful is to buy the right product from Japan and then resell it.

This merely confirms the classic definition of a capitalist as someone who'll make and sell the rope to hang himself. However, in this case the capitalist is reselling someone else's rope because he is too lazy to design and make his own rope.

The essence of distributorships is completely counter to the principles that made American industry initially great. The new principle is simply that with no work and no capital, anyone (everyone) can do nothing and succeed. All that's important is to find a supplier who'll put up the capital, design, and manufacture products that we can distribute. In computing, the trend has also started: Itel is buying Japanese-manufactured IBM 370-compatible computers. Thus we expect Itel to have good financial metrics and be a good investment. It will also cause a high net flow of dollars from the U.S. as it becomes more successful.

American business, of course, is only slightly at fault because the U.S. non-business communities (politicians in government, consumers, and academics) have introduced and strongly support heavy borrowing, beyond income. These thwart an environment conducive to manufacturing. Both the per capita rate and amount of savings for both individuals and corporations in Japan is twice that of their U. S. counterparts! For example, the retirement system in Japan is actuarially sound. Of course, the Japanese government operates a balanced budget and taxation supports savings. Furthermore, as a society, they understand themselves simply as an island that must have a favorable balance of trade.

There's no way a manufacturer can re-enter a lost business once he has becomes a distributor. The spirit, and capability to catch-up and manufacture are gone. Society and the investment structure are all aimed at continuing a status quo. Radio, television, hi-fi, and video recorder products are all built using key U.S. developed ideas and patents, yet are no longer built by U.S. manufacturers. Again, we can blame the Japanese, but someone in the distributors had to choose to buy the products rather than design and build competitive products. In the case of Motorola, the television division was purchased by Matsushita in 1974 and included both manufacturing and distribution. By 1976, the U.S. plant was reduced by 2/3, but the distribution network was left intact.

We (U.S.) have a higher regard for business training versus engineering and technical training. In the U.S. many engineers regard the MBA degree as necessary for a career in industry. The Japanese do not yet have many business schools; therefore, instead of MBAs, engineering master's degrees are sought. This makes the Japanese better engineers for the same educational investment. Also, the management of manufacturing organizations are the better equipped to understand technology and products.

By having more people just concerned with distribution, we are becoming a nation of shopkeepers. The emphasis is simply to keep stores open longer and to find new ways to distribute Japanese manufactured goods. Not only does this further stimulate consumption, but it takes people from the primary production work force and makes us merely an island of consumers with no material means of support.

THE JAPANESE HAVE PRIORITIES AND SUPPORT FOR TRADE

At a government/society level the Japanese appear to have their act together. The Japanese seem to have a clear, crisp ranking of goals and priorities. For starters, the Japanese know their goals and priorities, whereas nearly all our goals that begin simple become entangled as special interest groups enter the fray. Some issues that compete for priority include: human rights versus equal rights; full employment versus inflation and balance of payments; environment versus region versus country; capital versus labor; and consumer protection versus business protection.

Because of the need to manufacture and export, the Japanese educational system supports engineering and technology, while we support lawyers and other semantic accountants. There are fewer lawyers per person by a factor of two than in the U.S. The Japanese emphasis (priority) is on physical output. The increasingly large number of U.S. lawyers: consumes productive and creative output of workers; creates a self-perpetuating, non-productive body; detracts from persons who would otherwise enter productive occupations; and tends to build an even larger governing body. With an increased emphasis on legal training, our output is measured by intergroup contracts, policies, laws, rules, regulations and other forms of bickering among semantic accountants.

As a simple explanation, more money is available in Japan for investment to enable them to manufacture (for their island) because of lower taxes. This clearly affects their ability to invest in industry.

Their government spending for military is nearly nonexistent. Although there are prototypes from our military spending, they seem small and are by-products. In the case of research for semiconductors and computers the benefit though impressive might have been as great, given a different goal (e.g., energy self-sufficiency).

The Japanese don't have the federal research over-expenditures, epitomized by NASA and NIH. In the event of results, the Japanese will capitalize on our research for their manufacture and export. The NASA goals, for example, appear to be vague now that they've stopped providing the world with exciting space shots and television pictures from the moon, and the immediate needs for this research is unclear to most of us.

National health research seems equally vague. This research appears to increase health care costs, through a number of secondary effects. By contrast the Japanese spend one-half of what we do per capita for health care and medical research. They can capitalize on our research, but since they have a longer lifespan, it is not clear what we gain with the extra expenditures. In effect, Japan's lack of spending in medicine goes to investments which result in full, lifetime employment which is probably the best solution to personal health.

The Japanese believe computers are fundamental for the long term and they are prepared to invest in them and wait for return. Non only are machines used in all products they build for export, but they save labor too. Labor is both precious and expensive in Japan: there are only about one hundred million people and two percent unemployment. They're considering raising retirement from 60 to 65 to get the extra productivity. They must have computers to raise productivity; computers are vital to their continued domination of manufacturing. As a separate research area, robots are an important component of manufacturing domination. While much of the pioneering work was done in the U.S., the continued work to make robotics practical takes place in Japan. By contrast, in Australia where there is increasing unemployment, there's a belief that computers must be eliminated. Australia buys nearly all Japanese products, produces less and less, and the small Australian automotive industry of GM- and Ford-based large cars is rapidly declining under the stress of small, mass-produced Japanese cars.

THE JAPANESE SOLUTION TO OUR BALANCE OF PAYMENTS PROBLEM: SELL (IN JAPAN)

Can we solve our balance of payments problem by selling to Japan? Selling to Japan is the answer our government and industry want and willingly, but foolishly, look to. However, the Japanese rhetoric is only for our gullible government and academic communities and the naive business people. Furthermore the trade missions are only stocked with powerless, non-responsible, short-lived politicians whose main purposes include visiting Japan and being able to say something to the folks back home. For example, when state trade envoys visit Japan with the expectation of selling high technology goods, they succeed in selling only a few prototypes. The real sales will come in 5-10 years when these products are resold in volume to the U.S!

There has not been, nor will there be any serious trading of American products with Japan. The distributor/trading network entirely thwarts such an effort! The results are clear and we must face them.

<u>Japan is a closed society and market</u>. As the most powerful, homogeneous culture in the world it has a long history of being closed. There is no counter-evidence that an open market exists. The <u>language is a code to</u> further <u>segment</u>. Although business people do learn the language in crash courses, the language is relatively useless without the societal understanding. We only teach Japanese minimally on the West Coast of the U.S. On the other hand the technically trained Japanese have several years of English language training.

Even though there are major cultural differences among Japan and other far eastern countries (e.g., China, Taiwan, Korea) there is closer proximity among them than with western countries. This closeness is especially advantageous in finding additional sources of especially low cost labor.

The <u>tariffs support the establishment of any industries</u> they target. Although the semiconductor and computer import duties have been "advertised" to be on a parity with the U.S. they aren't there yet, but this matters little since their industry is strong enough to withstand imports. Still prices of U.S. produced computing machines are cheaper. In semiconductors the rationale for high tariffs has been protection of infant industries, yet outside of Texas Instruments and Western Electric, Japanese companies have been manufacturing longer than all other U. S. corporations. As evidenced in other industries, this is a come-on to further strengthen the Japanese manufacturers for export competition by having them compete in a token way with the few imports and thereby gain ideas to sharpen their exports.

For example, in the early seventies the Japanese encouraged U.S. minicomputer imports, although there were high tariffs. These occurred and now there is a significant Japanese minicomputer industry. For example, the basic structure of Fujitsu's minicomputer is quite similar to the DEC PDP-11.

<u>Because of the closed nature of society</u> and the <u>emphasis on personal relationships, it is difficult, perhaps impossible to have significant Japanese sales</u>. There are no significant examples to the contrary. "Doing business" together appears to be done over a long time period and is almost ritualistic. This means that it's essentially impossible to have an effective international company as we know it. A foreign manager is clearly tabu and sales are limited to one-shot deals with trading companies. There is no trading except as joint ventures. A foreign-owned company with controlling equity is so rare that it is an effective unwritten law.

JAPANESE HIGH LABOR COST, LIMITED POPULATION, FULL EMPLOYMENT AND FEW NATURAL RESOURCES, CREATES IMPORTANT BY-PRODUCTS TO FURTHER HELP TRADE

<u>Japanese transportation and meetings run on time and at full capacity</u>. Roughly twice as much as in the U.S. can be accomplished per day in Japan, especially those requiring meetings. The cordial, formal protocols help meetings proceed rapidly.

<u>There's measurement of and pressure for efficiency</u>. That is, the work-out/work-in ratio is high. For example, taxis have a driver-operated back door opener so that passengers can load/unload faster. The notion of efficiency seems to be taught to all and factories measure, graph and display key results. Concepts like fuel efficiency versus speed, weight and pollution are difficult concepts for Americans to understand, yet the Japanese "feel" them.

Given a notion of efficiency, <u>there's real</u> concern for <u>saving physical resources too</u>. At the computation center, printing isn't automatic; it's queued and must be requested separately. Lights, always florescent for high efficiency, are off when not in use. Of course small cars, taxis, a good train/subway are other indicators. The cars have mandatory bells that ring when the car is going over 100 Kmh! None of these artifacts for efficiency exist in the U.S.

Contrary to our "feelings", they are working the environment issue by less consumption, for example. This will indirectly make more money and resources available for production at lower costs. For example, cars don't pollute. U.S. environmental people at conferences in Japan are politely ignored while taking their basically boondoggle-oriented conference registration fees paid for by the U.S. government research establishment.

There is a range of basically human and personal concerns which encourage and support productivity. The result is a longer life span in the face of stress on productivity. While the subways and high density trains jostle people pretty badly, and there's no segmented smoker areas (and many smoke), there's great concern for the feelings, privacy and treatment of individuals. On arrival and departure at every organization, one is given moist cloths and refreshments. Taxis and buildings are air-conditioned. The hotels, though very expensive, provide privacy, ambiance and excellent food and service. For example, one expects a cloth cover over the telephone to enable it to fit the room decor. There are Japanese baths, and these are great too!

They are compulsively clean. In an indirect way, this really helps the manufacturing of small, precise goods including cameras, semiconductors, high-speed computers and disk memories.

There's orderly queueing at each server. The Japanese appear to be the world's best self-queuers. Queued systems of this type have higher through-put and make the best use of resources. One might suspect there is lower general hostility arising from competing for a finite resource when queueing.

Inventions are to labor-saving devices. There are countless gadgets to save scarce labor. Computation center line printers have paper cutters and conveyors in order to bring printing back to a single station. There are no computer operators and people to serve the users! This direct use of facilities not only costs less, but provides better service and through-put.

Conclusions

We must be impressed with the intense drive coupled with the technical, manufacturing and marketing acumen of the Japanese. This drive and ability, coupled with many factors of our society, has enabled the Japanese to systematically plan and dominate every U.S. market that they've attempted. Although there's been a "feeling" that the market domination is limited to low technology, there is evidence that nothing is immune.

However, despite a desire to blame the Japanese for dominating our manufacturing, it comes about because there are U.S. buyers and distributors for their goods. Distributors come about because of the intense emphasis we have on profit and return-on-investment. By only distributing and not designing and manufacturing the investment is negligible, giving a high return-on-investment.

The intent of the paper is to describe variously "how" this market/product domination is carried out. Like any good Japanese product, the ideas within the paper have been taken liberally from many sources -- mostly without credit. It should be self evident that, we (the U.S.) have a problem. Each of us, whether we be part of industry, government, or academia, can now address the issues we're responsible for. There's no real need for another fact-finding trip to Japan to further define the problem. Japan is clearly not a place to search for the solution.

Many solutions are required. Freezing the current level of government size spending and non-productive people (e.g., lawyers) would be fine first starts. Living within our collective energy budget is also needed. Rather than engaging in a trade war the following mechanism could simply address the trade deficit:

> No company can import and distribute a foreign product without arranging an equal export credit. That is, a company; such as Itel who buys and resells Japanese computers can get agricultural products to sell or it could export its own services in an equal amount. The trade balance has to be the distributor's problem -- not that of the President, or the Secretary of Commerce or Congress.

Appendix 1. A Chronology of Systematic Domination*

I. "Development of a domestic Japanese industry. The Japanese industry is developed and grows rapidly. The major aspects that mark this development include:

(a) Market control. Imports limited essentially to zero. Only a few major manufacturers are permitted. Prices remain significantly higher in Japan than in other competitive markets.

(b) Borrowed technology. The Japanese borrow heavily from foreign technology, including a large number of purchased licenses and patent rights, and wholesale reverse engineering.

(c) Vertical integration of most manufacturing.

(d) Major investments. Major investments are made in modern plant, equipment and technology, both for the final product and throughout the vertical chain of manufacturing. Continued research, development and plant investment expenses are made.

II. Establishing an export market base.

(a) The establishment of world-wide sales organizations.

(b) Researching and understanding of the foreign markets.

(c) Establishment of a reputation for quality and reasonable prices.

(d) A limited focus, especially in those markets less attractive to domestic manufacturers.

III. Major market penetration. Major market penetration occurs usually during an economic downturn in Japan. Previous efforts by the industry have set the stage for them to be successful in this endeavor. It is marked by the following considerations:

(a) Cooperation among the Japanese companies with respect to models, prices, and markets.

(b) Focus at the mainstream of the foreign market.

(c) High inventories because of poor markets in Japan, i.e., an export push at any cost is necessary and expedient.

(d) Extremely low prices to the mass market to gain market share rapidly, i.e., a knock-out punch to the domestic manufacturers. Modern plants, reasonable costs, an established export organization, and good reputation set the stage for success.

At this time, marketing muscle is established. Not only was the export market share large, but the domestic market remained closed. It should be pointed out that this major market penetration had been made by a combination of factors, as outlined. The greater marketing muscle allows the Japanese manufacturers to profit from their long investment.

IV. Market exploitation. This period is marked by higher prices -- often higher than domestic manufactured models. However, the higher prices are often more than offset by perceived higher quality, both real and imagined. There is also continued cooperation on prices and markets, as well as continued limitations on imports to the Japanese market."

paper 1, Original paper 10/78.

C. GORDON BELL

Gordon Bell is Vice President of Engineering for Digital Equipment Corporation. The native of Kirksville, Missouri, earned his B.S. and M.S. degrees in Electrical Engineering at the Massachusetts Institute of Technology.

On leave as Professor of Electrical Engineering and Computer Science at Carnegie-Mellon University, Pittsburgh, he was previously Manager of Computer Design for Digital from 1960-1966. During that time he was responsible for DEC's PDP-4, -5, and -6 computers. He consulted for Digital in 1966-1972 while at CMU working on various computers and products including the PDP-11.

He has worked in the computer field on computer architecture, modularity of design, multi-processors, and applications. Publications include "Computer Structures" (McGraw Hill), co-authored with Allen Newell; the Digital Press book, "Designing Computers and Digital Systems, Using PDP-16 Register Transfer Modules", with John Grason and Allen Newell; and several papers.

In addition to his industrial interests, Bell has served the U.S. Government as a member of three COSINE committees of the National Academy of Sciences for computer engineering education, and the National Science Foundation, Office of Computing Activities. He is a department editor for the CACM, a Fellow of the Institute of Electrical and Electronics Engineers, and a member of the National Academy of Engineering.

Subject: My Role In The Six Most Important Things the Company Has to Do!

To: Ken Olsen

CC: Operations Committee
OOD

Date: 8/16/80
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

HAVE REALLY GREAT PRODUCTS (Fundamentally responsible)
continuing: support the plan in Red and Beige Books
evolution: get quick resolution on VT/PDT/Gigi for low end
revolution: Interconnect and The Personal VAX
recover/lead: get organization and products for the office!
build fundamental technology base: physical interconnect, semis and disks

UNDERSTANDING THE TRUE COMPETITION: Japan, IBM, and new micro-based systems
Get the Japan competitive analysis and understanding-action groups going. Have a "Stratton" around Manfacturing and Engineering that targets these competitors. Get disk, semi, terminal and system M/E pairs to Japan!
Evaluate the inevitable competition based on the emerging lines of very fast, large address-space microprocessors enabling higher performance/cost.

STREAMLINE OUR ORGANIZATION to have a single stage, FAT-less product flow to
halve the inventory and double the turns based on point of mfg. and field merge. Improve product quality, minimize system configurations, pare old products and discourage mutations, provide a system to permit salesman to order "legal" systems (those specified, tested to work and can be built), and get the right product/plant/organizational structure which supports the manufacturing reorganization.

BETTER ORGANIZATION by location, coupling and decoupling (Operations Committee? responsibility. Offer a framework (cauldron) and plan. Encourage the troops to make (bubble up) a proposal.)

Have proposed a framework and got support to meet with Jack and Shel. We are organizing engineering to be better aligned with various business units based on technology (manufacturing) and market (product lines). Support a terminals and terminals based systems grouping. Improve Mass Storage coupling by review of plans. Significantly improve semiconductor M/E grouping. Align systems appropriately with new Mfg. organization.

IMPROVE ADMINISTRATIVE SYSTEMS: Order processing and product flow control seem to require a different structure. (Lend encouragement and moral support)

TOTAL RESOURCES (CAPITAL/EXPENSES, PEOPLE, SPACE, AND COMPUTERS) BASED
MANAGEMENT FOR PRODUCTS versus engineering expense-based resource allocation

EBOD is to do this review. Couple and check the Manufacturing and Engineering plans. Do a detailed example for Mass Storage to understand.

Mr. Benjamin Rosen

200 Park Aveue
New York, New York 10166

Dear Ben,

It was good to talk with you about The Computer Museum. I'm enlisting your support for this first round of The Computer Museum when it opens in Boston, November 14. The Museum operated in a Digital facility for five years where it gathered artifacts, enlisted members and built a team. The Museum has achieved international-level excellence as a public insitution. Now it is going public in Boston to a wider audience and 240,000 visitors are expected annually.

The Museum is technologically current, yet archival and will be interactive. It will illustrate the dynamic growth of the industry and its potential. The Board of Directors is broadly representative of the industry with each of the 24 members having a 4-year non-reelectable term of office. The Curatorial Staff is lead by Dr. Oliver Strimpel who had been curator of the computer gallery at London's Science Museum. He is the best in the field.

Your leadership is needed now as a founding partner in several ways:

. help in collecting artifacts you have or believe are significant (eg. your statement about Visicalc, an early Osborne, a Compaq, Grid); The PC Gallery will use PC's interactively in lieu of text panels.

. direct financial support on this "first round"; and

. help in New York by sponsoring some affair at which the Museum could be presented. For example, in Silicon Valley, we are accepting Amdahl's WISC at Trilogy, and in Minneapolis, CDC is presenting Cray's Little Professor.

Since this is a request for your precious time and money, I know you'll want to visit the Museum before making a commitment. I hope we can discuss this at lunch or dinner at the Museum, or I'd be happy to meet with you in New York. You can call me at Encore (617-237-1022), at home (259-9144) or the Museum (426-2800) if your coming to Boston.

Sincerely,

Gordon Bell
Chief Technical Officer

P.S.
An essay on the current micro computer generation is also enclosed which I hope you'll find interesting or useful.

SUBJECT: BERKELEY OPPORTUNITY: ETHERNET DIAGNOSTICS

Forest described the poor situation at Berkley vis a vis the 750's we
gave.

They flushed the RK07's due to the incredible space they require and
replaced them with 8" Winis. We now refuse to maintain the

machines
because of our policy and need to have an RKO7.

These machines are connected via Ethernet and ultimately, we expect
diskless and fixed disk VAX's to be diagnosed using Ethernet.

This is an incredible opportunity.

Let's work with Berkley to have them build and be a test site for this
kind of diagnosis. This means getting Maynard F.S. engineers involved
to make this a project. Could you please start this dialogue with
them?

I intend to visit there next week and hope to hear it's moving.

"CC" DISTRIBUTION:

FOREST BASKETT SAM FULLER DICK HUSTVEDT
BERNIE LACROUTE DICK POULSEN STEVE MUELLER @OAKB

Thoughts on various acquisitions and product companies

Both IBM and DEC are positioned as FULL service suppliers. NO niches of any significance. Old line minis, including DG and Prime are trying to get the range, but may be too locked into past to make it.

Am prejudiced about DEC's compatible, computing environment which provides a full range of computing from VLSI'd personals/super micros to clusters of mainframes. Only see niches around communication, real time, or specialized applications as the way to penetrate. Must have interconnectablity ot standardized envrionments (eg. IBM, LANs, x25).

The world is being standardized for software convenience and publishing: IBM compatible mainframes, UNIX/C/68K+... supermicros, and cpm or ms/dos 8086 compatible PC's. Note the history of BUNCH versus IBM compatible which shows steady erosion of a "loyal" base. Will software be done to any extent outside these environments?

BETA
Can a proprietary, vanity architecture exist at all unless it's capable of being used in the UNIX environment? (A cobol compiler runs for a particular machine, and can rarely run to compile acceptably for several environments.)

It's vital to look at a product strategy before it's too late to make changes and before all development resources are chewed up. The deal for UNIX with Nova university could be enhanced by working more closely with their president, Dr. Shure... provided UNIX can exist on the new machines. A similar relationship could be developed with the Lawrence Berkley Laboratory.

Is there a user base that is loyal enough to even care about staying with a vanity machine? (The very intelligent user may have already decided to bite the bullet.) Note DG came in later with an upward compatible machine and really hasn't extended its base. All the world's going compatible. How and when can Beta switch?

Will Beta's design work? is it manufacturable? or is it beyond the Soul of a New Machine in terms of complexity? What tools have they used? Is it probably or convincingly correct? What is the quality of the engineering? it's age and education?

We need to get into Beta to develop the product strategy:

- What is going to be the niche? real time lab, satelite processing, control, communication, Telext, Prestel, etc. What about a corporate switch and PC database server as front end to all terminals and machines?

. How are they going to get standards?

. Is there a relationship with a PABX? develop one?

. are there synergistic relationships with other vendors of terminals and factory controllers?

In general, we need to see and help develop a winning path.

RELIABLE, NON-STOP COMPUTING
Reliable computers are competitive with the establishment:
IBM has an effort, Tandem though established has been flattened and is coming out with a new offering, DEC is delivering the clusters and
these will come down in price with the micros!

Therefore, it's imperative to go after installations within the next year, getting to 100M level within two years, otherwise, don't bother.
This is a marketing, distribution and manufacturing problem... not a development problem, given the short gestation time of products aimed at reliablity.

WORKSTATIONS
Only 123 of them now. To bet now for the next two years: Apollo, Apple, DEC, SUN, HP, Teletype?, IBM ... on installed base 85.

The next chip set with large memory addressing <u>and</u> the BI will enable us to offer microprocessors.

RSX-11 M+ supports multiprocessors with the 11/70mP. Jega Arulpragasam has published a paper on Modular Minicomputers using Microprocessors of an experimental system based on M+.

Will M+ run on the BI-based multiprocessor system?

GB:swh

D I G I T A L INTEROFFICE MEMORANDUM

DIST:

Jega Arulpragasam	ML3-2/E41	Roger Cady	MK1-1/E25
Dick Clayton	ML12-2/E71	Bob Daley	MK1-2/H03

Ken has been especially unhappy with the BI in terms of schedule, package, and the fact that we have appeared to make decisions which overally favor the OEM (especially the European OEM) versus end user. I (and Ken) are delighted with BI's performance, RAMP, multiprocessor, large address and user features!

Given the TAT020 demise, now is the time to look at BI and reaffirm or change the direction vis a vis the packaging. In this note I don't want to get into the decision on it being a standard, or whether we license National to use the bus, or even whether we focus on being an end user versus OEM company, but only the technical questions:

1 Do we have the right sized module? Why not use a standard quad?

2 Why are we using such an expensive connector with so many conductors when BI was made to be so narrow? What module needs so many conductors? Why not use unique slots and connect the i/o there, or use a connector on the backpanel?

3 Why don't we use cables that come off the side or back of the module ala the old days? or why not extend the module so that i/o can plug directly into the back ala Pluto line cards or IBM's PC? These both look much more elegant and relevant to our use.

Basically, as a strawhorse, let me propose an alternative package which is quad form factor, uses both rear connection (ala the IBM PC), and allows front or direct cable connection ala our traditional (old) Unibus and Qbus... even though I don't expect we'll use this. Can we compare the strawhorse and the current BI in terms of:

. cost (at module and set of modules level),
. time to market impact,
. ability to make system of small, medium and large size,
. OEM desirability and market size impact,
. compatibility with existing box package sizes (eg. Qbus) and module manufacturing, NOTE WE ARE SURE TO HAVE A Q TO BI CONVERTER, GIVEN THE PLETHORA OF QBUS MODULES WE ARE BUILDING!)
. RAMP
. Ease of customer installability of module and cables.

We just have to bring this BI package to a close. Can we do it soon?

.

The Museum Technician reports to the Exhibit Coordinator. The main duties of this part-time job are:

1. assist in display setup
2. dust, clean, polish all displays
3. make minor repairs
4. general maintenance
5. asist in bulk mailings
6. run errands (to post offfice, etc.)

June 25, 1984

Mr. William Gates, Chairman

Microsoft Corporation
Bellevue, WA 98004

Dear Bill:

The Computer Museum is opening in downtown Boston on November 12.

A first-rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the Computer and the Image. Predictions are that we should have attendance of over 200,000. This world-class, international Museum should be a major attraction and asset for the computing community.

The enclosed brochure describes the Capital Campaign. Note that Mitch Kapor has joined the Board. Now I want to enlist your support as a leader in the software industry:

1. Microsoft's "core" contribution to the Capital Campaign at the 4K level or becoming a founder ($2,500) during this last month of the two-year founding period,
2. your personal "core" contribution and foundership, and
3. assistance by making your "Flight Simulator" suitable for use in the Museum in the Image Gallery. The modifications are attached. The Museum is broadening its audience to include the computer interested, general public.
4. PC artifacts that you have in storage that would be appropriate for the galleries and archives.
5. Microsoft's own historical artifacts.

I'd like to call you next week to discuss these items and to get the name of a person who could modify the simulator. We need the modifications and artifacts quite soon for the exhibits.

Gwen and I will be in Seattle the first week of August and would enjoy seeing you.

Sincerely,

Gordon Bell

Enclosures

Mr. William Grinker, President
American Computer Company
? see the letter to me or literature

Dear Bill:

It was good to talk with you yesterday, and get your candid feelings about supporting The Computer Museum. The Museum started out with the name, The Digital Computer Museum, and that was probably a mistake because people thought it only had DEC computers in it. When it opened in 79 to DEC folks and friends it was already more than 50% non-DEC. Now, only a few artifacts are DEC computers. More importantly, the IRS believes the Museum is a public, non-profit institution -- eighteen months ago it achieved this status.

To make it a truly great (one of the top 6) world-class technology museums requires that it be in Boston and not tied to a particular company. DEC is still committing major support after the move. They bought the building, but unless we raise enough to make the move and get an endowement, the Museum won't exist. The target amount over the next four years is $10 million.

Today there are over one thousand members ranging from Amdahl to Zuse (both of whom have spoken at the Museum and are archived on videotaped). We are getting very strong support from other companies. For example, DG has pledged $75K, and CDC has committed to raise $1 Million in the midwest for the archives/library.

Enclosed is a letter which that describes why I think the Museum is so important to the future (and to Boston). Also enclosed are several Museum Reports that describe the various activities and list people involved with the Museum. I would like a chance to convince you and your partner to become a corporate founder, and to help us with the fund-raising. If the material raises your level of interest, let me know. I'd be delighted to offer a tour and dinner at the current site.

Several of us from Encore will visit you in the next few months to see if there are possiblities of interest.

Sincerely,

Gordon Bell

Dr. William Perry
Hambrecht and Quist
235 Montgomery Street
San Francisco, California 94104

Dear Bill:

Enclosed is a brochure on The Computer Museum which describes the plan for opening the Museum in downtown Boston in November. We believe that the Museum will draw 200,000 people annually. Since the Museum is both international and industry wide, including everything from semiconductors to computer users, we are anxious for wide-scale participation. We would like you to lead in getting participation within the financial community.

Given the important roles that you as the leading venture capital company has played in the industry formation, I would like to urge you to become a Corporate Founder and a "Core" Supporter. Since the founding period closes July 1, a letter of intent or phone call would suffice to meet the deadline.

I hope you, too will become a personal founder. We were delighted to have Bill Hambrecht as a founder, and hope you'll discuss this corporte membership with him.

When you're in Boston, I hope you'll stop by the Museum to get a better feel of the real thing.

Sincerely,

Gordon Bell

Follow-Up: 9/21/79

I was most impressed with the work that was going on at Watson in experimental computer science. Birnbaum was open...and we ought to find out as much as we can about the work they are doing. Apparently they are very open with the universities. Joel Moses, MIT, also commented that they are leading in both speech and robotics. In this regard, they are using Robots in the typewriter plant for assembly. They are also working on inspection. This has come out of much understanding about what is actually done in factories. He talked briefly about:

801 Minicomputer which they are open about. John Cocke designed this and is probably worth talking to. John McCarthy was at Watson this summer and could also be contacted. It is a machine designed for emulation, and for one chipness, taking advantage of the machine code statistics. A few instructions, e.g. move, jump, are hardwired and the rest are microcoded. It has been used for many purposes, especially IBM Channel emulation. It may also be implemented using Josephson Devices, because it is so simple.

FFT and Winograd Transform Research. Lots of it. They are going back in the <u>technical</u> domain cause they need it for speech, vision, and signal processing in general. Here again, the Josephson Devices will be used as the implementation form.

They view their work on their new relational Data Base language as being similar to that on APL. Namely, they have a much better, easier to use DATA BASE, and they believe that it will ultimately be THE data base system. Can we get the manual and get it up on one of our systems...as it was no doubt, first written on a DEC machine?

They are building a chip to help with routing that does Lee"s algorithm, just as we were planning to do with U of Leuvan.

They are exploring the repartitioning of their operating systems into functionally seperated parts, just as we are doing in Hydra/Mercury/HSC50.

They have lots of work aimed at GRAPHICS in the office, and at printing and print quality. Also, there is work on use of computers in home and includes sending lots of machines to homes. The MCA deal with video disk started at Watson.

IBM now has a system with about 1000 installations that read and interpret EKGs. This one hit me in the stomach, because this work was first done on LINCs and 12's.

All in all, impressive!

Can this display be designed and built by the terminals group? I shudder at another graphics terminal, graphics architecture, or terminals effort outside of Maynard, Albuquerque, LDP, CSS (several sites) and Tewksbury (Caltech).

Why not use a Gigi for now to do the software work, and get the higher performance, architectural compatible one through the single, graphics group (fund them and transfer people if the people aren't available to do the job)?

Let's get a quality, single, graphics group!

Go ahead with the mass storage exploration. Get the software going.

Subject: **Bluefish Wind-down**

To: Bluefish Project Team
OOD
Jim Marshall, TW/C03
Nat Parke, TW/B02

Date: 31 OCT 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

I would like to congratulate the Bluefish team on the work and the creation of various ideas that have been and will be used in subsequent machines. It is important now to document the effort sufficiently so that others within DEC can utilize the concepts and I would hope that there would be various seminars given at the various DEC sites on what the structure of the machine is and what we learned. Also, although I would hope that it will not be necessary to build a follow-on 11 at the size of Bluefish, it is necessary to have the documentation and understanding of such, in the event that our planning proves wrong. In the strategy that I put forth, part of which has been accepted, I suggested going on with Bluefish and not marketing the 11/74 in order to insure a longer 11 life at the high end. Given that we did not do that the task ahead for us all is clear:

WE MUST AGGRESSIVELY IMPLEMENT VAX SYSTEM ACROSS A BROAD RANGE OF PRODUCTS!

Therefore, the task of the Bluefish team should be clear too. We must get on with the VAX enhancements, which I believe will most likely take on the form of a significantly improved communications and interface structure, together with peripherals to support this structure. This direction should emerge as the above wind-down work gets completed.

Again, let me say that I'm sorry that the work has not directly resulted in a product. It is essential now to get on with some of the products which we badly need from a total systems standpoint.

Mr. Manuel Blum
Associate Chairperson
Computer Science
University of California, Berkeley
Berkeley, California 94720

Dear Manuel:

I just received the information and offer from you on the Regent's Professorship and Lectureship. Since our telephone conversation I've been thinking about the offer and discussing it with my family and colleagues.

With these considerations I must decline the offer because of the rather strenuous commitments here for the next two years.

I'm sorry, and hope I haven't delayed things at Berkeley.

It was regretful that we couldn't meet at the NSF meeting that Jerry Feldman organized two weeks ago.

Sincerely,

Gordon Bell
Vice President,
Engineering

Mr. Manuel Blum
Associate Chairperson
Computer Science
University of California, Berkeley
Berkeley, California 94720

Dear Manuel:

In reference to your letter of October 13, I don't know Dr. Despain's work and I'm in the midst of some work here that I can't interrupt.

Sorry, I can't help on this issue.

Sincerely,

Gordon Bell
Vice President,
Engineering

SUBJECT: RELAYOUT

I think we are in agreement... but we still have a problem.

Manufacturing willl pay for relayout of boards, but it's up to engineering management to direct it. I'd like the list of requests to the various groups to be clear, and what the priorities are within the various groups.

There is going to be much conflict. I will push to have new products be the second priority, with the breadboarding of prototypes being the highest priority, and relayout being third. Highest ROI is on new products! ... and we have to get this turnaroud time substantially better.

IBM is rumoured to have ordered 25 multiwire machines. If I were them, I would have ordered at least one per engineering site so as to be able to compile designs as fast as software. Our overall prototyping facilities and ability to get hardware done is really abysmall. I would like to get Multiwire at each facility! (The issue is not getting the first pcb or wirewrap, relatively quickly, because this is improving I suspect (or would hope). The issue is getting it accurately, and keeping an up to date copy in a breadboarded fashion. And then getting a few copies maded quickly and easily.)

I don't see anyone except Ulf worrying about the Engineering process per se. This would seem to be about our highest priority in the 80's.

SUBJECT: RE: RE: RE:ONE WEEK PROTO BOARDS

We must be careful not to abuse it. The goal of turn around accompanied by a comparable goal of each engineer to reduce the number of passes for a design by one, should also help turn around like crazy.

Therefore, the goal is: one week board turn around for a correctly stuffed pwb, given the suds input and reduce the number of designs submitted by one (currently it is about 3), by doing structured design, logic design walk through to check for correctness, and having the design right in the first place before antyone looks at it.

We must address quality by doing things right!

3 COM
1390 Shorebird Way
Mountain View, CA 94043

Dear Bob:

Congratulations on enlisting IBM's support to make Ethernet a success. It is truly gratifying to see that persistence (mainly yours) is beginning to payoff. This is going to make

LANs possible instead of the continued reinvention of physical links. I can't say that I'm very proud of the rapidity with which I lead the DEC products, but we spent a fair amount of time looking at new cables rather than just building Ethernet products. Unavailability of chips contributed to the slowness too. The newer chips, especially National's should really make it widely available for use with PC's and even terminals. Ethernet will become the base component to build new systems.

I met some folks at Excelan the other day at Electro and they indicated that the IBM cabling announcement was unleashing orders. AT&T's support, along with various vendors such as Prime, is encouraging too.

Maybe it's my inventive mind, but what's the possiblity that IBM has licensed the token ring patent in order to make their own net proprietary and NOT an open standard?

Is it possible to get all (or a few Ethernet vendors) together and make a big cabling announcment? I would lead this if I were at DEC, but you could count on me to be part of a serious spoof if you lead it. It would posit an alternative to their announcement which would solve the same problems, but has been here for two years. I think it needs to be done, and AT&T might be persuaded to join in if the announcement also says don't pull out your old telephones. It was surprising to see that IBM didn't include CATV in the bundle, since there were already 5 other cables.

When I get the full poop on their scheme, I'll try to work this out in more detail, but for now, what do you think of the idea, complete with manuals, cables, etc.?

The dream you inspired in me of "Ethernet is the Unibus of the Fifth Generation" is in sight. Thanks for inventing it, but the real contribution is persistence.

Sincerely,

Gordon Bell

Chief Technical Officer

GB13.19

CC: Ken Olsen, Pat Courtin
May 18, 1984

Dr. Robert Metcalfe,
Chairman
3COM
1390 Shorebird Way
Mountain View, CA 94043

Dear Bob,

Congratulations on going public. I now want to take you up on the offer to get The Computer Museum $5,000,000 (recall I agreed to work on the other $5,000,000).

The Museum is now moved to Boston, and we had our first opening, the Pre-Preview Party at which Bob Noyce recounted the invention of the IC for our archives and report. 300 people, including bankers, new company presidents and contributors visited the Museum for the first time.

The Computer Museum needs **both corporate and personal level support** right now in order to open on November 12 and demonstrate its capability. Enclosed is various material, including a short letter on why the Museum that I wrote.

Our goal is to have 200 companies who provide annual support between $2500 and $25,000. This will create the needed additional annual funds and insure that the museum is industry wide.

Digital is providing $600,000 annually (paying the building costs and a variety of operating costs), for the next four years. After that, The Computer Museum must be on its own. A large portion will come from visitors and other earned income, but the Museum also needs annual membership from a large number of corporations. At present, **the annual membership is $2500** (and 3COM can also become a Corporate Founder if this happens **prior to June 24.)**

$2500 annual support would insure that 3COM could use the archives, hold several membership cards for employee check out, and help us insure that artifacts are saved. The Museum will also make its facilities available after hours and on closed days, only to Corporate members. Gwen will be happy to prepare any documents for your contributions committee or appear before them.

On the other hand, the capital campaign to raise $10,000,000 is largely directed towards individuals. At the level of $100,000 gifts we are willing to consider a wide variety of commemorative and other opportunities to insure given exhibitions and collections. One possiblity is the "Bob Metcalfe Collection and Archive of LANs", that would be archived and targetted as a special exhibit. You could also make sure that the right things were saved just by creating the "shopping list" of things to go after, like the cable that IBM just announced. Currently, we have an Alto, and one of the early Ethernet Transceivers from PARC.

We are seeking about $1.5M for the November 12 opening, of which we have commitment now for about $350K from various companies, board members and others. Mike Spock, a board member and the director of the Children's Museum, believes we will have an audience of over 240,000. Our breakeven is about 120,000 so the push now is to get the Museum open in Boston in order to really test the market. I believe we have the plan and capability to do it, provided we get the money to open. The past five years have proven that The Museum can deliver what it promises. **This is why I sollicit $100,000 from you now.**

Gwen will be out to visit on Friday, June 8 to discuss this in more detail and to enlist help from you and Robin.

Sincerely,

Gordon Bell
Chief Technical Officer

Enclosures

GB13.

Bob Rau, one of the principles of ELEXSI called me about our interest in funding a Supercomputer company which he'd run. He's now in charge of the I/O devices and has designed several gate arrays for Elexsi. They want our marketing and overall management expertise since they feel well qualified to get the product to production status. They have people from TRW and a financial type. This has been in planning for about 3 years with several people from other parts of the country.

Elexsi is coming along fairly well with about 3 in the field. It's an 8 processor UNIX based computer... and could even be a source of multiprocessor UNIX to us.

Their product would be a Cray-like computer, built from MCA 2500 gate arrays and the goal would be to consistently deliver 50 Mflops by having a really good compiler married to the architecture. He was sketchy on the compiler person. The machine would sell for about $400K and deliver about what a Cray does. He doesn't see how it could have caches or demand paging and still get the speed, nor would it have multprocessing at fcs.

He believes it would take 2-2.5 years and cost $8-10M to bring to market. He wants to meet me when I'm out there the week of Thanksgiving in order to hand me their dozen or so page plan that'll be done.

Can we discuss this?
June 2, 1982

Bob Spence
ML1-1/T63

Dear Mr. Spence:

On behalf of Central Engineering, I would like to personally thank you for your contribution to the success of the Central Engineering Booth at the DECUS Meeting in Atlanta.

Very positive feedback has been received from our customers that were in attendance. Thank you for the effort you expended to support their needs. Your enthusiasm and endless energy in the preparation and execution of the booth is recognized as a key factor in our success.

I wish you continued success in the future and look forward to future activities that demonstrate the abilities of our products and our people.

Sincerely yours,

Gordon Bell

SUBJECT: WHAT ABOUT THIS BOOK THAT WE MIGHT DO?

Am not sure you folks have any more time than I do, but
somehow
the following needs to be done. Maybe we could spend the
next
few months planning and then try to do it this summer.

What do you think of a book which the three of us might
sponsor and
edit?

It would have a bunch of parts which we'd each have to take
responsibility for and write introductions and then get the

various
authors (and spur them on).

THE DESIGN AND CONSTRUCTION OF THE DIGITAL COMPUTING ENVIRONMENT

I. Overview-GB
    The Corporate Strategy, December 79, goals
    Central, distributed computing, personal computing and clusters
    Technology driving the 5th generation and the transitions
    VAX as the basis for 5G computing-Strecker/Hustvedt
    The process to manage this-Fuller

GB:swh
GB0002/28

GB3.S4.3

It would be great to have a book that counters Soul of A New Machine. My problem with it, other than the engineering, was that I don't think the author liked the subjects at all, nor did he understand them. Unfortunately, the book was successful as measured by the Pulitzer Prize, and there is some expectation about what a project book might look like. Fortunately, VAX and VMS didn't look like DG's project and hence it really would appear dull by comparison. Also, copies of books always turn out to be much less significant than the original. (I sure like dull engineering projects versus the exciting ones say like Venus.) Therefore, I am highly negative about Soul of VAX/VMS because it has the markings of a copy, which unlike VAX/VMS was original and which caused DG to have to have their project.

What I would really like to see is a companion book to COMPUTER ENGINEERING, entitled COMPUTER ENGINEERING: A DEC VIEW OF SOFTWARE ENGINEERING. Note that COMPUTER ENGINEERING has sold in the range of 20K copies the last time I looked, so I know there's an excellent market. Bob Supnik had talked about such a book and we often talk about this book along with the idea of a DEC Engineering Journal. Others have talked about writing various articles. I have a tree that Richy Lary drew that relates various versions of various Operating Systems to one another, for example to give an overall perspective.

It would seem to me you would be the ideal person to write and edit such a book. You would gather many articles that exist today plus you would write the really definitive article or section (set of articles) on VMS. The issues you raise in your outline could be addressed in a section on VMS... or even a book on just the Engineering of VMS.

It seems to me you could proceed on a book, but really write it from a technical perspective, although putting in the people parts, but the audience is really Engineers (Software and Hardware and others) and the emphasis is how to do it right. It isn't a book about a bunch of kids trying to build something where the management is playing games.

What you think? Let's get together on this to brainstorm if you think it has merit

Roger S. Borovoy
3065 Bowers Avenue
Santa Clara, California 95051

Dear Roger:

I'm happy to contribute, but I'm very poor at this kind of work. Also, I'm on the EE Visiting Committee, give a lecture every other year, and so I do contribute time already.

Sorry, I must decline.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

June 18, 1984

Dr. Lewis Branscomb, Chief Scientist
International Business Machines
Old Orchard Road
Armonk, New York 10504

Dear Lewis:

I'd like to thank you for all the help you've given the Museum that resulted in IBM becoming a Corporate Founder. It is great to be able to "communicate" with IBM for photos and artifacts for the November opening.

Enclosed is a new brochure on the Capital Campaign that outlines the plan. If you have any ideas that might help get IBM support for the campaign or exhibits such as Sage or the 1401 that Travelers Insurance is sponsoring, I'd certainly welcome them.

A first rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the computer and the image. We predict attendance of over 200,000. This world-class, international Museum should be a major attraction and asset for the computing community.

Given the difficulty of obtaining large corporate support for public institutions, it is vital to get support from individuals. I hope you'll consider becoming a "Core" supporter to the campaign. Also, I hope you'll become a founder. (The founding period closes July 1.)

Thanks again. I hope you'll consider visiting the Museum in the near future when you're in Boston; Gwen and I would be delighted to give you a tour and a meal.

Sincerely,

Gordon Bell

BRAZIL

Dear Silvio:

Please accept my warmest thanks for the fine hospitality shown Gwen and I in Rio and Sao Paulo. Manaus and the Amazon turned out to be great too.

I'm more enthusiastic than ever about the potential of Brazil and hope we can somehow act to make it a large, DEC market. We thoroughly enjoyed the sights, the conference, visiting customers, and the enthusiasm and competence of fellow employees. Will be sending you the paper soon on "Approvals to Establishing National Computer Industries" and look forward to your comments and it being a useful educational tool in effecting Brazilian policy.
Again thanks and I look forward to a continued interaction.

Sincerely,

Gordon Bell

Dear Professor:

I certainly enjoyed our interaction at the University of Rio on October 10.

Enclosed you'll find a list of the design programs we currently use together with an abstract of what each does. Also enclosed is a list of some of the test equipment we use in design and manufacturing.

If you want manuals on them, let me know and I might be able to send some to you. Please <u>do</u> <u>not</u> copy either of these documents. In case you don't have a copy, I'm sending a copy of the book, Computer Engineering, written by several of us here which describes the design of DEC's computers.

Again, I enjoyed meeting you.

Sincerely,

Gordon Bell

Professor Lucas A. Moscato
Universidade de Sao Paulo
Escola Politecnica
Depto. de Engenharia de Electricidade
CX. Postal N: 8.174 - Cidade Universitaria
Sao Paulo, BRAZIL

Dear Professor:

It was a great honor to visit your department and to learn about the activities of the Institute for applying computers through Professors Nelson and Zuanella. I enjoyed the interaction with your students and some of your faculty and deeply regret that the three of you could not attend my talk because I would have liked to learn more from you through discussion.

