Answer: I think better encoding is going to help. I think pictures may be a way of essentially soaking up that and basically doing some encoding. Let's gets some useful information out for a change. I mean those goddam EDP machines that generate these massive piles of paper that then--who ends up doing the processing is. I have seen more reports where people sit with a calculator trying to get stuff off of the EDP runs. I think that the processing has really has got to go into sending that information. It really should be done keeping it in the data base then going in and accessing it only transmitting the exceptional kinds of information so people can operate. Number of cards at last is not rising and that is the number of cards produced per year is sort of flattened out. I think that's one of the major breakthroughs because with for every hundred cards, one of them is in error then there is a high probability that that error's going to make that other data that gets generated from those cards useless. In these reports I see I think the people I work with are putting me on when they say "Oh the input datas got garbled and therefore all this stuff is meaningless and that's why I'm overbudgetted" and it's all because of the EDP problem. I think fundamentally a lot of the power is just going into doing useful information processing where a person is committed to making them.

Question: ?

Answer: No I think they're fairly good in terms of what they're doing. It's the DELFI techniques. I'm not worried about these people. It's the market surveys which gets the information and the DELFI is in fact one layer removed from that chain. I don't know who they asked for those things to get all the garbage that came out of that report. There is something useful about that report though. Are there any wild ideas that might be feasible now that might actually be interesting to have. Of course I'd like to have a display on a 40' wall and have it all electronically changed.

Question: ?

Answer: That's one I apologized for two years ago in that paper. Now I know. The neat thing about doing all this stuff is you clearly now know what the opportunities are going to be and I think if I had done essentially this much work. That one I knew in my gut but now I can prove it any way you want to prove it including you can even get marketing people, users to say that too. But the drive there really is a significant effect on the architect. In fact, trace that back; how much, if you also believe the constant price model, then it says every couple of years we need another bit in the memory space. The thing that holds us from that really is the ability to make machines that will go do that with those larger memories.

Question: ?

Answer: That's one piece. I see a lot more value now in looking at that base technology data than I did...now in retrospect the whole history is clear to me. Why everything is the way it was but now does that do any good in the future? I'm not sure but I'd like to at least understand why things were the way they were and I think so far its been useful to me to at least get some ideas about how long I've got to live in the future or what kind of an environment one could have sort of in 1985 time parameter. That's why I look at these in a sense I think any of these curves that would come in ? exponential limit ? I'd say great I won't have to worry about that any more. Sometimes I'd like to see some of that happen but nothing like that's happening. You can only see until 1981 in the semiconductor thing because that's really clear because that's the ? limit. But yet all the experiments are done for the x-ray and e-beam exposure of semiconductors in making a mast and so they're saying--the other day we were talking to some people and they say "Oh we're not worried about going past '80 now" so I'm feeling good up until 1985. I don't know what that means because I'm now worried more about how the hell do we use all these things. Let's take my curves, run them up to '82 say I'm wrong by 3 or 4 years and that gets us to '85. A million bit chip appears in '85. That's only 8 years. So we've really got virtually zero cost computing at that. There aren't that many people who got a million bits, an eighth of a million bytes or 128K byte chip in that time slot and that's a reasonable price. You could put a few together and in fact that's right at the limit of the programs...it's way past the limit of most of the programs that we use most of the time. All the text editing, all the interface programs and things like that. That'll all fit on a ? chip but the other programs...so these big data base systems and the other programs I think are ones that we really need to be working on now. Those are the ones I'm very concerned about.

Question: ?

Answer: But I'm making the assumption that one of the interesting things that's going to happen is when that fits on a chip, then in fact that will present a much lower cost threshold. People will do things with that as a unique device as opposed making million computers. Yesterday's talk was these computers came down and reached the stable state and I don't know to find those states but in fact we're here right now and there's a stable state beneath that...which or maybe it's this state here doing something else and there's going to be all sorts of activities around that lower cost thing and in fact building at the high end is going to be the hardest and we've got to find new organizations because we're going to keep stumbling over the complexity thing. How do you build that many machines together? How do you get them to communicate? I think it's going to be incredibly exciting in terms of what one can have in the next few years. I think by '80 we'll be at a very exciting time too. An 8K byte thing...well that's kind of interesting too because that means every typewriter can for not much money remember everything you've every typed on it and have corrected on it. It may have written it even. And I think what else do we do? So the DELFI I do read for any wild ideas that are now feasible and also useful.