I am sending a copy of a book on Computer Engineering that several of us at Digital have written. Hopefully it will be of use in your teaching program. If you would like more copies for various faculty members or for the library please let me or the local Digital office know.

Again, thank you for the honor of meeting with me in Sao Paolo. I hope you visit us here and I have a chance to return the hospitality.

Alain Brieux
Expert
48, rue Jacob,
PARIS VIe

Dear Mr. Brieux,

I have studied the Malassis Chauvin Collection in some detail and have a proposal that I believe would be advantageous to both of us.
There are a number of pieces in the collection that would round out my own, and would not essentially disturb the totality.

The offer that I have to make is in three sections -- each one conditional to the previous one.

I. 13 items for $25,000:

1 59. L. Bollee Calculating Machine

2 92. Comptometer No 5857.

3 103. Arithmometer Archimedes.

4 118. Gauss circular machine. 1905.

Willard Gardner
Director of Computer Services
Brigham Young University
Salt Lake City, UT 84100

Dear Dr. Gardner,

Dick Eckhouse informed me that you were retiring the Stretch from active service. I would certainly like to preserve parts of it in the Digital Computer Museum. For your information, I'm enclosing a museum brochure and one of the first newsletters. Posters of computer genealogy and announcing J. Forrester's lecture are being sent under separate cover.

The goal of the museum to preserve computing history, and in so doing want to use every form of record keeping. Thus, I have a variety of ideas that for Stretch.

First, and most simply, we'd like some good color and black and white photographs of the machine in action, giving some concept of scale.

Second, we would pay $500 towards the making of a short video-tape record of the machine in use, demonstrating a simple program. I would hope that you would also find that this would be useful for the universities own archives.

Third, we would very much appreciate a console panel, with its lights and switches and some modules, and cables that could be integrated into a display that might simulate the environment of Stretch using some of the photographs of the machine. In addition, we would like some manuals and diagrams for archiving. We will, of course, pay all expenses for boxing and shipping the pieces to Marlboro and give you the appropriate credits. We would also like a single disk, and actuator from one of the drives if you dismantle them.

We hope that you would consider cooperating with us on this endeavour as I am distressed when the early machines are simply dumped without good records being kept and an exhibit created. Please feel free to call me or Gwen Bell if you have any questions.

If you have an opprotunity to come to Boston we would be delighted to show you the museum and will put you on our mailing list.

Sincerely yours,

Gordon Bell
Vice President, Engineering
Keeper, Digital Computer Museum

British Science Museum
Jane Raimes, Assistant Keeper
South Kensington London SW72DD
ENGLAND

Dear Jane:

We can give you a Classic PDP-8 (circa 1965) that we believe was the first minicomputer. It would sit on some pedestal (we'll supply if you want) and is approximately 2 1/2' high and 20W wide x 30" deep. Do you still want it?

We're in the throes of opening our own Digital Computer Museum in Marlboro, Massachusetts this fall. It includes a reasonably good collection of calculators; a logic exhibit; MIT's Whirlwind and TX-0; MIT's LINC, a LINC-8, PDP-12, and our MINC Laboratory series evolution, a PDP-1 (first Spacewar), a PDP-8, and a collection of artifacts from our machines.

What's the chance of borrowing some parts from the Science Museum for a year?

Sincerely yours,

Gordon Bell
Vice President
Engineering

| d | i | g | i | t | a | l | **interoffice memorandum**

Subject: **VAX Advertising Input**

To: Doug Towle, MR1-1/M55

CC: Jim Bailey, PK3-2/M88
Bernie Lacroute, TW/A08
John Leng, MR1-1/A65

Date: 1/16/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Thanks for allowing us to have some input to the advertising and promotion of VAX. Please convey my thanks to the agency and pass along this note.

I'm sorry that we didn't learn more about advertising and PR in the process because it might be more helpful in the future. Although I think the ads so far are fine, and hopefully will win awards all over the place, I believe we were fed a baloney sandwich (there are other similies). Since I don't know the right adeeze for this, Clayton defines this sandwich as something you feedback, independent of what the input is. The meeting was relatively useless. Namely, we couldn't change anything, I don't feel any of our input was used, and in general there was lack of involvement to get what may of been a pretty good thing into the great categorie...which is how I feel about the machine. Since the PR and marketing has been so abysmally poor, I must be thankful that something is happening at last. John and you are to congratulated. Now, I have an understanding, given the support including the training program why the sales have been so disappointing and only the customers love and respect the product. Hopefully, the computer market will develop to the point it is needed and we will have to sell it.

The brochure could be really good and the future work could be too, but I don't feel you have a plan or idea in place as to the next ads and the direction of the brochure. The idea of interviewing people to me in an unstructured way and basing a program on what they feel like seems just somewhat leaderless.

Of course, the developement group is at your disposal to help on any future work because they are also dedicated to the success of the product. Please keep up the good work.

Mr. Brook Byers
Kleiner, Perkins, Caufield and Byers
4 Emarcardero Center
Suite 3520
San Francisco, California 94111

Dear Brook:

Just a short note to follow our phone call last week requesting help for the Computer Museum. I understand your firm's reluctance in fund raising for the Museum at this time, and regret that you and Tom will be unavailable when Gwen and I visit the Bay Area Thanksgiving week. I do hope to call on you for personal assistance after your sabbatical. As a first step, I hope you can visit the Museum soon to see it and understand the vision behind it.

As I mentioned on the phone, the Museum is now raising 10 Million dollars in order to: buy 55,000 square feet of space with the Boston's Children's Museum; move from the current space within Digital's facility in Marlboro Massachusetts; build new exhibits; and provide an endowment for future growth. We will spend about $500,000 for San Francisco's Computer Mart exhibit when it opens in September.

I'm enclosing Reports which describe the Museum together with a Statement of Case for our fund raising. Note the extensiveness of the collection, it supporters, and hence why the institution is both unique and so important.

My plea right now is to urge you to **give a substantial gift this year**, perhaps with a conditional pledge for subsequent year gifts if our efforts continue to bear fruit. I have currently pledged $100,000 for the next 3 years, and hope to increase this as my earning power increases... hopefully along with the price of Digital's stock. We have a commitment of $1 Million from Digital for the building; $1 Million to be raised by CDC in the Midwest area; and several $ 50,000 gifts. The campaign just started this fall.

I do hope you can begin to support us now financially, and follow this with your very persuasive and enthusiastic personal support over the coming years.

Have a good sabbatical.

Sincerely,

Gordon Bell

Dr. Harvey Brooks
Chairman, CSS
c/o Dr. Edward Epremian
Executive Director, CSS
National Research Council
Commission on Sociotechnical Systems
2101 Constitution Avenue
Washington, D. C. 20418

Dear Dr. Brooks:

Although the proposed study is sure to yield interesting and possibly useful results, I fear that the interpretation and popularization of the results could easily limit future and even stop computer science's study of various computer applications.

In reading the proposal most broadly, it encompasses nearly all use of computers. For example, personal computer aided instruction systems control the learner as he proceeds to scan and learn educational material. We could conjure up situations where erroneous material or even errors in the program had some consequences to the learner. Somehow, I see such a system as being quite analogous to a book -- society permits relatively free publication. A study committee could easily recommend a bureaucracy for the evaluation and qualification of all such systems -- including verifying whether the add key of a calculator adds properly -- because a calculator may be used in a vital control application.

I believe computers supplement other information processing (including transmission, switching, transduction and memory). There is always a human or organization responsible for the consequences of the application of the instrument, just as there is when employing a person to carry out a task. I'd like to leave the situation this way until there is a better way to test and regulate the largest body of information processors (i.e., people and society). I shudder at the thought of a committee singling out and looking at the problem for just computers. For example, computers and privacy once understood was really an issue of information and privacy, independent of how the information is stored and processed.

To answer the questions in your letter:

1. There may be a problem, but the study group is certain to make it a significant problem.

2. The study should be attacked from a very detailed case study and then attempts to generalize should be carried out. For every system, I propose that there be a parallel study of a system involving no computers in order to assess the same question of vulnerability, failure modes, graceful degradation, and include noise that may trigger erroneous control behavior, errors, certification and verification of capabilities.

3. The study is likely to trigger more studies, and more legislation with no public benefit.

4. Probably not. Detailed case studies over a long time period prepared by many individuals working on specific systems (with a wider board guiding the directions).
No. No.

Thank you for giving me the opportunity to comment on the CSS study. I hope that the comments have been helpful, however, I'm skeptical of anything that is likely to get large, legislative groups involved in detailed system or component designs (e.g., using catalytic converters, more mass for protection) instead of broad guidelines (e.g., greater than x miles/gal, less than y ppm of certain materials).

Good luck on the study.

Sincerely,

Gordon Bell

SUBJECT: TREATING BROWN WITH RESPECT

I think we want to work with Brown somehow. I'm terrified of having another small group go there, Tom, and talk to them. They are really not in a mood to have us trapse through and be performed to with no action. If this is the design review portion, then George and the team ought to be there to get the
full benefit.

At the meeting we had with Brown, I got the sense that we have to go there (at least Sam, Dick, George and I, plus some others who'll benefit by the interaction on presenting the workstation). Because they are so close, we treat them the same sloppy way as we treat ourselves.

I think it's imperative that someone within engineering take on this liasion role and lead us to a conclusion (go/no go) with them. I do not want to be on the receiving end of Andy Van Dam's pithy letter to Ken that says what a jerk we are for not working with them and for leading them around by the nose. This next visit that you are proposing is

NOT at all what I think we agreed to in the meeting with them, and it will get us into just more hot water there.

We have a history of really screwing up these things by having everyone involved. The mess at CMU finally got straightened out by finding a sponsor who would take the lead.

I'm concerned that we set the right tone. If this is just a presentation on the onyz and opal architecture, fine. If it's
more, then we'd better get our act together so as not to just make this another visit for them to get their dogs and ponies out for. Clearly if it's to get their input, then it should be aimed at getting a large team down there to present so that we get the maxiumum learning. Sam, I'd like you or your delegee or me to go in order to take advantage of this independent
assessment of our WS architecture.

Clearly we must have someone taking the lead. Who is this??????

LESSONS ON REJUVENATING EXPERIMENTAL COMPUTER SCIENCE

+DON'T WAIT AROUND FOR SPECIAL FEDERAL FUNDING IF YOU HAVE IDEAS.

ALTHOUGH IT IS CLEAR THERE HAVE BEEN A PLETHORA OF BAD IDEAS FUNDED, IT IS UNCLEAR TO ME THERE IS A COLLECTION OF NEEDS RIGHT NOW JUST LOOKING FOR FUNDS. IN WORKING ON THE COSERS REPORT, IT FELT LIKE THESE WERE INDEED ONLY A FEW, MAJOR IDEAS.

+IT IS NOT CLEAR THAT EXPERIMENTAL CS IS SO DEAD THAT IT NEEDS REJUVENATION. -- IT DOES HOWEVER, NEED TO BE REDIRECTED. VIRTUALLY ALL PAST, SIGNIFICANT CONTRIBUTIONS CAME FROM A NEED (APPLICATION) OR WELL AS BY-PRODUCTS OF SOLVING A PROBLEM, AND I WORRY ABOUT WHETHER OUR WORK NOW IS NEED BASED!

IF WE LOOK AT THE GREAT CONTRIBUTIONS, ESPECIALLY IN THE HARDWARE AREA, THEY WERE ALL DOMINATED BY A SINGLE INDIVIDUAL AND THEN EITHER EXECUTED BY THE INDIVIDUAL OR A TEAM.

UNFORTUNATELY, BABBAGE ALTHOUGH ONE OF THE EARLY GIANTS MAY HAVE INITIATED BOTH GROUP WORK AND THE IDEA OF GOVERNMENT

FUNDING. BABBAGE ALSO LEARNED ABOUT OVERRUNS, MISSING SCHEDULES, AND MAY EVEN HAVE STARTED AREA RESEARCH BECAUSE HIS OUTPUT WAS NEVER FOR WHAT HE WAS FUNDED. THE SIDE EFFECTS WERE INTERESTING AND WE ATTRIBUTE THE IDEA OF COMPUTING TO HIM NOW! MOST OF THE EARLY WORK WAS DONE BY INDIVIDUALS WITHOUT GOVERNMENT FUNDING.

DON KNUTH'S TEX SYSTEM, IS REPRESENTATIVE OF THE KIND OF SYSTEM I'M TALKING ABOUT. IT IS RELATED TO A SIGNIFICANT NEED OF SOCIETY AND DON IS PERSONALLY DRIVEN TO SOLVE THE PROBLEM. THE CONTRIBUTION CAME BY BEING A GREAT CSCIENTIST <u>AND</u> LEARNING ABOUT TYPOGRAPHY VERY DEEPLY.

ENIAC, WHIRLWIND, AND EVEN CTSS WHERE GROUP PROJECTS GREW OUT OF VARIOUS NEEDS - AND IT'S HARD TO SEE SIMILAR ACTIVITIES NOW, WITH THE EXCEPTION OF VLSI PROJECT - WHICH TOOK TOO LONG TO START. WITH ALOT OF FUNDING, RESEARCHERS GET SOFT AND DON'T WORRY ABOUT NEED. TOO MUCH FUNDING COULD PREMATURELY AGE EXPERIMENTAL COMPUTER SCIENCE BEYOND REJUVENATION, BECAUSE RUNNING EXPERIMENTS IS HARD WORK.

<u>+DON'T BELIEVE THAT FUNDS, PER SE WILL SOLVE PROBLEMS.</u>

THE FELDMAN REPORT BEMOANED THE FACT THAT UNIVERSITIES LOST FACULTY TO INDUSTRY AND I HOPE GOVERNMENT. DEPARTMENTS SUCH AS HISTORY AND ENGLISH WOULD LOVE TO BE IN THIS SITUATION OF LOSING PEOPLE BY FLOW-THROUGH. THIS IS THE KEY WAY TO HAVE A DEPARTMENT REJUVENATED. THIS SEEMS IDEAL TO ME. MORE FUNDS WILL ONLY CREATE HIGHER SALARIES AND LESS EQUIPMENT BECAUSE THE GOVERNMENT EXPENDITURES IN THIS AREA BARELY KEEPS UP WITH INFLATION.

<u>+COPY FROM THE JAPANESE.</u>

THEY SEND ALL THEIR FACULTY AND INDUSTRIAL RESEARCHERS TO AMERICAN UNIVERSITIES THAT ARE ARPA FUNDED. MAYBE, JUST A FEW UNIVERSITIES FOR EXPERIMENTATION ARE ALL WE NEED, THE REST DO TEACHING.

THE JAPANESE UNIVERSITIES ARE FUNDED BY INDUSTRY, BUT USUALLY NOT BY GOVERNMENT. THIS IS BECAUSE THE JAPANESE DON'T HAVE SUCH A BIG GOVERNMENT AND INDUSTRIES CAN AFFORD TO FUND MORE RESEARCH AND RESEARCHERS (EITHER IN JAPAN OR ABROAD - WHICHEVER IS MORE COST EFFECTIVE). FURTHERMORE, JAPAN HAS INSIGNIFICANT GOVERNMENT LABORATORIES. THEY FUND THE COMPANIES AND BY THE FUNDS FLOW, THERE IS ALSO A PATH AND REASON FOR IDEAS TO FLOW.

<u>+WHILE GENERAL PURPOSE PROGRAMMING LANGUAGES (AND NOW I SHOULD ADD OPERATING SYSTEMS, EDITORS, TYPESETTING SYSTEMS) SEEM TO BE FUN TO INVENT, WE REALLY DON'T NEED ANY MORE, THEY TAKE UP PEOPLE AND MACHINE RESOURCES. WE NEED SYSTEMS THAT SOLVE PROBLEMS WITHOUT PROGRAMMING (AND LOOKING TO AN EVOLUTIONARY LANGUAGE REALLY LOOKS FRUITLESS).</u>

<u>+LOOK OUTSIDE THE COMPUTER SCIENCE DOMAIN NOW FOR APPLICATIONS (NEED) AND DON'T IGNORE BUSINESS OR THE ARTS!</u>

IT FEELS LIKE WE HAVE A REASONABLE BASE SET OF CONCEPTS (ALGORITHMS) AND MECHANISMS TO IMPLEMENT THEM, AND MOST OF THE ADVANCES NOW WILL COME FROM SEARCHING FOR THE APPLICATIONS LIMITS I.E. NEED. THIS FEELS QUITE SIMILAR TO HAVING VARIOUS MECHANICAL LAWS AND WAYS OF ANALYZING SYSTEMS AND THE VARIOUS MECHANICAL CONSTRUCTS (EG. LINEAR TO ROTATION, 4 BAR LINKAGE) THAT ABIDE BY THE LAWS. THE ISSUE AND REALLY SIGNIFICANT ADVANCES WILL COME (AS BY-PRODUCTS) FROM BUILDING SYSTEMS THAT DO USEFUL THINGS.

THE BUSINESS COMMUNITY IS CRYING FOR HELP. BUSINESS SCHOOLS ONLY UNDERSTAND THE COMPUTER AS A TOOL AND HAVE NO KNOWLEDGE OF BUILDING SYSTEMS - THIS COULD REVOLUNTIONIZE THE BUILDING OF ORGANIZATIONS THAT ALL END UP AS BUREAUCRACIES. ENGINEERING IS QUITE A LOT MORE ADVANCED IN THAT COMPUTERS HAVE BECOME COMPONENTS, AND THE ARTS IS JUST STARTING TO USE MACHINES. HUMANITIES COULD BE A FERTILE GROUND ESPECIALLY HISTORY.

FOR EXAMPLE, THE STANFORD COMPUTER COMMUNITY SUPPORTED THE JOHN CHOWNING OF THE MUSIC DEPARTMENT. JOHN, A COMPOSER BECAME INTERESTED IN CS AND CE AND CAME UP WITH AN IDEA FOR DIGITAL FM FOR MUSIC SYNTHESIS AND HAS A PATENT ON IT WHICH HE HOPES WILL BE SUFFICENT TO SUPPORT THE STANFORD MUSIC DEPARTMENT. RECENTLY, HE HAS APPLIED THIS FORMULATION OF SYNTHESIS TO VOICE, AND IT STANDS TO BE AN ALTERNATIVE TO THE VARIOUS THE VOCODERS THAT HAVE EVOLVED IN A RATHER SINGULAR DIRECTION FOR THESE LAST 50 YEARS.

<u>+WORK ON FIELDS YOU CAN EXCEL AT, MUCH OF THE EASY WORK HAS BEEN DONE IN CS; I BELIEVE THE MAJOR WORK WILL COME FROM A MULTIDISCIPLINARY APPROACH.</u>

FOR EXAMPLE, THERE'S A SIGNIFICANT NEED IN VLSI IN APPLYING WHAT WE UNDERSTAND ABOUT BUILDING COMPLEX SYSTEMS (MAYBE THERE'S NOT THAT MUCH EXCEPT THAT IT TAKES A LOT OF WORK, AND COMBINATORIALS WILL GET YOU IF YOU DON'T WATCH OUT). HOWEVER, LOOK OUT, IT REQUIRES KNOWING A LITTLE ABOUT THE FABRICATION OF CIRCUITS, WHAT ONE BUILDS WITH THE CIRCUITS, AND HOW CIRCUITS WORK. THE ENTRY COST IS HIGH!

<u>+WORK ON SOME PROBLEMS FOR WHICH THERE MAY BE SOLUTIONS AND WHERE PROGRESS CAN BE MEASURED.</u>

A VARIETY OF MEASUREMENTS SHOWING PROGRESS CAN INSPIRE CONFIDENCE THAT LEADS TO FUNDING AND UTILIZATION. IF MEASUREMENTS SHOW THAT AN UNEXPECTED RESULT LOOKS FRUITFUL, FOLLOW IT.

ALTHOUGH WORKING ON THE GENERAL PATTERN RECOGNITION PROBLEM IS FUN FOR COMPUTER SCIENTISTS WHEN THEY ARE LEFT ON THEIR OWN, IT DOES NOT REFLECT A NEED OR AN AREA IN WHICH A VARIETY OF USEFUL MEASURES CAN BE APPLIED. IN CONTRAST, WE DESPERATELY NEED PEOPLE TO WORK ON BANDWIDTH COMPRESSION THAT WILL BE SUITABLE FOR PROVIDING SERVICES LIKE THE PICTUREPHONE MEETINGS. THIS WOULD HELP THE ENERGY PROBLEM ENOROMOUSLY, BUT THERE ARE OTHER PROBLEMS IN THE COMMUNICATIONS DOMAIN TOO.

<u>+COMPUTER SCIENTISTS SHOULD ADDRESS OUR CRITICAL PROBLEMS:</u>

<u>ENERGY CONSERVATION BY SUBSTITUTING INFORMATION FLOW FOR MATERIAL FLOW IS; MANAGEMENT OF INFORMATION AND BUREAUCRACIES, BUT THE MOST IMPORTANT IS THE APPLICATION OF RESOURCE ALLOCATION TO THE BIG ISSUES , REPLACING THE ANTIQUATED CONCEPT OF THE INTERNATIONAL MONETARY SYSTEM WITH INTEGRATED ACCOUNTING OF THE FLOW OF ENERGY, IDEAS, AND HUMAN RESOURCES, IN ORDER TO GET US OUT OF THE UNSTABLE SYSTEM DEPENDENT ON THE DISTRIBUTION OF ARAB OIL AND JAPANESE GOODS, AND INTO A STABLE SYSTEM WHERE BOTH REGIONS AND THE WORLD HAVE SELF-SUFFICIENCY AND LONG TERM VIABILITY.</u>

June 2, 1982

Mr. Bruce Laskin
NYIT
Gerry House, Northern Boulevard
Old Westbury, New York 11568

Dear Bruce:

Thanks for the presentation of your graphics work that was presented to our engineering group on Friday. It was certainly impressive and we will certainly make good use of the videotapes.

I am trying to get a Professional Personal Computer for you so that your system might be transported for viewing at SIGGRAPH.

Because we had such a brief period of interaction, I do hope you can come and visit us at SIGGRAPH time. I'd like to invite one of you to present a lecture to our engineering community on your work there. We'll present our on plans for graphics, together with some demos to your group. I hope this will stimulate us.

I'd like to have the lecture at the museum in Marlboro, and have a reception afterwards, followed by a dinner there. The lectures typically start at 4 or 5. We might spread the events over two days to simplify scheduling if you prefer. In this regard, I have asked Geogre Champine to co-ordinate your visit.

I do hope this can be arranged because I believe we can work more effectively together.

Again, please extend my thanks to your group for the presentation of their fine work.

Sincerely,

Gordon Bell
Vice President of Engineering

M J verify that Shel gets this first thing in the morning...we need the DEC
muscle.

Situation: it is DEC nite and NE Conservatory Preprary nite at the posps on
june 15. We (DEC) apparently have a soloist (piano) and they have
traditionally had a soloist. This is the first time that we

both have
soloists (piano)..but with different pieces..shauman and we have a mendelsohn.
The posps is saying no to 2 piano pieces. I say yes to 2, and we gave a
computer to the BSO for their 200th anniversary.

Vern Alden is on the board there of the BSo, and must surely understand.

The NEC student is 15, a poor, bright, relatively new emigrant from Korea who
is really impressive and a person from Chelmsford who has already invited the
whole town to see her perform and has sold many tickets, etc. We have sold
more, given that we're a bigger organization. Can you intervene and help here.
I say press the posps to have them both perform. The final tryouts is
Thursday, but this is usually a token thing.

The person handling the affair there is Ronnie Lorenzo, and the person at NEC
is Nancy Carter, a fifriend, whose no is 262-1120. Could you call her and
plot to overthrow the BSO?

Date: SAT 23-JUN-79 11:04:08 EDT
Subject: BTL I/C Scheme for computers

Could you arrane to visit A G Fraser next week to look at their breadboard in this area? Our salesperson, Bob Rao, DTN 335-2211 or 201 469 9211 can set it up. This is their second one and it has a structure that solves many of the problems that is contributing to the high cost in ICCS, furthermore, it looks like it is applicable or an alternative to NI. For ICCS it is cheaper, not locked into the speed, and can grow beyond 16. Also, centers can be coupled together in such a way that we might consider it as hubs ffor radiating to local machines...avoiding the need for an NI. Certainly it could be a way to get NI quickly without having to wait for NI and the IC work that it is predicated on.

Fraser has done a superb job and we should build on it. I'd like to meet with you all about Friday after you've visited there and come back and thought about it.

Jim...who is supposed to be working with BTL on what they are doing? Why hadn't we heard about this work?

They are also working on a concentrator for it too. While you are there it might be good to also see a few of their other projects such as the TV phone.

I don't think more than 4 people should go. If it weren't for the need to
meet them and see the lab, I would recommen d that this be done by the
picturephone conference service of ATT.

Just got a phone call from my friend, Max Mathews, head of speech and acoustics research at BTL. He is delighted with the 11/23 with RL01. It really does the job where they had tried, unsuccessfully, to use an 03 with floppy. A major piece is the RL01, in terms of size and response time. Shouldn't we capitalize on this aspect and maybe campaign against the micros and base it on the hard disk/response time?

It seems like everyone has floppies, but from a human engineeering and use standpoint, the cost of ownership is less when you have to figure the cost of people sitting around waiting for the terminal to search for the data or do a job. Maybe an ad showing that we have both, but pointing out the cost to do things like copy, or edit, or research, or do a database type thing really gets the message across. Let's use the fact that we have something unique!

Dr. Ravi Sethi
Bell Telephone Laboratory
600 Mountain Avenue
Murray Hill, New Jersey 07974

Dear Dr. Sethi:

It was indeed an honor and a pleasure to visit the laboratory at Murray Hill last Friday and present my view of the evolution of Distributed Processing.

Even more enjoyable was the interaction with individuals and seeing Ken Thompson's Chess Machine, A.G. Fraser's Datakit and Dave Weller's CRT-based telephone. I also enjoyed the exchange of views with Drs. Aho, Bourne, Chesson, Ritchie, McIlroy, and Hank MacDonald and am sorry we didn't have more time. Somehow I'd like to work out some arrangement whereby individuals from the Laboratories could visit us and have similar interaction - provided they were interested.

Again, thank you and your colleagues for a most enjoyable day.

Sincerely,

Gordon Bell

SUBJECT: STRATEGY TO RAISE THE C.E. BUDGET A % OF NOR

As we discussed at EBOD, I would like Mike to apply his analytical talents to fleshing out the rationale for raising the C.E. budget by approximately 1%, based upon what I believe are the increased costs of necessary backward integration. I would like to look in detail at the apparent shift in cost from manufacturing (component cost) where the engineering investment is made by our supplier to engineering - namely, is the increased engineering expense offset by lower manufacturing costs? A good model might be as if DEC had a captive semiconductor division doing the engineering and manufacturing and transferring the chips to C.E. at market price.

Now is the time to tackle this problem. Mike, would you please advise me on how quickly you can proceed here? Let's discuss other alternatives also.

Subject: Budget adjustments

I would like us to get a list of adjustments that have been made to the
engineering budgets each year for the last two years at least. If these look
worth going back further, then let's do it. My feeling, is we get "nickled
and dimed" back in terms of % and don't use this to reset each year. Now, is
the time to make this clear and stop it! (And go back after the money) I
believe we need the full $5M, not just the $3.1M, and I want to get it all
back fair and square.

THOUGHTS ON ENGINEERING RESOURCE ALLOCATION FY84
(Objectivity by remoteness)
Gordon Bell
4/20/83

LOW END

VT'S

-I don't think there's a clear direction or any exciting products!

-While we have an aftermarket and a connection to our timesharing market, the vast market ALL want their own PCs for responsiveness, a larger screen, graphics, private ownership. Can VT's on shared systems survive ? (I think we can make them appear to be more responsive, given there's so much processing and memory in them.)

-The new chips don't appear to be useful for implementing the WS graphics; on the other hand, it's unclear whether WS Grahipics architecture is competitive.

LA, LP, PRINTERS

-(Strategy ~= development work ~= budget) = Disaster
(The writeup using coding and many inconsitent budgets was

virtually
unintelligible by an average person (me)).
-Still don't believe in our building a laser printer, buy it, and build a print server on Seahorse/Seaboard!
-The schedule and cost are terrible for the print server, given there's only one board to do and some applications software to write.
-The LA12 represents an interesting form factor (physical design) for building attractive, useful systems such as editing and forms (ie. the LA13). The LA13's schedule is ridiculous. It should take <6 months!
-Are we making our last acupuncture printer? and switching to thermal transfer? (What are we getting? What are we giving up? Make this decision much more visible and explicit!)

DECMATE
-I can't understand what it's trying to be, except a machine for doing everything. As 8 architect, engineer, resource allocation recommendor, and DEC stockholder it pains me to have seen us lose so much on the 8. Now, when we are about to make some money with it, we are about to piss it away. As such I don't see it as viable to be ALL of these:

- Super WPS (including full page) for all users including technical marketplace together with coupled.
- Configured with Wini so that users have to do backup, etc.
- IBM PC killer with WPS using Z80 and 8086.
- SBS based on the 8 (because we don't have the 3rd party software writers, nor are we spending money to enhance DIBS.)
- Multi-user machine (this one blew my mind).

-Why evolve it to be a Rainbow?
-Why not just concentrate on following the lowest cost line?
-Is the 19" that easy and that cheap?
-If we go all out like crazy to make the cheapest machine, giving us a true VT100/125 replacement, with these options, we could win big:

- Built-in modem
- Small screen and portable carrying case
- Z80 and appropriate software to do specific jobs (eg. Visi...)
- 19", if it doesn't drive the cost out of the ballpark

. VT125 emulator board, and ability to edit figures
. Improved WPS software, including interface to VAX, 11 (Business) and 10/20 for better total filing/file server system

RAINBOW

-What's the minimum set of constraints the group can be given so that they can concentrate on the competition versus internal conflict?
-Can the constraints include some minimal communication and file transfer to VAX?
-What additional resources are desireable?
-Charter should only be track and beat IBM (for awhile)!
-Resolve whether we are trying to be an alternative PC PC (Plug Compatible PC) so as to take advantage of IBM fallout or whether we are trying to be unique!!
-Who's going to supply the IBM compatible card for the Qbus in order to capture and migrate users to us that Ken talks about?
-Stay away from MicroVAX unless it is totally externally constrained versus having to meet DEC architectural constraints (and meetings).

PROFESSIONAL

-Fix the response time now, otherwise we won't get the sales!
-Decide on market: connected to VAX, UNIX, RT, Industry standard via standard language interfaces (eg. RM Cobol), softcard
-Decide on applications (if any) vs generic tools: WPS, Spreadsheet, database, plotting, etc. Is this for any of the business area? Just scientific? Should concentrate in applications that can be moved to MicroVAX... we seem to be in do everything mode.
-Minimize systems investment in 11's (POS for better graphics and response time, J-board, etc.)
-Just do DECnet and stay out of clusters world. CT attaches to VAX and its file system/file server.
-Microswitch seems idiotic and gets us another protocol and set of operating systems beyond DECnet, Omninet, Ethernet, and CX/DX. Why?
-Send people to Quality Design Methodolgy school. The ECO costs and time to market indicate poor hardware design

including the disk area.
-I doubt if a good PC can be made using the current, dispersed software organization: firmware, base system, mods, and applications.
-Overall: Cut the number of things down to meet the group. We must not expand the group forever to meet every opportunity, given the cost and performance of the current product.

MICROVAX PC
-VC (Microvax, 1/2-2 Mbyte, NI, bounded) is the ultimate product centered around a disk server. Requires an unbounded product too for stand-alone and interfacing to real time and other equipment.
-I believe a Qbus-based PC based on Seahorse I, and shippable in Jan. 84 is the most critical product for the PC/WS area. (See Workstations and Seahorse I) because:

- It forces the definition of an architecture for graphics and whether the Workstation Graphics Architecture is it.
- Lets us do the VC a year earlier and incrementally. Also trains VC crew.
- Provides a base for MicroVMS/PC, and applications ONE YEAR earlier. Low Cost Nebula/ Workstation could provide a similar base if you ignore the cost, heat, noise, size (it ain't a PC), and performance (Workstations aren't worried about this.).
- Said another way: LCN/WS sure doesn't look like the answer (see Workstations), nor does it look like one!
- Our users want unbounded VC's as well as bounded versions!

SEAHORSE I ++ or whatever they want
-We are getting more bang/$ from this group than any other, but we aren't building on their hardware or software yet!
-Build Cluster servers on this base for printing, files/Database, gateway
-Use as the base for a MicroVAX PC for shortest time to market!

SEAHORSE II (Lipcon's MicroVAX)
-Precisely what is it besides a board?

16-BIT - (Switch resources to MicroVAX)
-Can we minimize investment more in the Unibus J area (Unibaord)? Still think we should have just done a 24 board replacement that would have also been useful for existing customer upgrades in 11/04, 5, 20, 34, ... 44.
-Don't understand the formation of another group to do Qbus systems under Don Gaubatz, except to create overhead.
-How can we get work done and not spend it all sitting in wait for the J?

SAC

WORKSTATIONS
-An expensive, dumb terminals group with coupled software support... not a PC, nor a competitive WS due to performance, size, cost, power.
-LCN/WS looks ok, but still a factor of 2-4 off in performance, cost, size and power! This is why we have to do a WS based on Seahorse I!
-We must understand whether the performance bottleneck can be fixed, otherwise we should stop building on this architecture! (I say it has a 50-50 chance of being too roccoco.)

MID RANGE
-Scorpio has several critical issues associated with it: board size, connector and cable egress... as well as recovering from TAT020 fiasco.
-LCN addresses the VAX in the office by noise reduction, I hope.

GLORIOSO
-Let's get on with the VENUS follow-ons. We need them yesterday too.
-What can be done to get VENUS more quickly? Work harder? Smarter? In parallel?

36-BIT
-Ken's comment to me this morning, slightly parapharased: "There's got to be a better way, given the PC and WPS revolution, and the fact that we are investing in high end disk, file and database servers, and high performance VAXen."

Find it.
-It seems to late. It will be non-trivial to build a 4X KL with technology that doesn't appear to be 4X. Maybe a Minnow or a 2020 in an LCN box is a better solution now!
-The notion of ever stopping the line isn't there and hence I think we must stop it, otherwise we are committing for Jupiter's follow on too.
-The only attraction is the learning we'll get from doing the design following their new design methodology. But why not apply this technology to VAX?
-We really could use the resources to make some really hot machines: eg. PPA, VENUS etc, HyperVAX, TITAN into production!

DISTRIBUTED SYSTEMS
-Co-ordinate the myriad of servers.
-Answer Ken's concerns about getting large number of terminals into central, shared systems. Show the alternatives, and answer whether we ought to offer a (buy out) switch.

SYSTEM SOFTWARE
-When are you ready to try to reproduce DECwest elsewhere?

MASS STORAGE
-Am very concerned about design methodology for hardware (gate arrays, VLSI, 1 board complex microprocessor-based, and large systems).
-Send engineers to Quality Design Methodology school.

TAPES
-Maya should be it for build. Let's buy everything else.
-Don't see that we can do both IVIS and DAD. Pick one and do it.

LOW END
-After the AZTEC slips and long time to market for RX, it's clear we don't have enough uniqueness or capability or responsiveness to be making proprietary proudcts in what is fundamentally a commodity marketplace.

COLORADO

-Too many new, aggressive products. Can we do even a fraction of them?
-Am concerned about systems ability in the large systems area (ie. HSC). This requires a lot more software discipline than we may have.

BOSE

COMMERCIAL
-Don't we have a unique opportunity with VMS 3B (Hydra) and TP (ie. TDMS/ACMS? Should we invest anymore here until there's a marketing group? I see only an Office Marketing Group and a Small Business Marketing Group? (And a nil to marginal set of products for those area, yet I see strong basic commercial tools, and no marketing or Base Product Marketing.)
- Are we giving up what little momentum we had in Commercial processing?
-Can we continue putting money in the typesetting rathole? Now that I'm supposed to be more directly involved in this allocation on a line management basis, I must declare a clear failure! I have never been enthusiastic about this product, nor do I see it ever completing in my lifetime... Given what I know of it, I believe we should stop this project, not just rename it!

OFFICE
-The group has not shipped a single product outside of DECmate WPS, until the basic problem of ANY productivity is solved, it's crazy to consider any growth. The typesetting part of the budget is clearly and office product too, further exacerbating the spending.
-DECmate WPS Software evolves like molasses as it costs hundreds of dollars per instruction to make the most minor enhancement or hardware support. We must get to a 4th generation architecture, and modern language, eg. Rainbow and Pascal, if we are to provide a competitive product in terms of features.

SMALL BUSINESS SYSTEMS
-The plan to make the revenue on extending DECmate in every direction is as insane as the DECmate plan.
-What's our plan? Buyout from COEMs and PC software industry

OR Develop in house on TAP and DIBS base?
-Why use DIBS versus industry standard, unless we are prepared to support DIBS, given the revenue and architecture? Can we make it a standard? (And if you believe this, then I have some more tall tails.)

SEMIS

-Gate arrays look important. Where were you on the TAT020?
-Will J make it?
-Why are we making mundane, purchasable, commodity items like Octart?
-What is the role for Semis vis a vis unique applications and how are they discovered?

PRODUCT LINE MARKETING/ENGINEERING

OFFICE
-A $14M budget is clearly a typo... even $1.4M is quite high!
-Clearly wins the Proxmire Golden Fleece Award if we let it go anywhwere, or support such incompetence. This is what we spend in a large engineering group or project (such as the Office Engineering Group that's suppose to or actually brings in real (eg. 200M-1B /year) revenue.

MDC
-Am anxious to look at real time base (PDP-14+). How does this operate with the project in CSS?

CSS

-What's the small Graphic system?
-Why not take over the expensive VS300 and build it, given the low volume it will achieve? This looks like a better approach than Giant to get to the market quick. Do we really want or need anything bigger than the VS300?
-Why not collaborate with or combine with MDC's real time process control effort? The two plans look very similar! (I think that one competent group, located a great distance from New England could accomplish much!
-Why not go back to the geographically dispersed centers of competence to go after the vertical markets like real time, communiations, banking, etc.?

Love,
Gordon, 4/20/83 Wed

Pauline Nist, Bob Murphy

Date: 19 JUNE 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 7/3/78

Given the budget reduction (the Q1 slowdown + 2% cut), the sure method to frustrate engineers (especially me) is spending to improve surroundings that are superficial. While these may be necessary to meet our aesthetic standards please hold (indefinitely postpone) all of these activities until better financial times.

I don't have a complete list, but the things that must be postponed include:

1. A new sign at Tewksbury.

2. A fence around the air conditioners at Tewksbury.

3. Decorated halls and tunnels.

Anything to improve working conditions or get capacity (e.g., cafeteria) or keep clean the areas we have wouldn't be postponed...although these have to be done with 2% less resources!

Bob, will you please get the list of projects that are in progress and have them presented at OOD?

Subject: **FY80-81 Engineering Budget Redistribution and Comments**

To: EBOD
OOD
Senior Product Managers
Paul Bauer, ML3-3/B91

Date: 5/6/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Roger Cady, MK1-2/E25
Andy Knowles, ML10-2/A52
Mitch Kur, ML12-2/A16
Bill McBride, MR2-3/E70
Dave Quimby, ML3-3/B91
Mike Tomasic, ML12-2/E71

Given the situation of having inadequate support for the Mass Storage products in light of the systems we want to build, and the necessity to manufacture products like the RX03 because our suppliers are unwilling to commit so much to DEC, I am proceeding to redistribute the FY80 Engineering budget along the following lines. I ask that EBOD approve this so we can get our Redbook in place.

The suggested* net flows (in millions) are:

Mass storage	2.7
Mass storage (HSC delay)	-.5
PAX'd 23	-.5
CIS'd 23	+.1
11/24	-.4
LA/VT	-.5
Software	-.4
High end (2080/Venus)	-.5
High end (target)	-1.5
TOTAL (net)	0 to - 1.0 (depending on Hi end)

THE RATIONALE FOR THE SPECIFIC RECOMMENDATIONS

Mass storage gain
We have to have a low cost 6250 tape for back-up in our mid-range and small systems. There are no low end disks presently funded, and have to have either RL04 or Aztec. We have to have an interface to the IBM drive for the hi end.

*These are group guidelines. Just as it's necessary to "tune" based on projected products of engineering, it would seem worthwhile to "tune" with the various groups (eg. T/SS for chips, systems, LA and VT). This analysis should take into account ROI, survival, new market support, risk, and other factors.

It seems possible that we could get a better position if we could avoid doing the RX03 and instead concentrate on a combination of bubbles and the TU58 to get us a 1 megabyte system. Also couldn't we delay the RX03? While this bubbles/floppy crossover looks unclear now, I would believe that pushing the semiconductor companies might yield the necessary costs to make this happen.

It is necessary to identify people both in Mass Storage and in SS/T, MSD, and LCG who are going to do the planning. Now it's our big job!

<u>HSC</u>

This has been tied to Hydra FCS, and given the number of new pieces that form Hydra, it seems prudent to not have it also depend on HSC. Furthermore, the other systems that are equipped for HSC are non-existent. The main volume of HSC should go to Venus and 2080, and these are currently scheduled for later shipments. HSC has been detracting from solving our Hi-end problem on the Massbus, which is necessary for the short term survival.

Let's base HSC on the backplane interface currently being defined for Mercury and Nebula, and not start a new physical architecture for HSC along it's current lines. It should be clear that Hydra, 780, large and multiple Comet, Venus and 2080 systems within MSD and LCG are the customers here and the definition and schedule should match their requirements. This should relieve some of the apparent manufacturing cost (versus cost of ownership) pressure and put a better focus on reliability and availability that seems to be lacking. Also, I'd like Dan Siewiorek to review the design in terms of RAMP. It is distressing that this product has been described to a customer and that it's schedule is being predicated on when they want it. Now is the time to stop this behavior.

Given a delay in HSC to be in line with system needs, then it should be possible to delay the availability of the HSC IBM drive and this would hopefully result in additional savings (or budget slack).

<u>11/23 and 11/24</u>

Given the recent direction in terms of putting more devices on the 23 and that we are defining a new, modern backplane bus (UNIBUS 90 described below), it is essential that we not extend the two products in nearly the same system space... especially since neither are where we want or have to be long-term. We must conserve our resources for long term gain rather than on very short term 1 product market opportunity and incrementalism. The only conceivable market for 11/24 might be the 11/34 replacement market for customers who have a big investment in UNIBUS options. Since this is only the TOEM, then it might be prudent for them to fund this, although it feels like a fundamentally bad idea.

UNIBUS-90 IS THE PAX'D 23 AND 24

We are out of gas in both the Q and UNIBUSSES. The Q has become the Q' as it got 128Kw addressing and we must avoid forming the Q" to get it beyond 128Kw (i.e. the PAX'd 11/23) because such an extension would place us sadly behind the state-of-the-art as being defined by Intel in their Multibus. Our new backplane interconnect, need the UNIBUS-90, should be good enough for the 80's just as the UNIBUS almost made it through the 70's. The kinds of things we are asking this bus to do include: being better than Multibus; low cost, short and defined for backplanes, handling multiple processors and procesor-memory combinations connected to it, narrow to match LSI, checked for reliability, and fast enough to handle variations in successive implementations in technology.

It would be the bus for HSC, Mercury, Nebula and the follow-on DCG products where we are now limited. It is essential for the LSI-70 and for a VLSI-VAX.

We can not exist by incrementing ourself through this bus design space in the ad hoc fashion we are doing now. Happily Dick and Bill agree and will provide the leadership to make this happen.

<u>LA/VT</u>
Although there a large number of terminals requested, it seems prudent to get a better focus and organization on this combined area, particularly architecture. There are currently separate Advance Development, Support, Product Management, and Development groups; and Dick's and the groups current desire to combine these should have a very high payoff. In addition, by having a single architecture function to handle the commonality of terminal modems, interfaces to modems, line protocols, intelligence functions and behavior specifications we should have products that others can build on and that we can support in a rational way versus the current ad hoc approach. We must be careful about diluting our effort to get every possible terminal type (especially in the printing area), as this often reduces the volume (and raises the costs). By good planning we can have the necessary options and spend much less doing it.

<u>Software</u>
SCS-11 is the most common idea for budget reduction. I would hope that we don't need this system because it would, no doubt, have a high payoff by non-introduction. I want to see what it provides the user. We must look at it, however, in terms of what it offers the user and decide then if this is the area for reduction.

<u>High End</u>
Part of the reason for combining Venus with the 2080 was based on the desire for common components and processes. Although we have reduced this budget by .5 million, it seems we could reduce it even further. I would like to target a reduction of 1.5 million in these two products, subject to their definition and schedule. If we do not use the MCA gate arrays, then the project cost should be significantly less. I am predjudiced against the MCA approach because of expense, longer time to market, and difficulty of the designs for ECOs.

<u>REDBOOK FORMATS FOR 80 AND 81</u>
So far, I have only seen projects that are budgeted for FY80,

except for the Low End and Terminals. I asked to not have this done, but instead we want all projects considered in terms of their requirements in 80, 81 and beyond, so that we can tell the fraction of resources committed by starting some of these projects. This has to be done so that we can avoid the crisis that could arise when we find there isn't enough money to finish the started projects.

APPLYING SANITY CHECKS IN FUNDING NOT METRICS ON THE ALLOCATIONS
Given this redistribution of funds we should redo the evaluation of the allocations in terms of product price range and by market area. In addition, we should collect the Product Line funded parts that are outside OOD so that we can present the company a total picture in these terms. Dave Quimby did the original work and this should be redone for this new allocation even though there doesn't seem to be a size shift.

SUBJECT: DEALING WITH THE BUDGET PROBLEM

I believe things are much worse in engineering than my outburst to you indicated today.

We have been doing a crappy job in making you face the hard issues of resource allocation within your groups.

For the last year, I have watched you identify needs in the product and process area, go present them and get the encouragement and approval to execute the addition. I have seen NO reductions in the product plans, nor have I seen an incredible increase in productivity that would say we could do the additions with the same resources and in the same time.

I don't think you (we) are being fair to the company because think we all love to engineer, and once a plan is approved, we proceed to execute it in any sort of fashion, even though it may mean that all other parts of our plans are destined to slip.

This latest request to operate at 320 is typical... we have signed up to execute about 360 worth of products. This means that we'll see at least a 12% slip accross the board, but since we only have about half of engineering working on new products, the demand on an engineering base of say 200 of 40% could mean a slip of say 25%, or possibly as much as 6 months if you assume all projects are 2 years.

Things aren't good. We are not being honest with ourselves or

the
company and the last people to say that we are fools are the troops who want to do more and ourselves.

It's clear to me we have to ask the really tough questions: Are you sure you have reasonable product plans that in be executed in the time and money of the plan?

Subject: **Budget/Redbook Guidelines and Categories**

To: ?

Date: 16 NOV 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up <>

Let's move NOW to have better segmentation and more autonomy in managing engineering groups. Here, each group would:

0. Operate autonomously. This would not limit the buying and selling (e.g., common power supply, disk development) we currently do among groups! Here, the notion is that I do not want or have the responsibility to allocate funds within an engineering area. Thus an area would be <u>independent</u> as to:

   - budget (including all the categories in 2, below)
   - personnel
   - g + a + library
   - buildings and grounds (it would buy it unless a host manager corresponds to an area manager)
   - computers
   - diagnostics
   - drafting
   - product packaging
   - product architecture and standards, etc.
   - product specific design tools

1. Decide above the line (POTS preview)/below the line (less POTS preview).

2. Budget the following categories:

- product development
- product changes and ECO's (product contingency -- this _must_ be budgeted more aggressively)
- product support
- product management

- research
- advanced development
- architecture and standards
- development process and tools
- administration
- unallocated opportunities

3. Move to a point where the _whole_ budget (above and below the line) is scrutinized by POT. In this regard, each area should regard the POT as a review board, _not_ the executing or deciding body.

4. As phase 1, allocate and budget money for whole project.

5. Budget two years, with the _known_ commitments _beyond_ two years.

6. The eight autonomous, segmented product areas are:

memories
small, LSI MOS components and terminals
mid-range
large
(software)
base systems
networks and comm. hardware
commercial
technical

7. The five "common" areas are:

Central administration including
Control
EDP
CAD

Drafting standards
Space procurement
Personnel
Technical director including
Architecture and standards
Diagnostics techniques
Software tools
R&A/D review; process review
Central R&A/D
LSI development (including CAD)
Central product support
Power supply design
Packaging and interconnects development
Physical environment standards
Systems and performance testing

8. Engineering management (GB and RP) will recommend a "by-area" allocation. This will be reviewed and approvied by EBOD and/or Marketing Committee.

SUBJECT: FY81, 82, 83 BUDGET

FROM: GORDON BELL & LARRY PORTNER

We believe we have adequately considered your request for redistribution of the FY82 & 83 Budget Package of January 15, 1980, and as we indicated, we feel the money should go toward chips. If you want to work with the Product Lines to add additional Terminals' funds we support those actions.

In any event, we wish to review the Terminals' strategy because
we feel uncomfortable that there are too many of the wrong products
being developed. Would you please arrange a review with us as
soon as practical?

Gordon & Larry

SUBJECT: PROPOSAL TO RAISE THE ENGINEERING BUDGET

We must really get focussed in this endeavor. I'll try to write a preparatory memo to the OC, along the lines we talked about at EBOD. Here, we must have EBOD"s full support and we should shoot for a special meeting in not more than 2 weeks!

We should decide soon who's going to spearhead the effort. Mike
and his group together with Mitch's help will put together the
analysis and presentation.

Another approach I think we should examine is to demonstrate the effect of using gate arrays on Comet. We would look at the

costs and performance and development costs with and without the gate arrays to be able to show what the net results are. Here, it might not turn out like we hope for, but then I think
we have to understand this too (remember comet II, and Venus?).
Also, we can look at Fonz and the alternative we were looking at of building Jaws internally. In this way we have some real case studies versus the pure trend approah Mike has outlined below in 2.

EBOD was extremely supportive, as was Win, Bill Thompson, and Al Bertocci, when we explained our funding dilema of having to backward integrate into semis. (Also Mike has some very good insight from his days at being within TI.) Now we owe them some real meat showing that the cost of having our own architecture and semicondcutor capability is going to cost us x% more (corresponding to the parts of Intel, TI, etc.) and this will result in either lower product cost, better cost/ performance ratios, or simply allowing us to build higher performance machines.

Larry, Dick and Jim.
Let's get together by Tuesday, via at least EMS, and make someone responsible for working with the group to get this data and crucial story written.

Gordon

E71

SUBJECT: ENGINEERING BUDGET

My group shall put together the following data to help understand if the 5.5% of NOR for the Central Engineering budget should be raised in the future.

1. Make versus buy content of cost of goods sold. If we are making (developing) more today, than in the past, there might be a correlation regarding the appropriate percentage of NOR for engineering investment as a function of the make versus buy mix.

2. Make versus buy semiconductor component. The transfer cost of in house manufactured semiconductors does not include the engineering development costs. When we buy from T.I., Intel, etc., their prices include covering their development costs. If we, in theory, raised the in house manufactured transfer costs, what amount is reasonable to consider for covering engineering chip development costs?

3. How much of our engineering budget is going into chip development? How big in dollars/percentage is this problem? How do the

resultant
products with in house developed chips compare with competition with
standard chips? Does this answer differ with system size?

4. Competitive R&D Investment Analysis. Essentially done by Bob
Flynn/Jeff Scott for the recent December 4 EBOD meeting.

Is this generally what you are looking for? We should have it in two
to three weeks.

SUBJECT: PARAMETERIZED SOFTWARE AND THE ENGINEERING BUDGET

BUDGET IMPLICATIONS

I want clarification with what you thought the Marketing Committee agreed to. I thought the vote was to allow you to spend money to start this project together with Stan's product lines, taking the money out of profit in both of your areas. To this I vote Yes!

If it should be a below the line investment that is corporate

wide and coming out of the technical marketplace, which I share
an extremely strong identity with, I vote No. If this is is the
case, we must have EBOD decide, cause they are responsible for
the corporate engineering budget.

After the fact, what you appear to hear from the Marketing Committee was go ahead, take it out of profits, and somehow factor it into the engineering budget next year. Given that the
engineering budget is very thin, and getting thinner by the day, then this is patently irresponsible.

I have been here before (remember the 11/74 Multi-processor, or
the PDT 150 ... and the grandest of all, WPS ?) Somehow the game
is to somehow start a product, and it is left to me to figure out
how to finish it... all, mind you, within the existing fixed engineering budget! How some of you folks that are supposed to
be business leaders (here, I am just a simle engineer) can believe that we can simultaneously forward integrate, backward
integrate (to get more margins to cover the mistakes in forward
integration and the absurdly high inventories implied by having
to have old and new in every range forever), meet the increasing
government regulations on all (including old) products, get a wider price range of products, while still designing products on
all old architectures, is more than I can understand. How can I
explain it so that I don't think you are a bunch of dumb, irresponsible, jerks that are totally devoid of any leadership or
understanding? Or, conversely, how can you help me

understand
how to get enormous gains in productivity by getting rid of negotiators who appear to introduce hassle, or by reorganizing to
be near the marketplace like we did in word processing, or by going over the bottom n projects so as to add these new goodies?
I ain't getting any help or understanding of our pligth! (And
another project with its on going budget, Engineering doesn't need!)

WE ARE NOT GOING TO START IT IF IT HAS ANY, ONGOING BUDGET IMPLICATIONS ON THE ENGINEERING BUDGET!

THE PROJECT
I have had too many meetings where the PM and Development person
has tried to convince me that this is the approach to product design. I bought it, made suggestions that they didn't follow
because it violates my model of software evolution, and waited
for substance. I continued to get a series of presentations over
a period of what seems like at least a year, which had no technical bone structure, but only added budgetting/staffing fat.
In this regard, the plan is totally unacceptable as it contains
no base architecture, or the key people who are going to do it.
If the person proposing it ever did one, he is probably all used
up in the process here of politicing. By spending 700K, the remaing part of this year, the only thing we will do is spend 700k!

Having watched about 6 projects like this recently, I say let's
go ahead with a small, competent team of about 3-5, one of whom

is a leader. This team will design and then implement. Let's
first review their design assumptions (which I call goals and constraints) so we know which way they are heading, and then let's review the general design when they have it. NO WAY CAN WE
SPEND 700K to do this! (They might even have a breadboard by now. My suspicion is that in this year we've spent selling, a
really good technical person could have designed and breadboarded
the whole thing!)

So the model I have of successful products has been violated, although I'm prepared to learn about hiring hoards of COBOL applications programmers that design and code like crazy and the
whole thing is a beautiful product when you finish.

Therefore, I'll listen patiently to the product design concept,
or to the plan of how we are going to get it, as long as I get
some new data. AM READY TO LISTEN, LEARN AND HELP!

SUBJECT: RE: YOUR MEMO ON PARAMETERIZED S/W IN ENG'G. BUDGET

Julius,
I want applications and belive in them. Something smells funny
on this one. The project staffing and direction doesn't feel right vis a vis starting small with a quality group and then building up when the architecture (design is in place). I don't see the underlying design, so I am really queasy. Also,
it feels like a design of yesteryear (Cobol, batch, etc.).

I want it to go, and I will support it, I do want to get it into a form where it has only a single port through which people can view it so I and all the other engineers, committees
and marketers can walk by and review it and question it. This
is for its protection as well as ours (you get a product, and I'm convinced it is going to make it as a product).

SUBJECT: JULIUS' COMMENTS ON THE OFIS PROGRAM: HELP

I think you ought to get a briefing from BJ, Bob Daley and Bruce as to why do it in the UK. My reading is simple: there is some talent and a team there to bring it in and get a product
out.

I am distressed too, but I am heartened by the fact that we are
building a group that I think can build a product now. This view
has gone from: give us money and we can do anything in two years;
to complete hopelessness based on the way we interact and define
things (including the way we did it in Hydra); to some hope by putting a small team together and giving them all we know about this area and asking for a proposal. You are now where I was a few months ago... dispair.

You can throw us back into the pits, but for now, I would like
to give tthe group a couple of months. They have produced more
in 2 weeks here then all the meetings over the last 6 months have produced between the marketing and product management folks. Honest, we do not need more input to define the product,

we need some understanding of how to build it!

PS,
My recent concern about the parameterized software package stems from the fact that it's schedule and budget driven versus
idea driven. So far, I would predict it to go the way of Hydra,
although it is about 1/10 as complex to build and having 1/10 the product requirements. My message:
get some idea about what you are going to build and how you are going to build it before embarking on major hiring and product schedule promises.

SUBJECT: OFIS IN EUROPE

I don't understand the logic behind doing software development
for OFIS in Europe. It is nine hours' time difference from the
source of the interim product, WORD-11, so there is absolutely
no ability to communicate between the documenters and the producers. It is nine hours and 6,000 miles, one quarter of the way around the world.

Furthermore, OFIS will be introduced very late in Europe because of the language; and we are not building a base of knowledge on which to build the future OFIS products close to the market where it will be sold.

I am personally extraordinarily depressed because of this and other issues. I feel it is impossible to influence projects, and this one makes no management sense to me. Since no one really cares about OFIS, maybe we should cancel it.

SUBJECT: ENG MGMT COMM & BUDGETS

Engineering Management Committee won as the name for us. Let's keep PEG as is for the guys who do the work. In addition
it probably could be added to.
I don't think we want a name for the old engineering staff, since this is in the process of being eliminated.

Grant was uncomfortable with his budget. The budget assignment
certainly looked reasonable. It was the first cut. Joe and Rick are putting together a look as it based on where we want to go strategically. I think there's a chance we are on the road to hell strategically! We have only accepted additions and shorter schedules. Furthermore, we are promising

everything in every product area I know of, except robotics.

We have to update the simple table that shows, by group, what we're spending and what the products and potential nor are.

Currently, I can't tell if the budget is crazy because I ca't relate to what SW is, vis a vis the NOR projections for it. The goal of the segmentation is to focus on systems. BJ, you have only 32, 36 and office components. We somehow have to look at the mass storage and technology budgets in terms of the systems they support. Jack, I still don't see the evidence that you are going to bring in revenues that are in anyway proportional to the spending in terminals, workstations, 16-bits, 12-bits.

The look at this budget also includes the under the table money like the 12-bit stuff and P/L's like DECset and others where we don't spend the money. WE have to put the push forward to do the right thing, cause the drive at this point could be really wrong.

Grant, you had some ideas to save/cut. Please share them quick.

SUBJECT: FY81 BUDGET (5 PAGES)

GB1.S1.72

THIS IS A DRAFT

COMPANY CONFIDENTIAL

SUBJ: WHY WE MUST SIGNIFICANTLY INCREASE THE FY81 ENGINEERING BUDGET

The FY81 budget is the thinest in years, and truly depressing for the long term. We must not be mislead with our current euphoria of orders. From my standppoint, things were never worse. We'll pay the price in the next three years if we don't get the necessary increase in funds now. My concerns:

General

*Our range of products is increasing faster than the allocation of NOR, when corrected for inflation. The high end is constant and the low end is decreasing at 20%, creating a product thirst we are trying to satisfy. The recent rash of missed schedules in one of the best indicators of our overcommitment, where we promise everything, and end up slipping everything.

*Despite the strategy change, we still require a highly overlapped product set during the transition phase. In effect, the spending for overlap was reduced somewhat and traded for the necessary interconnect. However, the overlap is still present and apparently not further reducible (see each section below).

*We are entering a competitive era where we are in the big leagues versus competing with overgrown PC board stuffing garage shops (like GA, CA, SEL, etc.) and DEC trained amateurs (DG). These competitors include: well run semicomputer companies (Intel, TI); semicomputer company OEMs like

Olivetti, Apple, and Datapoint; IBM who has incredible depth in research, marketing and manufacturing and are getting better in products; well financed newcomers like the Exxonites and Xerox, who has both a vision and the R and D to pull it off; and finally the high volume consumer oriented, well financed Japanese are beginning to send terminals, microprocessors and mainframes into the money grubbing, MBA run, marketing oriented, non-manufacturing distributors like Tandy, Itel, etc. A recent memo by me on our Manufacturing / Engineering limits in the December plan describes the details of this dilema none of which are being addressed by this budget pass!

*We have sucked both the Research and Advanced Development funds dry, as we have tried to respond to our customer demands. This is fundamentally fool-hearty, but the pressures can't be overcome. The cost will be felt in the development areas, as we enter a project in a respond mode panic, and pay the inordinate price of on the job training (eg. comm options, quality printing, small terminals, Comet, the interconnect, WPS, databases, and applications). These budgets are currently flat, or only growing at inflation!

*We have cut the administrative growth to inflation, which will cost in the necessary technical and adminstrative control and productivity. We believe we have the administrative key to about 100 million dollars worth of expenses by a drastic rearchitecture of the product nomenclature scheme coupled with a systems configuration control process such that it will be impossible to express the systems that are now ordered on an ala carte basis and that manufacturing is left holding the bag to build. WE WANT A ONE TIME INCREASE THIS YEAR TO PUT THIS PROGRAM, FUNDED ON A SEEDLING BASIS WITHIN OOD, INTO OPERATION. We know it has one of the highest ROI's around.

*Europeanization and FCCization. The later is set aside fortunately for the potentially big eco that we is likely to come when the

FCC cracks down on radiation.

*Geography is hitting us with start-ups in Hudson, Spitbrook and another move which can not be amortized over more than engineering. Costs are higher with small sites over working in packed facilities like TW and ML. The mill appears to be the cheapest, and best service due to size.

Semiconductors and Backward Integration

*We are only now, beginning to understand the incredible cost of backward integrating, as we look at total product costs across engineering, manufacturing and the field. Perhaps we are doing too much and we have to have a major strategy look, but I think the disruptive cost of doing this would be more expensive than the few 10's of millions involved in additonal budget. Jaws, the VLSI VAX, Comet, and Venus are all about 50 million dollars a program, as opposed to their predecessor programs of 5-20 million, where all we had to do was to stuff boards with off the shelf MSI and LSI parts. This amounts to having to spend at a higher rate in engineering, somewhere in the range of 1/4 of what they spend on a per what we buy from them basis, because we are doing semiconductor engineering. I DON'T THINK THERE IS ANY ALTERNATIVE BUT TO SPEND THE MONEY AND BUILD THE CAPABILITY IF WE WANT TO BE A VIABLE MANUFACTURER, VERSUS DISTRIBUTOR OR SEMICOMPUTER COMPANY OEM! I would like a whole percent to be added to the engineering budget for this during the next few years while we are in the transition phases to VAX and have to dual spend in the 10/20 and mid range 11 areas.

Software, Applications and Forward Integration

*Our customers are demanding this too in terms of WPS, Electronic Mail, Profession Based Systems, and overall, systems that are readier to use. Previously, we were nowhere near this.

*New languages on the horizon

include Pascal and ADA, the first new ones in years.

*The commercial marketplace is now getting revd up requiring significant investments and good products in COBOL, DBMS, Transaction Processing, coupled to Distributed Processing (our forte'), plus applications.

*The RPG is also projecting a similar scenario and is acquiring software.

Terminals

*Our ECO budgets are significantly higher than expected as we have increased revenues recently and moved to distributed manufacturing plants.

*Increased terminals product thirst will hit in next couple of years as we build the bigger business and require more breadth. Note LA30 > LA36 > LA34 + LA120 > LA12 + LA34 + LA200. The designs for quality using anything other than dot matrix and for thermal printing for portability and / or VT quick look are non- existent. We have moved the LA12 portable terminal from CE to PL funding as a means of coping, but we are still too low, given the revenue expectations and competition.

*The evolutionary terminals to sustain the base and extend the VT100 life are not funded.

*High volume graphics are needed, possibly 66 lines in the short term for the word processing market, and then you might recall the recent color graphics announcement by IBM that Peter Christy has described recently from a user viewpoint. Built-in modems are also necessary for survival.

*The next VT100 (VT200/LA200) is funded too low to get a true replacement. A 66 line monitor and higher quality printing are required, neither seem to be forthcoming.

Chips and Low End

*For the next few years we are committed to continue to bring in 8-based chips and build systems with them in an overlappped fashion due to the WPS and RPG needs. Also, only recently do we see a way to get the price of small system 11's down to that of the 8. Also, we do have a plan for moving and preserving the software, but it has been expensive in the interim.

*Similarly, we must build VLSI VAX-11 chips AND continue to preserve the 11 base by building Jaws for our systems and micros business. Consequently we must double fund these two architectures. VAX is necessary to build the competitive personal computers (with chips such as the M68000 presently on the market) and for the 32-bit machines that each of the semiconductor companies is working on.

Mid-range

*Fundamentally, things are so thin that all we are doing here is finishing Comet, Nebula and the 11/24. We lack funds in getting the technology ready for Comet II and for enhancements to the 11/780 to stretch it out in the long three year wait for Venus. We have only a single VAX replacement and are waiting for Jaws to replace all the 11's from the 24 to the 70!

*The need for both Q and Unibus in the 11/23 and 11/24 still remains.

*The 11/23 has been n+1'd with requests to support RSTS too now. Here, we can deal by a discipline.

Interconnect and Distributed Processing

*Here, we need more funding to get the semiconductors (and cost) that is necessary for the next few years. Delaying this, will cause more bandaid solutions and more expense. We can't apply enough now, because we are bandaiding (11/24 versus NI and BI based systems). These will ultimately have a positive affect on spending percentages.

*.x25 We have a problem here with getting the work done versus what people need to stay in the market.

*We need modems for our terminals and systems, and we now have the ability to get them designed and integrated.

*The comm hardare group has been traditionally underfunded for years. We are within a year of being able to get the plans and people base that would be capable of spending the money wisely to get leadership products. Given our dependence and desire to serve TELCO and to have a leadership position in distributed processing, we need to build the group and get the products.

High End

*Both the 2080 and Venus require funds. This came about as we entered the detailed design phases and learned all the costs. The strategy change last year last year is now much clearly understood in terms of schedule and cost. Both projects can be accelerated with more money. We need to spell out the alternatives that will give us a better strategic position. Given the IBM announcements in the 4341 and its souped up successors in the 4300 and H series, we are clearly poised to lose by doing too many products, too late. I want to understand this, but I think we should make a choice as to funding one of them properly, and slipping the other.

Mass Storage

*The low end needs are coming in faster than we can start the projects. There are 9 specific product requests versus the two that we are working on for 1 Mbyte floppy and a cost reduced floppy. These include smaller and cheaper hard disks, two low end tapes to follow the TU58, another cheaper floppy, and RL03. These come about as we work to design systems for the store and for the single user. It is not acceptable to buy these out since no supplier will deliver our needs!

*We are not spending enough for Advanced Development and components. The videodisk and videotape for low cost archiving are really non-projects. The videodisk looks like a real possibility that we at least need to understand. Our outlook for a viable external source of a critical component such as thin film heads is grim. We also need backward integration here for critical fundemental components.

*The tape situation is going to get even worse when IBM announces its next product (soon). Hopefully it will be contained at the high end, but it likely would make a very nice high volume low cost product too, given much tooling (which IBM is traditionally good at).

*Overall, our product costs are too high because we aren't funding them to the extent they need to do the LSI work and get the lower costs. This is another problem with the wide range. I am asking Grant to look at buying out one significant product, and taking an apparently lower ROI, in order to get better cost of what remains. I believe we need much lower costs in the small systems areas to be competitive in the store.

*We believe the RP07 and RM05 will ship and be reasonable products. There are no projects going to follow them. The high end is clearly uncovered now in the marketplace, it will get somewhat better in the near term, and then be much worse, particularly as IBM moves traditionally high end technology hard into our main product ranges. We have to get a strategy (and work started) in this space.

Frankly folks, I am scared about our future, and engineering needs your help.

We can deal with the normal requests, but the above abnormal situation
requires significant funds!

g
u
t
f
e
e
l
i
s
:

1. We will be uncompetitive with the MSI design and can't afford the vanity chips in time, engineering dollars and manufacturing cost.

2a. We don't have any real data here, and I believe we must get experimental data on this. Bill Keating, can you perform a real experiment with the difficulty of the conversion and test the feasibility of including the alternative handlers in our operating systems for a comm option and a floppy option? I don't believe the cost of handlers can be as high as you have estimated.

2b. Someday we may have a way to handle this when we get an approach to i/o architecture. Possibly this is a time to revamp to the low end as well as the high end. In using this approach, we are switching most of our programming over to another ISP, and will end up with only languages being run on our own ISPs.

2c. I believe the performance differential is so bad that this will not be useful except in all but a very few, bounded systems. Certainly it wouldn't let real time options such as comm or disk interfaces ala TRAX to be built and let us evolve our current options and operating systems. The marketplace demands more and it isn't a general solution.

2d. Given that a program has been written (2c) to make a standard peripheral behave as an 11 peripheral, means that the problem is theoretically tractable. Now let's make it in hardware. I personally favor this approach. I would like to understand this approach by seeing some designs of Q and/or Unibus peripherals constructed using this hypothetical, magical interface.

Some of the questions that come to mind:

1. What's the cost/feasibility of 2a?

2. What are the peripheral options we could use right now and how much would we save using them? (I.e., does this memo identify a real problem?)

3. What would an interface look like? Can we use a PROM or ROM approach to handle the variability from device to device?

4. What's the effect with the SQUID (see Keith Amundsen) proposal?

Would you (and some people who could help address this) schedule some bi-weekly meetings with me when you've gone the next step in thinking here?

MESSAGE ID: 5171824787

SUBJECT: GETTING A WINNING BUS AND SYSTEMS STRATEGY

BACKGROUND (AIN'T IT AWFUL)
We've got to have a bus/system strategy for VAX. Many years ago
a bus strategy group recommended that every CPU would have its own backplane and that we would build adapters to this backplane for particular peripherals. Only the Unibus is common to all VAXs, so there's only really one common interface. We end up with long chains like: Venus Backplane to SBI to UB to NI, for example. Comet has CMI to SBI for the CI adapter because they can't afford to make the module to interface to 1 of the other 4
boards that make up the SBI to CI adapter. Scorpio will have 2
levels of busses during the transition. We can't get the cost of
CI down because we're building more CPU's (we have to, too), and
certain customers would still like higher bandwidth to memory. Personally, I think this need will decline with much more local memory and intelligence distributed, thereby making Ethernet acceptable, or in certain cases CI should be the interconnect!

WHERE DO WE WANT TO GO?

Declare what our public bus posture (in order of preference):
.NI is the preferred interconnect
.BI is for interconnecting high speed devices and for building small systems in a "Unibus" type design. These include disks, bus adapter to CI, dual ported memory for video, special processors for voice and signal processing. Dual Ported Memory will be the way to get very high bandwidth (eg. grahpics memory) interfaced to a VAX; not via the backplane or DEC provided bus.
.CI for interconnecting VAX systems and for connecting special processors to VAX processes tightly
.Unibus will be provided, but only via BUA
.DR will go away... or do we have to have a BDRA
.Specific backplanes interfaces (eg. CMI, NMI, SBI) won't be used
to build ad hoc interfaces by us; instead, we'll pay the cost of
the extra adapter to get to BI.
.HSCI may get more adapters for it

IMPLICATIONS?
0. Really get the NI products out, like Pluto Jr. etc. Get line
printing devices for example onto NI or to serial lines.
1. Bill Strecker has recommended we use the VAX processor which has the integrated NI, as the BNA. While this is great for Scorpio, how's it for Nautilus, or do we need to put an integrated NI in Nautilus too, or on the BI?
2. Get the BI and CI done asap for Nautilus and Scorpio. BCA would be high priority.

3. Really think out what we want NMI to be... who'll interface it, or will it be just another orphan, like CMI and SBI that we
have to feed and that we really don't get the world into.

NMI and NAUTILUS CONFIGURATIONS

I really like the dual processor of Nautilus, particularly because we can have a high performance memory port for designing and connecting array processors or other exotic device (if we don't use the CI). However, this is in direct violation of using a particular machine interface to build a bigger system product. Somehow this feels wrong to me because NMI is over 200 lines, and it would seem like more lines are going to take more design time.

CDC sends 16 bit packets every 20ns in a port to port protocol they use... therefore, I think there's room for much innovation in NMI as we look at the Nautilus configurations.

If we build Nautilus MCA will it still be 2 processor? (I think we should, even if the 2 Pc version comes out later.)

What I/O busses? (Let's make it simply BI (say 2 of them) and then bet BCA).

Is NMI public? (I say no, but we or someone may want to replace the second processor by an array processor or special device on occasion.

We have to have a relook at all we're doing in the base system's area, assess the risk (erring toward the very aggressive, but with a backup that can be executed in several years), and then make it all happen.

What you folks think? Can we say where it is we want to go and what we need to do to get there?

LOC/MAIL STOP: ML12-1/A51

SUBJECT: ENGINEERING POSITION ON 10/20 BUSINESS

Ulf has put together the Engineering position on the 10/20 and I fully support it without any qualifications. Note:

Engineering has met its commitments to the product in every way: leadership, quality, and availablility. Now, we have proceeded to design a really great (in terms of cost/performance as measured over the life cycle) constant cost follow-on product we call the 2080. It is fully in agreement with the strategy which we and the BOD approved. Furthermore, we have a really competent team for designing machines in the range over 250K. We (EBOD and Marketing Committee) approved a constant budget spend plan which we are using for the next few years planning.

We want to keep the engineering hadware group intact to build high performance machines. Also, we need a dedicated group for the 10/20 software. The current organization, under Ulf and Bill McBride does this. In the event we want to increase the investment here, we can do it either at the direction of the Marketing Committee, a specific product line, or what might be a new 10/20 Product line. THE ENGINEERING GROUP WOULD NOT BE PART OF ANY PRODUCT LINE(S)!

The Product Lines have not met their commitments to sell 10/20's!

We believe the best organization is to create a product line which has expert marketing and product support people from the
selling product lines, and subcontracts to market 10/20s using
the various sales persons from the product lines and in turn will
deliver unto them, NOR and Product Contribution. In this way,
the NOR P/L budgets are left intact, and the sales careers are in
tact, and it is an all around win without conflicts at the customer site or within the sales or P/L organization.

It is especially important to manage the situations so as to not enter new markets or areas where we are going to have to invest in a subcritical fashion. (Eg. given that Europe has not
sold a large fraction on of 10/2's to date, then now is not the
time to start. We must continue to sell and support the installed European base however.)

Hope this is clear. Ulf says it too and better. Believe us!

SUBJECT: BUILD, USE, AND SELL -- BUS -- THE APPLICATIONS KEY

GB4.S1.20

Propose we rethink our direction regarding application products to follow a set of three guidelines:

1. Build, Use and Sell - BUS -

2. Buy and Resell

3. Refrain from MAKING software, such as small-business computing, where we have no design talent or way of testing and understanding the products.

BUILD, USE AND SELL - BUS - What this means

This parallels the make/buy policy: DON'T MAKE IT UNLESS WE USE IT

In essence, don't make it unless it's good enough to use internally.

We have been successful in providing tools to be used by hardware and software system's builders because our own system's builders are also the primary users of the product. All models of the product innovation process show that the innovative (not

evolutionary)
products come from the user. Thus for maximum innovation, we must
closely couple design and use - preferably in the same group. HP
traditionally adopted this philosophy which it calls designing for the
person at the next bench. Some examples at DEC include:

. Tops 10, VMS, Tenex (by a user) and Tops 20, OS-8, RT-11

. our electronic mail came from CCA, LDP group evolved it, and DIS
took it over

. MSG's medical tracking system being used in our semiconductor
group

. Manufacturing Control and engineering design

Our priorities: work from the lowest level of integration outward -
because it creates the largest base:

Base Products --
Clearly we have to remain tops as these feed all products.

AI System Base Products --
We have an edge in AI because we are active users. XCON could be the
basis of a generic configuration program which assists in the building
of systems from well-structured components (eg. cars, pre-fab houses,
tractors).

Generic Applications for People Communications -- i.e. Office --
Mostly all of us, including system developers, spend a large fraction

of our time at a terminal simply handling text. This area includes:

. word processing and list processing of text files
. electronic mail -- sending/receiving text
. typesetting -- producing high quality documents
. presentation slides and overheads including simple graphics

Other generic applications

. calculators and spread sheets
. tabular, relational databases (eg. Datatrieve) with graphing capability
. forms

Electronic, especially Digital Design

We build and use these systems. Note, Digital observes that when use and design are decoupled, we do not build effective design tools.
This should include tools for engineering management.

Discrete, especially Semiconductor, Electronic, Electro-mechanical and Mechanical Manufacturing

We are simply not building, using and then marketing what we build.
We should be incredibly strong in this area -- and we're not!

Sales and Field Support including Administrative Order Processing

We have a wonderful opportunity for raising our productivity by creating a sales support product which we can build and use! Such a product would support the salesperson with:

. electronic mail and generic text processing

. customer files, monthly quantitative reports
. fully electronic expense accounts
. automated quote and proposal generation
. order status enquiry
. configuration checking (XCON/XSEL)
. phone management for call backs including automated Rolodex

transaction processing

While this is a somewhat generic product for business applications, we need to find internal users who can verify that we have uniqueness.

BUY AND RESELL

Given the large number of experts developing software for sale in the outside world, I don't believe it's necessary for us to do any development, unless the product can be used both internally and externally.

We need to understand from ESG's success and build on this model for all other areas, especially for the small business.

REFRAIN FROM MAKING WHEN WE DON'T USE

What you think?

SUBJECT: BUS SCHEDULE AND ROUTES: UNIBUS, BI QBUS, CTI

GB5.24

We urgently need some general policy guidelines about what busses
we're going to use for our computers, because we're in a critical
decision period on J (Unibus), Scorpio, MICROVAX PC, and PRO (J).

Historically, we've not made much use of bus converters in our
systems, and instead have simply not offered options, or have
replicated options on both the Unibus and Qbus. If we're to reduce
the time to market in our systems world and are to support our
customers (mainly OEMs) investment in hardware, then the bus issue can
be important. We should plan to use bus converters, bearing in mind
things can get out of hand (eg. Venus bus->SBI->Unibus->NI).

We'll build various bounded, no bus systems like VT's, DECmate, and
Rainbow where there are no options or the options are afixed to the

board in various creative ways. This will continue like crazy.

DOUBLEDECKER BUS PROPOSAL

PHASE OUT AND DO NO NEW OPTIONS ON THE UNIBUS OR CT BUSSES.

Dec 1. Use Qbus for 11's, Personal 11 (any PRO follow-on) and Seahorse I and II (MicroVAX version). All kinds of systems will be built from these options including PC's, shared, rack mountable, rack and stack, etc. Build a BI/Qbus (and maybe BI/Unibus for customers) converter until we have the necessary options on BI.

Dec 2. BI will be used for systems starting with Scorpio, and we should drive like crazy to get the cost of these options to be competitive with their contemporaries (eg. Multibus II). Whether there's a MicroVAX processor on a module is a tactic.

VAX PRODUCTS
We're at a crucial period in the BI where it would be possible to change from a BI to Unibus converter to a BI to Qbus converter for the Scorpio system. This might make sense now that we're doing a QDA, and some Qbus comm options. Also, we're making several Qbus boards for PC video. Nautilus is committed to the BI.

The dilema is whether to introduce the Qbus into the VAX world.
Clearly, MicroVAX is bringing it in.

PRO QBUS and MICROVAX PC
As we are currently moving, the Qbus is the lowest cost bus
to
interface to. To me this means we made an error in CT, and
that we
should make PROs out of Qbus rather than having a new set of
options.
If we do this, then only a couple of options need to be done
to make a
Qbus PRO, and we can get back to a single investment stream
that will
feed the MICROVAX PC too.

UNIBUS 11
It sounded like we're not going to do a J based 11.
Therefore, this
need for various Unibus options will diminish.

POLICY STATEMENTS
Note, the above is just a proposal. We must decide because
right now
we do blow resources just to have group identify. The
customer's the
loser because it increases prices and we never seem to have
the right
rider on the right bus.

I'd like you folks to drive a proposal that we'd ratify at
EMC.

What you folks say?

Skoldungagatan 2
S-11427 Stockholm
SWEDEN

Dear Bengt-Arne:

Thanks for the draft report. Since it's your report based on your interviews and observations, I don't think its' appropriate to comment on it.

It is all right to identify B as DEC, provided <u>all</u> companies are identified. Again, if all companies are identified, identify DEC as one.

Again, I enjoyed your report.

Sincerely,

Gordon Bell
Vice President,
Engineering

Subject: **Busses: Help!**

To: Lorrin Gale

CC: OOD, Sam Fuller

Date: 10 MAY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 5/24/78

I heartily support Dick getting you to write down the Bus Strategy. As per our discussion, the Red Book would have a section on these proposed or existing busses and a policy on them:

Speed	Bus	Use
9.6Kb	Communications DDCMP	C-nT's
56Kb	IPG Bus	IPG terminals C-n (T or C)
56Kb	Communications DDCMP	H.S. terminals; C-n (T or C)
?	Radial/Serial	?
1Mb	DMC11 Pt-Pt. DDCMP	C-C
1Mb	DMC11 multidrop DDCMP	C-nC
10-20Mb	"Official" CIOB	nC
16+Mb	Massbus	K-nK(Ms)
? or ? Mb	IBM Channel (MPX, Select,B.MPX)	Pio-nK
?	NDS - Host (pt.-pt.)	C-C
?	NDS - Ms.drive (pt.-pt.)	C-Ms
80?Mb	ICCB for inter-C transmission on	nC

	Reliable Computer	
?	8080 Bus	intra-C (Pc,Mp,K)
16Mb	Qbus	intra-C(Pc,Mp,K)
?	Omnibus for PDP-8	intra-C(Pc,Mp,K)
24Mb	Ubus	intra-C(Pc,Mp,K)
106Mb	SBI (STAR)	intra-C(Pc,Mp,K)

The section would include a plot of cost to interface (Howard Fineman has data on many of them) versus data-rate, with marks along the data-rate line of the devices that operate at a given speed.

SUBJECT: WILL OUR BUSSES DRIVE US OUT OF BUSINESS!

Every day, I run into this traffic jam when there's some system that needs to be built. We may be happy because we have (make) work to do by making all these components, but alas, they do little good in the marketplace because the user doesn't care! Note, we have:

1. a-c UNIBUS (system unit, hex, quad)

2. a-c Q(4,18), Q(2,18), Q(4,22), Q2,222), Q(4,22,?)

3. CT

4. BI (new VAX bus)

5. II (a virtual bus for building one board systems and interconnecting micro peripherals to processors.

6. NI and CI for connecting to Jupiter, Venus, HSC and various

servers:

The bottom line(s):

0. The plethora of similar options, on different busse drive our SW costs up.

1. These options (boards) may not be very competitive because they are not adequately using VLSI microprocessor peripherals.

2. It's virtually impossible to put together many desirable systems (options exist, but on wrong bus).

3. The systems aren't very cost effective.

4. Our development costs are being drained cause we have to do a job at least 2-3 times Big-11 [U+Q(4,22,?)] or Little-11 [Q(2,22)+CT] or VAX (U+BI).

5. The organization mitigates AGAINST learning curves because,

outside of disks, each group has its own bus...the cost is
even higher since an option has to be designed 1-3 times!

Surely there's a way out of this morass, or should we just accept the inefficiency to gain the independence? Are adapters possible? Virtual adapters? II-based futures? Can research help? Does QTA do it?

Dear Butler:

I was delighted to learn of your election to the National Academy of Engineering. Congratulations. I believe you can be very helpful to the Academy in providing a strong view, which it needs, on the nature of engineering and computer science.

Am also delighted that you have joined Digital and hope to see a string of creative ideas come from your lab.

I especially enjoyed your insightful paper, Hints for

Computer System Design.

Please stop by on a trip to Boston.

Sincerely,

SUBJECT: CABINETS + RLO2'S   (<1 PAGE)   FOLLOW UP: 2/29/80

I understand that there are too many versions of cabinets (at varying heights), to have field merge of RL02's. Therefore, we have to bring RL02's into FAT plants because they can't possibly be stocked or forecast in anything other than an ad hoc basis.

Is there anything we can do to get the number down?

Why are our cabinets of varying heights?

VII. **HARDWARE IMPLEMENTATION**

While logic and memory technology are often the prime determinant of the performance and cost of a computer system, fabrication and packaging technology are equally important. This section surveys logic, fabrication, and packaging technology as it affected the various DECsystem 10 models. Table Imp. summarizes the various logic, fabrication and packaging technologies.

Logic

The PDP-6 used a set of logic modules that evolved from the earlier PDP-1, which in turn were derived from the Lincoln Laboratory circuits developed for the TX-0 (Mitchell and Olsen, 1956) and TX-2 (Olsen, 1957) computers as part of the air defense program. These circuits were the forerunner of modern TTL, but included the series transistor circuits to give great flexibility in designs. The PDP-1 circuits operated at 5 mhz clock, and new transistors enabled the PDP-6 circuits to operate at 10 mhz. The computer's clock was derived from a delay line which carried pulses generated by a pulse amplifier using pulse transformers, (this too came from Lincoln Laboratory via the early work at MIT on radar and pulse transformers). The pulses were used for register transfer operations (i.e. moving data among the registers) and some logic gating.

Parallelism		simpler (faster) data path	instruction look-ahead (4-word) fetch	instruction look ahead; 2 Kword cache memory	
Fabrication	(too) large modules	Gardner-Denver automatic wire wrap for backpanel interconnection	semiautomatic wirewrap for twisted pair	large (hex) modules with many pins; lost cost minis front end	(KL20) integrating Pc and Mp together--eliminating Memory Bus=> high density core memory modules
Consequences	served as PDP-10 production prototype	buildable in production	more performance (scientific & real time); and paging for operating systems	more performance via cache; microprogramming for better COBOL ISP; i/o computers	lower cost

Instead of using a small number of lines in a fixed, synchronous clock, many delay lines were used. The route through the control path determined the state of the machine. At each decision point, the next line or chain (set of lines) was selected. Hardware subroutines were also unique with this implementation. A control sequence consisting of a set of delay lines was defined as a subroutine and a calling module marked the calling site (e.g. add, subtract, and complement are at the lowest level). The basic multiply subroutine used add or subtract, and finally floating multiply used the normalize, and multiply subroutines. In this way, the implementation was kept structured and turned out to be quite straightforward. The flowcharts for the PDP-6 were only 11 pages, where each page has about 25 unique statements (actions), yielding a total of only 250 microsteps (each step causes 1 to 6 operations and corresponds roughly to current microprogram statements). The asynchronous adder was designed so that on completion of all the carries, the sequence would restart. Thus we took advantage of the observation made by von Neumann, et al in 1946 (see Ch.4, Bell and Newell, 1971), that the average number of carries is log base 2 (36) or slightly over 5, versus the worst case of 36. And since the average delay time was about 20ns per carry, this reduced the average add time to only 100n versus 720nsec., yielding a very simple and fast circuit.

The KA10 used essentially the same circuitry but with significantly better packaging so that automatic wire wrap backpanels could be used. Note that in Table Imp, the existence of certain semiconductors were the basis of new machines. The TTL/H series logic appeared about 1969 and formed the basis of a machine (the KI10) with roughly the same power dissipation and physical size as a KA10, but with a factor of 2.2 more performance. In scientific applications requiring double precision computation, this performance differential is much greater. Surprisingly, the TTL/Schottky (TTL/S) series was first available in production quantities about the time of the PDP-11/45 which was delivered at the same time as the KI10. The KI10 design was started earlier and design options chosen so as to preclude the subsequent advances in speed, power and density that the TTL/S gave.

The other important logic advances employed in the KI10 were the MSI register file and associative memory packages. The register file provided four sets of accumulators and thus decreased the context switching time. (This probably had a higher psychological than real value but was useful where special devices were operated on a high speed, real time basis.) The associative memory package permitted the construction of a 32 word associative memory to support a paged environment.

The KL10 provides almost a factor of five performance improvement over the KA10 for programs using the basic instruction set. An even larger performance improvement is realized for COBOL or extended precision scientific programs. The organization and much of the base work for the KL10 was done by Dave Poole, Phil Petit, John Holloway and Jack Wright at the Stanford Artificial Intelligence Laboratory.

The KL10 is microprogrammed using one Kbit bipolar RAM. A cache memory is also constructed from the one Kbit chips. The cache provides a substantial speed-up over larger memories and their associated cabling. The KL10 is implemented in the Emitter Coupled Logic (ECL) 10K series rather than the TTL/Schottky of the original Stanford design. It was felt that the ECL speed advantage with 3 nsec. gate delay vs 7 nsec. gate delay for Schottky was worth the extra design effort especially since the ECL could supply more power over the board and backplane.

Fabrication

The Gardner-Denver automatic wire wrap machine was significant in the fabrication of machines. Automatic wire wrap economically provided accurately wired backpanels. As a more important side effect, it made the high volume, low cost fabrication of minicomputers possible! Some backpanel wiring on the KI10 and KL10 processors using twisted pairs can not be done using the Gardner-Denver machinery. For this, DEC developed a semi-automatic wire wrap machine which locates the pins, and selects the wire length for an operator.

Computer design aids have evolved to support computer implementations on an "as needed" basis, barely keeping ahead of the implementations. These have included printed circuit board layout/routing, backplane layout/routing, circuit/logic simulation, wire length/logic delay checking, and various manufacturing aids. One notable exception to this trend has been the Stanford University Drawing System (SUDS) developed by the Stanford Artificial Intelligence Laboratory. SUDS was used for drawing the entire KL10 design. The design time and cost would have been significantly greater if SUDS had not been available.

Packaging

Semiconductor density is a major determinant of the system size, and size in turn is a major determinant of speed (e.g., shorter interconnection paths). Seymour Cray has stated in a lecture at Lawrence Livermore Laboratory (Dec., 1974) that for each generation of his large computers, the density has improved by a factor of five. But semiconductor density is not the sole determinant of speed; how circuitry is packaged and interconnected is equally important.

The packaging for the PDP-6 was identical to that of the PDP-1, 4 and 5 and used a board area of about 40 sq.in. with a 22 pin connector. A logic density improvement of two was achieved over the previous designs by using six special function modules. However this density turned out to be too high for the number of pins. A natural extension was a board twice as large with 44 pins. The most interesting module was the bit slice of the working registers: accumulators, multiplier-quotient, and memory buffer. This module required more than 44 pins, so the extra signals were bussed across the back of the module. This bussing increased module swap time and the mechanical coupling increased the probability that fixing one fault would cause another. Because of this, the designers of the KA10 and KI10 became fearful of large boards. Only with the KL10 in 1972 were large boards re-introduced into the DECsystem 10. On the other hand, large boards had been used in DEC minicomputers since 1969.