Question: ?

Answer: In a way this part feels the softest to me in terms of a way of really doing a good analysis of what the structure looks like because it gets into a whole bunch of dimensions in the marketplace. The ones that are comparatively hard are that some of these use that functions structure dimensions

SUBJECT: CMU LOSS: WHY, SIGNIFICANCE AND NEXT STEP

I'm very sorry we lost the bid to do a PC with them. I think it will turn out to be an extrememly pivotal event in history.
Andy rightly fully gave me hell for losing the order, because although I felt strongly about the necessity of doing it, I didn't spend enough time, nor did I offer to really get into the design. Similarly, I didn't push to get some of the other
folks like Avram into the effort of the new machine.

The reasons why we lost: With IBM there was potentially higher
risk, but much higher payoff since if they were successful, then
IBM would leverage their work by distributing millions of them.

With us, it was a surer thing, and lower cost, but not as potentially exciting.

IBM was willing to let them manage the project. This had an incredible appeal to them. (note the potential risk/reward for an environment that is normally not used to this)

IBM was enthusiastic about using the CMU operating system and environment called SPICE, built in Computer Science.

IBM's head of the Palo Alto Scientific Center lead the effort on a full time basis, with a larger, resident full time team. IBM appeared to take the whole project much more serious.

IBM made the initial sale via Lew Branscomb and Cyert. It was
uphill for us and we never really sold Cyert.

They really liked the idea of swimming in a bigger pond, as we've not always responded to potential opportunities.

IBM's providing their scientific personal computer that was just
announced today as the first machine. The REAL machine will be
available in Summer 85. We believe this is the 801, very high performance machine driving a display.

NEXT STEP

We must continue to have a strong presence there and must continue to watch the Spice Project, learn from it. We have MANY projects going with the CS department and we can't give these up: robotics, LISP, Ethernet, SPICE, etc.

I believe we need to provide a significant computer of the kind they wanted. Whether it would have been sold in droves on colleges, remains to be seen. However, I do know that such a machine is what the professionals need.

I also think it is necessary to get another, demanding partner.
Candidates include: MIT, Stanford, Waterloo?, Harvard,, ??. We need someone who has the commitement to do it across the whole campus and someone who is very competent! Right now I don't see a single university that has both of these attributes.

IBM's POSTURE NOW

They will use this sale like crazy to say they now dominate the Computer Science and University Market! We have to down play it, as anything other than an isolated example. As I've recently pointed out, IBM is building machines according to specs now from CMU, MIT (An AI machine) and NYU (the

Ultra-Computer). This is a model that they used when they established themselves in computing in the early 50's when they worked with Columbia, Harvard, MIT (Whirlwingd). It's also the model the Japanese use to transfer technology.

BOTTOM LINE (WITH RESPECT TO IBM)
They have many more resources, and they are being used very effectively on high quality, creative products. This is in contrast to a substantial number of evolutionary products we are doing. Hopefully, they have some really poor products in the works too. Otherwise, it's ...

GB3.S8.70
@KGF, 11/21/84

I think it is quite crucial to get the first computer into Carnegie-Mellon University.

My own ties are still strong:
.they still list me on the faculty and I still have many professional friends that I'm close to (including Raj et al)
.I'm on the board of the Software Engineering Institute that was just funded by DOD
.I remember putting the first VAX there, and I'm superstitious

Apart from this, CMU is:
.rated 2 or 3 (with MIT... which we really can't afford to do business with). Furthermore, other schools follow them.
.an advant garde user and Raj is opinion leader in the DARPA

community
.DEC and IBM oriented
.tolerant and can help us get the machine up to snuff

DARPA is simply critical to Encore because:
.the early machines will not be operate efficiently enough to compete
.this community will do their parallel processing and robotics and AI
work on Hydra. These will probably end up being key to ECC's success.
.the general technical community follows DARPA
.DARPA has an incredible amount of money in the next few years to
throw at computing and parallel processing. We need to catch much
of it.

Re The Large Memory Boards
Henry will have to get an answer from Hydra. Large boards are quite impressive, and may turn out to be the best or only way to get the Mips out of Hydra by making sure we never swap. (I recall a paper in the IBM Systems Journal in which it is predicted that very large timesharing systems don't work because of the growth in various times associated with managing a large number of page tables and disks.)