Multilayered boards were required for the KL10 ECL logic. These boards were adapted from the multilayered boards developed for the TTL/S PDP-11/45 (1972).

Price/Performance

Surprisingly, over time the various models of the DECsystem 10 have been implemented at an essentially constant cost. The option to apply technology at constant performance with reduced price was never examined as an alternative strategy. In the minicomputer part of the company, both alternatives were vigorously pursued in order to provide a growing business and stimulate design alternatives. The relatively static DECsystem 10 strategy with constant price, no doubt, stems from the highly coupled interaction of: builders (wanting to go on to provide the next highest level of performance which was the founding principle of the group); the salespeople (many of whom came from other companies and are only used to working with a particular user class); users (who want more performance so as to reduce their overall cost/performance ratio); and marketing (which integrates needs and alternatives). This is illustrated in Fig. PerfPr. Here we give the performance in terms of the number of general purpose users versus the system price.

Figure PrSys gives a single price of the system for each generation, together with the percentages going of each for the system components. The best cost/performance systems are shown (except, in the case of the minimal PDP-6). Figure PrPc gives the price of the various processors versus time for the family; note the processor price has been increasing roughly at the inflation rate, suggesting a manpower intensive (or service-type) market structure. Note that since the performance (Table Imp) has improved at roughly a factor of 10 in 10 years, the increase in performance/cost is nearly 20% per year. In contrast, a minicomputer line (constant performance) is plotted which shows the price decreasing at 21% per year, with a factor of 10 price decline in 10 years. We should ask--could a PDP-6 level processor be built in 1975 to sell for $10K? (Clearly!)

Such a system has been built as an advanced development project. This small 10 has a unified bus structure like the PDP-11 with a connection to use the Unibus family i/o devices. A system with 512 Kwords and the performance of greater than a KA10 occupies a cabinet somewhat smaller than an 11/70 minicomputer.

Figure PrMp shows how the price of memory has decreased with time. Note that even though there was growth in memory size of the monitor of 25%/year, there was a positive improvement in the memory price performance. In reality, many functions which the user was explicitly responsible for were moved to the monitor as a basic operation. A similar plot for secondary memory prices is given in Fig. PrMs.

Conclusions

We believe the existence of the DECsystem 10 has been beneficial to the many environments for which it has provided real time and interactive computation, including the computer science and computer engineering communities. In turn, we have tried to respond to the needs of these users. It's existence has also been a positive force in encouraging alternative, competitive products in what otherwise might have been a dull, batch environment. The system has also been used by and influenced minicomputer, and now microcomputer development including: hardware technology (e.g., wirewrap); support for machine development (including simulation); and exemplary design leading to timesharing systems (e.g., DEC's TSS/8, RSTS) and user environments (e.g., RT-11 and microcomputer systems).

We believe the key to the 10's longevity is its basically simple, clean structure with adequately large (one Mbyte) address space that allows users to get work done. In this way, it has evolved easily with use and with technology. An equally significant factor in its success is a single operating system environment enabling user program sharing among all machines. The machine has thus attracted users who have built significant languages and applications in a variety of environments. These user-developers are thus the dominant system architects-implementors.

In retrospect, the machine turned out to be larger and further from a minicomputer than we expected. As such it could easily have died or destroyed the tiny DEC organization that started it. It is a tribute to the machine and to all those involved with it that we consider it successful.

Hopefully this paper has provided insight into the interactions of its development.

Acknowledgements

Dan Siewiorek deserves our greatest thanks for helping with a complete editing of the text. The referees and editors have been especially helpful. Mary Jane Forbes, Louise Principe, and the DEC WPS8 are to be commended for the typing, editing and filing of the numerous drafts. The important program contributions by users are too numerous for us to give by name (e.g., APL, BASIC, BLISS, DDT, LISP, Pascal, Simula, SOS, TECO, and TENEX). Likewise, there have been so many contributions to the 10's architecture and

implementations within DEC and throughout the user community that we dare not give what would be a partial list.

ABSTRACT

DECsystem 10 [sic] PDP-10 evolved from the PDP-6 (circa 1963) for five implementation generations to presently include systems covering a price range of five. PDP-6 was the first commercial computer designed explicitly for timeshared use. The origin and evolution are described.

I. INTRODUCTION

The project originating the PDP-6, DECsystem 10, and DECsystem 20 series of scientific, timehsared computers began in the spring of 1963, and continued with the delivery of a PDP-6 in the summer of 1964.

Initially, the PDP-6 was designed to extend DEC's line of 18-bit computers by providing more performance at increased price. Although the PDP-6 was not constrained to be a member in a family of compatible computers, the series evolved into five basic designs (PDP-6, KA-10, KI-10, KL10, and KL20) with over 700 systems installed. The notions and need for compatibility were neither understood then nor did we have adequate technology to undertake such a task. Each successive implementation in the series has generally offered increased performance for only slightly increased cost. Currently, the KL10 and KL20 systems span a 5 to 1 price range.

TOPS-10, the major user software interface, developed from a 6 kiloword monitor for the PDP-6. A second user interface, TOPS-20, with upgraded facilities is based on multi-process operating systems advances.

The paper is divided into seven sections. Section 2 provides a brief historical setting followed by a discussion of the initial goals, constraints, and basic design decisions. The instruction set and system organization are given in sections 4 and 5 respectively. Section 6 discusses the operating system while section 7 presents the technological influences on the designs. Sections 4 to 7 begin with a presentation of the goals and constraints, proceed to the basic PDP-6 design, and conclude with the evolution (and current state). We try to answer the often asked questions "Why did you do ____?", by giving the contextual environment. Figure TL helps summarize this context in the form of a time line that depicts the various hardware/software technologies (above line) and when they were applied (below line) to the DECsystem 10.

II. HISTORICAL SETTING

The PDP-6 was designed for both a timeshared computation environment and real time laboratory use with straight-forward interfacing capability. At the initiation of the project, three timeshared computers were operational:

a PDP-1 at Bolt, Beranek and Newman (BBN) which used a high speed drum that could swap four kiloword core images in one 34-millisecond revolution;

an IBM 7090 system at MIT, called CTSS which provided each of 32 users a 32 Kword environment; and

an AN/FSQ-32V at SDC which could serve 40 simultaneous users.

The Bell Laboratory's IBM 7094 Operating System was a model operating system for batch users. Burroughs had implemented a multiprogrammed system on the B5000. Dartmouth was considering the design of a single language, timesharing system which subsequently became BASIC. The MIT Multics System, the Berkeley SDS 940, the Stanford PDP-1 based timeshared system for computer aided instruction, and the BBN (Bolt, Beranek and Newman) Tenex System all contributed concepts to the DECsystem 10 evolution in the 1960's.

In architecture, the Manchester Atlas (Ch.23, Bell and Newell, 1971) was exemplary, not because it was a large machine that we would build, but because it illustrated a number of good design principles (architecture). Atlas was multiprogrammed with a well-defined interface between the user and operating system, had a very large address space, and introduced the notion of extra codes to extend the functionality of its instruction-set. Paging was a concept we just could not afford to implement without a fast, small memory. The IBM Channel concept was in use, on their 7094, and was one we wanted to avoid since our minicomputers (e.g., PDP-1) were generally smaller than a single channel and could outperform the 7094 in terms of i/o concurrency and i/o programmability by a clean, simple interrupt mechanism.

The DEC product line in 1964 is summarized in Table 1964. Corporation wide sales totaled $11 million at that time and it was felt that computers had to be offerred in the $20,000 to $300,000 range. Architecturally, we were sensitive to the problems encountered by not having enough address bits by watching DEC and

IBM machines exceed their addressing capacities.

Table 1964. DEC's 1964 Computer Products

Name	Year Introduced	Word Size (Bits)	Price ($K)	Status
PDP-1	1960	18	120	Marketed
PDP-2	1960	24	-	Reserved for future implementation
PDP-3	1961	36	-	Paper machine
PDP-4	1962	18	60	Marketed
PDP-5	1964	12	27	Introduced
PDP-6	1964	36	300	Introduced

On the software side, most programmers at DEC had been large machine (16 to 32 Kwords) users although they had most recently programmed minicomputers where program size of 4 to 8 Kwords was the main constraint. There was not a good understanding of operating systems structure and design in either academia or industry. For example, MIT's Multics Project was being formed and IBM's 360/TSS Project didn't start until 1965. Generally there were no people who directly represented the users within the company, although all the designers were computer users. A number of users in the Cambridge (Mass.) community advised on the design (especially John McCarthy, Marvin Minsky and Peter Sampson at the MIT Artificial Intelligence Laboratory).

Although there was little consensus that Fortran would be so important, it was clear our machine would be used extensively to execute Fortran. The macro assemblers, basically unchanged even today, were used in various laboratories and our first one for PDP-1 was done by MIT in 1961. We also felt the list languages, especially LISP for symbolic processing were important. There was virtually no interest in business data processing although we had all looked at COBOL.

In technology, there was no concept of evolution, especially in view of the new integrated circuit then under development.

Germanium transistors were available, and silicon transistors were just on the market. IBM was using machine wirewrap technology, while DEC back panels were handwired and soldered. The basic DEC logic circuits were saturating transistor as distinct from the more expensive current mode used by IBM in the 7094 and Stretch computers. Production core memories of 2 microseconds were beginning to appear, and their speed was improving. Our PDP-1 used a 5 microsecond core. Hence, it was unclear what speed memory a processor should support.

The notations of compatibility and family range were not appreciated even though SDS (eventually XDS and now non-existent) had built a range of 24-bit computers. We adhered to the then imposed convention of the word length being a multiple of six bits (the number of bits in the standard character code), but designed the machine to handle arbitrary length characters.

III. OVERALL GOALS, CONSTRAINTS AND BASIC DESIGN DECISIONS

Table IGC lists the initial goals, constraints and some basic design decisions. Presentation of this list separately from the design is difficult because the goals and constraints were not formally recorded as such and have to be extracted from design descriptions and our unreliable, and self justifying memories. Table IGC will be used in discussing the design.

The initial design theme was to provide a powerful, timeshared machine oriented to scientific use, although it subsequently evolved to commercial use. John McCarthy's definition (McCarthy, 1962) of timesharing, which we subscribed to, included providing each user with a large computer. Thus our base design provided protection between the users (not himself) and a mechanism for the common resources to be allocated and controlled. The machine had to also support a variety of compiled and interpretted languages. The construction was to be modular so that it could evolve and users could build large systems including multiprocessors. It should add to the top of DEC's existing line of 12- and 18-bit computers. It should be simple, buildable, and supportable by a small organization. Thus, it should use as much DEC hardware technology as possible.

Table IGC: Initial Goals, Constraints and Basic Design Decisions

User/Language/Operating System

cheaper cost/user via timesharing without inconvenience of batch processing

timeshared use via terminals with protection between users

independent user machines to execute from any location in physical memory

unrestricted use of devices e.g. full duplex use of terminals

support for wide range of compiled and interpreted languages

no special batch mode, batch must appear like terminal via a command file

device independent i/o so that programs would run on different configurations and could be shared among the user community

direct i/o for real time users

primitive command language to avoid need for large internal state

minimum usable system < 16 Kwords

modular software to correspond to modular hardware configurations

Instruction-Set Processor (ISP)

support user languages by data-types and special operations

scientific (i.e., Fortran) = > integers, reals, boolean

list processing (i.e., LISP) = > addresses, characters

support recursive and reentrant programming => stack mechanism

support operating systems

effective as machine language = > booleans, addresses, characters, i/o

operating system is an extension of hardware via defined op. codes

word length would be 36-bits (compatible with DEC's computers)

large (1/4 million 36-bit words = 1 million 9-bit bytes) address

require minimal hardware = > simple

general-register based (design decision) with completely general use

easy to use and remember machine language

orthogonality of addressing (accessing) and operators completeness of operators

direct (not base + displacement) addressing

few exceptional instructions

2's complement arithmetic (multiple precision arithmetic)

PMS Structure

maximum modularity so that users could easily configure any system

easy to interface

asynchronous operation - system must handle evolving technology

multiprocessor for incremental and increased performance (2-4 in design)

no Pio's (IBM Channels), use simple programmed i/o with interrupts and direct memory access for high speed data transmission

Implementation

simple; reliable

asynchronous logic and busses for speed in light of uncertain logic and memory speed

all state accessible to field service personnel via lights

use DEC (10 mHz vs 5 mHz) circuit/logic technology (manpower constraint)

buildable without microprogramming (no fast, read-only, memories in 1963)

Organizational/Marketplace

add to high end of DEC's computers

use minimal resources, while supporting DEC's minicomputer efforts

IV. THE INSTRUCTION-SET PROCESSOR

The goals of an ISP are:

. to efficiently encode the various programs using both compiled and interpreted languages

. to be understandable and able to be remembered by its users;

- to be buildable in current technology at a competitive price; and

- to permit a compiler to provide efficient program production

Data Types and Operators

Earlier DEC designs and the then current 6-bit character standard forced a word length which was a multiple of 6, 12, and 18 bits. Thus a 36-bit word was selected.

The language goals and constraints forced the inclusion of integer and real (floating point) variables. We chose two's complement integer representation rather than the sign-magnitude representation used on the 7090, or the one's complement representation on PDP-1. The floating point format was chosen to be the same as the 7090, but with a format that permitted comparison to be made on the number as an integer in order to speed up comparisons and only require a single set of compare instructions. Special (common) case operators (e.g., V=0, V=V+1, V=V-1) were included to support compiled code.

Our desire to execute LISP directly resulted in good address arithmetic. As a result, both LISP and FORTRAN on DECsystem 10 are usually encoded in less space than the 360/370.

Since the computer spends a significant portion of its time executing the operating system, the efficient support of operating system data types is essential. A number of instructions should be provided for manipulating and testing the following data-types: boolean variables (bits); boolean vectors; arbitrary length field access (load/store only); addresses; programs (loops, branching and subprograms); ordinary integers; and the control of i/o. A significant number of control instructions were included to test addresses and other data-types. These tests either controlled flow by a jump or skip of the next instruction (which is usually a jump). Loop control was a most important design consideration.

Table DT gives the data-types and instructions present in the various implementations.

The KA10 and PDP-6 processor instruction sets were essentially the same, but differed in the implementation. The PDP-6 had 365 instructions. A double precision negate instruction in the KA10 improved the subroutine performance for double precision reals. The instruction, find first one in a bit vector, was also added to assist operating system resource allocation and to help in a specific application sale (that fell through). Finally, double precision real arithmetic instructions were added to the KI10 using the original PDP-6 programmed scheme. A few minor incompatibilities were introduced in the KI to improve performance.

Table DT: Data-types of DECsystem 10/20

Data type	Length (bits)	Machine	Operators and [#instructions]	Operator Location
boolean	1	all	0,1,-, test by skip [64]	AC <--f(AC)
boolean - vector	36	all	all 16 [64]	AC and/or mem <-- f(AC,mem)
characters	0-36 = v	all	load, store [5]	AC <-->(mem)
character-string	v x n	KL	compare [8]; move [4]	f(mem)=g(mem); mem <-- f(mem)
digit-string	v x n	KL	convert to double integer	f(AC) <-->f(mem)
half word, 2's comp. integers= addresses	18	all	load, store [64]; index loop control	AC <-->mem; AC <--f(AC)
full word, 2's comp. integers (and fractions)	36	all	load, store, abs., -(negate)[16] +,-,x,/,+1,-1, x2's, rotate test (by skip & jumps)	AC and/or mem<--f(AC,mem)
double word, 2's comp. integers (and fractions)	72	KL	load, store, -(negate)[4]; +,-,x,/[4]	AC <-->f(mem); AC <-- f(AC,mem)

real 9 all load, store, abs., AC and/or mem
(exponent) -(negate),+,-, <--
f(AC,mem)
(exponent)+ x,/,x2's,[35] immediate
mode was
(mantissa) test (by skip, added in KA
+27(mantissa) jump) [16]

double real 9 + 54 KI,KL load,store,abs, KA provided
negate
9 + 63 KI,KL negate,+,-,x,/[8] instruction

word stack 36 all load, store, call, Stack <-->
Memory
return[4]

word vector 36 x k all move [1] mem[a:a+k]<--
mem[b:b+k]

[unclear]
i/o program 36 all short call/return;
AC, mem
UUO

With the decision to offer Cobol in 1970, better character and decimal string processing support was required from the instruction set. The initial Cobol performance was poor for character and decimal arithmetic because each operation required software character by character conversion to an integer, the operation (in binary or double precision binary) and software reconversion to a character or a decimal number. The KL10 provided much higher performance for COBOL by having the basic instructions for comparing character and decimal strings--where a character can be a variable size. For arithmetic operations, instructions were added to convert between string and double precision binary. The actual operations are still carried out in binary. For add and subtract, the time is slightly longer than a pure string based instruction, but for multiplying and dividing, the conversion approach is faster.

Stack vs General Registers Organization

A stack machine was considered based on the B5000 and George Interpreter (which later became the English Electric KDF9). A stack with index register machine was proposed, but rejected on the basis of high cost and fear of poor performance, for executing the operating system, LISP, and FORTRAN. The compromise we made was to provide a number of instructions to operate on a stack, yet use the general registers as stack printers.

An interesting outcome of our experience was that one of us (Bell) discovered a more general structure whereby either a stack or general register machine could be implemented by extending addressing modes and using the general registers for stack pointers. This scheme was the basis of the PDP-11 ISP (Bell, et al 1970).

Currently we believe that stack and general register structures are quite similar and tend to be a tradeoff between control (either in a program or in the interpretation of the ISP) and performance. In use, compilers for general register machines often allocate registers as though they are a stack. Table SGR compares the stack and general register approaches.

Table SGR: Comparison of Stack and General Register Architectures

	Stack	**General Register**
Number of registers	approximately the same	

Register use	fixed to stack operation	can be arbitrary
Control program when	built in hardware (implicit)	simple, explicit in used as a stack
Access to local registers variables	1 or 2 elements at top of stack	full set in general
Compiler problem	easy (no choice)	an assignment (use)
Program encoding to registers index values	fewer bits	more bits give access for intermediate and
Performance registers	high if element on stack top	high if in general (performs relatively better than stack)

A general register architecture was selected with the registers in the memory address space. The general registers (multiple accumulators) should permit a wide (general) range of use. Both eight and sixteen were considered. By the time the uses were ennumerated, especially to store inner loops, we believed sixteen were needed. They could be used as: base and index, set of booleans (flags), ordinary accumulator and multiplier-quotient (from 7090), subroutine linkage, fast access for temporary and common sub-expressions, top of stack when accessed explicitly, pointer to control stacks, and fast registers to hold small programs.

Since the AC's were in the address space, ordinary memory could be used in lieu of fast registers to reduce the minimal machine price. In reality, this rarely happened; hence eight registers may have been enough. A smaller number would have provided more rapid context switching and assisted the assembly language programmer who tried to optimize (and keep track of) their use. In fact, Lunde (1977) has shown that eight working registers would be fine to support the higher level language usage. Multiple register sets were introduced in the KI10 to reduce context-switching time.

Instruction-set Encoding and Layout

The ease of implementation goal forced an instruction-set design style that later turned out to be easy to fabricate with the KL10 microprogram implementation. This also simplified the fabrication of compilers. In fact, of the 222 instructions useful for Fortran data-types, the earliest compiler used 180 of them and the current compiler uses 212. We used three principles, we now understand, for the ISP design:

a. Orthogonality - an address (with index and indirect control fields) is always computed the same, independent of the data-type it references. Indirect addressing occurs as long as the instruction addressed has an indirect bit on an indefinite basis.

b. Completeness and symmetry - where possible each arithmetic data-type should have a complete and identical set of operations.

c. Mapping among data-types--instruction should exist to convert among all data-types. Several data-types were incomplete (characters, half-words) and these should be converted to data-types with a complete operator set.

The instruction is mapped into the 36 bit word as follows:

```
  !-----------------!---------!---!-------!-----------------------
-----!
  !      Op Code    !   AC    ! I !  XR   ! Address or 18-bit
Literal !
  !-----------------!---------!---!-------!-----------------------
-----!
   0              8  9      12 13   14   17 18
35
```

AC is 1 of 16 accumulators (general registers)
XR is index register designation (1 of 15 AC's)
I is indirect bit

The entire instruction-set fits easily within a single figure (see Fig. IS). The bold face letters denote instruction mnemonics. The data-types and operations are generally deducible by the instruction names: operator names (e.g., ADD) for word (or integer); D-double integers; H-half word; BL-vector; 16-operator names (e.g. AND) for boolean vectors, Test-boolean (bits); J-jump/skip for program control; F-floating; DF-double floating. The i/o and interrupt instructions are described in the PMS section.

<u>Multiprogramming/Monitor</u> <u>Facilities</u>

The initial constraint (circa 1963) of a timeshared computer with a common operating system led to several hardware facilities:

1. two basic machine modes: user and executive (each with different privileges);

2. protection against operations to halt the computer or affect the common i/o when in user mode;

3. communication between the user and operating system for calling i/o and other shared functions; and

4. memory mapping--separation of user programs into different parts of physical memory with protection among the parts and program relocation beyond the control of uses.

An executive/user mode was necessary for protection facilities in a shared operating system while providing each user with his own environment. Although there was a temptation (due to having a single operating system) to eliminate or have the executive mode and the general registers be an option, we persevered in the design and now believe this to be an essential part of virtually every computer! (The only other necessary ingredient in every computer is adequate error detection, such as parity). Separation into at least two separate operating regions (user and executive) also permits the more difficult, time constrained i/o programs to be written once and to have a more formal interface between system utilities and user.

The UUO (Unimplemented User Operation) is an instruction like the Atlas Extracode and IBM 360 SVC to call operating system functions and common user-defined functions. It also calls functions not present in earlier machines. Thus a single operating system could be used (by selecting the appropriate options) over several models. This use appears to be more extensive than in the IBM System 360/370.

The goals of low cost hardware and minimal performance degradation constrained the protection facilities to a single pair of registers to relocate programs in increments of 1 Kwords. Two 8-bit registers (base and limit registers) with two 8-bit adders were required for this solution. Thus each user area was protected while running and a program could be moved within primary or secondary memory (and saved) because user programs were written beginning at location 0. This is identical to the CDC 6600-7600 protection/relocation scheme.

In the KA10 a second pair of registers was added so that the common read-only segment of a user's space could be shared. For example, this enabled one copy of an editor, compiler or runtime system to be shared among multiple users. Programs were divided into 128 Kword read-write segment and a 128 Kword read only segment. Since each user's shared segment had to occupy contiguous memory, holes would develop as users with different shared segment requirements were swapped. This led to "core shuffling" and in a busy system up to 2% of the time might be spent in this activity. The operating system was modified in the early 70's at the Stanford Artificial Intelligence Laboratory so that the high, read only segment could share common, global data. In this way a number of separate user programs could communicate, to effectively extend the program size beyond the 256 Kword limit. In retrospect, instructions to move data more easily between a particular user region and the operating system would have been useful; this was corrected in KI10 and is described below.

With the availability of medium scale integrated circuits, small (32 word) associative memories could be built. This enabled the introduction of a paging scheme in the KI10. Each 512 word page could be declared sharable or private with read only or read-write access. The basic two mode protection facility was expanded to four modes: Supervisor, Kernel, Public and Concealed. There were two monitor modes: Kernel mode provides protection for i/o and system functions common to all users; and Supervisor mode is specialized for a single user. The two user modes are: Concealed for proprietary programs, and Public for shared programs. For protection purposes, the modes are only changed at selected entry portals. The page table was more elaborate than the Atlas (circa 1960) whose main goal was to provide a one level store whereby large programs could run on small physical memories. In fact the first use of KI10 paging required all programs to be resident rather than having pages being demand driven. A gain over the KI10 was realized by not requiring programs to be in a single contiguous address space. The KI10 design provided more sharing, and increased efficiency over the KA10. The KL10 extended KI10 paging for use in the TOPS 20 operating system to be described later.

VI. **OPERATING SYSTEM**

PDP-6 Monitor Design Goals and Philosophy

The initial goals and constraints for the user environment are summarized in Table IGC. The most important goal was to provide a general-purpose timesharing system. The monitor was to allow the user to run in the mode most suited to his requirements, including interactive timesharing, real time, and batch. In timesharing there was no requirement for a human operator per se. Instead, the operator's console was a user terminal with special privileges. Real time programs had to be able to operate i/o directly, locked in core, and batch was to be provided as a special case of a terminal job.

Because of the modular expandability of the hardware structure, the software system had to be equally modular to facilitate varying system configurations and growth. The core resident timesharing monitor was only fixed at system generation (i.e., IBM's SYSGEN) time when software modules could be added to meet the system requirements. The core space required for monitor overhead had to be minimized. Thus job-specific functions were placed in the user area instead of in the monitor. The first 96 locations of each user job contained pertinent information concerning that job. A temporary area (stack) for monitor operations was also included. In this way, the monitor was not burdened with information for the inactive jobs. This structure permitted the entire job state to be moved easily.

Adequate protection was to be given each user from other non-malicious users. However the user was not protected against himself because various user status information in the job area could be changed to affect his own job. Since common system resources were allocated upon demand and deadlocks could occur, the term "Gentlemen's Timesharing" was coined for the first monitor.

The UUO (Unimplemented User Operation), or system call instruction, provided both monitor-user communication and upward hardware compatibility. In the latter case, the instruction would use the hardware if available, otherwise the instruction would trap to the monitor for execution. For example, double precision hardware was available on later CPU models. The number of UUOs implemented in the monitor for monitor-user communication has been significant. The initial use of UUO's included requests for: core, i/o assignment, i/o transmission, file control, date and time, etc.

<u>PDP-6 Monitor</u>

Monitor was the name given to a collection of programs that were initially core resident and provided overall coordination and control of the operating environment. A non-resident part was later added with the advent of secondary program swapping and file memories (i.e., drum and disk). The Monitor did not include utilities, languages, and their run time support.

The PDP-6 Monitor was constrained to run in 16 Kword (minimum) machine with console printer, paper tape reader (for maintenance) and two DECtape units. DECtape was a 128 word/block, block addressable media of 450 Kcharacters for which a file system was developed. The goal of minimizing memory led to very sparing use of shared tables. The key global variable data was restricted to: core allocation table, clock queue, job table, linked buffers for Teletype and other buffered i/o devices (e.g., DECtape directory), and a directory of system programs and monitor facilities.

The original PDP-6 Monitor was less than six Kwords. The monitor has increased at about 25%/year with the KA10 at 30 Kwords, KI10 at 50 Kwords, and KL10 at 90 Kwords. This increase provided increased functionality (e.g., better files, batch, automatic spooling), larger system configuration size, more i/o options, increased number of jobs, easier system generation, and increased reliability (e.g., checking, retries, file backup).

Note that with a 16 Kword memory, a nine Kword Fortran compiler with five Kword runtime package, and one Kword utility programs, two users could simultaneously reside in PDP-6 memory and use the machine for program creation and checkout. By keeping the monitor program size small, subsequent functionality increases kept the monitor module sizes in bounds such that program swapping was reduced. This provided high performance for a given configuration with little monitor overhead.

Monitor Structure

Table MonF summarizes the development of the monitor with the various systems. The facilities are arranged beginning with basics. The following sections will deal with the various facilities, in turn.

Protection Swapping - These basic environment was discussed above in the ISP section on Multiprogramming/Monitor Facilities.

Facilities Allocator - The Facilities Allocator was a module called from a console or program for an i/o device or memory space request. This module would attach (or assign) a given peripheral or contiguous physical memory area to a given job. Although this module was relatively trivial initially, it evolved to a more complex module since improper resources allocation caused deadlocks.

The KA10 generation software introduced queued operation. A line printer (output), paper tape (input/output) and a card reader (input) spooler were implemented. These spoolers ran as timeshared jobs, accepted requests from other user jobs and managed the input/output operation.

Table MonF: Monitor Functions Evolution

Facility	PDP-6 (1964)	KA10 (1967)	KI10 (1972)	KL10 (1975)
Protection machine shared	one segment per user	two segments with shared program segment (required re-entrant programs)	four modes for shared segments	virtual with segments
Program paging (job swapping be resident	core shuffling	core shuffling; with swapping (via drum disk)	paging used for core management	demand need not wholly to run)
Facilities of all allocator	devices assigned to users upon request (dead-lock's possible => gentlemen's timesharing	printer & card reader	spooling of line devices	spooling
Scheduler and system mgr.; job and pie-schedule	round robin parameters for scheduler scheduling set	scheduler to favor interactive jobs using multiple queues	swapping efficiency considerations	fairness by priority classes slice
User head movement Files	user files on DECtape, optimization; Magtape, Cards, reliability,	significant enhancement of	improved file structure file function;	disk

	and Magnetic tape	on-line, random access disk-based files	error recovery, protection and sharing; mountable structures	
Command control program	simple (to implement) requiring little state	evolution to more powerful, easier to use command language	Common Command Language (CCL)	extensions to CCL
Batch	no real batch	remote & local single-stream batch	multi-programming batch	improved multi-programming batch

Terminal handling & communica-tions	asynchronous task-to-task communications communications (for inter-active terminals) as monitor module	synchronous communications for remote job and concentrator stations; "birth" of networks with simple topologies; ARPA network	synchronous communications in complex topologies; new protocol; IBM BISYNC for 2780 emulation/ termination	DECnet*
Multi-processing	- symmetric multi-processing	dual processor support (master/slave)	high availability through bus switching hardware	

*DECnet is DEC's computer network protocols and functions.

Program Scheduler - The scheduler was invoked by line frequency (50 or 60 Hz) interrupts to examine run queues and to determine the next action. The first monitor employed a round robin scheduling algorithm. At the end of a given time quantum of 500 milliseconds, the next runnable job was run. A job was runnable if not stopped by the console or when not waiting for i/o.

Because terminal response time is the user's measure of system effectiveness, subsequent scheduler improvements have favored interactive jobs. With the KA10, separate priority queues were added so that jobs with substantial computation were placed in the lowest priority and then run the longest without interruption. This, in effect, approximated batch operation; for example, jobs from a card reader would operate as a batch stream. Later, batch operation was added for interactive users.

The introduction of disk/drum swapping caused additional complexities since runnable jobs might be located in secondary memory. The concept of "look ahead" scheduling was required and a more complex queueing mechanism was implemented. As the monitor selected the next job to be run, it would "look ahead" to determine future queues, and invoke the swapping module if required to move a runnable job into core. Because of the higher swapping overhead it was essential to run large jobs longer and less often. A "fairness" consideration also assured that each job, whatever its size, received enough run time to maintain responsiveness.

Recent enhancements permitted a Systems Manager to set scheduling parameters including established priorities of job classes, and specifying "pie-slice" where classes of users are guaranteed parts of the machine resources.

User Files and I/O Device Independence - In the initial PDP-6 design, resources such as magnetic tapes, unit record devices (e.g., card readers, line printer, paper tape reader/punch) and DECtapes (which were file structured) were requested by each user as they were required. The monitor allocated the device to a requesting given job until released.

I/O calls were evoked by the UUO call instructions. A particular device program call could specify the number of i/o buffers to provide so that arbitrary amounts of overlapped i/o and computing could be realized.

In order to realize the goal of modularity, each i/o device handler was implemented as a separate module. These modules used a common set of subroutines. The device tables were made as identical as possible to help achieve the device independent goal. Thus, a user specified an i/o channel, not a specific i/o device. The channel to name assignment could take place at various times from log-on to program run-time.

In the original monitor, a user was allowed to assign file devices to his job and read and write named files with the devices. The current permanent, on-line user files with automatic backup was not implemented until the KA10 generation Monitors. The concept of Project/Programmer Number was adopted (after MIT's CTSS) in order to provide increased file security and sharing. In the same evolution, a user was required to enter a project/programmer number with his associated password. This not only established a job, but identified the user to the monitor. In additon to having resource privileges associated with better ID numbers, the user received a logical disk area for files. File access can be allowed (by the creator of the file) to any of the following levels with decreasing protection (increasing privileges): no access; execute only; plus read; plus append; plus update; plus write; plus rename; plus alter protection.

Significant evolution occurred in the user file facility. Improved file structure reliability and error recovery (such as writing pointer blocks twice) was achieved. With moving head disk availability, disk head movement optimization for file transfers on single or multiple drives was added. The concept of "mountable" structures was implemented to allow disk packs to be mounted and dismounted during timesharing operation as well as allowing a user to have a "private" pack mounted. As the number of users supported on the system and the diversity of their applications grew to include "business data processing" both hardware and software allowed expansion of the number and capacity of on-line disks.

<u>Command Control Program</u> - This program processes all commands addressed to the system from user terminals. Thus terminals served to communicate monitor commands to the system, to communicate to the user programs, and to serve as an i/o device for user programs. Terminal handling routines were an integral part of the PDP-6 Monitor. The original commands were designed to minimize the amount of state in the Monitor. As a result, users had to type several commands to control programs. The evolution

was to a much more powerful command language.

Batch Processing

Batch processing has evolved from the original, fully interactive PDP-6, where a user was expected to interactively provide commands for each step in the generation/execution of a program. The first batch on the KA10 was based on a user-built command file that mimicked his terminal actions. The user invoked this command file to execute his programs. Later, a multi-programmed batch system was added and the job control syntax evolved to provide more functions per command. However, batch/interactive command commonality has been preserved through the current monitor versions. Still, batch control ran as a timeshared job using queued batch control files. Thus, the ability to log in a job, run to completion, and log off, is accomplished from a card reader, or any other storage or file device. Symbiant (queued) operation allowed control of card readers, line printers, etc., by the batch control program so that the machine could be scheduled more effectively. During this batch evolution, little monitor enhancement was necessary to specifically address the batch environment. Modules to improve efficiency (by multiple strands and better scheduling) and increase functionality were implemented as "user" jobs and interprocess queueing allowed communication between the "user" modules.

A line printer spooler, for example, was run as one of many jobs by the operator--a notion that evolved beginning with the KA10. If a special form was required for a print job, the operator would be notified and act accordingly. The user was relieved of this responsibility. Operator allocation, control, and media loading of the card reader, magnetic tape, private disk pack, DECtape, and plotter were provided in the KI10.

Terminal Handling and Communications - We believe the users' perception of system effectiveness related directly to his feeling that he was interacting and was in control. The requirement to communicate effectively with the user via the terminal was one of the most difficult design constraints. The very first version of the Monitor used half duplex communication for simplicity. But finally we decided to pay the additional price to gain the benefit of full duplex communication, i.e., being able to continuously input and output independent of system load. These philosophies have guided subsequent monitor generations.

A hardware module was constructed to facilitate terminal communication. This hardware was called the scanner because it looked at all the interface lines connected to Teletypes and interrupted the software when a character was received or needed to be transmitted. These line units, which we built on a single card, formed the basis of the UART (Universal Asynchronous Receiver Transmitter) LSI chip. A software monitor, called SCNSER (Scanner Service) handled interrupts from the hardware. SCNSER provided the important function of logically coupling a physical terminal with a job running under timesharing. The user was never burdened with attempting to relate his terminal with his job. This software module, by far the most logically complex, has been rewritten two times to increase terminal functionality.

Later the KA10 terminal interface was implemented via a "front end" concentrator PDP-8 computer for large numbers of terminals - particularly where variable line speeds were involved (up to 300 baud). This implementation allowed some off-loading of the processor. Characters were assembled (serial parallel conversion) in the front-end PDP-8 and communicated with the KA10 via the I/O Bus on an interrupt basis.

In 1971 a front-end PDP-11 was provided direct memory access over the I/O bus. This connection provided high speed, full-duplex, synchronous communications and was the prototype for the current KL10/PDP-11 front-end computer. Software modules were added to the Monitor to allow these synchronous lines to terminate remote PDP-8 and communication concentrator stations in simple point-to-point topologies. A remote station (e.g., line printer) is viewed by the user in the same manner as a local priniter.

With the KI10, a second front-end was produced which allowed BYSINC protocol of the IBM 2780 terminal to be used. However, most of our users were laboratory oriented and wanted greater performance and functionality. Thus, concentrator/remote station capability including route-through (i.e., communication via multiple concentrators) and multiple hosts was added. These formed the basis of some of our understanding for subsequent DECnet protocol standards and its functions. The use of DECsystem 10 in the Advanced Research Projects Agency (ARPA) funded projects formed another key base for our DECnet protocols and functions (Roberts, 1969).

DECnet 10 now provides the capability to have processes in different computers (including PDP-8's and PDP-11's) communicate with each other. These jobs appear to each other as i/o devices in the simplest applications.

Throughout all of this communications functionality evolution, the goal has been to free the user from concern with the link, communications mode, hardware location and protocol.

<u>Multi-Processing</u>

Although we predicated the original PDP-6 hardware on multiprocessing, the monitor was not designed explicitly for it. Lawrence Livermore Laboratory did build a two processor system with their own operating system and special segmentation hardware. To meet the needs of the predominately scientific/computation marketplace in achieving higher processor throughput, a dual-processor KA10 was implemented using a master/slave scheme with wholly shared memory and one monitor. The slave CPU scanned the queue of runnable jobs, selected one and ran it. If a monitor call was encountered, the job was placed in the appropriate queue and the monitor located another runnable job. The "master" handled all i/o and privileged operations. In a CPU-bound environment, the dual processor provided approximately a 70% increase in system throughput.

An off-shoot (and evolved design goal) of the dual processor implementation was higher availability. Monitor reconfigurability and bus switching hardware allowed redundant components to be fully utilized during normal operation and, in the case of a hardware malfunction, separated into an operating configuration (with all available i/o) and a maintenance configuration (consisting of CPU, memory, and the faulty component).

At Carnegie-Mellon University (CMU) we proposed to build a 16 to 32 PDP-10 structure (Bell and Freeman, 1971). It would have 16 Mwords of primary memory available via 16 ports at a bandwidth of 2.1 to 8.6 gigabits/sec. Using larger than KL10 processors, performance would have been over 50 mips (million instructions per second). The 16 processor, C.mmp (Wulf and Bell, 1972) based on PDP-11's at CMU is a prototype of such a system.

Language and Utilities

Monitor commands called the utilities and languages. The utilities, we called CUSPs (for Common User System Program), and languages included: EDIT, an editor for creating and editing a file from a user console; PIP, the peripheral interchange program to convert information among the i/o media and files; LOADER to load object modules; DESK, an interactive calculator; MACRO, an assembler; and Fortran II. Figure TL shows these programs at various times, together with their origin.

Utilities and language has taken advantage of the interactive, terminal-oriented environment. Thus highly interactive editing/debugging facilities have evolved in terms of the program's own symbols. The file/data transfer utility, PIP, for Peripheral Interchange Program, is still in existence today, although in a much enhanced form. It has since been expanded to support the peripheral devices and the data formats encountered in the DECsystem-10 memory and i/o devices. Such a utility eliminated the need for a "library" of utilities and conversion program to transfer data between devices. Such tasks as card-to-disk, card-to-tape, tape-to-disk, etc., conversion are controlled by a terminal using common PIP commands. PIP evolved in a somewhat ad hoc fashion from one or two Kword size in 1965 to ten Kwords with substantial generality.

A powerful and sophisticated text editor, TECO (Text Editor and COrrector) was initially implemented at MIT using a graphics display. TECO is character-string oriented and requires a minimal number of keystrokes to execute commands. It included the ability to define programs to do general string substitution. As the sophistication of users was later perceived to decline, the powerful editor created training and use problems. Thus a family of line- and character-oriented editors evolved which were easier to learn and remember. These were based on other line-oriented editors, but especially Stanford's SOS, which replaced the initial DEC line editor in 1970.

Many of the higher level languages were initially produced by nonDEC groups and made available through the DEC User Society (DECUS). For example, APL, BASIC, DBMS and IQL (an interactive query language) were purchased from outside sources and are now standard, supported products.

BLISS, Basic Language for Implementing System Software, developed at Carnegie-Mellon University, became DEC's system's programming language (Wulf, Russel, Habermann, 1971). A cross-compiler was subsequently developed for the PDP-11. It's use as a system's program language has been due to the close coupling it provides to the machine, its general syntactic and block structures, and its high quality code generator. BLISS has been used for various diagnostic programs, the BLISS Compilers, the PDP-10 APL Interpreter, recent Fortran IV (compilers for both PDP-10 and PDP-11), and the BASIC +2 system. BLISS has also been used extensively within DEC for Computer Aided Design Programs.

TENEX and the TOPS 20 Operating System

Bolt, Beranek and Newman started a project in 1969 to build an advanced operating system called Tenex based on a modified KA10 (including rather elaborate paging hardware). This work was influenced by both the Berkley SDS 940 and MIT Multics Systems. Subsequently Tenex imported the KI10 design and became the base of TOPS 20. The system was described by Bobrow (1972), and the three major goals stated in the reference were:

"I. **State of the Art Virtual Machine**

a. Paged virtual address space equal to or greater than the addressing capability of the processor with full provision for protection and sharing.

b. Multiple process capability in virtual machine with appropriate communication facilities.

c. File system integrated into virtual address space, built on multi-level symbolic directory structure with protection, and providing consistent access to all external I/O devices and data streams.

d. Extended instruction repertoire making available many common operations as single instructions.

II. **Good Human Engineering Throughout System**

a. An executive command language interpreter which provides direct access to a large variety of small, commonly used system functions, and access to and control over all other subsystems and user programs. Command language forms should be extremely versatile, adapting to the skill and experience of the user.

b. Terminal interface design should facilitate intimate interaction between program and user, provide extensive interrupt capability, and full ASCII character set.

c. Virtual machine functions should provide all necessary options, with reasonable default values simplifying common cases, and require no system-created objects to be placed in the user address space.

d. The system should encourage and facilitate cooperation among users as well as provide protection against undesired interaction.

III. **The system must be Implementable, Maintainable, and Modifiable**

a. Software must be modular with well defined interfaces and with provision for adding or changing modules clearly considered.

b. Software must be debuggable and reliable, allowing use of available debugging aids and including internal redundancy checks.

c. System should run efficiently, allow dynamic manual adjustment of service if desired, and allow extensive reconfiguration without reassembly.

d. System should contain instrumentation to clearly indicate performance."

Dan Murphy (one of Tenex's designers/implementers) came to DEC and led the architecture and development that became TOPS 20. The effort at DEC has been to increase the performance of TOPS 20 to be competitive with the highly tuned TOPS 10 Monitor while not losing its generality. The TOPS 20 structure does provide significantly increased reliability and modifyability.

V. PMS *STRUCTURE

Table IGC gives the major goals and constraints in the PMS structure design. This section describes system configurations, the i/o system, the memory system, and computer-computer communication structures.

System Configurations

We wanted to give the user considerable freedom in specifying a system configuration with the ability to increase (or decrease) memory size, processing power, and external interfaces to people, other computers, and real time equipment. Overall, the PMS structure has remained essentially the same as the PDP-6 design, with periodic enhancements to provide more performance and better real time capability. (A PDP-6 memory or i/o device could be used on a KI10 processor, and a PDP-6 i/o device can be used on today's KL10 systems.) A radical change occurred with the KL20 to a more integrated, less costly, design for the processor, memory, and minicomputer i/o preprocessors.

The PMS block diagram of a two processor PDP-6 is given in Fig. PMS6. But, for simple uniprocessor systems, the PMS structure was quite like our small computers with up to 16 modules on both the i/o and memory buses:

```
Mp...Mp              Kio-...KMs...
!____!_____Pc________!______!
(Memory Bus)          (I/O Bus)
```

Interestingly, a unified i/o-memory bus like the PDP-11 Unibus was considered. The concept was rejected since a unified bus designed to operate at memory speed would have been more costly.

The goal to provide arbitrary, modular computing resources led to a multiprocessor structure with shared memory. The interconnection between processors and memory modules was chosen to be a cross-point switch with each processor broadcasting to all memory modules.

An alternative interconnection scheme could have been a more complex, synchronous, message-oriented protocol on a single bus. More efficient cable utilization and higher bandwidth would have resulted but physical partitioning into multiple processor/memory subsystems for on-line maintenance would have been precluded. All in all, the crosspoint switch decision was basically sound although more expensive.

____

*Processor-Memory-Switch. The PMS notation is a scheme for concisely representing the "block-diagram" level of computer organization. Common abbreviations in PMS are P for processor, M for memory, S for Switch, K for control unit, C for computer. Abbreviations may be quantified by lower case letters such as c for central (i.e., Pc => central processor), p for primary (i.e., Mp => primary memory), and s for secondary (i.e., Ms => secondary memory). For a complete description of the PMS notation see (Bell and Newell 1971).

Figure PMS10 shows a PMS block diagram for the KA10 and KL10. There are up to 16, on 65 Kword, 4-port memory modules, giving a total of one megaword of memory. (Each processor addressed four megawords). With high speed disk and tape units (e.g. 250 Kwords/sec.) a program controlled i/o scheme would place too much burden on the central processor. Therefore a direct port to memory was provided like in the PDP-6. In the KA10/KI10 systems, a switch (called a multiplexor) was introduced to effectively expand the number of ports into memory to four for each Memory Bus used. The communications controllers were also expanded to handle more asynchronous and synchronous lines.

The KL10 was, by comparison, a radical departure from previous PMS structures (see Fig. PMSKL). In order to gain more performance, four words from four low order interleaved memory modules were accessed each cycle. The effective processor-memory bandwidth was thus over four Mwords/sec. The processor also contacts to as many as four PDP-11 minicomputers (shown as C(11) in the figure). Most of the i/o is handled by these front end computers.

Each PDP-11 can access the KL10 memory via indirect address pointers and transfers data in much the same manner as the peripheral processing units of a CDC 6600. Notice also that the KL10's console is tied to a PDP-11. This PDP-11 can load the KL10 microprogram memory, run microdiagnostics, and provides a potential remotely operated console. Each of the PDP-11's can achieve a word rate of 70 Kchar/sec.

Up to eight DEC Massbus controllers are integrated into the processor. The Massbus is an 18-bit data width bus for block transfer oriented mass storage devices such as disks and magnetic tapes. Each Massbus can transfer 1.6 Mwords/sec. yielding a maximum 12.8 Mwords/sec. transfer rate for all channels. However, contemporary disks need about 250 Kwords/sec. so that all eight channels only require 2.0 Mwords/sec. of the 4 Mword/sec. memory bandwidth of 4 modules. Individual disks and tapes can be connected to a second port for increased concurrency. For larger memory configurations, a memory bandwidth of 16 Mwords/sec. is not uncommon. A processor cache (with a 90% hit rate) also reduces memory bandwidth demand by nearly a factor of ten.

The cost reduced KL20 evolved by integrating the Massbus controllers and PDP-11 interfaces onto a single high speed, synchronous bus. The model 2040 and 2050 computers are based on the KL10 processor and integrate 256 Kwords of memory in a single cabinet with the processor (thereby eliminating the external memory bus). The i/o bus is also eliminated and all i/o transfers are either via the Massbuses or the PDP-11 i/o computers. (It must be noted that the 2040 structure is only possible because of the drastic increase in logic and memory density!)

I/O System

Relatively low speed i/o (200 Kwords/sec.) in the PDP-6 was designed to be under central processor programmed control rather than via specialized i/o processors (IBM System 360/370 Channels). This method had proven effective in our minicomputers and was extended to handle higher data rates with lower overhead than specialized i/o processors.

The rationale for not using the IBM-type channel structure was based both on high overhead (cost) in programming and hardware. Since i/o record transmission usually caused a central processor action, we felt the processor might as well transfer the data while it had access to it. This merely required a good interrupt and context switching mechanism, not another specialized processing entity. However, when an inordinately high fraction of the processor's time went to i/o processing, a second, fully general processor was added...not a processor that was fundamentally only capable of data transmission.

The PDP-6 interrupt scheme was based on our previous experience with a 16-level and 256-level interrupt mechanism for PDP-1. The PDP-1 scheme was an extension of the Lincoln Laboratory TX-2 (Clark, 1957). The PDP-6 had a 7-channel interrupt system and each device on the I/O Bus could be programmed to a particular level. Hence a programmer could change the priority of a particular device that caused interrupts on the basis of need or urgency. The PDP-6 also had an i/o instruction (Block Input or Block Output) to transfer a single data item, between a block (vector) in primary memory and an i/o device. Thus as each word was assembled by a controller, an interrupt occurred and the block transfer was executed for one word, taking only three memory references (to the instruction, to increment the address pointer and block counter, and to transfer data). Most of the hardware to control the count and address pointer was already part of the processor logic.

In applications requring higher data transmission (e.g., swapping drums, disks, TV cameras) a controller with a data buffer (erroneously called an i/o processor) and link to memory were provided. These controllers only required a single memory reference per data transfer with the address pointer and block counter in hardware. In the KA10 the name was changed to channel, and parameters for transferring contiguous records into various parts of memory were part of the channel's control. The device control was via the I/O Bus hence we ended up with a structure for high speed device control not unlike the IBM channels we originally wanted to avoid.

Competitive pressure from the Xerox Sigma series caused a change in the way interrupts were handled beginning with the KI10. Although the Xerox scheme had many priority levels, its main utility was derived from rapid dispatch to attend to a particular interrupt signal. We kept compatibility with the 7-channel interrupt by using a spare wire in the bus and adding the ability to directly dispatch to a particular program when a request occurred. At the interruption, the processor sent a signal to requesting devices and the highest priority device responded with a 33-bit command (3-bit function, 18-bit address, 12-bit data). The functions were:

1. execute the instruction found at addressed location
2. transfer a word to/from addressed location
3. trap to addressed location
4. add data to addressed location

Little use was made of these functions (especially number four), since only a small number of devices were typically connected to a large system thus relaxing the requirement of rapid dispatch. Anyway, the competitive problem was solved (or went away). In systems that did have a large number of devices, a front end i/o processing minicomputer was more cost-effective than central processor controlled i/o.

Memory Systems

Because it was unclear how memory technology would affect memory speed, a completely asynchronous, interlocked memory bus was designed. Thus the 16 fast, general registers, the initial five microsecond memory, and the next generation two microsecond memory could all operate on a single system. (Most memories are now less than one microsecond cycle time.) The asynchronous bus avoided the problem of distributing a single high speed clock and allowed interleaved memory operation.

Modularity was also introduced to clarify organizational boundries within the company and to make low cost, special purpose, production and engineering testors for the memory and i/o equipment. We believe the concept of well-defined modules was relatively unique, especially for memory, and was the basis for the formation of third party add-on memory vendors. MIT and Stanford University purchased memories from Fabritek and AMPEX respectively in the mid 1960's to start this trend. (Note, this design style differed significantly from the IBM System/360 design with its relatively bounded configurations, special interfaces and integrated memory. Add-on memory did not appear until the early 70's for the IBM machines because, we believe, of the difficulty of the interface definition.)

The KI10 memory system was improved by assigning signals to request multiple, overlapped memory accesses and to increase the address size to 24 bits (up from 18). The additional physical memory addresses are mapped into a program's 18-bit addresses as described in the ISP section.

The KL10 processor-memory organization was a significant departure from the KI10 as previously discussed. The KL20 eliminated the original Memory Bus to provide an integrated system. It should be noted that this evolution was based on the drastic size reduction (a factor of about 300) from a single cabinet (6'x19"x25" or about 34,000 cu.inches) for 16 Kwords to a single logic module for 16K words (15"x8"x1" or about 120 cu.inches).

<u>PMS Structures for Computer-Computer Intercommunication</u>

Throughout the evolution a number of schemes have been used to interconnect with other (usually smaller) computers. The schemes are given in Table IC.

Table IC: <u>Computer Interconnection Structures</u>

Scheme	**Data Rate**	**Structure**	**Models**	**Examples**
Standard communication link	300 1200, 4800, 9600, 50K bits/sec.	network	all	
Specially parallel, block transfer via hardware or software	100K-1M words/sec.	tightly coupled	all	
Multiprocessors proposed	at mem. access rate	multiprocessor	all	2 Pc 16 Pc,
Access into computer mini address accesses data in space with small computer interruption	at mem. access rate	multiprocessor shared memory	PDP-6	The large the
The mini can used to	at mem.	tightly coupled	KA10-	Scheme

transfer data interconnect minis into large machine via special control   access rate   KL10 to do i/o. Multiple logical channels are provided.

Note, the first four schemes were conventional while the last scheme was used in the KL10/20 structure so that an attached PDP-11 minicomputer could transmit data directly into the memory of the KL. This scheme was first used in the early 1970's for handling multiple communication lines.

Digital **Interoffice Memo**

Subject: **Review of DEC's CAD Activities**

To: Bob Puffer

CC: Jim Bell
Leo Bennett
Ed Vrablik

Date: 22 SEP 76
From: Gordon Bell
Dept: OOD

I've asked John Gray (University of Edinburgh, Department of Computer Science, Edinburgh, Scotland, UK.) to come visit DEC within the next month to be a member of a CAD review group which I'd like you to organize and get someone to chair. It might consist of 3 or 4 internal people too, who have CAD and/or performance analysis capability (especially from Stanford Drawing System Groups). Some of the concerns in systems like this are:

a. Where are we versus

commitments? expectations?

b. Can we ever afford to use it? Can we get the 10's?

c. How much tuning will be needed to make them useable (for the level of machine support)?

d. What's the likelihood that we'll have to abandon the DBMS system and go to an ad hoc data base like in the past? When will we know?

e. Was PGP a good idea? a good design?

f. What's the likelihood that a significant decrease in memory price will "save" the system? I.e., since the system was designed on the basis that "core is cheap", will it ever be cheap enough to permit the co-residence of the 6 or so very large jobs that the system is also predicated on to avoid "expensive, time-consuming, swapping"?

I really don't know how to start this review, but it's past time to, and I'd like to get some external interaction with John to help kick it off. We also might want to hire him. Since Luther (and Ed?) know him, it should be no problem to have him help here.

SUBJECT: EXTRA 600K MULTI YEAR MULTIWIRE SUPPORT

I believe we should hold the CAD budget constant for physical interconnect. This would mean not having a direct translation from multiwire to PWB or we would do it manually until such time as we got around to making the translation.

I'd like to participate in a detailed review of all the projects we have in this area and what we might alter. Can I also recommend your MR, TW, CX and ML customers also participate?

Subject: **Thoughts on CAD Machines and Personal VAX**

To: Bert Bruce, ML1-1/E24
Bernie Lacroute, TW/A08
Bob Puffer, ML12-2/E38

Date: 2/14/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

I was happy to hear about the general direction in the CAD effort and would like to support a continued interchange here about the general direction. Here's what I gleaned:

1. The DBMS approach doesn't really work very well. A simpler file structure is being considered along the lines of the BNR system. It seems like a better approach would use the techniques which large programming systems use to manage its files is more appropriate. Earl Van Horn is doing such a file library management program that might be appropriate. Before we leap again, however, we will understand why we are leaping and what the problems are likely to be with this new approach...which could be construed to be back to the ad hoc set of files approach (albeit better organized) we've always used for a design.

2. We will try several experiments before we go out in a single, direction.

First, a 2020 should be used to see just how many terminals and how much work can be done.

Second, we would get an Applicon system for some of the layout. Also, we will talk to them about futures and whether we can work with them.

Third, we will buy programs or parts of programs in preference to doing any programming.

Fourth, we will generally set off in the direction of the corporate stategy and use VAX. In this later regard, the first program to migrate will be the interactive PC Layout System which will have a tube directly attached to VAX in the form of the GT62...because VAX supports the terminal. The program would be moved over to carry out the editing, and the 10 would be used for main routing and clean up. Although we stated that mag tapes could be carried back and forth, I say get a VAX and get at least a 9.6 KB DECnet link. We got no work done in a similar situation and DECnet really works (note all the VAXs that are interlinked between Maynard and Tewksbury).

Fifth, new work could be/(should be?) done on VAX or in compatible BLISS. Should we start a SUDS redo effort so as to use the latest McWilliams/Stanford work (uses Pascal and needs a larger address space)?

This should be the start of ...

Personal VAX

Many people have pointed out the essential need to get a common, personal VAX rapidly and to get experience with it. The above use is one case (we'll have to use a 780 to start with now) and we want the same systems for use in the LSI area in order to do the LSI VAX. In this later case, the plan right now, as I understand it is to get 3 of the CALTECH scopes connected to one or more systems. In order to get experience with this, we need to think through the packaging on Nebula, because I assume it is the ideal computer to first try out the notion. Here, we would give 6 of these to various universities ASAP (e.g., CalTech, CMU, MIT and Stanford)...and I believe it is essential to have a uniform system structure, otherwise we have no guarantee of getting any useful software or sharing work.

Rather than design IT (one) here, I'd like to encourage ideas. Somehow, I like the idea of a pedestal package like the HP 300, but I don't see what we should do for the scope...hence, should we make a desk package that can handle several terminals, but maybe two should be standard, with corresponding hard copy output. Therefore the system might just include the computer, two RL02 disks, comm interfaces (DECnetting to 10/20 and other VAXs including personal VAXs). What are the current plans on the Nebula package?

Who is co-ordinating its definition? Anyone interested?

These are thoughts, not commands.

Subject: **CAD Strategy**

To: Bill Green

CC: Leo Bennett, Bill Johnson,
Bob Puffer

Date: 19 JUNE 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 7/3/78

I'd like to get Bob Kusik freed up in October for a couple of months to work with me and Bill Johnson to look at our overall CAD strategy.

Some of the questions I have:

1. What groups are into this? What are their charters, goals and strategies?

2. Are the directions we have adequate? For example:

   a. DBMS versus a Relational Data Base
   b. What Graphics consoles?
   c. When will designers be on line?
   d. Will we see any increase in productivity?

3. How do we prioritize projects (e.g., backpanels vs chips) so as to allocate resources?

4. How do we motivate/keep people in this area?

5. How do we couple to outside work (research, current products, new developments)? Can we sell our work via ESG?

6. How do we become much more effective?

Subject: **Selling our CAD Tools**

To: Bert Bruce, ML1-1/E24
Rattan Dhar, MR1-1/M42
Bill Johnson, ML3-5/H33
Bob Kusik, ML3-5/H33
Si Lyle, MR1-1/M42

Date: 3/22/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up 4/6/79

Why don't we start by seeing if we can sell SAGE II?

SUDS?

Other?

GB:ljp

Can you get us two with two to follow for immediate experiments and/or use in Venus CAD?

We are trying to give our Venus designers immediate access to drawings via VT125 in their own offices! Dick Helliwell is in Colorado to do the interface and we also need ours in Marlboro. The other two would go to VLSI and PC CAD.

Our PC CAD terminals and workstations are really abysmal. For example, LSEG and others have:

A ten year old VB10 that Bill Bruckert designed and has to maintain.
GT40's
GT60's operating as GT40's, but functioning poorly due to prom problems
An Aydin hi-performance Color Processor
Homebuilt Cal Tech Color workstations
VSV11's
PDP-15's
Applicon
Calma, etc.

Can the CAD group Managers get together and agree on some decent, standard graphics workstations?

This is a Mess!

SUBJECT: CAD, OUR KEY TO SURVIVAL AND WHO CAN MANAGE IT?

I'd like to discuss candidates who might take over the functional management of CAD, report to BJ, so that we might start to manage this software intensive effort as a large, complex, software engineering project. It is clear we have a disaster of major proportions in CAD at all levels including planning, programming, and computer operations. We are spending something like 10% of the budget in this area, and are getting substantially worse, as measured by gestation times, product quality, productivity, etc.

We are in deep, deep trouble with VENUS, and I see no one to get us out of the hole! Only Scorpio sounds like it has a chance of working. Venus needs help and other areas either will or also do too. I think we have to act now.

Let's discuss on Thursday for a few minutes.

GB2.S6.23

EMS 13-JAN-79 15:13:19 310 1

To: Robert Kusik
CC: Bob Puffer, Bill Johnson
From: Gordon Bell
Date: SAT 13-JAN-79 15:13:19 EDT
Subject: Your suggestion on breadboarding PCLayout

Yes, I have to agree on this. Somehow, we have to restructure theCAD group

to do this. I believe now, that the fundamental probelm is that we have
never had the CAD person (Bert/Ber't predecssor) report to a software manager
and the fundamental problem is that they don't know how to plan and manage
these projects, especially ones that theere i{sn't a lot of proior art.
I want to change the reporting strucutre. Thus, let's tlk 3 changes: 1. remove
the simulation work and cluster it elsewhere as we discussed
giving both critical mass and less for bert to do. 2. restructure to have
definition and prototyping out from parts that are either maintainence or
ongoing, well-defined projects. 3. change the reporting to either technical
director, software
or quite possibly to Dick Snyder who a Larry is discussing to have a roll
change. Note also Ulf is the technical products group which
is an application we are also marketing. There may be other ideas,
please prepare some alternatives for the meeting (jungle type).