Re Prices
Regarding our pricing. Our prices, whatever they are have to be our prices. We can't afford to give things away yet. Hopefully we won't need to even in the case of the Beta units. Note our mark-ups appear to still be sustantial.

Re Doing their boards
We have several choices (for each board):
1. Lock these boards into the DARPA contract! We could lock the two together and it will get CMU to put pressure back on DARPA to give us a contract.
2. Do nothing.
3. Offer some amount of consulting.
4. Do each board for a fixed fee. The video one could be done this way, but the Systolic interface could be a mess.

In short, of the friends I've introduced to Hydra (including Sperry), CMU will probably be much more lucrative, fun and helpful in both the short and long term.

SUBJECT: PROCEEDING AHEAD TO EXPLORE THE CMU/DEC RESEARCH PROPOSAL

I described the proposal and ask for an agreement in principle to enter the study phase, and if successful, go on to fund the proposal. The Operations Committee was reluctant to give a unilateral endoresement of the proposal without having an understanding of what the proposal would cost.

We did agree that that we must go into the study phase and that it would be ideal to have a combined R and D center in Pittsburgh, closely linked to CMU. In this way, we would not have to have the total incremental funding, but would have to cover the project in a substantial fashion out of existing programs by correctly coupling the CMU Project with our own work.

I'd like to meet on Monday morning and discuss how to proceed.
I'll call Allen today and get a reading on where things are.

PROPOSAL FOR THE JOINT DEVELOPMENT OF

PERSONAL COMPUTING

BY CARNEGIE-MELLON UNIVERSITY AND DIGITAL

G. B.
10/14/81

THE CMU PROPOSAL

- BUILD A PERVASIVE ENVIRONMENT OF PERSONAL COMPUTERS THAT GRADUALLY EVOLVES FROM EXISTING T/S SYSTEMS IN DAILY USE BY A LARGE, DIVERSE POPULATION.

EVERY STUDENT, FACULTY, STAFF MEMBER WILL HAVE A PC. STUDENTS WILL TAKE PC WITH THEM.

-DEVELOP APPLICATIONS APPLICABLE TO A BROAD MARKET, ENCOMPASSING:

+ OPERATIONAL SUPPORT OF LARGE INTEGRATED NETWORK (ARCHIVAL, RETRIEVAL, ETC.)
+ PRINT IMAGING, GRAPHICS, AND VOICE
+ ROBOTICS
+ MODELLING
+ KNOWLEDGE ENGINEERING
+ INFORMATION AND DOCUMENT PROCESSING
+ HUMAN INTERFACES AND SOCIAL ASPECTS OF "LIVING ON THE MACHINE"

-CREATION OF AN OFF SITE INSTITUTE FOR INFORMATION MANAGEMENT AND TECHNOLOGY TO DISSEMINATE AND TRAIN STAFF, CUSTOMERS, POTENTIAL CUSTOMERS.

G. B.
10/14/81

BENEFITS, COSTS, RISKS

BENEFITS

-OWNERSHIP OF TECHNOLOGY (FIELD PROVEN HARDWARE AND SOFTWARE DESIGNS) FOR FIXED OPTION PERIOD.
-CLOSE COLLABORATION WITH A LEADING UNIVERSITY AS A WAY TO EDUCATE, INNOVATE, VITALIZE ENGINEERING.
- REDUCE ENGINEERING ISOLATION FROM CUSTOMERS AND ACCESS APPLICATIONS

COSTS

- $6-7M PER YEAR
-REQUIRES MANAGING AN ENGINEERING SITE LOCATED IN PITTSBURGH

RISKS

- STAFFING
-TRANSFER OF DEVELOPED TECHNOLOGY INTO PRODUCTS
-UNCLEAR ASSOCIATIONS WITH OTHER CMU INDUSTRIAL AFFILIATES (WESTINGHOUSE, THREE RIVERS, IBM, HP ...)
-WE ACCELERATE THE DEVELOPMENT OF A MARKET THAT WE DON'T QUICKLY CAPITALIZE ON
- NO PRODUCTS FOR THREE-FIVE YEARS
-ADVANCED DEVELOPMENT TREND IS MOVING AWAY FROM DEC (UNIX, XEROX, THREE RIVERS, WESTINGHOUSE)

SUBJECT: THE CMU PROPOSAL, US AND THE NEXT ENGINEERING SITE

Bottom line:
They are going out for bid on their proposal with HP, IBM and us.
We must not only go out and get this, but it must be part of a combined SWE, Research, P/L (EDU, Education Services, SWS=Network development) facility... otherwise it makes no sense to go after it. I want it to be our next site together with Japan and Washington... capable of holding 500 people by 85!