Regrarding the breadboarding of PCLS: I'd be happy ot brainstrom this.
Bringin some people who are knowledgeable here too like Helliwell and grooss.
I see taking the existing system and making it work by getiing the rightr
coupling with craphics and the system. Here we could: 1. Fix the program by
understanding the interaction and move some parts 2. give them a2020 with a
tightly coupled display to it...that doesn't take any other development. 3.
give them a VAX with the tightly coupled GT60 as we sell/support it. 4, Keep
them away from doing this on an 11 only becasue of the large databaase and
total recodeding /etc required.

```
You convened the right gurus and get us over there to explain
what it is we
have to sove and why it doen't work.

May 24, 1982

John D. Roberts
Vice President and Provost,
Dean of the Faculty
California Institute of Technology
Pasadena, CA 91125

Dear Jack:

Following are my expenses incurred during my visit last week, May 19 thru 21, to attend CALTECH's Visiting Committee meetings:

Mileage (Lincoln/Boston/Lincoln)	
50 miles @ 20 cents per mile	$10.00
Tolls	.60
Parking	15.00
Airfare	514.00
Total	539.60

I received the honorarium and have endorsed it to the Digital Computer Museum. California Institute of Technology is now a founder of the museum...congratulations!

I thoroughly enjoyed learning about computing at CALTECH and I hope we have helped clarify the direction.

Sincerely yours,

Gordon Bell

Vice President, Engineering
Keeper, Digital Computer Museum

SUBJECT: FASTER VAXES AND SCIENTIFIC COMPUTING AT CALTECH

At a CalTech Visiting Committee on computers, I got an enthusiastic endorsement for CDC's Vector Fortran for the 205. They endorse it because it helps them write better programs! I said: Get it standardized! (This totally agrees with my own biasses and historical observation that "Hardware follows software" and the reason we don't have vectors is that Fortran and nearly all other languages don't support them.)

They are currently ecstatic users of VAX, because none of them have any of the hotter 32-bit machines. They use external supercomputers. Let's look at the Fortran and extend ours, and see if we can speed things up by the language. (See Professor Geoffrey Fox) Vector

microcode in some form might help a language.
Noyce Comment on Vectors. Jeff reports that a scientific chip to supplement the 432 is coming to boost performance X 100.

Using the 2080 Accelerator

If the 2080's as fast as we're hoping for, the big market is as a VAX accelerator, at these sites not another general purpose timesharing system. IBM and IBM-compatibles have the large, shared central system market. VAX's have been undermining these centers. Let's play to our strengths.

Using the FPS 164 as a 780 Accelerator

We MUST really understand this and really support it as we're faced with the high performance 32-bit minis that'll try to capture VAX market. Who can take it on?

SPSS

On VAX is apparently very slow. Why? Who? Isn't this an LDP responsibility?

Multi Computer Project

Professor Charles F. Seitz (CS) and Professor Geoffrey Fox (Theoretical physics) are going balls out to get an easy to build, 64 computer system up that's 20 x a 780 or 1/2 a cray based on an 128K byte 8086/8087. The 64 computers pass messages to their peers on 6 busses, in packets, at a rate about equal to the 8087 FAD time. I'm

sending a paper around on this. It looks like a great alternative to
the FPS. They're confident it'll work and can be programmed by
mortals for many problems. I see it useful as a simulator and router.

Having been directly involved in designing 4-50 multiprocessors, I say
- fantastic - it would be great to have a simple solution. Note, if
they find it, the whole computer market becomes one large commodity
business. Let's get them J-11's A.S.A.P., and then MicroVAX when they
go to 1000 computers! Frankly, I'm impresed with this work. The key
just maybe the user involvement of their system.

SUBJECT: CALTECH VISITING COMMITTEE TRIP REPORT

A VAX, DISTRIBUTED PROCESSING SHOWCASE

As a member of a visiting committee to look at their computing, I got a glimpse of CalTech, one of my favorite places. The committee included McCredie, Dave Pensak and Ralph Gomry, VP of Research IBM. Their problem is that distributed computing has removed support for all central computing. Now they're installing Ethernet to make our computing environment a reality. Note that a really good service is operating the Network, as the need for centralized computing could disappear. In effect, distributed VAX's undermined the Computing center and overthrew it.

LET'S MARKET, ADVERTISE AND SELL VAX. We need a product marketing group that would go back and finish the "ask any user" series. Here, we'd just show CIT. They are fanatics about owning and running their own VAX's at personal, project and departmental levels. (They don't like the central VAX's). They love it because it's: cheaper, run exactly like they want (priority-wise) - switching daily if necessary, less people intensive, more convenient good for instructing people on how computers really work, and giving them much more service. They use the honor system to control expendables, do all their own systems work, hire DEC maintenance and buy third party peripherals. (Incidentally, this may also mean we shouldn't have computation centers within DEC! VAX's could be owned/operated by person or group just as WPS's are.) A strong CIT ad would have a profound effect on our own marketing to education and laboratories!

The students (800 of them) have a VAX, but want much more. Currently they're lobbying for a 2060. They've unfortunately just bought a 4331- and are starting to do interactive, administrative dp on it. We should have gotten this order! Is this a problem of the fact that CalTech is LDP and not EDU or a Commercial account? Apparently SCT (System and Computing Technology) is coming in to do their administrative computing. Do we sell VAX software here?

They need supercomputing too and individuals use Cray's and

205's
whenever possible on an ad hoc basis. The 2080 can help. They're also looking at an FPS 164 but are worried about getting the performance out of it. They recommended Heath 789's at $2.9K for Word Processing. We really should now push Professionals and DECmate II's!! Note, DECmate has BASIC. We really ought to have tried to push DECword, together with BASIC as a high performing, VAX compatible system. Since there's little graphics, we need to get them some 125's to get started.

They're just starting to install powerful PC's in CS. Carver got a bunch from HP using the 68K.

They're very interested in the Professional also as a VAX compatible alternative to their low cost Heath P/C's.

GB3.S5.53

A VAX, DISTRIBUTED PROCESSING SHOWCASE

As a member of a visiting committee to look at their computing, I got a glimpse of CalTech, one of my favorite places. The committee included McCredie, Dave Pensak and Ralph Gomry, VP of Research IBM. Their problem is that distributed computing has removed support for all central computing. Now they're installing Ethernet to make our computing environment a reality. Note that a really good service is operating the Network, as the need for centralized computing could disappear. In effect, distributed VAX's undermined the Computing center and overthrew it.

LET'S MARKET, ADVERTISE AND SELL VAX. We need a product marketing group that would go back and finish the "ask any user" series. Here, we'd just show CIT. They are fanatics about owning and running their own VAX's at personal, project and departmental levels. (They don't like the central VAX's). They love it because it's: cheaper, run exactly like they want (priority-wise) - switching daily if necessary, less people intensive, more convenient good for instructing people on how computers really work, and giving them much more service. They use the honor system to control expendables, do all their own systems work, hire DEC maintenance and buy third party peripherals. (Incidentally, this may also mean <u>we</u> shouldn't have computation centers within DEC! VAX's could be owned/operated by person or group just as WPS's are.) A strong CIT ad would have a profound effect on our own marketing to education and laboratories!

The students (800 of them) have a VAX, but want much more. Currently they're lobbying for a 2060. John Gray called me regarding his concern over the funding deal that we are proposing with CALTECH. His concern was that the other sponsors (i.e. IBM and HP) were really upset because they have other policies about equipment grants, etc. In effect, they are paying for DEC equipment. It seems like the only way out is for us to get out of the program, but this may be premature.

The problem comes because they are using our equipment for the work, and it feels like we are even profiting from the deal. This last proposal, which seemed ok by me is: we give them 20% off on the equipment and then we give our share in 2 - 100K equipment grants for two years. This, said another way, is we give them a 300K equipment grant and they buy 500K worth of equipment.

The other sponsors see it as: DEC sells 500K worth of equipment which the other sponsors buy with their cash grants; the equipment costs us somewhere between 125K and 167K (actually 250K?); 400K of cash comes to us and we make a cool 75K or 33K.

Somehow we're supposed to suffer (John Gray's englishman attitudes showing through). He feels we should pay something what amounts to an out of pocket expense of 100K in cash and not treat them as a customer, but rather as part of our engineering which doesn't have to pay that much for equipment.

I suggested that we give early delivery. We should get the equipment there before the end of this fiscal year because we have it in stock and the budget can afford it...here it could come out of the engineering budget cause we are underspent.

Any ideas? (I would hate to go because we want something like this arrangement at CMU.)

What does it mean?

GB:ljp

The Store Manager reports to the Director. There are presently two part-time store assistants each working two days 1-6 p.m.

The Manager's main functions are to plan, organize, direct and control the operations of the store as follows:

A. Physical Store
   1. Display merchandise
   2. Layout
   3. Maintenance
   4. Storage
   5. Security

B. Store Personnel
   1. Recruitment, Selection and Training
   2. Supervision and Team Meetings
   3. Scheduling
   4. Duties of store assistants
      a. open, operate, close store
         1. clean cases
         2. display merchandise
         3. inventory control
         4. address mailings for museum and store
         5. greet public who are potential customers (most important duty)

6. answer questions about museum and store merchandise

b. other duties

1. update display board in lobby
2. artwork such as posters, placecards for dinners, signs,etc.

C. Buying

1. Determine needs and interests of customers
   a. Coordinate merchandise with exhibits
   b. determine big sellers

2. Locate sources
   a. search for new products
   b. attend gift shows
   c. read catalogs
   d. spend time with salespeople
3. negotiate prices and place orders
4. Delivery schedules
5. Follow up orders
6. Check in merchandise

D. Merchandising

1. Unit Control
2. Taking Inventory
3. Pricing
4. Advertising: high tech vans, Digital This Week (DTW)

E. Systems

1. Sales System

2. Accounting

3. Sales Summaries

4. Check Invoices

5. Record gifts and loans to Museum personnelwithin the organization

F. Customer Service

1. Mail Orders
   a. check incoming order form for arithmetic, checks, charges
   b. check merchandise out of inventory
   c. pack order
   d. thank you note to customer or note explaining an incomplete order
   e. phone customers to correct errors in charge or inventory
   f. record and document sale
   g. returns
   h. feedback

2. Telephone orders

3. Catalogs
   a. Fall catalog with Fall Report
   b. Spring catalog with Spring Report

4. Merchandising Mailing List
   a. List of merchandise carried in store other than that in catalogs
   b. List in process of being compiled
   c. to be sent to printer
   d. then to customers who request it

G. Long-range Planning

1. Business Plan for 1983
   a. Projections of sales in 83
   b. justify salary
   c. inventory control - what to carry, how much for store, how much for mail order business
   d. sales contacts and contracts; lock in inventory for year

e. inventory on regular basis and computerized
f. match expenses with revenues

H. Documents, reports, lists used in operation of Store are stored or filed in Store office. No floppies are used at this time.

1. Sales Slip
2. Monthly Sales Reports to staff
3. Daily Sales Summaries (to Bus. Mgr.)
4. Inventory Turnover
5. Purchase Orders
6. Invoices
7. Catalog Order Forms
8. Inventory Lists
9. Personnel Schedules
10. Accounting System is being devised

I. Daily Schedule

1. Sales Slips
2. Tally Sales Slips
3. Check inventory from sales slips
4. check MC/Visa charges

J. Weekly Sales Summary

1. Mail Orders

2. In Store Sales

3. Inventory

K. Monthly schedule

1. Monthly Spread Sales Sheet

2. Monthly Reports

a. what was sold
b. best sellers

Professor Carver A Mead
Computer Science Department
California Institute of Technology
Pasadena, California

Dear Carver:

Was delighted to finally learn of your election to the National Academy of Engineering. As one who has been part of your election process (hopefully as a helper) over the years, it is indeed gratifying that the Academy has finally made the right decision. I think and hope you can be helpful in the Academy by providing some strong, revolutionary views about Engieering... which it badly and often needs.

How about stopping by and meeting the Encore principals on a trip through Boston?

Will see you in Palo Alto soon. I am getting to be very concerned about having to reinvent all the standard tools for Silicon Graphics before we can go into business with "The Compiler", because I don't think the company or board understands the investment or time this is going to take. I would like to hit this issue head on at the next meeting.

Sincerely,

Gordon Bell
Chief Technical Officer

Subject: **Marketing Computer Corporation of America's (CCA) Mail System**

To: John Alexanderson, Don Alusic, Jim Bell, John Buckley, Roger Cady, Al Crawford, Jack Gilmore, Ken King, Andy Knowles, John Leng, Julius Marcus, Stan Olsen, Art Krusinski, George Plowman, Chuck Stein, Marketing Committee

Date: 20 JUNE 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 7/5/78

For the last few years we have been engaged in a joint development with CCA. Julius Marcus gave them a machine on which to develop the software, Al Crawford has been operating their system on a test basis and Ken King has been working on the co-ordination. It'll run on RSX-11/M 11/34 or bigger.

They are advertising (see the attached ad) and have about six organizations in a market test of several hundred subscribers, and they have many enquiries for more subscribers from commercial, lab and government customers. Telenet is threatening to build and offer a similar service.

Now it's time to get a serious marketing/distribution thrust. They believe the potential is bigger than they can satisfy, and they would like us to either get involved so as to install the hardware and their system or take on the marketing. If we did this there would be several product groups routes:

0. Treat them like a hardware or software OEM.

1. Commercial.

2. Word Processing (Office Automation -- if Stan takes over this charter area too).

3. Communications P/L (if we only had one).

4. A basic DECnet product (like Fortran) that all groups would sell.

5. A basic software product sold through ASG.

6. Other?

The president, Tom Marill, is a friend and since I believe he has a very nice product (in this case unique), I'd like suggestions and help on how we can get the product into the marketplace -- and sell a lot of RSX-11/M systems!

Any suggestions?

Which distribution method?

Who can carry on this banner in order to get this product to the market?

EMS 30-JUN-79 18:43:06 130 1

To: Al Crawford, Don Alusic, Jack Gilmore, Murray Copp
CC: Al Bertocchi, Stanley C. Olsen, Mary Jane Forbes
From: Gordon Bell
Date: SAT 30-JUN-79 18:43:06 ED
Subject: Embarassing Discussion with Tom Marrill last nite

Tom asked me what was happening given that his people have heard many rumours and probably started some. He had heard that we had pirated the ideas from Comet, put together a system and are now in the throws of test marketing it, having sold it and announced it a recent show in Chicgo. They (his people)

believe with the actions according to to the rumour, that we are violating
the contract we had with CCA. They are frustrated with the issue of not being
able to deal with a large company in a straightforward way such that there
are clear actions that follow the general trend (which they had been thinking
was positive). Now, this is a big yank around and opposite what they got as
signals from us. For some reason, they perceive this as unfair... because it
is certainly easy to understand why he /they think this way.

I told him the following: we (CIS) had decided to use the LDP system and I
knew not why, given the unclear direction of MUMPS on it and where it was
heading and what the performance of such a system would be...because Kramer
wanted it, it had more features, and d maybe becuase it was internal; we
could probably show him a manual of the LDP system; there is no way that we
are anywhere near announcing or even test marketing a product based on this or
any other system..

Unless you can see anything wrong with it, I would like to meet with you and
CCA when you have the message ready. I asume it is approximately what I
believe it to be as I relayed to him. It seems like there is nothing with
giving them the LDP spec and our internal reasons. After all, I presume they
have been working hard to make Comet met our idiosyncratic requirements, etc
and that as a minimum this is what should happen.

You guys ever read any of that garbage called DEC Philosophy where we go into

how to treat vendors, people etc./

I had heard Marrill was naive in business dealings. On the other hand, from
his recent conversation with you, he seems to know how to negotiate--subtly.

Obviously, the decision must be a disappointment to CCA. From what I have
observed, we have been quite ethical and "upfront". His people have been
informed of the decision and why. We have failed, however, to formally close
the transaction with them on the internal product. I do not know what is
occurring insofar as external relationships with whatever Product Lines have
been dealing with CCA and COMET, eg, GIS.

Yes, we shall arrange to get the principals together with Marrill. There is a
User Handbook available for the LDP package, and there is no reason why we
cannot give CCA a copy.

Message ID: EMS 30-JUN-79 18:49:30 390 1

Gordon, please be careful that we don't let a vendor yank us around either.
I do not feel that the Comet product is as good as the LDP one, and we
shouldn't necessarily let the MUMPS base be the determining factors. I
believe the salient reasons for chosing one over the other should be:

Ease of use -- the comet editor is an abortion

Features -- the LDP system has calendar etc.

Tie in with wordprocessing -- The comet will not allow direct coupling
of wordprocessing, you can't dump a word processed message into
the EMS system.

Ability to standardize on WP format (ala DEC) -- should be easier on our
own product.

Human Engineering -- I still get lousy backslashes on my CRT because
apparently no one thought about anything but hard copy. I also can't use
a VT05 because the format is fixed at 80 char. and the VT05 only shows
72.

I could go on forever, but lets make sure that we do the

right thing for
DEC and the marketplace not just for a vendor who "feels" screwed. I trust
that we have not really don that and he is trying to make noise to get
reconsidered.

Thanks for forwarding me your note.

CDC 6600

WORD LENGTH: 60 bits for the Main Processor and 12 bits for the 10 Peripheral and Control Processors (PCP)
Memory Size: 131,072 words in 32 banks of 5 4096 12-bit word modules and 4096 12-bit words for the PCPs.
Speed: 250 million bits per second; 2 million instructions per second for the Main Processor and .5 million instructions per second for each of the PCPs.
Clock Rate: 10mhz (4 25 nanosecond phases)
Arithmetic element: Main cpu contained 10 functional units that could operate in parallel on the 16 word general register array.
Instruction format: 15 bit (operations on registers) and 30-bit (memory access)
Technology: All transistor logic; 6700 modules with 64 transistors in a 2.5 x 2.5 x 0.8 inch module, "cordwood package"
Number produced: 10 by the engineering group at Chippewa Falls
Price: approximately $3 Million.
Project start: Summer 1960

First delivery: September 1964 to Lawrence Livermore Laboratory
Software: COS (Chippewa Operating System) and FORTRAN
Project leaders: Seymour Cray with James Thronton
Predescessor: CDC 1604 and 3600
Successor: CDC 6400, 6500 and 7600
Use: Batch processing and shared use in large scientific computing centers
Achievements:
6600 and 7600 were the fastest supercomputers until the Cray I was introduced.
Development of freon-cooled, "cordwood" packages proving a ten-fold increase in logic density.
Fine multiplexed control for Peripheral and Control Processors.
Independent parallel, functional units for high speed with tag control.

Mr. Neil Lincoln
Control Data Corporation
Advance Design Lab
4290 Fernwood Ave.
St. Paul, MN 55112

Dear Neil:

On behalf of the DEC engineering community, I'd like to thank you for the presentation last week. We all enjoyed the candid comments and interchange.

You mentioned a videotape of you and the designers of ASC, ILLIAC IV and the BSP. Could you tell me where we might obtain a copy?

As a fellow computer and organization biographer, I was delighted to hear of your book on the STAR. Could I get a copy, provided that I don't copy it? I'm sure Digital Press would love to publish it. After I've read it, I might have suggestions on how it could be released from CDC.

The discussion on networking was interesting. If you'd like to proceed, to examine using our protocols, then let me know. I'd think it would make sense to use our protocols around CI (Computer Interconnect) which is 2 x 70 Mb/s and NI (National Interconnect, or Ethernet).

Sincerely,

Gordon Bell

Subject: **CDC'S VISIT (TOM KAMPE**)

To: Henry Crouse, ML1-5/B98
Mike Gutman, ML3-6/E94
Bob Jack, ML1-3/E58
John Kevill, ML3-6/E94
Andy Knowles, ML10-2/A52
Stan Olsen, MK1-2/C36
Grant Saviers, CZ

Date: April 20, 1979
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Follow Up: 5/4/79

I'm glad that Henry and Grant are going to review the buying decision on the RP07/RP08 because it feels like we went out on a limb with ISS just because they were nice guys. CDC feels harder to deal with than either ISS or Memorex, but then the issue was we may have asked these folks to commit suicide when interfacing the MASSBUS.

They have really tried to understand the issue of the 8" drive and have a pitch on it, which they have agreed to give in Minneapolis. Somehow they see it as the wave of the future. Quite possibly now IBM is playing the game our way where the issue is lowest entry cost. Their main points are that it is the cheapest to make, quiet, and has the most flexible form factor for an office. (I don't fully appreciate the form factor, but do appreciate that a floppy in a WT/78 is too noisy if one uses it in a reasonably quiet environment.) It would be nice to have smaller cartridges too. Also, by having a light weight, users can replace their own disk units, for serviceablity.

They described their products under development: Fixed and Removeable of either 7 or 14 and 7 megabytes using 8" disks in a floppy package, with power and the SMD interface at a price of < $2K. The fixed-only version would be less than < $1K. Both use lots of LSI. He described their fixed and removeable versions of the 14" series. It was interesting to note that he sees the problem as we do: you have to get the fixed part off in good sized pieces and the hard disk is the cheapest way. Watch out for IBM, they have to solve this problem somehow, as the fixed-only disk doesn't feel right.

Note that the RL02 drive cost isn't too far off either of these costs...so let's not panic! How do we make it quiet enough? Can we get Bob Lotz to help here? Is there a way to make it more replaceable by a single individual?

We also discussed the 8809 tape unit, which they are doing. Given our recent experience with the TS04, let's get a product from them. Quite possibly we ought to encourage some other manufacturer too, or do a joint effort, if we can agree (in writing) up front.

He described their efforts in making a new, interface which assumes intelligence in the disk. Here, he wants to push it as a standard. Watch out, SDB, we have another form of the MASSBUS, in that we can't move to use a disk that's out there and have to wait till we get our own done. How can we get a strategy that doesn't lock us in to a lag everywhere across the product spectrum?

They spend about $ 30M on product R and D. I'd like to be part of a tour of their facilities when the next visiting firemen go.

follow up 11/30/78

Now that the book, Computer Engineering is available, we need a course for our employees taught either by Ed Services or by the universities or by both using it.

A key goal of the book, as indicated in the preface points at the need to educate our own people (DEC). Craig is teaching a course now at Cal Tech using the book and he is producing a study guide. Also, we have talked about making a full blown package with overheads, instructor material, and possibly videotapes with guest lectures. I've agreed to give some talks on it, and I believe the other chapter authors might do the same, so we have a really great opportunity.

I don't want to do the lectures unless they are taped, because I don't want to do them twice. Similarly, I won't do them without a live class and an instructor who is running things. Also we need problems.

Is there a way to get this going before the book gets obsolete?

What about a course starting in January?

What youse think?

SUBJECT: BETTER COST, PERFORMANCE AND PERFORMANCE/$

GB4.S1.24

Cycles for the Masses is beginning to look up. The following table indicates we have some very interesting possibilities for competitive machines everywhere. It also shows we are in a new computer generation, the Fifth, as the cost decreases by a factor of 10 or performance increases by a factor of 10. This gives a factor of 5-50 in performance/cost over where we are today. Note the following table of machines.

	Time	Price($M)	Perf.	Mflops	flops/$	# Users
Microvax W/S	85	0.01	0.9	0.45	45.0	1
Scorpio	85	.04	0.9	.45	11.0	5- 500
780	78	0.4	1.0	0.5	1.25	5- 500
790	6/84	0.5	5.0	2.5	5.0	5- 500
Nautilus	4/85	0.25	4.0	2.0	8.0	5- 500
dual proc.		0.4	8.0	4.0	10.0	
PPA	6/85	0.25	40.0	20.0	80.0	5- 500
Titan (proto)	12/83	0.1	10.0	5.0	50.0	1- ?
KL	74	0.75	1.3	0.66	0.9	10- 500
Jupiter	+30(mos)	0.75	6.0	3.0	4.0	10- 500
Cray 1	76	10.0	40.0	20.0	2.0	50-1000
with vectors			100.0	200.0	10.0	
Cray 2/XMP	85	10.0	120.0	60.0	6.0	
with vectors			300.0	600.0	30.0	

Notice there are several ways to get a performance:

1. Supercomputers (eg. Cray) operate in batch mode. At LLNL, a large user gets a maximum of 1 hr/day. Therefore, if one of our systems can deliver only 1/8 to 1/24 the performance, the price performance is likely to be better with a Supermini depending on the problem. In a real environment, most users would rather have something else so they can escape from the center.

2. Supermini, operated as a personal or with a small number of users.

3. The new, powerful microprocessor based personal computer with 750-780 performance. This gives a user the most power. I believe our technical marketplace wants this.

4. The new, shared, Supermicro such as Scorpio - These computers have the best cost/user, but will the added sharing be worth it versus the low cost PC's? This is quite attractive.

5. New, specialized facilities such as PPA, a 32 processor based on MicroVAX, FPS-164, XYCAD for high performance batch. All are quite interesting.

Performance/price depends on the fraction of a system that can

be
dedicated to a user. With MicroVAX PC - the price may be in the don't
care range 10K-20K (or 10% of a professional's salary) but the performance is at 780 level. Therefore, work will migrate both from
supers and superminis.

We have some incredible opportunities. It would seem desireable that
we first simply consider Titan and PPA as purely computational processors, although Titan would eventually be a PC when it has software. They would be operated as servers running, say Fortran, to
off-load KL's or VAXen via CI.

This VLSI generation is going to generate many more kinds of computers
than ever. Supers, Mainframes, and Superminis are all going to feel
the impact of Supermicros, PC's and interesting specials.

Bottom Line

We've entered an era (the Fifth Generation) driven by the powerful
microprocessor and this drastically changes the price, price/performance and maximum performance of the systems we can build.

The numbers should reinforce the gut feel that the Fifth Generation is
going to be exciting.

MESSAGE ID: 5173246177

SUBJECT: CFM: CYCLES FOR THE MASSES

BASIC PROBLEM

Based on a feeling of the market, I believe our current inability to sell machines and grow is mostly unrelated to the recession, but is due to products. We are at a point where we don't provide the best cost performance or highest performance in a given class. This means we are now dependent on marketing, applications, basic software and the remainder of the system for success. While these are ALL good and give us a cushion, it goes away when someone reputable (eg. IBM) has a product to sell.

CFM

I've asked Sam and Bill to lead us to define a program that is aimed at getting us back in the technical computer business. It's imperative that several of us start full-time to define, staff and then execute this program.

PREMISE OF CFM

Microprocessors are improving at 65% per year, whereas our high

performance machines using bipolar are only improving at 20%. A
780 performance machine's available on a chip; in 85 we'd expect
to see a Venus. The Japanese have targetted 100x improvement in
supercomputers for Knowledge and Database systems (late 80's).

The premise is that we have to BOTH get our high performance
processors to be effective AND we have to use multiprocessors and
multicomputers of various forms including large arrays of micros.
Los Alamos has tested and intends to use multiprocessors (of up
to 16) for their work, so we can't ignore extending conventional
multiprocessing.

Seitz et al is building a 64 microcomputer array (loose coupling)
to solve particular physics problems, and the Cm* experience
shows that problems can be run across large arrays of computers.

CFM RELATIONSHIP TO ALPHA OMEGA (POST VON NEUMANN COMPUTING)
The MCC sponsored project, which we've been driving, has a high
likelihood of being started by the first of the year. The site
will be Los Alamos, and we'll have several people located there.
Both CDC and Univac will co-sponsor the work. Los Alamos will
probably do much of the work. Please read the proposal.

We're sponsoring a conference at Los Alamos this next month to
further define the program. About 10 applications areas will be

examined, including: database machines, image encoding and storage, ultra and high speed LANs, scientific computation tasks,
knowledge based system with parallel interpretation, etc.

CFM must parallel the external program with the short term goal to get a plan to build competitive machines in the next few years
and then to follow-on such that we'll have competitive machines in the late 80's.

Los Alamos has 50 or so 780's. I want to get them:
1. CI's to do work on multicomputers for
2. GIPPER when we get them available
3. 784's if we can go that way

WHAT ARE WE WE GOING TO BUILD?
1. High end processors... not an option. We gotta have 'em.
2. NI Workstation clusters to offload whatever mainframes we have. Note if we have 5-10 x the performance of the Workstation in the mainframe, we still have an advantage. Again, not an option. We have to do it propitiously. Don't we need some work aimed at parallel procesing on NI?
3. Get VMS to do parallel processing. Los Alamos' results are quite spectacular both using the 1108 and the Dennelcor. They are confident of being able to use 4 processors routinely and have coded many of their programs for up to 16. Cray has a multiprocessor coming out and this will change the languages and
patterns of use. This looks important.
4. More than 16 multiprocessors, even though they are hard to build. Bill Strecker's proposing an array that would map into VAX memory and I hope this would be worth doing. Why not go to
5. Multicomputers.
5a. CI clusters provide by far the best multicomputer cluster I
know of. The great thing is that we can install and evaluate it
right now. It's an ideal test and debug facility for
5b. GIPPER. This sounds right as a first attempt, although the address space and intercommunication is always a concern. The

nice thing about GIPPER is that it can be built now using J's.
6. Architectural alternatives
6a. RISC. What does it look like to date with benchmarks?
6b. RISC with vectors. Is this possible? I don't want us to architect a machine that can't be built easily.
6c. Easy VAX microcode extensions without additional state that can be put in any machine with enough microcode space.
6d. Some attachment to execute operations on specific data-types.
7. Dataflow. Why not wait for the university results? Arvind would probably be delighted for us to build his machine.

CCCP-CHRISTY'S COMPUTATION CENTER FOR PARALLELISM
Peter can proceed IMMEDIATELY to build his facility into a dual operations and experimental site where the 780's are located in
one room and interconnected via BOTH CI's and NI's. The rationale is that SEG needs cycles so bad that we have to do this
work in order to get the cycles performance (historically, invention often occurs out of extreme need). In addition, the research machines would connect into this cluster so as to be

used as support for when benchmarks were run. I would hope that
we could also make them into 782's.

This facility would clearly look very much like the Alpha Omega Centers I proposed, except that it would be within DEC, and have:
1. CI/NI connected cluster of 18 or 36 computers (for 782).
2. an FPS164 for evaluation of vector processing especially for circuit simulation and for scientific benchmarking.
3. Zycad logic simulator for evaluating DECSIM speed up. We

need
a factor of 100 to really satisfy our needs.
4. Microcode support for the 780's to investigate VAX extensions.
5. Build and attach GIPPER (Jesse's project with Seitz to get a
Giga-instructions per second machine using a large cluster of J's
used as computers... not a multiprocessor, but a multicomputer).

We would first benchmark:
1. Logic simulation across 782's, Zycad, CI and NI clusters.
2. Circuit simulation matrix operations: compare it with the CRAY, FPS, and CI based clusters. We'd also explore the use of
microcode to extend VAX for sparse matrix operations.
3. Routing and DRC using CRAY, CI clusters and microcode accelerators. This could be compared with the Dataflow approach.
4. Signal processing tasks using microcode, FPS and the cluster.

The goal would be to get the facility and orient it to breaking problems to work in parallel for the clusters, seeing whether NI
is adequate for certain problems. Also, we need to know CI's limits. CI would serve the basis of design tuning for projects like GIPPER. Also, we look at: microcode, FPS and Zycad, etc.

ACTION
0. Identify resources for the planning part of CFM. Execution will have to be done in the various projects we form or changes to existing projects.
1. Build CCCP starting now.
2. Let's get ALL the alternatives out on the table as to what's possible together with who's doing what. This would include Gipper, Strecker's machine, the Dataflow machine, the NI clusters
for performance.
3. Identify resources for Alpha Omega. Bruce and I have been doing this. I need full time help for the next 6 months to refine the proposal and really drive it with CDC, Univac and

Los
Alamos. Any takers?
4. Firm it all up at a conference Oct. 14-15.

SUBJECT: PRODUCTS AND A/D TO GET MORE CYCLES TO THE USER (AND WIN)

The situation is clear: We are going to be pressed for orders until we get VENUS and Scorpio. The good news is that we're going to have to learn to market in order to survive.

Bill and I talked about several short term efforts that would address the problem. Jesse has a set of strong arguments that says it's going to be difficult to have a big seperation in performance anyway (eg. putting an r81 on a Scorpio is awfully powerful), and putting 5 of these out is probably going to deliver as much as a Venus with 5 r81's... except in the single job case.

Clearly we have to go after high end machines and we have to do it cleverly, while at the same time we provide shrinks in the Scorpio based machines.

The basic theme is then one of multiple machines to increase performance. The real issue is what are the structures and how can we get them asap?

1. nebula's for PC's on NI sure gets a lot for a single user

assuming there's access to something like a 782 for files and heavier computes. Maybe this should be the highest priority because it gives us the most uniqueness and it gets us into the cluster market we keep talking about and appollo is going to get!

2. Making 782 symmetrical, or lower cost by a single sbi or allowing a 784 (with major change? to vms) would permit the conventional multiprocessor to be supported, and we could exploit the fact that it's possible to use 4Pc's on a single job relatively easily.

3. We're coming out with 8 Pc J's as a standard product... but will it be supported?

4. Jesse and Bill are supporting the construction of 2, large multiprocessors (32) and multicomputers (the Hypercube) for special problems.

5. The CI probably represents the most exciting possiblity for immediate experimental results, especially since it does all the things the Hypercube will, except being very large. Furthermore, we can take any of our comp centers (eg. Hudson), attach CI's and start to run the experiment.   Here, let me urge that we do this for supporting DECsim, especially since it's so vital to our success on Scorpio!!

I see lots of resources being poured into efforts that are redundant or unnecessary relative to improving our product position (to provide more cycles). The first step is to define these projects. Given the need, the resources will follow.

Can we set about defining the project asap??
Can we get together soon to refine and further define?
How about after the talk I'm giving in Hudson on Monday?

WPS USERS - Leave HP mode and type <CR>

Prompted by the Japanese visit and sitting many hours in meetings, we have an incredible number of challenges ahead:

0. We have the greatest product array and strategy in existence today based on VAX-NI-CI compatiblity and as such should easily continue our position. We do have to follow it though! DEC has promoted a major style of computing which has evolved for 22 years that is much deeper than the cabinet skins. (About 7 years ago I went to a hardware session at DECUS and almost no one showed up.)

The Japanese approach computing totally as a commodity supplier problem without a feeling as to what computers can and should do. Ironically, I think it is the language and Kanji character set that puts up the boundry. As they get human interaction, they'll become an even bigger threat because their higher intellect will enable everyone there to become programmers. Recently, Dr. Kobayashi, the chairman of NEC stated that every employee MUST have and use a personal computer.

Right now I don't see us being a great commodity supplier because the technology depth, and manufacturing aren't good enough. The DEC versus Brother Keyboard is a good example. We've built an obsolete, lower technology, relatively poorer keyboard... maybe because it looked easier or who knows why.

This requires even stronger architectural leadership because there are so many opportunities around and this is the best differentiator we have. Most products are dead ends or don't allow enough control or are really poor. (Robin and Rainbow aren't off to a very good start, but they could/should be.)

The bottom line of this point: now our strength is our incredible architecture and it must remain so. If we are going to be serious in the commodities (eg. floppies, keyboards, monitors) and commodity computing (8086, 68,000 and 16032 x CP/M, UNIX), we'd better put the management and resources to succeed. We can not win at trying a little bit of everything! I don't think there's any way to even look at and decide on some of these issues because we (OC) encourage EVERYTHING and decide nothing. Making incremental decisions ultimately kills off a direction.

1. Getting everyone settled to sell what we've got and what we could easily have especially since Patti Seybold blessed us. Office/tp/data management/dp are the greatest and we've got to segment and approve the organization now. Julie's great here.

2. Segment the part of the organization in either a quasi or real divisional structure so that common engineering, manufacturing and marketing are together. Also, then ask these group leaders to come with some recommendations. In this way, the various operational committees can be cut down to manageable sizes and aligned to a common goal set. The notion of commodity terminals and personal computers seems like a natural. Also VAX and the main systems business are another natural.

Right now, decision making seems to be very slow because it has been clogged by the low end problem for the last 2 years. In engineering complex systems it has been observed that the design time is proportional to the number of people involved squared. The meetings are just too large to get the work done. People just want to know what the NEW DIGITAL is and what to do.

3. I'm very excited about the pipeline that's been established from: technology boutique (expensive, fast response, competitive, state of the art); systems (constrained to be compatible); and commodity (designed in Japan or Taiwan) for cost. I don't think an engineering/manufacturing group can be in more than one mode at a time. For example, it's crazy to ask a group making state of the art products to do low cost, third time around products. This is impossible emotionally for engineers. I've decided to be less involved in these products, but will continue to provide some direction including sending ideas into the hopper.

4. I share your view of having a great small business computer, but am concerned about whether you can be articulate enough as to what it is to get someone to take on

the charter. The parameterized software looks like a key here, but it's the first pass. Is it the motorcyle shop or the engineering department or the manufacturer with $10M sales (I can show you a company who's using a 780 in this mode, including mail)? The range is immense and hard to define. Given your intense interest, and the ambiguity of the space, you might ask: Is anyone smart enough to do the job, too smart to avoid the job because of personal risk?

5. There are the Japanese and I hope we get concerned before it's too late. Fujitsu has 10,000 engineers at Kawsaki all determined to make them number one. I intend to push to join the Alpha Omega and packaging consortia parts of MCC because they are really a way to reduce the development costs and get the vital research we need. This would be coupled to the work I would like to do aimed at a high performance machine structures.

6. An approach is needed to build machines. They aren't fast enough now, nor can they be designed. There are several approaches. This is the highest priority of all, especially since the recent announcement of the Japanese to TARGET MINICOMPUTERS because NTT has asked the big 3 to supply them machines for distributed processing (again, expecially now that they've conquered supers and mainframes and are en route to commodity personals). I don't have the answer now, but only understanding that we are headed toward a cliff.

This is the area that I must work in, even though I would also like to remain part of the management team on an as needed and as desired basis.

7. Going with National. I fully support this and we must make it happen!!! They will supply the peripherals (can not be underestimated) and the marketing outlet. I see our leverage and control as software. This means we would command a premium for MicroVMS and NOT sell it on look-alikes. This means it is bundled!! We could also bundle UNIX in a similar fashion, or we could allow it to become a commodity that all the random unicee suppliers support... probably the best way to not support unix.

8. The organization does bother me both in content and form because I see it becoming typically American and it is the antithesis of the Japanese companies. I looked at the top 17 of NEC: 13 are engineers, there's a lawyer, salesman, and 2 accountants. About 8 are PhD's. This is typical of a highly divisional structure. Similarly, I had dinner with the head of engineering of Sharpe, who was a very deep and thoughtful engineer (he has Maxwell's Equations chiseled in stone at their research center); three days later he became President. They believe in and do real, very directed research (eg. a class 1 room and 0.8 micron line width at Hitachi Central Research) and this pays off. We have little directed research or advanced development outside of a tiny bit in semis and in disks.

The organizational form is of concern: they have NO marketing groups per se. Marketing is done in either sales or in engineering. This is the famous 3 body problem or 3 stage pipeline. We must get back to this before it's too late. For example, we've allowed the real time response of our systems to be dissipated because the engineers only see customers at DECUS. NEC has the two groups meet quarterly for a week where sales and engineers listen and present to each other.

June 25, 1984

Mr. Charles Sporck, President
National Semiconductors
2900 Semiconductor Drive
Santa Clara, CA 95051

Dear Charlie:

The Computer Museum is opening in downtown Boston on November 12. A major semiconductor exhibit is being planned and John Payne is really helping on an overall conceptual level. I am delighted at National's support as a founder and driving force of the semiconductor exhibit, your contemporary chips will be shown as a result. Of course, the historic chips from Fairchild and Intel will be appropriately placed in the evolutionary story.

A copy of the statement of purpose and case for raising $10,000,000 is enclosed. The levels of giving start with 4K ($4096) and get as large as a megabit. Our latest thought is that we will burn all contributor's names into ROM! I'd like to ask you for a personal pledge because like all public institutions, the main financial support comes from individuals. My own gift so far has been $128K from a relatively small net worth, and provided Encore is successful, I intend to give all gains to the Museum. Bob Noyce has just made a very generous contribution. Could I get a pledge from you for $128K over five years?

A first-rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the Computer and the Image. Predictions are that we should have attendance of over 200,000. This world-class, international Museum should be a major attraction and asset and resource for the computer and high-technology community.

I'm visiting Silicon Valley on July 5 and 6. Could I see you then?

Sincerely,

Gordon Bell

SUBJECT: RE: DUTIES

I thought you were going to get into more serious product development we need for monitors. If not, then having another
bright person there would be ok, especially aimed at applications.

Fundamentally though, I think you should get from Bob Glorioso
the measures we use for research. Here, it is papers, people transferred, ideas, patents and you measure flow. Can you go back over the last 2 years and point to the work in these terms? Given your proximity to the government labs, I advocate
a strong outward flow of results. Namely, what can you flow from them into our products? Here, as a conduit, you measure idea flow?

Mostly now, your raise concerns:
Ken Fine (Intel) is building a bit map control chip for Intel which he says is a direct embodiment of the ideas presented
to him (while at Intel) at one of your conferences. Worse yet,
he won't let us interact with him or find out what it is because
he is working with some other company (probably HP or IBM) which
will come back to bite us in the ass. I joke about helping the
competition so that we can then respond to them. This one isn't
especially funny.

On the other hand, I'm not so sure that your charter shouldn't
be directed at Manufacturing. Here, the important area of inspection could be addressed, or managing flow or simple assembly operations.

What your question evokesd was some thoughts. It sure looks like a problem to me that you have to address. I have no biasses.

Follow-Up: 10/15/79

I enjoyed the discussion with Chuck Scheibe, Ward Davidson, and the Regional Software Support managers. They do have some concerns however, which I'm sure we can address:

10/20 Support- We have all sorts of good messages to the field, but they are largely for naught because there isn't adequate support back in the product lines. We have a choice here: support at the P/L level, the Group Level or within the Product Management structure. I say, let's do basic marketing at group level, field support that is financial related deal at the P/L level, and do all technical and configuration support via the Product Management Support group (ie. Per Hjerppe). Ulf, can you and John get a proposal for the TPG and maybe this might also work in CPG?

11/74- When? Tandem continues to make inroads. Will the 74 do any good at all?

MDC Terminals- Expensive and need for integrating other manufacturers terminals. Is there a better strategy?

MINC off the shelf delivery is nonsense, given a 6 mos backlog- Proposal: get rid of FAT and use the effort for manufacturing more!

VT100- Needs a printer port. Chuck Scheibe noted that the way to get a hard copy from the EMS system is to send a TWX via the RCS system. This is wierd. He also noted that the EMS system is maybe too expensive to use in terms of line charges and he is going to hire someone to build a concentrator and work the comm problems. Why doesn't the corporate communications or corporate sales systems people have someone to do this and let Chuck motivate his managers? Why did a system get put in if it wasn't feasible to use?

WPS - I also note the September DM Report has 3 pages on this. There are a number of problems here ranging from we need Sort, Math and Formating...to the 200 System Doesn't Work! I think it's time to slow down in WP before we damage our reputation anymore. We have to learn again that a given system design can only be pushed so far... and the 8 system is way beyond what can ever be made reliable (my gut says). Hence, continued enhancements will mean a progressively unreliable, poor product. Chuck is sending a sheaf of memos, etc. discussing the problems in his region, which I assume is just typical. For now, I think we should seriously consider putting the 200 on hold and reviewing just where the development is and should go. There will be more, as soon as I get the documentation. Jack Shields how visible are these problems in the service organization?

Software Patching Can Still BE Significantly Improved-- The 20 is apparently doing it reasonably, but the SWS group would like to have a history of the patches, versions, etc provided by the machine so they can see what's happening. Can we get this looked at for M, VAX, RSTS, ant RT?

The Patches are bad! -- How can we have QA before we send out the patches so as to avoid the looking bad syndrome?

Remote Patching- When?

We have a poor policy for Synchronizing O/S's and our layered products-- In essence, it is really quite impossible to evolve each of the components independent of one another, and believe that a system composed of various levels will work. We must have more stringent rules and test as to what will work with what. I would propose some scheme that says all components of an outer most layer have to be at the same or less layer as the inner most part they have to work with. Alternatively, why can't we put in the software a compatibility plug that checks to see that the components it depends on are present? Can we simplify this by just having things synch'd better? Clearly there is little or no communication between SWS and SWE... a recurring theme.

Are Maintenance and Development too tightly linked-- It has been observed that there is little or no response in the first few months after a release.

SUBJECT: GETTING ALMOST FREE 100K TRANS. CHIP,YOUR THOUGHTS?

GB4.S1.9

I visited Craig Mudge's group of about 15 doing VLSI R & D in Adelaide, South Australia. They've put together a good tools / VLSI
publishing system whereby they do several multi-chip systems per year
for all sorts of government, university and private companies. (e.g.
Evans and Sutherland).

They now have access to an advanced US 2 metal 2.5 micron process, and
they're building tools to use it. They're in the process of defining
and building a 100K chip to do speech recognition of isolated words.
I was quite negative on using this chip as a test because it's unclear
what such a chip would do, and failure of the algorithm would equate
to failure of the chips.

Craig is now soliciting chip ideas. He would like us to spec an
interesting chip, and he would build it for us. The goal is to
experiment with and test the methodology. We have to tell him soon
what such a chip would be and what its characteristics are. I'm sure
we could get access to it if he's successful. I'd like to solicit
your ideas.

What about: speech, video, a processor of some sort, a FPS-compatible
processor, n-digital filters, MicroVAX , an 11? What you say to this
very low cost, but medium risk, high payoff possibility?

Ideas ?

SUBJ: Chip Policy

To: Dick Clayton

Date: 7/11/78
From: Gordon Bell
Dept: Office of Development
MS: ML12/A51 Ext: 2236

CC: OOD, Marketing Committee, Bill Green, Roy Moffa, Mike Titelbaum

The following was decided at the last Marketing Committee:

"Andy Knowles recommends that we not enter the chip business, instead push a strategy that looks much like Dataquest scenario #3.

- Ken's not convinced that we shouldn't take on Intel on their own terms, concerned that we have become too inward focussed, not heeding our competition.
- Andy has arranged for funding Tiny again.
- Put another way, strategy is to compete with Intel's customers, rather than Intel.
- Gordon is convinced we should be working harder toward applications products rather than intermediate level products.
- General agreement is that we should not be striving for chip sales in the commodity market. It's important to realize that, though this item was

intended for discussion only, we have blessed a de facto decision not to pursue the PDP-11 chip business."

Ken has asked that you come to the Marketing Committee to give the competition, their rates of introduction, and costs for various system configurations for F, T and the 8086. This should give us a pretty fair benchmark as to where we stand competitively. (I'd also like to see channel width vs. time, and the FCS's of the products that use them.)

For OOD, the message is clear:

1. IF THE 11 IS TO REMAIN A VIABLE ARCHITECTURE AGAINST THE CHIP COMPETITION, IT IS SOLELY UP TO OUR OWN INTERNAL DEVELOPMENT OR ANY SUPPLIER WE CAN GET TO DESIGN CHIPS FOR US.

2. WE CAN NOT LET THE FONZ AND TINY CONTINUE TO SLIP...THEY HAVE TO GET DONE, WE NEED THEM NOW TO AVOID LOSING THE CURRENT RACE!

3. With Intel supplying us technology, we are pretty well locked into where they want us (at 2-3 years behind them). We have to know this position accurately so that where we can not build competitive parts, we can move to the standard chips. (This is where we should be with programming anyway, because we are moving more into applications.)

4. We have to make the funding reflect the move to applications.

5. For programming, we must become machine independent. While this is easy at the applications level, it looks more difficult for operating systems.

LOC/MAIL STOP: ML12-1/A51

SUBJECT: THIS AIN'T GOOD ENOUGH

I believe you have to drive this via Kalb (with Roy's help). This means we lose a month.

Today at GVPC we got a strong endorsement to:
Go get a VAX subset chip with a reputable US vendor such as TI, Motorola, or Intel and to permit that vendor to market the microprocessor chip on the open market too.

DEC would put a VMS compatible run-time environment on this system and provide other software.

DEC would market boards and perhaps chips (?) and make a bus that would be suitable for this market. Maybe this would get BI off the dime, or maybe it would mean we would select an existing or emerging bus standard.

We want to work through this scenario in order to make a recommendation BY no later than the last of Jan. This means the subset, bus direction, software environment and vendor recommendation have to be done by then.

I will not support any effort that says we do this work in
We are not on an adequately aggressive course to get this work done by then.

Jack and I both agree you should take a much more active role via Jeff and stop this nonsense. If the meeting isn't until he 14the, this will mean that the whole effort has taken 6 weeks from the Dec. 1 request to you folks to just get started!!
(No wonder we have not made ONE competitive chip in Hudson!)

Jack will give you his perspective tomorrow, and I'm around all week to help get this moving.

SUBJECT: VAX TASK FORCE

A 2 day Task Force meeting has been schedule for the 14th and 15th of January.

GB3.S2.52
The Programs Coordinator reports to the Director.

I. The Coordinator's programs include the organization of:

A. Pioneer Lecture Series

1. 6 annually - 3 in Spring, 3 in Fall
2. held in Lecture Hall of cafeteria
3. for members or by special invitation
4. content of talks generally deals with pioneering developments in the field of computing and/or major contributions to the industry
5. checksheet for procedures has been developed to make sure everything gets done
6. most scholarly (and often technical) of all museum lecture programs and always archived for scholarly use.

B. Gallery Talks

1. usually held Wednesdays at 4 p.m. during summer months
2. one hour talks by local speakers or others who are in the area
3. talks relate to speakers' area of expertise, usually as it relates to a particular museum exhibit
4. Museum visitors, DEC employees and/or

customers, interns and staff attend

5. talks are audio-taped

6. less technical and scholarly than Pioneer lectures but still for relatively "initiated" into the world of computing

C. Bits and Bites

1. Sunday series of one hour talks by local speakers

2. Spring and Fall series with an average of 8 speakers each

3. free to the public; refreshments sold at modest prices

4. not too technical in approach; the lighter side of the computing world with a historical or artistic bent

D. Excursions

Trips to significant computer installations, or exhibits relating thereto, access to which might normally be difficult for general visitors

E. All Special Events

Past events include Babbage Play. Future event will be Archiving Conference in May 1983.

II. Another major area of responsibility for the Programs Coordinator is public relations through

A. Publicity and Promotion

1. Computer Conferences both locally and nationwide--making all exhibit arrangements and occasionaly representing the Museum at conference

2. developing press releases and acting as Museum liason for general level promotion (e.g. Boston Globe Calendar, Middelesex

News)

3. liason to the membership assocition which functions as a resource pool for volunteers, to provide suggestions, and to act as a sounding board for prospective programs

B. Dinner Functions

1. held in museum galleries outside function spaces or lecture hall following lectures

2. by request for outside groups (connected to the computer field)

3. in connection with lectures or special events

III. Other Responsibility

A. Tours

l. Docent training - tour guides come mostly from the staff or DEC

2. Scheduling of tour guides

B. Other

l. Request donations for special events (e.g. champagne for play)

2. Some solicitation letters sent for fundraising when Program Coordinator is the primary contact

IV   Documentation used in Programs Area

A. Floppy - Chris R. (correspondence, etc.)

B. Chronological list of major publicity since 6/10/82

C. Chronological list of programs since 6/10/82

January 16, 1979

Don Christiansen

Yaohan Chu
Professor of Computer Science
University of Maryland
College Park, Maryland 20742

Dear Yaohan:

Enclosed are copies of the Technical Summary, Volumes 1 and 3 of the VAX Reference Manuals series.

I'm also sending a copy of the Computer Engineering Book draft as it now stands -- please bear in mind it's still rough (e.g., the chapters on C.mmp and C.vmp have been eliminated due to size.)

I'd hope you could use it in your courses -- it'll be ready by fall. Please let me know what you think.

Sincerely,

Gordon Bell
Vice President,
Engineering

GB:ljp
To: Steve Chapin, Ike Nassi, Chuck Wegrstyn
CC: Hydra and Resolution Boards, Steve Emmerich, Ken Fisher

Subject: Chuck Wegrstyn Operating System Software Group

Chuck has joined us and will report to me and reside in Wellesley. Chuck will begin work on ??, but will be available ?? for discussions.

The motivation (goals) for this group and approach is:

0. to get the kernel exec that's required for building BOTH tightly coupled multiprocesing and network oriented UNIXen that will deliver the highest performance. Decisions to tradeoff various goals

including performance, especially for real time in EITHER environment, against schedule, reliability, security, and extendability must be explicit.

1. to get another experienced software group to assist in our ambitious product plans and increase the parallelism especially in Hydra (because it is at a later stage) by allowing the kernel exec and MPUNIX to be implemented in parallel
2. to design a single kernel specification and have a common implementation (to ensure compatiblity) for creating a homogeneous environment within Hydra and its extended DLA, within a single Resolution Workstation, among multiple Workstations, and among the Workstation and Hydra environments
3. to build a common system which can use and preserve the very large software investment we are making in adapting UNIX (4.2 and V) to run in our environment
4. to build a common system which can use and preserve the very large investment in special software that results in a vanity kernel

By all accounts, the investment in UNIX 4.2 and V, its utilities such as networks and databases, and special servers built directly on the Kernel is going to be both very costly to build and it is also the Encore value-added. Therefore it is vital that this "systems level" standard be identical across the environment.

Our first effort is to define the goals of the system to be built. The most critical issue is performance in both the multiprocessor and uniprocessor/distributed workstation environments.

Then we must proceed immediately to get a specification so that a phased, work plan can proceed with the utmost urgency. For example, I would hope a kernel could be written to run on VAX to test the interface to various mPUNIX functions and to operate in a reliable environment before migration to Hydra hardware.

Attached is the Encore Computing Environment which has some very sketchy high level goals which I would like us to really

firm up.
subject: ci clusters, our hottest product. now what?
to: ed kramer, jack shields, market/sales committee, demmer, ryan, berube
cc: roseann, psc, heffner, carchidi, hustvedt, burneice

In Colorado, they're running a maximum configuration VAX Cluster with:

12-780's
4-HSC's, with
2 x 24-Dual ported R81's (over 20 Gigabytes)

It was very impressive in terms of performance and reliability... now that it has been tested. Also, American Bell has some running and gave a very strong endorsement at DECUS.

Recall that 5 years ago HYDRA was started as the most important project to build a comptetitive (especially with Tandem) system, providing high reliability and incremental upgrade. Also, we have a unique product in the HSC disk server. IT's HERE now.

It's incredibly disturbing to see such a lackluster approach to the marketing and sales, especially since we seem to need the revenue.

While one might observe that we're following Land's guideline that "marketing is what you do when you don't have a product", since

1. we've put all of our marketing and sales attention on PC's
2. VAX clusters are good enough to sell themselves.

However, I think we need someway to tell the world we have this unique product. Also, it might be possible to get sales from competitors like IBM because of our uniqueness.

Marketing and Sales Committee, is there anyway to get off the dime with this great product? How about at least a review at your committee? Why can't Rose Ann get this marketing charter?
.

SUBJECT: THE HIGH COST OF THE CI - BUT KEEP GOING

GB0005/20/EMS

I understand that it's more expensive than we thought. The temptation to start over now should be avoided. Note, there is a much larger market for high cost somethings, versus zero cost nothings. Even if we want to redo it, start over or cost reduce it, it's essential that we build and operate this one at least as a breadboard. Remember we built the 780 after the VAX breadboard. This was to avoid building the product right the first time.

Someday I hope us product development people will learn that doing advanced development is essential - if we've never built a thing like this before. Doing Advanced Development as part of product development is expensive, prone to missing ship dates, and occasionally not having products at all.

Mr. Kenneth Hope
Acting Director
Prize Fellows Program
J.D. and C.T. MacArthur Foundation
Suite 700
140 South Dearborn Street
Chicago, Illinois 60603

Dear Mr. Hope:

Wesley A. Clark is one of the most creative people I know. For evidence of this, I'm attaching a letter in which I nominated him for the Eckert-Mauchly Award which recognizes innovation in computer systems design. (He did get the award.) To sum up the creativeness, I believe he invented and developed the first personal computer... it was the LINC and is described in the recommendation.

It's hard for me to know just how Wes compares with others at this stage of their career. I do expect more accomplishments from Wes, and I believe they'll be significant.

For others who might comment on him, try:

George Pake	Chief Scientist, Xerox, Stamford Conn.
Ivan Sutherland	Carnegie-Mellon University
Larry Roberts	Telenet Corporation (don't know address)
Frank Heart	VP, Bolt Beranek and Newman, Cambridge, Mass.
Dr. Larry Weed	U of Vermont Medical School
Prof. Carver Mead	Cal Tech
Prof. Jerry Cox	Washington University, St. Louis
Prof. Charles Molnar	Washington University, St. Louis

In my opinion Wesley Clark possess the exceptional qualifications for a Prize Fellow Award.

Sincerely,

Gordon Bell
Vice President of Engineering,
Digital Equipment Corporation

2236

Thanks for the input/thoughts on classical symmetric multiprocessors versus dual computer (which are also classical and predate classical, symmetric multiprocessors). I don't agree in terms of cost (i.e., utilization of resources), cost to program, availability, switchover time, and secondary benefits for giving performance and incremental performance.

I've passed your paper on to John Holz who heads a group looking at this question.

Subject: **AUSTRALIA -- Clocks on 11's**

To: Dick Clayton, Bill Demmer, Bill Johnson, Jim Marshall, Larry Portner, Wayne Rosing

Date: 78 AUG 14
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

I got another input for good clocks that run forever and can't be tampered with because they enable software to be rented! In this way software destroys itself at the right time. Monash University has apparently built such a device.

A customer would also like a good clock which gives consistent measures of cpu use versus elapsed time so that constant bills result.

Am giving the following next week, what do you think?

CLUSTER

.Aggregation of homogenous single and multiuser systems
(eg. VAX/VMS, VAX/UNIX, Tops 20, Altos, Xerox Star)

.Behaving as a single, multiple access system
(usually sharing a common file system)

.High speed interconnect (10-100 Mbits/sec)
High connectivity among systems
Systems located in a machine room or office area

.Extenesion of low-level O/S service
(eg. file, print/plot) via network procedure calls

LOCAL AREA NETWORK-LAN

.Aggregation of heterogeneous systems
(eg. VAX/VMS-PC-Tops20-Unix; gateways to others)

.Purpose is to connect a network of autonomous systems
(message, file, process, terminal intercommunication)

.Relatively high speed interconnect (1-30 Mbits/sec)
High connectivity among systems (and clusters)
Systems located in an office area, building, or campus

.Based on ISO 7 layer network protocols (application)

WIDE AREA NETWORK-WAN
.Aggregate of heterogenous systems and networks

.Purpose is to connect systems across a wide area

.Relatively low speed interconnect (4-64Kb)... 128Kb
 Low connectivity via PABX, and packet switches
 Systems located in different regions

.Communication services between autonomous systems via
 DECnet and with other networks via X.25/SNA... gateways

SUBJECT: YOU MAY NOT HAVE GOTTEN THIS IDEA ON CLUSTERS

We really do have the basic architecture and technology in place.

We should sell what we've got. It's very good. Looking at a price only model of the world that we did is crazy, since it's a price, price per terminal and software that's the issue.

We should go balls out and get the CI cost reduced and get the next round of products to be aggressive price leaders. Nautilus, Scorpio and even an NI based Nebula may get all the price leadership we need.

I am not willing to get into the usual marketing war where unless we win on every dimension, we don't sell it... this is our classic behavior. Here, look at how we've built up incredible overheads in WPS and we didn't sell it because of the features or whatever. Similarly, the CT was the same story. I say we don't need a marketing group if we don't have a product!!

Therefore, Let's decide can we compete now, soon, never? Then, let's decide whether we need any marketing? or whether we continue the engineering?

SUBJECT: CI CLUSTERS, OUR HOTTEST PRODUCT. NOW WHAT?

GB5.52

It's incredibly disturbing to see such a lackluster approach to the
marketing and sales, especially since we seem to need the revenue.
The announcement should have been front page news!

In Colorado, they're running a maximum configuration VAX Cluster with:

    12-780's
     4-HSC's, with
         2 x 24-Dual ported R81's (over 20 Gigabytes)

It was very impressive in terms of performance and
reliability... now
that it has been tested. Also, American Bell has some
running and
gave a very strong endorsement at DECUS.

Recall that 5 years ago HYDRA was started as the most
important
project to build a competitive (especially with Tandem)
system,
providing high reliability and incremental upgrade. Also, we
have a
unique product in the HSC disk server. IT's HERE now.

While one might observe that we're following Land's guideline
that
"marketing is what you do when you don't have a product",
since
    1. we've put all of our marketing and sales attention on
PC's
    2. VAX clusters are good enough to sell themselves.
However, I think we need someway to tell the world we have
this unique
product. Also, it might be possible to get sales from
competitors
like IBM because of our uniqueness.

Marketing and Sales Committee, is there anyway to promote
this great
product?

How about at least a review at your committee?

Can Rose Ann get this marketing charter, given the clear
marketing
failure to date?

SUBJECT: CLUSTERS - WHERE WE ARE & WHERE ARE WE GOING

GB5.59
BACKGROUND
Bill and Mahendra got our terminology turned somewhat, but we still aren't organized right to get the various products.

We aren't moving rapidly or with enough focus to get a MicroVAX PC Cluster, a single system formed from a collection of single user and single function servers to provide what is fundamentally a shared, system. They're tied together using a LAN cable, and might be

called
a LAN-based cluster.

The CI Clusters are great as one can see in Colorado. These are
really the aggregation of several, shared systems to form a single
system where many more users can operate together in a shared file
system, using a set of computers. These might be called Close Are Net
(CAN) Clusters.

LANs on Ethernet are creeping into existence as we have hopes someday
to have our own, Ethernet controller for VAX. However, systems built
this way are still networks of independent systems with more formal,
hierarchical protocols. They're an evolution on our Wide Are Nets.

Seaboard/Seahorse is an excellent base for building specialized
function clusters, providing network-wide construction, debugging,
loading, etc. Clearly OEMs will use it this way for real time. This
should be used for specialized servers for the MICROVAX PC CLUSTERS:
file/database (being done in CX), communications (gateway to Ethernet
Network of VAXen), printing (if we ever get a printer and a group to
write the software). This is really a SEAcluster.

MICROVAX PC CLUSTERS is what we need. Finally it looks like we're
going to get a CRT controller for Seahorse, and VC100's being defined
as the first, bounded version of the MicroVAX PC. Dick Hustvedt's
doing the SDA graphics architecture implementation. We still

need:
0. The Person Server- Hardware's not committed yet, Dick software
1. Someone to take overall responsibility for the Cluster
2. File/DB Server- Rubinson
3. Communication Server to Ethernet- ?
4. Print Server- ? (We still don't have a Printer interface spec'd.

In doing it this way, there's a major question as to how and when we
build a standalone MicroVAX PC, as the Cluster is predicated on being
diskless. (These work just fine at Stanford using SUN Workstations

and 750's for file servers!)

I'd like to get together and find out who's doing what, since it's
beginning to look like we have the right components coming. For
starters, I'd like to see someone take the responsiblity for the whole
cluster and be given as many resources as possible to get the product
done. This could get us a quality product most rapidly! (I have less
faith that we should do it again like PRO.)

Can you folks set up a meeting to start this discussion? (or state
that it's all decided?)

F/U 12/13

Remember how frustrating the enivronment used to be without a policy on 8080 chips and their support versus LSI-11? Is it possible, things will be 5/2 = 2 or 25/4 = 6.5 or 10/1 = 10 times worse with the new interactions?

The troops are frustrated with at least 2 groups working chips issues.

Who should drive for clarity? I've gotten no help yet here from Lorrin.

Who are the appropriate chips level systems managers/architects? Can we assign them? How does this interface to a higher level PSG structure for market use? Are chips just an internal issue or can we get components/OEM to lead/help here?

Can we state:

0. Our goal is to be competitive at as low a level as possible.

1. No new designs should use an 8080 without OOD approval.

2. Low end should be CMOS-8 or LSI-11.

3. Our board level systems should have bus adaptors to

industry standard; i.e., 8080 and 6800 peripheral chips.

Martin Hall talked with me on this and is anxious to help. He'll direct CSS designs to CMOS-8 immediately if we give the nod of chip support. Also, he might want to join us.

By saying nothing, the 8080 is getting more embedded, and we defer what we do. Now we have no written plan to be competitive at anything but systems or sum-of-boards level...not the 1 special board level.

Let's talk...we're not leading when the world wants consensus, and we don't provide it.

SUBJECT: CM'S AS A PERFORMANCE ALTERNATIVE TO BIG MACHINES

Pete Smith informed me that the FPS 164 delivers ten times a 780 for $300K when it's connected to a VAX.

Computer modules may represent a real alternative to the large machine. For years, there's been hope. Now, the gap is so great in terms of cost and performance (64-8086/8087's = 1/2 cray = $100K), but the software problem may be insurmountable.

I feel a knowledge-based system may be a way to do the programming.

Right now I'd like to watch this effort carefully, but try to do
some applications for such a structure.

Some candidates:

1. Routing using Ivan's dataflow model.

2. Simulation ala DECSIM.

3. Various tasks which Pete Smith has benchmarked.

4. Knowledge engineering (say running OPS5 on XCON).

Could your group posit a structure such as the hypercube, and then let's try to apply it to these particular problems?

Note: If we can build these systems, they could have a very radical impact on the future course of computing.

SUBJECT: SEITZ HYPERCUBE

Gordon,

I'm delighted that you're as enthusiastic about this as I am. When Chuck gave the VLSI course in January we discussed it and I tried to create some enthusiasm for (say) building J-11 modules
for them. I couldn't penetrate their interest sphere at that time; hopefully, you'll have more luck!

I have asked Chuck if it is possible for him to come and give a
talk on the ideas in the nearish term future. I'll let you know what comes (although you may be in Japan).

What do you think of building a uVax hypercube module? I'm looking
for some target systems that we might breadboard. Strikes me that this configuration aimed at VLSI CAD workstations, presuming
that we can decompose some of our key algorithms, would be a nice,
incestuous target to drive some system understanding. Comments?

Loc: ML12-1/A51 Ext: 223-2236

They believed we believe the two proposals are independent.

Allen was surprised at the panels and how they would enter into the process. Are they buy in for the liaison? Are they to direct CMU? To approve? (I'm curious too.)

They've gone from an early view where they wanted a gift and wanted us to get out, to the point where they're worried about involvement. They want to use standard software and to affect the way people compute...through us.

They'd like something that feels more like a joint venture in R & D versus a buyer-seller and arms length transaction. They want to be part of our engineering effort for this. They'd hoped we had gotten into the second session to find out details like interfaces, SW license cost exclusion, foreign peripherals, interaction with other projects, etc.

Allen sees two critical issues:

1. Can they and we afford to go this way - especially given CMU's resources? Allen also asked whether they needed to go out for another $1M from somewhere.

2. How's the cost relative to others?

    a. The 4331 is cheap and it looks like IBM might just be willing to buy them with a fat contract plus give them the machine. They have a bias against this. The SW is a nightmare, but IBM is beginning to see the merit (cost-effectivness) in their research.

    b. The Pascaltos Personal Computer (by a small Pittsburg company) which can be obtained for $30K. It came out of the Xerox Research Lab as a 3rd generation Alto.

People were confused about taking the next step. Overall they want to get started and are excited. (Thursday there is a meeting on putting DOD-1 on VAX) with the possibilities if we can get going. I called Bob Sproull and he can help on our personal computer definition - but not until July 1.

I'm worried that we are going to mess this up by losing to IBM and by our attitudes and hassling them. <u>I want to work with them.</u>

Gordon Bell
Vice President, Engineering
Professor, Computer Science
Carnegie-Mellon University (on leave)

GB:mjf
GB0004/60

Q. How long have you been at DEC?

A. I came to DEC in 1960. Before that, I was at MIT. I had gotten a Master's Degree there in 1957, went on a Fulbright to Australia in 1958, then came back and started down the Ph.D. route. But I really wasn't that much interested in a Ph.D.

Q. You were at MIT when you met Kenneth Olsen and the others who founded DEC?

A. Yes. There was a computer called the TX-0 at MIT--the first transistorized computer--and I started using it on a speech research project. The people who designed the TX-0 were the same ones who had founded DEC in 1957. I was working on some circuitry associated with that computer, using DEC products. They'd just built the PDP-1 when I came aboard in 1960 as the second computer engineer.

Q. You preferred DEC to the academic life at MIT?

A. I had pretty much decided that I didn't want to work as an engineer because of my experiences as a co-op student for a large corporation. I had wanted to be an engineer since I was old enough to know what they were. But practicing as a co-op student and my mental image of engineering just didn't match. I thought I'd <u>have</u> to go to academia for more freedom, responsibility, and more interesting work.

Now we're faced with trying to keep the engineering environment here from becoming like it was in the places where I worked as a student.

Q. You left DEC in 1966 to come to CMU. Why?

A. Yes. I worked here from '60 to '66. I did a lot of design and engineering. I was in charge of computer design. DEC was at about $15 million in sales then. We had more computers than we needed from a market standpoint, and I was feeling burned out--as a manager, and I wasn't designing things. I wanted to learn and do projects again.

That's a period I see many of our engineers go through here. It's the dual-track/dual-ladder problem--wanting to be fundamentally technical, to do design, to do projects as an individual, and, at the same time, wanting or feeling that one has to be a manager just to get more leverage on the projects one wants to do.

Traditionally no company is supposed to work this out very well, but I think we are. We try to keep both paths open. We try to have comparable positions as both management and individual contributing engineers.

Q. Why did you come to CMU instead of going back to MIT?

A. I had met Newell, and Perlis. Also Everett Williams, Head of the Electrical Engineering Department, influenced me to come. Carnegie had really put together the first computer science department. Ivan Sutherland, a Carnegie graduate aid head of ARPA (Advanced Research Projects Agency of the U.S. Dept. of Defense) also suggested CMU.

Q. Was the CMU experience what you'd hoped it would be?

A. Absolutely. CMU's a great place. Compared to other state and private universities I'm familiar with--it seems to be the right size and scale. I thoroughly enjoy the student-faculty interaction, general atmosphere and learned more than during any other period of my life. Writing the book with Allen Newell was especially rewarding.

Q. Your work at CMU was, of course, the computers. It's been said that by the end of the twentieth century, every major enterprise of science, goverment, education, and industry will rely on them. What does that mean in terms of how managers are or should be trained at GSIA and other business schools?

A. I think there's still a long way to go. many of the business schools, CMU, Wharton, Harvard, Chicago--they all have their own departmental PDP-10's. But they're just scratching the surface of what they could do. It all pretty much revolves around the difficulty of using computers. The students do solve some problems on a canned basis. They're given a program to run, and they put some numbers in. Computers are used for building simulation games. Students learn a little bit about programming--perhaps just enough to make them dangerous. Then they think they know what computers are all about because they've written some one-page BASIC programs. I think they need to build some large, non-toy systems and solve non-toy problems where they write reasonable programs.

The business schools have to change a lot in this area, and I don't know how they're going to do that. The computer science departments could help if they became much more strongly involved with the application in business schools. So much business school activity is in the industrial organization that that's a good application area. And I think every science or engineering discipline needs a target user to really understand systems design.

Q. You're implying that there are problems inherent in the use of computers by people who don't know as much about them as they should?

A. We get management reports that are absolutely impossible to deal with. The computer's made that possible. And it's probably made organizations grow bigger than they might have otherwise simply because you can keep your hand on a lot more information. You'll never be able to test that as a hypothesis. But we're far away from being able to have any kind of understanding or control in an organizational sense because of the way a lot of the reports are done. The touch part is putting machines within a human organization so that you can get more out of that system, not strangle it with paper.

The way the computer ultimately has to go will really be as something that supplements human information processing.

Q. Has the problem been compounded by the fact that computers have changed so much in recent years?

A. Right. Many managers still think everything has to go through one central place. That's sort of like having the Electronic Data Processing person be in charge of every telephone that's put in. Sure, you can do that. But is that the right way to build or run an organization? That's saying that person has to be <u>so</u> bright, because he's really setting and controlling the organizational structure.

But computers are being built differently now. Soon they'll be in every telephone, in every typewriter, in every copying machine, in every mechanism--and we all will be interfaced with very many of them in various ways.

Q. In another vein, how do you keep in touch with what's happening at DEC's 23 manufacturing plants? Do you do a lot of traveling?

A. Not as much as I should. I get out a couple of times a month. Unfortunately I haven't visited all of the plants. I should. It's too stimulating and frustrating because it causes me to push for changes in products, the plants, and the engineering process.

Q. Your work is mainly here in Maynard?

A. Yes. Every manufacturing plant has engineers responsible for the product flow in that plant. Design engineering is here and the design engineers do a tremendous amount of traveling.

Q. Do you rely on information sent to you by computers from the various plants?

A. Not really, although we use it extensively for message switching. Also, I don't stay that coupled to manufacturing. To really know what's going on I have to be more direct by visiting the plant or talking with somebody who has been there. The financial numbers tell superficial kinds of things. The whole notion of control should not be so oriented to financial numbers to the exclusion of other metrics. Mostly what's being controlled is not an item that is easily assigned a dollar value. In several years when classical engineering control theory gets into business schools and then can be taught and also learned, some change may be possible.

There are two basic ways to control: the input and the output. Business schools seem to teach controlling (actually just accounting) the input. For instance, one might control spending into the library. But whether or not that's at all right, one has to look at the output and its value. Controllers don't report on how many books get checked out or other transactions because these are non-financial. Much of the output of an organization really is non-financial. For a drafting room, the response time and the drafting they do per dollar are the control metrics.

Q. Do you try to control what's happening in your plants from your headquarters in Maynard?

A. That's manufacturing's domain. When we set up our first remote plant years ago, our Puerto Rico operation, we started out with just assembly there. All the controls were from here, all the ordering. Parts were taken down, assembled, and then testing was done back here. And from a control standpoint, it was not very satisfactory because there were long delays in the information channels. Now plants control their own raw materials and are self-sufficient.

Q. How do you spend your time on the job?

A. I try to avoid going to meetings, with little success. I try to work by phone, and I like to walk around and visit the projects--contribute to them and critique them. Sometimes I visit customers to see how other people use our computers--at Kodak, Dupont, and other customer sites. Applications are all different at each site in terms of what their problems are. I also try to spend a fair amount of time on product issues. If I look at the problem list that I deal with, it includes everything from defending the engineering budget, to supporting a product that I feel particularly strongly about, to hiring. I like products. So I worry about strategies, advanced development, research and things we ought to be doing that we're not.

I worry some about space and that people, space and capital and equipment are in balance. I worry about keeping all the processes going. Essentially we've got a whole zoo of processes that have to be kept on-going. Traditionally, in a high growth company, these are the things that you ignore until there's a disaster because all the effort is on product strategy, hiring and training.

As a hobby, I like to write about computing. This was training I got at CMU. Now, one of the engineers and I are doing a book of readings with several original papers on the engineering aspects of our computers.

Q. Do you pay close attention to your competitors?

A. Sure. I'm always worried about the competition. they can come from everywhere. IBM, the semi-conductor vendors, all the people the semi-conductor vendors put in business, the existing institutions, the Japanese.

Very often the only thing our engineers understand, however, is market feedback or competitive feedback, and I detest our behaving that way. The minute you start responding like that, you're building a development process that's going to produce obsolete products. I think that's always the biggest danger when you get bigger. Keying off of a conventional marketing structure is the biggest worry that I have. And DEC traditionally hasn't done that. It doesn't mean we don't listen to the marketplace. But the minute you start responding, then in fact you're gearing a process that is going to be about eighteen to thirty-six months behind--or whatever the gestation period of a product is.

Q. Are you concerned about what IBM is doing with minicomputers?

A. IBM has such vast resources to do things that by and large it sets its own standards and goes off and does what it wants. Everybody has to couple in with them in some way. We have to be able to communicate with their machines.

Q. Are you working on tieing machines together and what standards exist?

A. In the network area, standards are very desperately needed. Yet the standards work didn't progress rapidly enough so people could key off them. IBM seems to have made some mistakes in the network area that we think will be too limiting. They may move the users around so much that it'll be too hard to track.

When we went off on our DECnet system and standards, which allows users to build a variety of networks connecting our computers to each other or to those of other manufacturers, we felt we knew networks. Still, it's turned out to be harder than we thought. We are successful now.

Q. What about standards for computing?

A. Historically, I believe computers have evolved rapidly because the government has been an intelligent and demanding user. They have not designed the systems by specifying standards. The government really bothers me in terms of the way it seems to now want to operate in the standards area. One particular standard that I was very much opposed to is supposed to reduce their disk acquisition costs. I worry that it will impede technology and cause higher costs too?

Then, too, on something like the networks, communication protocols should have been standardized before now. That one's trailing, and we're facing some real problems as a result. It's like having a bunch of private telephone exchanges, each with different signal levels so that every phone network needs a converter if it wants to communicate with another.

The government, together with the telephone company, should have set the standards. I don't think it would have been political, and it would have saved an incredible amount of time on everybody's part. We'll ultimately have to do that anyway.

Q. The computer industry isn't regulated by a government commission. But you do have numerous regulations to deal with?

A. Sure. there are product safety regulations, guidelines for power suply efficiency, radiation, noise--I could go on and on. We've got the government pulling at us. And I don't want us to get into a relationship like that which exists between the FCC and the telephone companies. Little happens outside of that structure. That doesn't mean the telephone company hasn't changed over a long period of time. They've improved service a great deal. But computers have evolved rapidly over a short perod of time. Looking at our indicators on an exponential basis, for the short time we've been in business, things have changed rapidly and a great deal. What was important a couple of years ago isn't going to be important in two years, just when the standards begin to come out. The government standards process can't deal with these very rapid exponential changes.

Q. Looking at computers in a general way--are they overrated?

A. Not at all. Historically we'll look back and say that they really started being used about 1975. It will be similar to the Industrial Revolution but more significant. There will be a clear line of things that have changed and were totally impossible without machines. People's lifestyles will change. I don't know what the revolution will be called at that point, but the computer is clearly the root of it.

Q. Will there be a number of computer-related inventions?

A. Much will be keyed off of supplementing existing information processing. On the other hand, we'll be doing things that we couldn't have done otherwise. For instance, having a robot in the room that's smart enough to know when there are people in it and controlling the lighting and heating accordingly--and doing other trivial tasks. Doing all the things that no one can train his children or wife or himself to do will be possible. Computers can take over a number of chores that are in the resource control domain.

Q. How will they be used in the near future?

A. In all kinds of ways in the communications area--for message switching, for all the office automation. I think computers will come to be used widely--simply for communications and text preparation, storage and transmission (e.g. electronic mail). More and more people will start to do local, totally distributed processing. I think most all conventional tasks computers perform will move to a totally distributed form to be associated with each organizational entity.

We have a word processing system here in my office. We moved from a big machine to this. My secretary loves it because she's not dependent on the large machine. Also, I can type memos and messages myself. It's got processing associated with it, and there's much that it can do that we use to go to the large machine for--report generation. In fact, we can operate and do a lot more control now. We keep a list of all the projects we track, for instance. To get that kind of thing done from the corporate data base is virtually impossible. So the task is to get some of these things down into the organization where people feel comfortable. There an organization can operate the way it's operated before, but more efficiently.

There are a lot of reports that are generated, a lot of files. Everybody's got file boxes on their desks, or a list of things to watch and do. All of that they can do now with these word-processing machines, and they'll do them informally. The centralized system person always says "I'll maintain all the files and all the reports that everyone wants in the whole organization. I've got this one data base, look how great it is. There'll never be any wrong information in there." But the problem is the timeliness of the information. Also large, central data bases are very difficult and expensive to build and maintain. Unless people are keyed in or have a terminal into that data base all the time, it's not very useful and it's generally wrong. You can't get the response you need in terms of kinds of queries and formats.

Q. Modern science fiction has utilized the computer extensively. The computer is the bad guy. Is there a danger associated with the computer?

A. It's not a bad guy. But it can be an instrument of bad guys. The notion that you can have a machine monitoring all of the communications in the world, processing all of that communication and filtering it--well, I've never tried to compute whether that's possible or not. But right now--and as far into the future as I can see--it feels impossible. And even if it weren't, there are very good security devices that we <u>do</u> have right now. You can put a personal scrambler on a telephone that you carry around with you, if you're worried about that sort of thing. Technologically we can deal with security problems. We can have secure communication channels.

Then there is this whole business of records. I don't think that presents an insurmountable problem, either, of course people have to be a lot more careful than they have been with information. The risks are no greater, however, than they have been.

Q. Does someone who aspires to running an organization have to know computers?

A. Yes. If for no other reason than to have some notion of what a process is. But whether they can really effectively understand how machines will diffuse into organizations and be used is questionable. So many mechanisms of how processes work in organizations, all the informal communications paths, how an organization performs its functions, aren't very well understood. And computers point out the lack of understanding because all activites for machines must be so explicit. Machines can force a rigor that I think is necessary in would-be, cloudy headed, future managers.

Q. Why should the average person bother to learn about computers?

A. Simply so he can get along and understand the world. You have to have some way of relating to what the world is today rather than just writing letters that say "Your computer screwed me."

It really burns me up the way people put in systems and then use the computer as a scapegoat. "My computer did it to you," they'll say. That's nonsense because the organization (usually just one person) is respnsible in any event. They'd better have a process in place to sort and cope with the input.

I get furious when I get a bill for 00 cents, or a check for 00 cents. It's simply unnecessary and at best a sloppy program which is permitted to exist by some sloppy, wasteful manager. And then sometimes people will get dunning letters and threats, and when they write or call to complain, and ask how can things be so absolutely screwed up, they'll be told laughingly "We;ve just installed a computer, and you understand what that means."

This is totally absurd. What it comes down to is that people have found a new scapegoat, something they feel everybody can relate to and understand. Somehow there is a notion that people weren't involved; it was a machine that did a dumb act. It really irks me. If you think the computer is causing the problem get it thrown out!

Q. Do you have any advice to people on what their attitude should be towards the computer revolution you predict?

A. People shouldn't worry about it. They should relax and enjoy it. Machines are (or should be) friendly, fair and basically helpful. I think it's going to be fun. It'll all come in a basically innocuous way, driven mainly from the economics of everything. It can'be stopped, especially as long as organizations are operated so much on purely economic metrics.

SUBJECT: CMU JOINT PROPOSAL DISCUSSION WITH DOUG VAN HOUWELLING

Just had a discussion with Doug on this. He is going to call me back on Tuesday morning.

We got into the heart of the issue: IBM has made the commitment
to the project. Doug noted that IBM moved very fast after receiving the proposal, and on the other hand we knew of the project and their desire to work with us for about a year, even
though the proposal had not been made. We're second in the pipeline to agree to do a Technical Proposal with them! CMU does
not believe that both DEC and IBM can do a Technical Study there
in parallel, hence the question:

Is there anything we can do to prevent IBM from making their
Technical Study, or should we simply agree that they should go
first and we will request a similar Technical Study period
following IBM?

WHAT IBM IS GOING TO DO
IBM has proposed to be their partner on this project, subject to
being able to reach agreement during the Technical Proposal

making phase. They are meeting for a day during the first week
of November in order to review and approve a memorandum of agreement ... for the technical study phase. They have designated a single individual to head the Technical Proposal group and have asked CMU to provide space for the 12 individuals
they want to relocate in Pittsburgh. They study is supposed to
take 3 to 6 months. Doug has worked with IBM before, and has been sceptical whether IBM can be flexible enough and understands
the importance of the area enough, but so far he has been surprised and has stated that IBM may have changed.

WHAT WE MIGHT (MUST) DO IF WE WANT TO DO THIS PROJECT
Right now, we run the risk of not being able to be asked to make
a Technical Proposal because we can not convince CMU that we can
or are willing to do the project. I don't see how we can convince them otherwise in the short period between now and when
they are meeting with IBM to make an agreement. We can not sit
by even now, otherwise, by default they might enter into a non-cancellable agreement with IBM which says the two must go ahead subject to an adequate proposal.

Therefore there are significant risks now that IBM will get the
project by default. We will be unable to convince them that we
are serious enough, hence they won't even bother to allow us to
make a Technical Proposal! We must still work during this time
to determine how to even stay in the race.

Since Doug is calling me on Tuesday morning at 9:30, I would like to get together on Monday morning to decide what we say.

PROPOSAL FOR THE JOINT DEVELOPMENT OF

PERSONAL COMPUTING

BY CARNEGIE-MELLON UNIVERSITY AND DIGITAL

G. B.

10/14/81

THE CMU PROPOSAL

- BUILD A PERVASIVE ENVIRONMENT OF PERSONAL COMPUTERS THAT

GRADUALLY EVOLVES FROM EXISTING T/S SYSTEMS IN DAILY USEBY A LARGE, DIVERSE POPULATION.

EVERY STUDENT, FACULTY, STAFF MEMBER WILL HAVE A PC. STUDENTS WILL TAKE PC WITH THEM.

-DEVELOP APPLICATIONS APPLICABLE TO A BROAD MARKET, ENCOMPASSING:

+

OPERATIONAL SUPPORT OF LARGE INTEGRATED NETWORK
(ARCHIVAL, RETRIEVAL, ETC.)

+

PRINT IMAGING, GRAPHICS, AND VOICE

+

ROBOTICS

+

MODELLING

+

KNOWLEDGE ENGINEERING

+

INFORMATION AND DOCUMENT PROCESSING

+

HUMAN INTERFACES AND SOCIAL ASPECTS OF "LIVING ON THE MACHINE"

-CREATION OF AN OFF SITE INSTITUTE FOR INFORMATION MANAGEMENT AND TECHNOLOGY TO DISSEMINATE AND TRAIN STAFF, CUSTOMERS, POTENTIAL CUSTOMERS.

G. B.

10/14/81

BENEFITS, COSTS, RISKS

BENEFITS

-OWNERSHIP OF TECHNOLOGY (FIELD PROVEN HARDWARE AND SOFTWARE DESIGNS) FOR FIXED OPTION PERIOD.

-CLOSE COLLABORATION WITH A LEADING UNIVERSITY AS A WAY TO EDUCATE, INNOVATE, VITALIZE ENGINEERING.

- REDUCE ENGINEERING ISOLATION FROM CUSTOMERS AND ACCESS APPLICATIONS

COSTS

- $6-7M PER YEAR

-REQUIRES MANAGING AN ENGINEERING SITE LOCATED IN PITTSBURGH

RISKS

- STAFFING

-TRANSFER OF DEVELOPED TECHNOLOGY INTO PRODUCTS

-UNCLEAR ASSOCIATIONS WITH OTHER CMU INDUSTRIAL AFFILIATES (WESTINGHOUSE, THREE RIVERS, IBM, HP ...)

-WE ACCELERATE THE DEVELOPMENT OF A MARKET THAT WE DON'T QUICKLY CAPITALIZE ON

- NO PRODUCTS FOR THREE-FIVE YEARS

-ADVANCED DEVELOPMENT TREND IS MOVING AWAY FROM DEC

(UNIX, XEROX, THREE RIVERS, WESTINGHOUSE)

SUBJECT: CMU JOINT VENTURE DISCUSSION WITH ALLEN NEWELL

I told Allen about our basic decision to go ahead with the study phase. I tried to give an accurate presentation that our position was to approve in principle, the idea of the proposal and engineering site, but that we weren't prepared to give a carte blanche approval of this sort of expenditure at this time.

In contrast, he stated that IBM has already given such an approval... namely, they have approved the plan to do the project, subject only to a detailed proposal. This is an interesting commentary on IBM vs DEC... I doubt if we could make a decision as fast even if the magnitude was about 1/10 the

size!! Also, it indicates that IBM is really going balls out for
this area, and they already understand the need for both research
and large scale prototyping in a pilot fashion.

Given that we can not make such a strong commitment, Allen would like to get some way of testing that we are serious about
doing the project, given that a successful business plan can be worked out. This may take on the form of visits to CMU by say Ken or Win or Andy. Their view, based on a relatively long
history, is that we really budget and control very tightly and
very much in a distributed fashion, making it difficult to make
a decision of this fashion. Furthermore, we don't believe very
much in research, but instead focus on short term results. I couldn't say that he was absolutely wrong. We did agree that the
proposal several years ago to put 100 PC's in the CS Dept. was a
different, though similar case. (In that case, there was no support from either development or from research. In retrospect, that would have been a bargain in order to get the
work done. We have spent the money internally and have no output.)

I think we are ready to go ahead with the convincing them process.
It should take the form of Ike doing the convincing with van Houwelling
et all, plus getting the other person who would head up the facility there to put together the study team.

I will argue very hard to do this project if we can get a team
and very good plan together.

SUBJECT: CMU JOINT VENTURE PROPOSAL.. I WOULD LIKE YOUR SUPPORT!

This is the most exciting proposal I've seen about building a computing environment that will allow us to understand computing in the explosive '80's. Everyone has a powerful computer (or access to one) in every part of his environment (home, office, classroom).

CMU is an ideal laboratory in terms of its size, attitude, determination to build the system, decision making ability to carry it out, competence (computer science and engineering), computer center support and computer use.

We would proceed with the 6 months study phase, and if successful, proceed with CMU to implement the environment. The mechanics would mean a DEC Facility there staffed with Software and Hardware Engineers, P/L Engineers, SW Support and EDUCATION Service persons. CMU (Pittsburgh) would become a key engineering site.

I'd like to discuss this on Wednesday or Thursday at the Operations Committee Woods. The purpose would be to get approval for the study phase, with a strong commitment to proceed if the study were successful. Given the tax structure, the cost is unclear. CMU believes it will cost five to seven million per year for both CMU and its partner. The duration is 5 years.

Based on the performance of the CMU Computer Science Department in implementing their SPICE (Powerful Personal Computer Network) which we rejected 2 years ago, I believe the project will be successful. Furthermore, the project is vital to our future.

TECHNOLOGY LECTURE (CMU - FEB. 22, 1977)

books to read and I read every time I see a serious technology forecast is a thing that was done in '70 by a bunch of people who got together in a DELFI experiment and I'll show you a diagram of what a DELFI experiment is if you don't know but I was amused by Bob Sprowl saying "why did all these bright people get together and they didn't produce a really startling system?" The thing that always amazes me is that when you put that many bright people together you get anything out. A DELPHI experiment is that in the limit although I'm not sure whether they use bright people or not. A DELPHI experiment is where everybody talks about what all of the wild life is and when things are going to happen and somehow all of these people conspire to make projections about the future; for example, I think it was one of the military that did this and this was for 15 years of data processing and in fact if you looked at all the statements that were made there by 1985 or so when this 15 year period ended, virtually every science fiction thing you'd every dreamed about had concluded. Somehow they should have given themselves 50 years instead of 15 years and maybe things would have been different because a color display with a thousand bit resolution low cost was going to be available in 1971 and this was done in 1969. Wall displays, 4 feet by 12 feet with rapid resolution of 40 lines per inch and color are feasible. That was going to be in 1973 and that was really far out. Low cost graphics terminals were somehow 1974. None of the responses to all these things that were going to happen were related to one another. They all seem to be independent. Widespread use of LSI, given all of that, for computer memories fortunately didn't happen until 1976 which is in fact sort of when it's happening. Occassionally they hit a few. Semiconductor caches were available in 1971. A universal computer language will have evolved through automated communication and that occurs in 1995. So the programming problem doesn't get solved. That did go outside--they didn't define it--that's what's so wild about this whole thing--it looks like everybody put statements in there and there was no attempt to sort out the overlap or anything and they voted on it and they have all these little votes of when something is going to happen and there's a distribution of when things are going to happen. User program systems without programmers--programmers only used to program firmware. That happened in 1975. For spoken input, computer vocabulary will be many hundreds of words and the computer will interpret simple sentences. That happened in 1972. A 7200 bit modem on voice grade lines was highly feasible and was going to happen in 1970. And we still don't have any decent modems at decent prices. The problem in all my graphs--I based them all on past data and if your foolish enough to think that those lines would go out into the 80's forget the fact that these lines are always--I draw access out and this is the only safe part and anything beyond 1977 forget about--but the lines are just drawn there for your convenience. Worry about exponential projections--I do. Initially the third talk was going to be on technology and I moved it back so we're going back into this diagram because in order to get into the--I can't start the context of where we were yesterday. So using the first diagram we used yesterday, I started building these talks from top down and then when I got to the bottom up part I found that they didn't mesh and that's why I had to go back and insert the third talk in this side because essentially one of my thesis is everything is driven from this technology, from this core or from the user and talking about the marketplace until one has what's driving this system, it doesn't make a great deal of sense. Just had this one slide--I never understood this diagram but this is a modified DELFI technique. All these experts get involved and there's interaction and person to person contact--these aren't my slides--I just talked to them because there awfully complicated and all these boxes and I can't imagine the thing working--and they don't. Back to this curve which is cars, and computers. I wanted to call attention to the fact that the whole thing that drives this is purely the number of units. I'm using time because units are virtually impossible to get in terms of looking. That all comes from the notion of production learning curves--that is the efficiency of the n'th units is you take the n'th unit and that's raised to some exponential or a positive learning constant so that the efficiency improves with the number of units and a lot of that work was done here in terms of studying and getting a correlation of why, not necessarily why because I don't think people know yet why that gets better, but in fact take that these are generally intherical data and a lot of that came out of work here in studying everything from liberty ships to airplanes or jet engines in terms of finding what the efficiency of a given unit is or what the cost of a given unit was is purely based on number of units, not time. All the early technology forecasting was done in terms of an exponential to some time period. A guy by the name of Fusfeld and maybe somebody else, but he claims he made this observation came up with a technology progess function which is really a learning curve in which he finds that the technology of the n'th computer, that is some performance indicater of the n'th computer is raised to an exponential and that's 2.5 for computers and .7 for autos if you take horse powers as the measure. He made this other observation that if the number of units increases exponential with time, then one ends up with the p of the n'th unit and the technology at some other time then those two are the same and that's been the case of computing. And in fact with computing that's also if you pass these production costs savings on to the user and you have an elastic demand curve then this whole thing is an unstable situation driving all the costs to zero which is exactly where I claim we're all going. Except the thing that keeps us in these stable bands is these salespeople. These sales outlets so institutions, classes of users and salesmen keep us all in particular stable bands.

Question:?

Answer: If you strip all the components out and say "What's the labor in building liberty ships", it follows these curves and in fact I was talking to somebody who was making Bell helicopers and he said "Oh yeh, we're on an 18% curve" and when they say that it means everytime the units double then the amount of labor comes down by 18% of what it was or 15% or 10% in some number and it's usually it means given a unit doubling whats the percentage labor contents it comes out so you have to push all that back into the constituent part and you say "Well helicopter steel isn't coming down" and in fact down at the end even though labor cost is coming down or learning may be taking place the amount of the wages may be increasing. Things like automobiles--that thing is down adding a factor of two automobiles at 10 to the 8'th automobiles is a hell of a hard thing because that takes another 25 years and by that time the labor prices have gone up a great deal. You have to be very careful how the thing is constructed or how you deal with the component.

Question:?

Answer: No--I'm claiming they work clear out into large numbers. But the point is that large numbers--nothing much happens there because it's hard to get a -- with automobiles-forget it--They've learned everything there is to learn about automobiles and nothing much is going to happen. But with helicopters there's a lot to learn because there are only a few helicopters and with anything that complicated to build, there has got to be a simpler way.

Looking at software, cpu, and disk constituent technology, I've put on them taking these various time scales that we had here and looked at the amount of time that one spends in research of anywhere from 0 to 20 years here and say to 1 to 10 years in each of these areas, and advanced development says they are breadboard kinds of technologies. Software one can do in the order of a couple of years to maybe 6 months. These are typically 1 to 2 year projects. Development is 1 to 2 years in software. Cpu's about the same and disks about the same. Testing, tooling, and design maturity testing somewhere 3 and 6 months, 6 months and a year. Here you're talking about a year in a very complex electromechanical system. Shipping may be somewhere between 3 and 6 months to actually ship. At this point we've maybe done a first ship and maybe back in here the product is announced and here this is the educating used thing and one gets somewhere between 6 months and 5 years. Maybe 6 months here from an education point of view. Here in a disk we've got, because people know what it is, it's a commodity, we have no times for it to come in to the marketplace. The education and understanding sort of increases with this complexity here. I did this and looked at these constants principally to do some understanding of what kind of development process one builds and with this you can see how, by spending certain kinds of resources you can actually build the system that can keep you 4 years behind the competition. Because if one keys all development off of announcements here, you use the conventional market pull kind of way for definition. So I'm into a kind of a commodity market. Market tells me I need something, I then go back and think maybe I can develop it because the markets already defined it and then I start through this cycle. Then the time through the cycles is in the order of somewhere between 3 to 4 years so in fact with these kinds of cycles you can understand how you can reliably build obsolete parts in an environment and we've had a case where we kept wondering "Gee, why do these products appear to be obsolete" and there's no surprise once you look at it from process standpoint. So when people say "Hey, is something market driven" I say if the market is defining it or if you're looking at the competitive products there in terms of what you're going to put in yours you've pretty much guaranteed that you've got yourself a system that's going to build products that are 3 or 4 years late.

The languages is a fairly interesting one because one has an educational window there where you can begin to look at the market buildup for a particular language. One that's been particularly one which we look at all the time is the case of PL1 because another language is like being vaccinated for another disease or something--hopefully that vaccination is not going to kill you again. So one wants to minimize the products in some sense--particularly in the language area where you talk about very high education, and higher support costs.

I think in the process sense the thing that seems to come out here is looking at the various people involved in this whole structure. We have in the middle block architects and hardware implementers, programmers, parking and salespeople, salespeople and in the time horizen here I put -25 years to +10 years because I claim they ought to know everything. I don't like to see inventions that weren't in. If there is a good idea in ATLAS I expect it to go in a --ATLAS is only 17 years old so there weren't any good ideas before ATLAS. Certainly 18 year olds have some good ideas that haven't been properly implemented in machines and clearly you've got to look out 10 years because with the software investment, the thing has got to last 10 years. Hardware--I don't know what there because there's a certain amount of implementation history that's important and one had better be pretty good for the next 4 years because that's covering that technology window that's coming out. Programming--that's wrong. It's got to be something in the future and with the different kinds of computers that are being built, I think they had better go back 25 years too because you can the ? microprocessor people learning now just up to the point where the mini people were in 1962 or so and then similarly we had learned what was by about 1952. So every 10 years or every time there is one of these new names machines and these stable states I really think (I don't know how to find out how stable they are) they appear to be quite stable market states.

There appears to be a whole new set of learning that goes on and a whole activity around that and they look almost independent of one another.

Marketing and Sales

Something in the 6 month horizen. Looking at orders they are losing and then forcing back in so that we're sure to build these obsolete products.

Activities--Technology and Historical Technology Selection and Use

This is a tremendous amount of standards. Marketing and sales is really specific use.

Goals - Major

I think another thing that drives is sort the clarity with which people can operate and architectural clarity I think is a fairly hard thing because it's dealing with a large number of concepts.

Hardware implementation--One thing that gets us there is the simplicity of the goals, set of cost, speed and then if you really want to make something complicated, add in the reliability and that gets very confusing. But one has a great deal of clear tradeoffs here.

Here, programming, I'd make as the most complex subject in terms of states, programming of size and speed, and in general a fairly unclear set of goals and that's what I think is probably the hardest thing in programming.

These are all very clear cut measures and in fact people can operate very nicely within--this one is especially clear-- this one's less clear because they're sort of sitting at the end and they don't know whether these guys are screwing off or they didn't give them the right sort of things or what.

Number of interfaces, goals simplicity/complexity -- I'd say this is probably the most complex activity - this is the second most - hardware is third most and marketing/sales are in terms of this is a product of states times the information content in those states. These have to be quite right and so maybe I ought to reverse these two. It's very hard to test an architect because there are lots of states here but the fuzziness surrounding those is something else.

I also made the statement about these three designers that we had: This was in the tenth symposium, I think. This is in the performance/price theme. One starts with no design, moves out here adding cost and finally gets a minimal machine and then one can add a little bit here and get quite a game until you get to this best cost/performance point and then you move up to this point and if you lose, you come down there and it's unbuildable.

This is kind of that projectory and one can see these clear design points here. This being the hardest point because it's easy to add something to the design but it's virtually impossible to take something out and you don't really know what that marginal utility is at that point.

This is one I had that is inside of trying to understand what we did and I went back and plotted all of our computers in various lines and say why are all our computers the way they are and so those lines are people migrating around and how much clarity they have in the design. The one here and the guy went off to III and I did the four and sort of split in two or three pieces and did big machines and worked on little machines. These are easy machines--I would never try to build a mid-range machine. That's a very difficult machine to build because you never know. Little machines and big machines are sort easy to build. Big machines are a little bit hard because it can lose through that precipice there.

Here are the four lines of machines and the PDP-5 machines and really that's been implemented as a family. Here's a machine that was implemented as a lower cost version of the 8 after the 8. What I really wanted to show here was this set of machines--this is the 11 series, in fact, which one designer has sort of been responsible for. This line, one has been responsible for that line, and this basic design has been used up here and this is sort of a maximum performance design and then we've split off some people here to go after a lower cost below this because, although I say this is easy, if you straining to make this machine already for a low cost, it's hard to split. It's hard to come up and say you're failing because in fact constraints here where these are all unibus based machines and in fact that's one of the constraints of why it's hard to make a machine that's lower price. In fact we've now started managing by who does the project rather than the project goal.

This is looking at the tree of the technology that drives all of this. The plasma stuff. This is letrastatic memories which really aren't used any longer. Crt's and capacitor sort of analog and digital stores. Here are the two main branches: the electromagnetic memories which I'll talk about--principally the disks and how they go. There is moving electromagnetic memories and semiconductor memory desity because this is the one that's evolved most rapidly and for starters, the thing that differentiates these two storage media and why this one evolves roughly twice the speed that this one does goes back to that very simple

concept of learning where the computer world takes about the half of the capacity of the semiconductors and in the case of magentic media, there is virtually no media from video tape outside computing. So essentially there is no market outside computing and the evolution isn't as fast as with semiconductors.
But again without the computer and the semiconductor, it's hard to think that that would have gone anywhere because there was this perception that it was a whole market in which you made a few hi-fi sets and you find that your limited by peoples ears and the FM band. That there's really not that much incentive to make better transistors after a while whereas with computer parts, we've driven them to do better.

This is a "hot off the press" curve. The only curves I really watch very carefully are ones made by people that have a hand on the valve. One hand with the pen and one making these curves and one on the valve controlling the resources to make it happen. I copied this off a chart by Dean Toome, who is Vice President of Engineering for TI--on Monday. His model of what's going to happen purely in one dimension and I'll go back to why this is an important dimension. This is size and bits of memory chips--these are the MOS chips, either by polar chips. This is the CCD, and these are bubbles. And in fact, these lines are sort of constant time lines of when things will be available. These are 1K, 4K, note roughly every 3 years one gets a factor of 2. My curves have been more every 2 years one gets a factor of 4 so I've been more agressive here but I've got other bugger factors that I can use. He hasn't defined what he means here in '76 or '77. He says the paper that was just presented to the solid state conference is at a high volume kind of thing or not, but note the implication here is that in this time scale the '76, '77 time scale one has a 16K chip; in the '79, '80 time scale it's three years. We're sitting here with a 65,000 bit chip or 8K bytes on a single chip and if you're going to have that much memory, you might as well throw a processor in for good luck because that isn't going to cost very much. So we have our 8K byte computer before around 1980 and I think the cost will be in the order of the 5 to 10 dollar range of what we see these machines coming down to now which is really a package cost kind of a thing. So we'll have 8K byte machines by that time on single chips.

Now as a kind of technology historian I'm having trouble noting when the fourth generation comes. The fourth generation I would say historically is as basically being the time we had a single processor on a chip. I would go for perhaps a single computer on a chip as being the next significant thing although that's already happened if you talk about these small number of 1,000 bit or 8K bit kind of machines on a chip. I don't think those are significant yet and it's hard to know how to peg that in the generation sense. I think maybe somehow a significant event has to coincide with that.

The other thing that was unique here is this factor of somewhere around 3 in terms of cost for 400 microsecond CCD memory. So here by the '80, '81 time frame you have a quarter of a million bit CCD memory and bubble memory being maybe a little bit earlier but with 4 millisecond access time. An interesting sort of research program at this time is how does one really utilize these memories because it really is a painful thing to deal with. From a memory hierarchy standpoint everything works but those models are awfully continuous and if we have to do something different to the machine then we really aren't doing very much planning now. If these are mere fixed head drum disk replacements that's an easy thing to do but note this very fast access time is to exploit some of the other properties of this. The transfers are going to take place a lot faster than they did before and the question is "Do you switch context" because we've had these long terrible context switching problems. We've learned to make context switches in the order of 5 milliseconds and be happy about it and now we've got these very fast devices and I don't see that those long context switches are going to be acceptable there. Perhaps a structure like the CCD 6600 where you have multiple context and once you get a page fault you switch to another context, compute there for a while, and so you really have -- multiple processors active at the same time on one physical process.

It is really important to operate there with that kind of thing so seed out work here is important at least from that standpoint to be able to have those processes active and to not have high overhead between them.

On the memory thing, I've always been fasinated as to why Grosch's law would hold and the only thing I could find in the past of why Grosch's law would hold would be that there was an economy of scale with disks and with core. That is, you had some physical structure a coincident occurrence--Whitcore says you double the amount of coincidence circuit, then you get 4 times the amount of bits there. So that was a square law relationship. I found another one which is in fact, if you'll buy that wild statement I made about "A good work indicator"--that is how much work is a computer doing--is the memory data rate by how much memory you have to work in times the processor rate or the memory data rate. Now lets just take one of those single chips and put a processor on it, then that's a measure of performance of that particular one. Now if we say that, then the memory size is strictly proportional to price. Memory data rate is also--this is data rate in bits per second is also strictly proportional to price, then we end up with the performance in bits times bits per second as being a price squared relationship, neglecting processor costs and in fact with the dominant costs going the way they are we can neglect processor cost--we can sort of throw those in for free either on the chip or you put those in in a bigger system when you put in another disk. It clearly holds but it turns out that holds if every time you put a chip in you've got access to that chip and you are able to get the bits out that having that chip implies. If you put them all in and have only one bus, and they're all selected then that doesn't count and you're on a either constant or even a linear relationship.

The interesting thing is that it doesn't matter if by that measure then we would equally well put a processor on every one of those chips and distribute that power if there were some way to pull back together, but at least in a pure work sense you have the potential of doing more work on a square basis if one adds money on a price basis. I'm kind of intrigued that there is a relationship there although I'm hard pressed to see Grosch's law really holding very well on the various machines we've built. In fact, when I get into the marketplace thing, on the 360 and on the 11 it's hard to get more than that power constant at being around 1.5. We feel that 1.5 may even be pushing it to show. In fact, on a 360 there is a price range of a factor of 65 and the performance goes up by a factor of 300. Again you have to almost choose the right problem. That's on the scientific problem. If you put it in to a disk space problem, the performance may not go up hardly at all. If you put one disk on a 195 and one disk on a model 30 and you've got a sorting problem, the performance is going to be relatively constant.

Looking at some of these performance measures--I'm going to go over some of them quickly. This is Noyce's curves in terms of components per circuit for semiconductors. I indicated that that's gone up by 1.78 to the t minus 1960. The one I always like to use is to the t minus 62 so I can remember it.

Neusbaum, who's head of switching circuits department at Bell Labs, has a 60% improvement in gate costs and that's probably fairly close to Noyce's if you assume that the gate cost is not going to go down as fast as the gate because you get into this packaging problem where packaging is probably increasing slightly. We've learned everything we can about packaging and these are new dye that we're building and getting the learning for versus those packages which really don't look a heck of a lot different than the ones in I guess 1965.

The other thing you see here is by the MOS circuitry and the TTL circuitry in LSI then there is something on the order of 7 or 8 years difference in terms of gate cost. So in fact they parallel one another and really it's a question of "when did you get to that density with this other technology". Some specific points--this is another form of that curve done in 1972--these are very maybe later than that--here's the IBM chip which is off the curve and in fact people come to me and say "why". The impressive thing about the IBM technology is their technology and in a semiconductor that's the only point I've seen that's interesting of IBM and the only reason that stands out is that the semiconductor people sort of sat there and said "but why would anyone want a 448 K bit MOS ROM". That would have been probably before IBM did it if somebody had said "Gee we want one". We know damn well that we don't want one because our software changes too rapidly and besides, our programs are a little bit smaller than that and we don't need 48K, those kind of chips, to write a good BASIC in so this makes up for having very large slow cumbersome software packages which is the advantage you have if you have enough technology. At that core you can blast through and make up for a lot of this software fat on those inner rings. But overall this is roughly a little bit less than a factor of 2 in transistors for chips. One of the things that always comes out is that you've got to be very careful taking these curves very seriously. I always use them but not to this precision because when you get into this precision you find that dooms kind of things come out. Here's core memory there, here's n channel MOS there and this is when these guys essentially cross over and it turns out that that hasn't happened yet. Furthermore, you see how bubbles really came in like crazy since 1974 and the other day we actually got one so about three years after these projections and I think this was really in the order of a '72 2 kind of projections. It's very hard to project two years in the future with any accuracy. In fact in Turn's book on computers of the 80's is remarkably inaccurate for the time the book was published. So starting in 1974 the curves were bad and I don't know what's going to happen by 1980.

This is another one of being very careful about what happens. This shows problems in two dimensions: Here, gate delay in now seconds and relative density and they put all the technologies that they knew about. This illustrates the problem of these things. Here's I-squared L which is really the dominant technology or that's beginning to come in as a form of bipolar. Here's the SOS technology. It's low power schotkey. I don't know whether that's that or not but even two years into the future one misses major technology changes in these forecasts and that's not surprising because of the way these curves are gotten. These guys are often getting curves and data from people we and everybody else, I guess, buy them and they come to us and say "we want to go to a consortium and we won't tell who the other members of the consortium are. We want you to spend $5,000 to get you 3 pounds of information on the semiconductors of the future" and they go away and they talk to everybody and/or how typesetting is going to change in 5 years or 10 years. And they come back with 3 pounds of paper on that subject and nobody can read. And they get it by talking to a lot of our own marketing people and of course we're very tight lipped about the whole thing and we're only going to tell them all the bad ideas that we are pretty sure aren't going to happen and we really got into it to find out what everybody else was doing. So, in fact, when you buy the 3 pounds you're generally getting obsolete stuff and in fact if you got a market survey, you can be pretty sure that if it's in the survey, the market's gone because only obsolete things go on market surveys. I don't think I've gotten any hot ideas out of the market surveys. I've got the ones that I know are pretty much going to be beaten to death by everybody else. In a semiconductor world then you end up starting with this relationship, this was done for the tenth paper because I've tried to make a model there. MOS read/write is the key date. Shift back a year for bipolar ROM, shift back 2 years for bipolar read/write. Shift ahead if you want ROM. If you're talking about production add 1 to 2 years and then from that you get all these things and low and behold this happens to fall on the curves that Dean Toombe gave me Monday so I'm feeling good that for 18 months this model has held and it corresponds to somebody elses model; in fact, it's the model that we've been on in terms of when things going to happen. It's kind of important to know when things are going to happen as long as you don't take it too seriously and be prepared to change.

The other technology that dominates is the disk technology and this gets into the notion of economy of scale and there is an economy of scale with this technology. One takes a given disk platter and builds a fairly simple mechanism around that. It's got a motor, it's got cheap metal, it's got electronics. Now if you start piling some more disks on top of that and just to the point to where the whole things topples over and you don't understand it and that number is 10 it turns out. Maybe it's 9 because we're using 10 and I'm not sure we understand all of that 10th one but that one builds that particular technology and the model I have there is this economy of scale by having a little bit bigger motor one ends up getting a factor of 10 in capacity with not much more cost. It turns out more than one would expect and 10 probably now doesn't seem like the optimum anyway. But you do that first and you do it in the high end so that it's going back to the designers again, the designers work at the high end and are driving to get the lowest cost per bit and that turns out to be this 10 high technology.

Behind that technology one takes this base technology and puts it in a low cost technology and this is in fact the mini technology. This right now we're seeing separating. We're not moving as aggressively here in the low cost technology at least in cost per year as in these more aggressive 10 high technologies because there isn't as much learning and much work going on into making achieve versus making it lowest cost per bit. In terms of those two technologies, a curve I plotted a couple of years ago; this is IBM technology, this is IBM disk 62 to 74, 38% per year in terms of price, in terms of dollars per megabyte and capacity is gone up at 42%

per year so in fact the average disk price has gone up slightly because sheet metal, we've already been (?) a lot of sheet metal, we've already built billions of motors and those things aren't changing very much and the thing that is changing is the magnetic density which is going up, which is changing quite rapidly. And in fact yesterday, I had plotted some hard disks here in terms of looking for an economy of scale on those and here I've got number of bits versus price, here's accesses per second, here's the pure performance and here's this payload factor. Here's a factor of 2 so it's gone up a little bit more than a factor of 2 or at a given time when I took this snapshot then in fact using these measures it was more cost effective to buy at the high end more than the square log. Interesting observation is that on the accesses per second this doesn't have much of an effect in terms of money. That is we're talking that mechanical motion is the same thing as why a mazerotti won't go 50 times faster than a pinto because of the difference which we'd expect out of the price. Here we're back into this mechanical constraint. We just can't violate, and we're stuck with a new toy in mechanics and when it gets into the system, then you're stuck again at the system level by not having any economy of scale. You'd think when you scale the whole bloody system off, it's going to perform faster but it doesn't because this is the limiting performance factor on all of the multi programs floppy systems. So you've virtually got the ceiling there that is it's multiplier. So it's really disk access rate, this is rate, maybe you get 50 per second out of this one, here you're talking 20 per second of these and that's the thing that's dominating our performance.

From an observation the disk and semiconductor technology is one goes at 41% doubles every two years, one doubles every year and that seems to be due to a tremendous (?) in the overlap of the discipline. In the semiconductor discipline, a number of the people who work on semiconductors all come from the same basic discipline and in fact have a common vocabulary of communication. In disks one has all those technologies plus some processing, testing, plating technologies that aren't in the semiconductor, so those two industries, it turns out, I believe varied both on the basis of there is a captive market for magnetic media versus not in semiconductors where only half of the semiconductors market plus the disciplines themselves are widely separated to make disks. And then the third factor is the semiconductor industry is a very unique industry in that knowledge is broadcast very rapidly in the semiconductor industry and they do it with sort of good scientific communication. A lot of them have been trained as Phd physicits, chemists, electrical engineers, materials people so in fact there is this whole discipline of report what you've done. There is a tremendous amount of reporting and so people know what's going on and then the crowning blow of all of that if you didn't have all those factors is they used to share agressive money to buy people and so people are changing jobs all the time. So it's a very exciting and interesting; it makes computers look like pikers by comparison. It's a really exciting industry but a half life of the people are varied too by comparison. So the character of those two disciplines is different and in the case of the disks, all of that technology really came out of IBM in sort of '65 time frame and again they used this universal solvent money to pull all those people back from IBM and in fact to get those disks made in the various places. In fact, why all those law suits, is that it wasn't clear when they brought some of those people out of IBM that they didn't have a few plans with them as they came out, in fact that's the whole business of what makes the thing interesting because they sue IBM for stealing the market, and/or whatever. I don't understand what it's doing but they do all those kinds of things and then IBM counter sues saying "but the disk your making was our disk in the first place" and so we should side with the underdog. It's fair to steal the thing and take it away and make it but that's gotten resented. It looked like TELEX for example. That was being rewarded; they were able to closely covet a design and then turn around and sue IBM for not letting them market it effectively by IBM merely changed its prices to respond to the competition which is the good old practice of American business or all businesses.

This is dumb terminal prices, this is I haven't put it in to the 10 into the right exponential. This was
I haven't put it into the 10 into the right exponential. This had a lot of thoughts around it. This was a high regression, I don't remember what he got out of this but it looked like a reasonable fit in other words and that's actually t-70 and that .03t and that's e so it's about 10% per year price decline so that's .9 in terms of price so 90% 10% price reduction per year at the dumb terminals.

<u>Minis</u>
I put 31% and that's improvement, that's not really 30% reduction, that's 1 over 30% or it turns out to be about 22 or so when you do the reciprocal. So this is basic machines, what the price decline is then for small machines, the minimal machines.

Overall we get these various effects. Semiconductors then are followed maybe 60% to 80% price improvement disks, 41% in density, core 30%, tape is 23% in density. Notice that that and that are correlated, or that this your only getting a linear improvement, here your getting a square improvement because disks are packed that way. Data rate: 6% improvement in data rate or 6% change in tape speed or over the 25 years that turns out to be a factor of 4 improvement in tape speed since tapes were introduced and that's pretty good going against Newton that way.

Packaging and power per watt per cubic inch haven't changed--they're sort of holding their own.

Minis: this is too hot but I believe it's improving. Better communication capability for computers I think drives distributed processing because that has to be based on communication capabilities. Otherwise we're going to be up against the limb of the telephone operators problem here where everybody becomes a telephone operator in switching information from machine to machine. In fact as you distribute it, everybody becomes a computer operator and that'll drive us into the network stuff. The density also changes the reliability radically because there simply is less mechanical parts to fail. It adds this greater functionality in terms of basic language and operating constructs and it makes every terminal a smart terminal with some additional capability and in fact will generate an electronic typewriter from that. Smart plants, smart labs where we put in every instrument that is fundamentally electronic will have enough intelligence in there to do significant data processing.

Greater disk density is really driving us to the need to get organized in the data bases area. Higher people--people costs are going up. Paper costs are increasing. That I think drives us into basically not generating information that we don't capture so that what will drive the typewriters to all be electronic, that in fact as you get into the problem of making corrections on copy or doing typesetting or filing. The worst thing about creating memos very often is not the memo per se but it's the fact that somebody's going to read that and with electronic mail we've got the possiblity we can have computers read all that mail and answer it and we get to that happy stage: they'll create them on-line, transmit them, store them, be able to retrieve them, then we can read them and in the next stage we can write them and so I think that I'm glad Bob Sproul is here. I think getting out of the Xerox is a good idea because if there is one thing that hurts this whole paper thing, it's Xerox creating more and more paper in the world. I don't know how to get around that. I think clearly we have the opportunity but whether or not paper is the absolute drug we cannot deal with, do without, I don't know. But I'd sure like to try. That's this section on technology.

Question: (Bob)

Answer: I think better encoding is going to help. I think pictures may be a way of essentially soaking up that and basically doing some encoding. Let's gets some useful information out for a change. I mean those goddam EDP machines that generate these massive piles of paper that then--who ends up doing the processing is. I have seen more reports where people sit with a calculator trying to get stuff off of the EDP runs. I think that the processing has really has got to go into sending that information. It really should be done keeping it in the data base then going in and accessing it only transmitting the exceptional kinds of information so people can operate. Number of cards at last is not rising and that is the number of cards produced per year is sort of flattened out. I think that's one of the major breakthroughs because with for every hundred cards, one of them is in error then there is a high probability that that error's going to make that other data that gets generated from those cards useless. In these reports I see I think the people I work with are putting me on when they say "Oh the input datas got garbled and therefore all this stuff is meaningless and that's why I'm overbudgetted" and it's all because of the EDP problem. I think fundamentally a lot of the power is just going into doing useful information processing where a person is committed to making them.

Question: ?

Answer: No I think they're fairly good in terms of what they're doing. It's the DELFI techniques. I'm not worried about these people. It's the market surveys which gets the information and the DELFI is in fact one layer removed from that chain. I don't know who they asked for those things to get all the garbage that came out of that report. There is something useful about that report though. Are there any wild ideas that might be feasible now that might actually be interesting to have. Of course I'd like to have a display on a 40' wall and have it all electronically changed.

Question: ?

Answer: That's one I apologized for two years ago in that paper. Now I know. The neat thing about doing all this stuff is you clearly now know what the opportunities are going to be and I think if I had done essentially this much work. That one I knew in my gut but now I can prove it any way you want to prove it including you can even get marketing people, users to say that too. But the drive there really is a significant effect on the architect. In fact, trace that back; how much, if you also believe the constant price model, then it says every couple of years we need another bit in the memory space. The thing that holds us from that really is the ability to make machines that will go do that with those larger memories.

Question: ?

Answer: That's one piece. I see a lot more value now in looking at that base technology data than I did...now in retrospect the whole history is clear to me. Why everything is the way it was but now does that do any good in the future? I'm not sure but I'd like to at least understand why things were the way they were and I think so far its been useful to me to at least get some ideas about how long I've got to live in the future or what kind of an environment one could have sort of in 1985 time parameter. That's why I look at these in a sense I think any of these curves that would come in ? exponential limit ? I'd say great I won't have to worry about that any more. Sometimes I'd like to see some of that happen but nothing like that's happening. You can only see until 1981 in the semiconductor thing because that's really clear because that's the ? limit. But yet all the experiments are done for the x-ray and e-beam exposure of semiconductors in making a mast and so they're saying--the other day we were talking to some people and they say "Oh we're not worried about going past '80 now" so I'm feeling good up until 1985. I don't know what that means because I'm now worried more about how the hell do we use all these things. Let's take my curves, run them up to '82 say I'm wrong by 3 or 4 years and that gets us to '85. A million bit chip appears in '85. That's only 8 years. So we've really got virtually zero cost computing at that. There aren't that many people who got a million bits, an eighth of a million bytes or 128K byte chip in that time slot and that's a reasonable price. You could put a few together and in fact that's right at the limit of the programs...it's way past the limit of most of the programs that we use most of the time. All the text editing, all the interface programs and things like that. That'll all fit on a ? chip but the other programs...so these big data base systems and the other programs I think are ones that we really need to be working on now. Those are the ones I'm very concerned about.

Question: ?

Answer: But I'm making the assumption that one of the interesting things that's going to happen is when that fits on a chip, then in fact that will present a much lower cost threshold. People will do things with that as a unique device as opposed making million computers. Yesterday's talk was these computers came down and reached the stable state and I don't know to find those states but in fact we're here right now and there's a stable state beneath that...which or maybe it's this state here doing something else and there's going to be all sorts of activities around that lower cost thing and in fact building at the high end is going to be the hardest and we've got to find new organizations because we're going to keep stumbling over the complexity thing. How do you build that many machines together? How do you get them to communicate? I think it's going to be incredibly exciting in terms of what one can have in the next few years. I think by '80 we'll be at a very exciting time too. An 8K byte thing...well that's kind of interesting too because that means every typewriter can for not much money remember everything you've every typed on it and have corrected on it. It may have written it even. And I think what else do we do? So the DELFI I do read for any wild ideas that are now feasible and also useful.

Question: ?

Answer: In a way this part feels the softest to me in terms of a way of really doing a good analysis of what the structure looks like because it gets into a whole bunch of dimensions in the marketplace. The ones that are comparatively hard are that some of these use that functions structure dimensions

SUBJECT: CMU LOSS: WHY, SIGNIFICANCE AND NEXT STEP

I'm very sorry we lost the bid to do a PC with them. I think it will turn out to be an extrememly pivotal event in history.
Andy rightly fully gave me hell for losing the order, because although I felt strongly about the necessity of doing it, I didn't spend enough time, nor did I offer to really get into the design. Similarly, I didn't push to get some of the other
folks like Avram into the effort of the new machine.

The reasons why we lost: With IBM there was potentially higher
risk, but much higher payoff since if they were successful, then
IBM would leverage their work by distributing millions of them.

With us, it was a surer thing, and lower cost, but not as potentially exciting.

IBM was willing to let them manage the project. This had an incredible appeal to them. (note the potential risk/reward for an environment that is normally not used to this)

IBM was enthusiastic about using the CMU operating system and environment called SPICE, built in Computer Science.

IBM's head of the Palo Alto Scientific Center lead the effort on a full time basis, with a larger, resident full time team. IBM appeared to take the whole project much more serious.

IBM made the initial sale via Lew Branscomb and Cyert. It was
uphill for us and we never really sold Cyert.

They really liked the idea of swimming in a bigger pond, as we've not always responded to potential opportunities.

IBM's providing their scientific personal computer that was just
announced today as the first machine. The REAL machine will be
available in Summer 85. We believe this is the 801, very high performance machine driving a display.

NEXT STEP
We must continue to have a strong presence there and must continue to watch the Spice Project, learn from it. We have MANY projects going with the CS department and we can't give these up: robotics, LISP, Ethernet, SPICE, etc.

I believe we need to provide a significant computer of the kind they wanted. Whether it would have been sold in droves on colleges, remains to be seen. However, I do know that such a machine is what the professionals need.

I also think it is necessary to get another, demanding partner.
Candidates include: MIT, Stanford, Waterloo?, Harvard,, ??. We need someone who has the commitement to do it across the whole campus and someone who is very competent! Right now I don't see a single university that has both of these attributes.

IBM's POSTURE NOW
They will use this sale like crazy to say they now dominate the Computer Science and University Market! We have to down play it, as anything other than an isolated example. As I've recently pointed out, IBM is building machines according to specs now from CMU, MIT (An AI machine) and NYU (the

Ultra-Computer). This is a model that they used when they established themselves in computing in the early 50's when they worked with Columbia, Harvard, MIT (Whirlwingd). It's
also the model the Japanese use to transfer technology.

BOTTOM LINE (WITH RESPECT TO IBM)
They have many more resources, and they are being used very effectively on high quality, creative products. This is in contrast to a substantial number of evolutionary products we are
doing. Hopefully, they have some really poor products in the works too. Otherwise, it's ...

OWEN FISK	PETER JANSEN	BILL LONG
AVRAM MILLER	OPERATIONS COMMITTEE:	PETER SMITH
BOB TROCCHI	BILL WISE	

GB3.S8.70
@KGF, 11/21/84

I think it is quite crucial to get the first computer into Carnegie-Mellon University.

My own ties are still strong:
.they still list me on the faculty and I still have many professional
friends that I'm close to (including Raj et al)
.I'm on the board of the Software Engineering Institute that was just
funded by DOD
.I remember putting the first VAX there, and I'm superstitious

Apart from this, CMU is:
.rated 2 or 3 (with MIT... which we really can't afford to do business
with). Furthermore, other schools follow them.
.an advant garde user and Raj is opinion leader in the DARPA

community
.DEC and IBM oriented
.tolerant and can help us get the machine up to snuff

DARPA is simply critical to Encore because:
.the early machines will not be operate efficiently enough to compete
.this community will do their parallel processing and robotics and AI
work on Hydra. These will probably end up being key to ECC's success.
.the general technical community follows DARPA
.DARPA has an incredible amount of money in the next few years to
throw at computing and parallel processing. We need to catch much
of it.

Re The Large Memory Boards
Henry will have to get an answer from Hydra. Large boards are quite impressive, and may turn out to be the best or only way to get the Mips out of Hydra by making sure we never swap. (I recall a paper in the IBM Systems Journal in which it is predicted that very large timesharing systems don't work because of the growth in various times associated with managing a large number of page tables and disks.)

Re Prices
Regarding our pricing. Our prices, whatever they are have to be our prices. We can't afford to give things away yet. Hopefully we won't need to even in the case of the Beta units. Note our mark-ups appear to still be sustantial.

Re Doing their boards
We have several choices (for each board):
1. Lock these boards into the DARPA contract! We could lock the two together and it will get CMU to put pressure back on DARPA to give us a contract.
2. Do nothing.
3. Offer some amount of consulting.
4. Do each board for a fixed fee. The video one could be done this way, but the Systolic interface could be a mess.

In short, of the friends I've introduced to Hydra (including Sperry), CMU will probably be much more lucrative, fun and helpful in both the short and long term.

SUBJECT: PROCEEDING AHEAD TO EXPLORE THE CMU/DEC RESEARCH PROPOSAL

I described the proposal and ask for an agreement in principle
to enter the study phase, and if successful, go on to fund the
proposal. The Operations Committee was reluctant to give a unilateral endoresement of the proposal without having an understanding of what the proposal would cost.

We did agree that that we must go into the study phase and that it would be ideal to have a combined R and D center in Pittsburgh, closely linked to CMU. In this way, we would not
have to have the total incremental funding, but would have to cover the project in a substantial fashion out of existing programs by correctly coupling the CMU Project with our own work.

I'd like to meet on Monday morning and discuss how to proceed.
I'll call Allen today and get a reading on where things are.

PROPOSAL FOR THE JOINT DEVELOPMENT OF

PERSONAL COMPUTING

BY CARNEGIE-MELLON UNIVERSITY AND DIGITAL

G. B.
10/14/81

THE CMU PROPOSAL

- BUILD A PERVASIVE ENVIRONMENT OF PERSONAL COMPUTERS THAT GRADUALLY EVOLVES FROM EXISTING T/S SYSTEMS IN DAILY USE BY A LARGE, DIVERSE POPULATION.

EVERY STUDENT, FACULTY, STAFF MEMBER WILL HAVE A PC.
STUDENTS WILL TAKE PC WITH THEM.

-DEVELOP APPLICATIONS APPLICABLE TO A BROAD MARKET, ENCOMPASSING:

+ OPERATIONAL SUPPORT OF LARGE INTEGRATED NETWORK (ARCHIVAL, RETRIEVAL, ETC.)
+ PRINT IMAGING, GRAPHICS, AND VOICE
+ ROBOTICS
+ MODELLING
+ KNOWLEDGE ENGINEERING
+ INFORMATION AND DOCUMENT PROCESSING
+ HUMAN INTERFACES AND SOCIAL ASPECTS OF "LIVING ON THE MACHINE"

-CREATION OF AN OFF SITE INSTITUTE FOR INFORMATION MANAGEMENT AND TECHNOLOGY TO DISSEMINATE AND TRAIN STAFF, CUSTOMERS, POTENTIAL CUSTOMERS.

G. B.
10/14/81

BENEFITS, COSTS, RISKS

BENEFITS

-OWNERSHIP OF TECHNOLOGY (FIELD PROVEN HARDWARE AND SOFTWARE DESIGNS) FOR FIXED OPTION PERIOD.
-CLOSE COLLABORATION WITH A LEADING UNIVERSITY AS A WAY TO EDUCATE, INNOVATE, VITALIZE ENGINEERING.
- REDUCE ENGINEERING ISOLATION FROM CUSTOMERS AND ACCESS APPLICATIONS

COSTS

- $6-7M PER YEAR
-REQUIRES MANAGING AN ENGINEERING SITE LOCATED IN PITTSBURGH

RISKS

- STAFFING
-TRANSFER OF DEVELOPED TECHNOLOGY INTO PRODUCTS
-UNCLEAR ASSOCIATIONS WITH OTHER CMU INDUSTRIAL AFFILIATES (WESTINGHOUSE, THREE RIVERS, IBM, HP ...)
-WE ACCELERATE THE DEVELOPMENT OF A MARKET THAT WE DON'T QUICKLY CAPITALIZE ON
- NO PRODUCTS FOR THREE-FIVE YEARS
-ADVANCED DEVELOPMENT TREND IS MOVING AWAY FROM DEC (UNIX, XEROX, THREE RIVERS, WESTINGHOUSE)

SUBJECT: THE CMU PROPOSAL, US AND THE NEXT ENGINEERING SITE

Bottom line:
They are going out for bid on their proposal with HP, IBM and
us.
We must not only go out and get this, but it must be part of
a combined SWE, Research, P/L (EDU, Education Services,
SWS=Network
development) facility... otherwise it makes no sense to go
after
it. I want it to be our next site together with Japan and
Washington... capable of holding 500 people by 85!

The rationale: we missed an opportunity with the CSDept
personal
computing work. They have made real progress and
got their 100 systems, while we TALK. Meanwhile, they've
also
produced a PLUTO we will probably end up using. The robotics
work includes all the key problems: vision, manipulation,
applications and AI for control. The McDermott work alone is
worth a site since we must use that technology now to manage
large projects... like Venus.

I want to get together this week and plan on how we go after
this. Also, I want to get the basic approval for proceeding
to bidding on this. The approach is to go into a study phase
for the next 6 months. In doing this, I want your support.

If you want to talk about this today or tomorrow, give me a
call. Otherwise we'll wait when we can meet.

At our meeting, I'd like to find someone who might be the site
leader so that when we work, we do it in conjunction with the appropriate ultimate doer.

SUBJECT: CMU JOINT PROPOSAL DISCUSSION WITH DOUG VAN HOUWELLING

Just had a discussion with Doug on this. He is going to call me back on Tuesday morning.

We got into the heart of the issue: IBM has made the commitment
to the project. Doug noted that IBM moved very fast after receiving the proposal, and on the other hand we knew of the project and their desire to work with us for about a year, even
though the proposal had not been made. We're second in the pipeline to agree to do a Technical Proposal with them! CMU does
not believe that both DEC and IBM can do a Technical Study there

in parallel, hence the question:

Is there anything we can do to prevent IBM from making their Technical Study, or should we simply agree that they should go first and we will request a similar Technical Study period following IBM?

WHAT IBM IS GOING TO DO
IBM has proposed to be their partner on this project, subject to being able to reach agreement during the Technical Proposal making phase. They are meeting for a day during the first week of November in order to review and approve a memorandum of agreement ... for the technical study phase. They have designated a single individual to head the Technical Proposal group and have asked CMU to provide space for the 12 individuals they want to relocate in Pittsburgh. They study is supposed to take 3 to 6 months. Doug has worked with IBM before, and has been sceptical whether IBM can be flexible enough and understands the importance of the area enough, but so far he has been surprised and has stated that IBM may have changed.

WHAT WE MIGHT (MUST) DO IF WE WANT TO DO THIS PROJECT
Right now, we run the risk of not being able to be asked to make a Technical Proposal because we can not convince CMU that we can or are willing to do the project. I don't see how we can convince them otherwise in the short period between now and when they are meeting with IBM to make an agreement. We can not sit by even now, otherwise, by default they might enter into a non-cancellable agreement with IBM which says the two must go ahead subject to an adequate proposal.

Therefore there are significant risks now that IBM will get the
project by default. We will be unable to convince them that we
are serious enough, hence they won't even bother to allow us to
make a Technical Proposal! We must still work during this time
to determine how to even stay in the race.

Since Doug is calling me on Tuesday morning at 9:30, I would
like to get together on Monday morning to decide what we
say.

LOC/MAIL STOP: ML12-1/A51

SUBJECT: CMU JOINT VENTURE DISCUSSION WITH ALLEN NEWELL

I told Allen about our basic decision to go ahead with the study phase. I tried to give an accurate presentation that our position was to approve in principle, the idea of the proposal and engineering site, but that we weren't prepared to give a carte blanche approval of this sort of expenditure at this time.

In contrast, he stated that IBM has already given such an approval... namely, they have approved the plan to do the project, subject only to a detailed proposal. This is an interesting commentary on IBM vs DEC... I doubt if we could make a decision as fast even if the magnitude was about 1/10 the

size!! Also, it indicates that IBM is really going balls out for
this area, and they already understand the need for both research
and large scale prototyping in a pilot fashion.

Given that we can not make such a strong commitment, Allen
would like to get some way of testing that we are serious about
doing the project, given that a successful business plan can
be worked out. This may take on the form of visits to CMU by
say Ken or Win or Andy. Their view, based on a relatively long
history, is that we really budget and control very tightly and
very much in a distributed fashion, making it difficult to make
a decision of this fashion. Furthermore, we don't believe very
much in research, but instead focus on short term results. I
couldn't say that he was absolutely wrong. We did agree that the
proposal several years ago to put 100 PC's in the CS Dept. was a
different, though similar case. (In that case, there was no
support from either development or from research. In
retrospect, that would have been a bargain in order to get the
work done. We have spent the money internally and have no
output.)

I think we are ready to go ahead with the convincing them process.
It should take the form of Ike doing the convincing with van Houwelling
et all, plus getting the other person who would head up the
facility there to put together the study team.

I will argue very hard to do this project if we can get a team
and very good plan together.

SUBJECT: CMU JOINT VENTURE PROPOSAL.. I WOULD LIKE YOUR SUPPORT!

This is the most exciting proposal I've seen about building a computing environment that will allow us to understand computing
in the explosive '80's. Everyone has a powerful computer (or access to one) in every part of his environment (home, office,
classroom).

CMU is an ideal laboratory in terms of its size, attitude, determination to build the system, decision making ability to carry it out, competence (computer science and engineering), computer center support and computer use.

We would proceed with the 6 months study phase, and if successful, proceed with CMU to implement the environment. The mechanics would mean a DEC Facility there staffed with Software and Hardware Engineers, P/L Engineers, SW Support and EDUCATION Service persons. CMU (Pittsburgh) would become a key engineering site.

I'd like to discuss this on Wednesday or Thursday at the Operations Committee Woods. The purpose would be to get approval for the study phase, with a strong commitment to proceed if the study were successful. Given the tax structure, the cost is unclear. CMU believes it will cost five to seven million per year for both CMU and its partner. The duration is 5 years.

Based on the performance of the CMU Computer Science Department in implementing their SPICE (Powerful Personal Computer Network) which we rejected 2 years ago, I believe the project will be successful. Furthermore, the project is vital to our future.

TECHNOLOGY LECTURE (CMU - FEB. 22, 1977)

books to read and I read every time I see a serious technology forecast is a thing that was done in '70 by a bunch of people who got together in a DELFI experiment and I'll show you a diagram of what a DELFI experiment is if you don't know but I was amused by Bob Sprowl saying "why did all these bright people get together and they didn't produce a really startling system?" The thing that always amazes me is that when you put that many bright people together you get anything out. A DELPHI experiment is that in the limit although I'm not sure whether they use bright people or not. A DELPHI experiment is where everybody talks about what all of the wild life is and when things are going to happen and somehow all of these people conspire to make projections about the future; for example, I think it was one of the military that did this and this was for 15 years of data processing and in fact if you looked at all the statements that were made there by 1985 or so when this 15 year period ended, virtually every science fiction thing you'd every dreamed about had concluded. Somehow they should have given themselves 50 years instead of 15 years and maybe things would have been different because a color display with a thousand bit resolution low cost was going to be available in 1971 and this was done in 1969. Wall displays, 4 feet by 12 feet with rapid resolution of 40 lines per inch and color are feasible. That was going to be in 1973 and that was really far out. Low cost graphics terminals were somehow 1974. None of the responses to all these things that were going to happen were related to one another. They all seem to be independent. Widespread use of LSI, given all of that, for computer memories fortunately didn't happen until 1976 which is in fact sort of when it's happening. Occassionally they hit a few. Semiconductor caches were available in 1971. A universal computer language will have evolved through automated communication and that occurs in 1995. So the programming problem doesn't get solved. That did go outside--they didn't define it--that's what's so wild about this whole thing--it looks like everybody put statements in there and there was no attempt to sort out the overlap or anything and they voted on it and they have all these little votes of when something is going to happen and there's a distribution of when things are going to happen. User program systems without programmers--programmers only used to program firmware. That happened in 1975. For spoken input, computer vocabulary will be many hundreds of words and the computer will interpret simple sentences. That happened in 1972. A 7200 bit modem on voice grade lines was highly feasible and was going to happen in 1970. And we still don't have any decent modems at decent prices. The problem in all my graphs--I based them all on past data and if your foolish enough to think that those lines would go out into the 80's forget the fact that these lines are always--I draw access out and this is the only safe part and anything beyond 1977 forget about--but the lines are just drawn there for your convenience. Worry about exponential projections--I do. Initially the third talk was going to be on technology and I moved it back so we're going back into this diagram because in order to get into the--I can't start the context of where we were yesterday. So using the first diagram we used yesterday, I started building these talks from top down and then when I got to the bottom up part I found that they didn't mesh and that's why I had to go back and insert the third talk in this side because essentially one of my thesis is everything is driven from this technology, from this core or from the user and talking about the marketplace until one has what's driving this system, it doesn't make a great deal of sense. Just had this one slide--I never understood this diagram but this is a modified DELFI technique. All these experts get involved and there's interaction and person to person contact--these aren't my slides--I just talked to them because there awfully complicated and all these boxes and I can't imagine the thing working--and they don't. Back to this curve which is cars, and computers. I wanted to call attention to the fact that the whole thing that drives this is purely the number of units. I'm using time because units are virtually impossible to get in terms of looking. That all comes from the notion of production learning curves--that is the efficiency of the n'th units is you take the n'th unit and that's raised to some exponential or a positive learning constant so that the efficiency improves with the number of units and a lot of that work was done here in terms of studying and getting a correlation of why, not necessarily why because I don't think people know yet why that gets better, but in fact take that these are generally intherical data and a lot of that came out of work here in studying everything from liberty ships to airplanes or jet engines in terms of finding what the efficiency of a given unit is or what the cost of a given unit was is purely based on number of units, not time. All the early technology forecasting was done in terms of an exponential to some time period. A guy by the name of Fusfeld and maybe somebody else, but he claims he made this observation came up with a technology progess function which is really a learning curve in which he finds that the technology of the n'th computer, that is some performance indicater of the n'th computer is raised to an exponential and that's 2.5 for computers and .7 for autos if you take horse powers as the measure. He made this other observation that if the number of units increases exponential with time, then one ends up with the p of the n'th unit and the technology at some other time then those two are the same and that's been the case of computing. And in fact with computing that's also if you pass these production costs savings on to the user and you have an elastic demand curve then this whole thing is an unstable situation driving all the costs to zero which is exactly where I claim we're all going. Except the thing that keeps us in these stable bands is these salespeople. These sales outlets so institutions, classes of users and salesmen keep us all in particular stable bands.

Question:?

Answer: If you strip all the components out and say "What's the labor in building liberty ships", it follows these curves and in fact I was talking to somebody who was making Bell helicopers and he said "Oh yeh, we're on an 18% curve" and when they say that it means everytime the units double then the amount of labor comes down by 18% of what it was or 15% or 10% in some number and it's usually it means given a unit doubling whats the percentage labor contents it comes out so you have to push all that back into the constituent part and you say "Well helicopter steel isn't coming down" and in fact down at the end even though labor cost is coming down or learning may be taking place the amount of the wages may be increasing. Things like automobiles--that thing is down adding a factor of two automobiles at 10 to the 8'th automobiles is a hell of a hard thing because that takes another 25 years and by that time the labor prices have gone up a great deal. You have to be very careful how the thing is constructed or how you deal with the component.

Question:?

Answer: No--I'm claiming they work clear out into large numbers. But the point is that large numbers--nothing much happens there because it's hard to get a -- with automobiles- forget it--They've learned everything there is to learn about automobiles and nothing much is going to happen. But with helicopters there's a lot to learn because there are only a few helicopters and with anything that complicated to build, there has got to be a simpler way.

Looking at software, cpu, and disk constituent technology, I've put on them taking these various time scales that we had here and looked at the amount of time that one spends in research of anywhere from 0 to 20 years here and say to 1 to 10 years in each of these areas, and advanced development says they are breadboard kinds of technologies. Software one can do in the order of a couple of years to maybe 6 months. These are typically 1 to 2 year projects. Development is 1 to 2 years in software. Cpu's about the same and disks about the same. Testing, tooling, and design maturity testing somewhere 3 and 6 months, 6 months and a year. Here you're talking about a year in a very complex electromechanical system. Shipping may be somewhere between 3 and 6 months to actually ship. At this point we've maybe done a first ship and maybe back in here the product is announced and here this is the educating used thing and one gets somewhere between 6 months and 5 years. Maybe 6 months here from an education point of view. Here in a disk we've got, because people know what it is, it's a commodity, we have no times for it to come in to the marketplace. The education and understanding sort of increases with this complexity here. I did this and looked at these constants principally to do some understanding of what kind of development process one builds and with this you can see how, by spending certain kinds of resources you can actually build the system that can keep you 4 years behind the competition. Because if one keys all development off of announcements here, you use the conventional market pull kind of way for definition. So I'm into a kind of a commodity market. Market tells me I need something, I then go back and think maybe I can develop it because the markets already defined it and then I start through this cycle. Then the time through the cycles is in the order of somewhere between 3 to 4 years so in fact with these kinds of cycles you can understand how you can reliably build obsolete parts in an environment and we've had a case where we kept wondering "Gee, why do these products appear to be obsolete" and there's no surprise once you look at it from process standpoint. So when people say "Hey, is something market driven" I say if the market is defining it or if you're looking at the competitive products there in terms of what you're going to put in yours you've pretty much guaranteed that you've got yourself a system that's going to build products that are 3 or 4 years late.

The languages is a fairly interesting one because one has an educational window there where you can begin to look at the market buildup for a particular language. One that's been particularly one which we look at all the time is the case of PL1 because another language is like being vaccinated for another disease or something--hopefully that vaccination is not going to kill you again. So one wants to minimize the products in some sense--particularly in the language area where you talk about very high education, and higher support costs.

I think in the process sense the thing that seems to come out here is looking at the various people involved in this whole structure. We have in the middle block architects and hardware implementers, programmers, parking and salespeople, salespeople and in the time horizen here I put -25 years to +10 years because I claim they ought to know everything. I don't like to see inventions that weren't in. If there is a good idea in ATLAS I expect it to go in a --ATLAS is only 17 years old so there weren't any good ideas before ATLAS. Certainly 18 year olds have some good ideas that haven't been properly implemented in machines and clearly you've got to look out 10 years because with the software investment, the thing has got to last 10 years. Hardware--I don't know what there because there's a certain amount of implementation history that's important and one had better be pretty good for the next 4 years because that's covering that technology window that's coming out. Programming--that's wrong. It's got to be something in the future and with the different kinds of computers that are being built, I think they had better go back 25 years too because you can the ? microprocessor people learning now just up to the point where the mini people were in 1962 or so and then similarly we had learned what was by about 1952. So every 10 years or every time there is one of these new names machines and these stable states I really think (I don't know how to find out how stable they are) they appear to be quite stable market states.

There appears to be a whole new set of learning that goes on and a whole activity around that and they look almost independent of one another.

Marketing and Sales

Something in the 6 month horizen. Looking at orders they are losing and then forcing back in so that we're sure to build these obsolete products.

Activities--Technology and Historical Technology Selection and Use

This is a tremendous amount of standards. Marketing and sales is really specific use.

Goals - Major

I think another thing that drives is sort the clarity with which people can operate and architectural clarity I think is a fairly hard thing because it's dealing with a large number of concepts.

Hardware implementation--One thing that gets us there is the simplicity of the goals, set of cost, speed and then if you really want to make something complicated, add in the reliability and that gets very confusing. But one has a great deal of clear tradeoffs here.

Here, programming, I'd make as the most complex subject in terms of states, programming of size and speed, and in general a fairly unclear set of goals and that's what I think is probably the hardest thing in programming.

These are all very clear cut measures and in fact people can operate very nicely within--this one is especially clear--this one's less clear because they're sort of sitting at the end and they don't know whether these guys are screwing off or they didn't give them the right sort of things or what.

Number of interfaces, goals simplicity/complexity -- I'd say this is probably the most complex activity - this is the second most - hardware is third most and marketing/sales are in terms of this is a product of states times the information content in those states. These have to be quite right and so maybe I ought to reverse these two. It's very hard to test an architect because there are lots of states here but the fuzziness surrounding those is something else.

I also made the statement about these three designers that we had: This was in the tenth symposium, I think. This is in the performance/price theme. One starts with no design, moves out here adding cost and finally gets a minimal machine and then one can add a little bit here and get quite a game until you get to this best cost/performance point and then you move up to this point and if you lose, you come down there and it's unbuildable.

This is kind of that projectory and one can see these clear design points here. This being the hardest point because it's easy to add something to the design but it's virtually impossible to take something out and you don't really know what that marginal utility is at that point.

This is one I had that is inside of trying to understand what we did and I went back and plotted all of our computers in various lines and say why are all our computers the way they are and so those lines are people migrating around and how much clarity they have in the design. The one here and the guy went off to III and I did the four and sort of split in two or three pieces and did big machines and worked on little machines. These are easy machines--I would never try to build a mid-range machine. That's a very difficult machine to build because you never know. Little machines and big machines are sort easy to build. Big machines are a little bit hard because it can lose through that precipice there.

Here are the four lines of machines and the PDP-5 machines and really that's been implemented as a family. Here's a machine that was implemented as a lower cost version of the 8 after the 8. What I really wanted to show here was this set of machines--this is the 11 series, in fact, which one designer has sort of been responsible for. This line, one has been responsible for that line, and this basic design has been used up here and this is sort of a maximum performance design and then we've split off some people here to go after a lower cost below this because, although I say this is easy, if you straining to make this machine already for a low cost, it's hard to split. It's hard to come up and say you're failing because in fact constraints here where these are all unibus based machines and in fact that's one of the constraints of why it's hard to make a machine that's lower price. In fact we've now started managing by who does the project rather than the project goal.

This is looking at the tree of the technology that drives all of this. The plasma stuff. This is letrastatic memories which really aren't used any longer. Crt's and capacitor sort of analog and digital stores. Here are the two main branches: the electromagnetic memories which I'll talk about--principally the disks and how they go. There is moving electromagnetic memories and semiconductor memory desity because this is the one that's evolved most rapidly and for starters, the thing that differentiates these two storage media and why this one evolves roughly twice the speed that this one does goes back to that very simple concept of learning where the computer world takes about the half of the capacity of the semiconductors and in the case of magentic media, there is virtually no media from video tape outside computing. So essentially there is no market outside computing and the evolution isn't as fast as with semiconductors.

But again without the computer and the semiconductor, it's hard to think that that would have gone anywhere because there was this perception that it was a whole market in which you made a few hi-fi sets and you find that your limited by peoples ears and the FM band. That there's really not that much incentive to make better transistors after a while whereas with computer parts, we've driven them to do better.

This is a "hot off the press" curve. The only curves I really watch very carefully are ones made by people that have a hand on the valve. One hand with the pen and one making these curves and one on the valve controlling the resources to make it happen. I copied this off a chart by Dean Toome, who is Vice President of Engineering for TI--on Monday. His model of what's going to happen purely in one dimension and I'll go back to why this is an important dimension. This is size and bits of memory chips--these are the MOS chips, either by polar chips. This is the CCD, and these are bubbles. And in fact, these lines are sort of constant time lines of when things will be available. These are 1K, 4K, note roughly every 3 years one gets a factor of 2. My curves have been more every 2 years one gets a factor of 4 so I've been more agressive here but I've got other bugger factors that I can use. He hasn't defined what he means here in '76 or '77. He says the paper that was just presented to the solid state conference is at a high volume kind of thing or not, but note the implication here is that in this time scale the '76, '77 time scale one has a 16K chip; in the '79, '80 time scale it's three years. We're sitting here with a 65,000 bit chip or 8K bytes on a single chip and if you're going to have that much memory, you might as well throw a processor in for good luck because that isn't going to cost very much. So we have our 8K byte computer before around 1980 and I think the cost will be in the order of the 5 to 10 dollar range of what we see these machines coming down to now which is really a package cost kind of a thing. So we'll have 8K byte machines by that time on single chips.

Now as a kind of technology historian I'm having trouble noting when the fourth generation comes. The fourth generation I would say historically is as basically being the time we had a single processor on a chip. I would go for perhaps a single computer on a chip as being the next significant thing although that's already happened if you talk about these small number of 1,000 bit or 8K bit kind of machines on a chip. I don't think those are significant yet and it's hard to know how to peg that in the generation sense. I think maybe somehow a significant event has to coincide with that.

The other thing that was unique here is this factor of somewhere around 3 in terms of cost for 400 microsecond CCD memory. So here by the '80, '81 time frame you have a quarter of a million bit CCD memory and bubble memory being maybe a little bit earlier but with 4 millisecond access time. An interesting sort of research program at this time is how does one really utilize these memories because it really is a painful thing to deal with. From a memory hierarchy standpoint everything works but those models are awfully continuous and if we have to do something different to the machine then we really aren't doing very much planning now. If these are mere fixed head drum disk replacements that's an easy thing to do but note this very fast access time is to exploit some of the other properties of this. The transfers are going to take place a lot faster than they did before and the question is "Do you switch context" because we've had these long terrible context switching problems. We've learned to make context switches in the order of 5 milliseconds and be happy about it and now we've got these very fast devices and I don't see that those long context switches are going to be acceptable there. Perhaps a structure like the CCD 6600 where you have multiple context and once you get a page fault you switch to another context, compute there for a while, and so you really have -- multiple processors active at the same time on one physical process.

It is really important to operate there with that kind of thing so seed out work here is important at least from that standpoint to be able to have those processes active and to not have high overhead between them.

On the memory thing, I've always been fasinated as to why Grosch's law would hold and the only thing I could find in the past of why Grosch's law would hold would be that there was an economy of scale with disks and with core. That is, you had some physical structure a coincident occurrence--Whitcore says you double the amount of coincidence circuit, then you get 4 times the amount of bits there. So that was a square law relationship. I found another one which is in fact, if you'll buy that wild statement I made about "A good work indicator"--that is how much work is a computer doing--is the memory data rate by how much memory you have to work in times the processor rate or the memory data rate. Now lets just take one of those single chips and put a processor on it, then that's a measure of performance of that particular one. Now if we say that, then the memory size is strictly proportional to price. Memory data rate is also--this is data rate in bits per second is also strictly proportional to price, then we end up with the performance in bits times bits per second as being a price squared relationship, neglecting processor costs and in fact with the dominant costs going the way they are we can neglect processor cost--we can sort of throw those in for free either on the chip or you put those in in a bigger system when you put in another disk. It clearly holds but it turns out that holds if every time you put a chip in you've got access to that chip and you are able to get the bits out that having that chip implies. If you put them all in and have only one bus, and they're all selected then that doesn't count and you're on a either constant or even a linear relationship.

The interesting thing is that it doesn't matter if by that measure then we would equally well put a processor on every one of those chips and distribute that power if there were some way to pull back together, but at least in a pure work sense you have the potential of doing more work on a square basis if one adds money on a price basis. I'm kind of intrigued that there is a relationship there although I'm hard pressed to see Grosch's law really holding very well on the various machines we've built. In fact, when I get into the marketplace thing, on the 360 and on the 11 it's hard to get more than that power constant at being around 1.5. We feel that 1.5 may even be pushing it to show. In fact, on a 360 there is a price range of a factor of 65 and the performance goes up by a factor of 300. Again you have to almost choose the right problem. That's on the scientific problem. If you put it in to a disk space problem, the performance may not go up hardly at all. If you put one disk on a 195 and one disk on a model 30 and you've got a sorting problem, the performance is going to be relatively constant.

Looking at some of these performance measures--I'm going to go over some of them quickly. This is Noyce's curves in terms of components per circuit for semiconductors. I indicated that that's gone up by 1.78 to the t minus 1960. The one I always like to use is to the t minus 62 so I can remember it.

Neusbaum, who's head of switching circuits department at Bell Labs, has a 60% improvement in gate costs and that's probably fairly close to Noyce's if you assume that the gate cost is not going to go down as fast as the gate because you get into this packaging problem where packaging is probably increasing slightly. We've learned everything we can about packaging and these are new dye that we're building and getting the learning for versus those packages which really don't look a heck of a lot different than the ones in I guess 1965.

The other thing you see here is by the MOS circuitry and the TTL circuitry in LSI then there is something on the order of 7 or 8 years difference in terms of gate cost. So in fact they parallel one another and really it's a question of "when did you get to that density with this other technology". Some specific points--this is another form of that curve done in 1972--these are very maybe later than that--here's the IBM chip which is off the curve and in fact people come to me and say "why". The impressive thing about the IBM technology is their technology and in a semiconductor that's the only point I've seen that's interesting of IBM and the only reason that stands out is that the semiconductor people sort of sat there and said "but why would anyone want a 448 K bit MOS ROM". That would have been probably before IBM did it if somebody had said "Gee we want one". We know damn well that we don't want one because our software changes too rapidly and besides, our programs are a little bit smaller than that and we don't need 48K, those kind of chips, to write a good BASIC in so this makes up for having very large slow cumbersome software packages which is the advantage you have if you have enough technology. At that core you can blast through and make up for a lot of this software fat on those inner rings. But overall this is roughly a little bit less than a factor of 2 in transistors for chips. One of the things that always comes out is that you've got to be very careful taking these curves very seriously. I always use them but not to this precision because when you get into this precision you find that dooms kind of things come out. Here's core memory there, here's n channel MOS there and this is when these guys essentially cross over and it turns out that that hasn't happened yet. Furthermore, you see how bubbles really came in like crazy since 1974 and the other day we actually got one so about three years after these projections and I think this was really in the order of a '72 2 kind of projections. It's very hard to project two years in the future with any accuracy. In fact in Turn's book on computers of the 80's is remarkably inaccurate for the time the book was published. So starting in 1974 the curves were bad and I don't know what's going to happen by 1980.

This is another one of being very careful about what happens. This shows problems in two dimensions: Here, gate delay in now seconds and relative density and they put all the technologies that they knew about. This illustrates the problem of these things. Here's I-squared L which is really the dominant technology or that's beginning to come in as a form of bipolar. Here's the SOS technology. It's low power schotkey. I don't know whether that's that or not but even two years into the future one misses major technology changes in these forecasts and that's not surprising because of the way these curves are gotten. These guys are often getting curves and data from people we and everybody else, I guess, buy them and they come to us and say "we want to go to a consortium and we won't tell who the other members of the consortium are. We want you to spend $5,000 to get you 3 pounds of information on the semiconductors of the future" and they go away and they talk to everybody and/or how typesetting is going to change in 5 years or 10 years. And they come back with 3 pounds of paper on that subject and nobody can read. And they get it by talking to a lot of our own marketing people and of course we're very tight lipped about the whole thing and we're only going to tell them all the bad ideas that we are pretty sure aren't going to happen and we really got into it to find out what everybody else was doing. So, in fact, when you buy the 3 pounds you're generally getting obsolete stuff and in fact if you got a market survey, you can be pretty sure that if it's in the survey, the market's gone because only obsolete things go on market surveys. I don't think I've gotten any hot ideas out of the market surveys. I've got the ones that I know are pretty much going to be beaten to death by everybody else. In a semiconductor world then you end up starting with this relationship, this was done for the tenth paper because I've tried to make a model there. MOS read/write is the key date. Shift back a year for bipolar ROM, shift back 2 years for bipolar read/write. Shift ahead if you want ROM. If you're talking about production add 1 to 2 years and then from that you get all these things and low and behold this happens to fall on the curves that Dean Toombe gave me Monday so I'm feeling good that for 18 months this model has held and it corresponds to somebody elses model; in fact, it's the model that we've been on in terms of when things going to happen. It's kind of important to know when things are going to happen as long as you don't take it too seriously and be prepared to change.

The other technology that dominates is the disk technology and this gets into the notion of economy of scale and there is an economy of scale with this technology. One takes a given disk platter and builds a fairly simple mechanism around that. It's got a motor, it's got cheap metal, it's got electronics. Now if you start piling some more disks on top of that and just to the point to where the whole things topples over and you don't understand it and that number is 10 it turns out. Maybe it's 9 because we're using 10 and I'm not sure we understand all of that 10th one but that one builds that particular technology and the model I have there is this economy of scale by having a little bit bigger motor one ends up getting a factor of 10 in capacity with not much more cost. It turns out more than one would expect and 10 probably now doesn't seem like the optimum anyway. But you do that first and you do it in the high end so that it's going back to the designers again, the designers work at the high end and are driving to get the lowest cost per bit and that turns out to be this 10 high technology.

Behind that technology one takes this base technology and puts it in a low cost technology and this is in fact the mini technology. This right now we're seeing separating. We're not moving as aggressively here in the low cost technology at least in cost per year as in these more aggressive 10 high technologies because there isn't as much learning and much work going on into making achieve versus making it lowest cost per bit. In terms of those two technologies, a curve I plotted a couple of years ago; this is IBM technology, this is IBM disk 62 to 74, 38% per year in terms of price, in terms of dollars per megabyte and capacity is gone up at 42%

per year so in fact the average disk price has gone up slightly because sheet metal, we've already been (?) a lot of sheet metal, we've already built billions of motors and those things aren't changing very much and the thing that is changing is the magnetic density which is going up, which is changing quite rapidly. And in fact yesterday, I had plotted some hard disks here in terms of looking for an economy of scale on those and here I've got number of bits versus price, here's accesses per second, here's the pure performance and here's this payload factor. Here's a factor of 2 so it's gone up a little bit more than a factor of 2 or at a given time when I took this snapshot then in fact using these measures it was more cost effective to buy at the high end more than the square log. Interesting observation is that on the accesses per second this doesn't have much of an effect in terms of money. That is we're talking that mechanical motion is the same thing as why a mazerotti won't go 50 times faster than a pinto because of the difference which we'd expect out of the price. Here we're back into this mechanical constraint. We just can't violate, and we're stuck with a new toy in mechanics and when it gets into the system, then you're stuck again at the system level by not having any economy of scale. You'd think when you scale the whole bloody system off, it's going to perform faster but it doesn't because this is the limiting performance factor on all of the multi programs floppy systems. So you've virtually got the ceiling there that is it's multiplier. So it's really disk access rate, this is rate, maybe you get 50 per second out of this one, here you're talking 20 per second of these and that's the thing that's dominating our performance.

From an observation the disk and semiconductor technology is one goes at 41% doubles every two years, one doubles every year and that seems to be due to a tremendous (?) in the overlap of the discipline. In the semiconductor discipline, a number of the people who work on semiconductors all come from the same basic discipline and in fact have a common vocabulary of communication. In disks one has all those technologies plus some processing, testing, plating technologies that aren't in the semiconductor, so those two industries, it turns out, I believe varied both on the basis of there is a captive market for magnetic media versus not in semiconductors where only half of the semiconductors market plus the disciplines themselves are widely separated to make disks. And then the third factor is the semiconductor industry is a very unique industry in that knowledge is broadcast very rapidly in the semiconductor industry and they do it with sort of good scientific communication. A lot of them have been trained as Phd physicits, chemists, electrical engineers, materials people so in fact there is this whole discipline of report what you've done. There is a tremendous amount of reporting and so people know what's going on and then the crowning blow of all of that if you didn't have all those factors is they used to share agressive money to buy people and so people are changing jobs all the time. So it's a very exciting and interesting; it makes computers look like pikers by comparison. It's a really exciting industry but a half life of the people are varied too by comparison. So the character of those two disciplines is different and in the case of the disks, all of that technology really came out of IBM in sort of '65 time frame and again they used this universal solvent money to pull all those people back from IBM and in fact to get those disks made in the various places. In fact, why all those law suits, is that it wasn't clear when they brought some of those people out of IBM that they didn't have a few plans with them as they came out, in fact that's the whole business of what makes the thing interesting because they sue IBM for stealing the market, and/or whatever. I don't understand what it's doing but they do all those kinds of things and then IBM counter sues saying "but the disk your making was our disk in the first place" and so we should side with the underdog. It's fair to steal the thing and take it away and make it but that's gotten resented. It looked like TELEX for example. That was being rewarded; they were able to closely covet a design and then turn around and sue IBM for not letting them market it effectively by IBM merely changed its prices to respond to the competition which is the good old practice of American business or all businesses.

This is dumb terminal prices, this is I haven't put it in to

the 10 into the right exponential. This was
I haven't put it into the 10 into the right exponential.
This had a lot of thoughts around it. This was a high regression, I don't remember what he got out of this but it looked like a reasonable fit in other words and that's actually t-70 and that .03t and that's e so it's about 10% per year price decline so that's .9 in terms of price so 90% 10% price reduction per year at the dumb terminals.

Minis
I put 31% and that's improvement, that's not really 30% reduction, that's 1 over 30% or it turns out to be about 22 or so when you do the reciprocal. So this is basic machines, what the price decline is then for small machines, the minimal machines.

Overall we get these various effects. Semiconductors then are followed maybe 60% to 80% price improvement disks, 41% in density, core 30%, tape is 23% in density. Notice that that and that are correlated, or that this your only getting a linear improvement, here your getting a square improvement because disks are packed that way. Data rate: 6% improvement in data rate or 6% change in tape speed or over the 25 years that turns out to be a factor of 4 improvement in tape speed since tapes were introduced and that's pretty good going against Newton that way.

Packaging and power per watt per cubic inch haven't changed--they're sort of holding their own.

Minis: this is too hot but I believe it's improving. Better communication capability for computers I think drives distributed processing because that has to be based on communication capabilities. Otherwise we're going to be up against the limb of the telephone operators problem here where everybody becomes a telephone operator in switching information from machine to machine. In fact as you distribute it, everybody becomes a computer operator and that'll drive us into the network stuff. The density also changes the reliability radically because there simply is less mechanical parts to fail. It adds this greater functionality in terms of basic language and operating constructs and it makes every terminal a smart terminal with some additional capability and in fact will generate an electronic typewriter from that. Smart plants, smart labs where we put in every instrument that is fundamentally electronic will have enough intelligence in there to do significant data processing.

Greater disk density is really driving us to the need to get organized in the data bases area. Higher people--people costs are going up. Paper costs are increasing. That I think drives us into basically not generating information that we don't capture so that what will drive the typewriters to all be electronic, that in fact as you get into the problem of making corrections on copy or doing typesetting or filing. The worst thing about creating memos very often is not the memo per se but it's the fact that somebody's going to read that and with electronic mail we've got the possiblity we can have computers read all that mail and answer it and we get to that happy stage: they'll create them on-line, transmit them, store them, be able to retrieve them, then we can read them and in the next stage we can write them and so I think that I'm glad Bob Sproul is here. I think getting out of the Xerox is a good idea because if there is one thing that hurts this whole paper thing, it's Xerox creating more and more paper in the world. I don't know how to get around that. I think clearly we have the opportunity but whether or not paper is the absolute drug we cannot deal with, do without, I don't know. But I'd sure like to try. That's this section on technology.

Question: (Bob)