The rationale: we missed an opportunity with the CSDept personal computing work. They have made real progress and got their 100 systems, while we TALK. Meanwhile, they've also produced a PLUTO we will probably end up using. The robotics work includes all the key problems: vision, manipulation, applications and AI for control. The McDermott work alone is worth a site since we must use that technology now to manage large projects... like Venus.

I want to get together this week and plan on how we go after this. Also, I want to get the basic approval for proceeding to bidding on this. The approach is to go into a study phase for the next 6 months. In doing this, I want your support.

If you want to talk about this today or tomorrow, give me a call. Otherwise we'll wait when we can meet.

At our meeting, I'd like to find someone who might be the site
leader so that when we work, we do it in conjunction with the appropriate ultimate doer.

Pittsburgh, Pennsylvania 15213

Dear Angel and Granger Morgan:

I will read your plan and send it around for review.

My first reaction is negative, based on watching public policy groups at Harvard and MIT. In fact, I believe strong scientific and engineering institutions have been weakened by the management and resources defocus that such a department represents. It seems to be extremely difficult to manage and participate in the technical change and simultaneously engage in the management and rhetoric that departments like this often represent.

Somehow the work needs to be done that's characterized by the goals in your letter, but I don't see how we can contribute, nor do I think CMU needs a whole department to address them.

While these are my own views, I'm sure others here will disagree, hence I'll send your proposal around for comment and review. Hopefully there are people here you might want to talk with when you make your study.

Dear Dr. Cyert:

As you may be aware, a number of individuals from our respective organizations have been discussing the possibility of Digital's participation in CMU's ambitious program for distributed computing in the 1980's.

Although our discussions have been preliminary, with a number of important issues yet to be addressed, we are optimistic that it will be possible for Digital to provide CMU with concrete financial assistance in implementing its vision. Specifically, we would like to consider the possibility of

Digital's providing a substantial research grant toward the purchase of computing equipment needed by CMU to implement its plans.

I would like to extend a personal invitation to you to visit us to discuss this matter further. Please feel free to bring with you any colleagues whom you feel would be helpful in our discussions.

I am looking forward to meeting with you.

Yours very truly,

Gordon Bell

Subject: VAX's at CMU

MJ Please send copy of this to Nat Parke and J Burness. It is imperative that
we get back to Al Newell by Monday evening in regard to the CMU proposal....ie
how to fix it, what to say so things can get strted through the sales office.
Jim can you read it on Monday? I'll brinng a draft in.

Allen called me on Friday evening with their dilema: several groups are
wanting to now purchase a VAX, and they don't want to predjudice the proposal.
I also taold him about the possibility that we were considering building an
LSI design console... and would like input from Bob Sproul. He also said that
Ivan Sutherland was spending the summer at CMU working with Sproul on the LSI
effort. We ought to get this console definition cleared up soon.

The groups who want a machine include : Raj for speech and image; Sproul for
VLSi (note CMU is probably going to get a big slug of $'s soon from ARPA on
this); and Robertson who works with Allen on Zog, etc.

Is there a way we cold loan them a VAX? I need to get back on this especially
so they can get started.

To: Bill Johnson
CC: Gordon Bell
From: Sam Fuller
Date: FRI 16-FEB-79 14:07:50 EST
Subject: CMU's Department of Computer Science Computing Needs
----
This statement of CMU's computing needs is the result of a discussion Bill
Johnson and I had with a number of the faculty at CMU (Newell, Reddy,,
Sproull, Fayman, etc.) on February 7, 1979.

This is only a characterization of the Department of Computer Science, and
related activities, at CMU, and not the entire university. The assumption
here is that the Computer Science Department at CMU is an innteresting
example of an R&D organization with some vision of the computing needs of
productive R&D groups in the 1980's.

1. CHARACTERIZATION OF THE COMPUTING COMMUNITY AT CMU:

- About 300 to 500 accounts on the existing PDP-10's. - About 150 "real
users". In other words, 150 of the 500 accounts
represent people who use the computers one or more times

a week. - There
are a set of heavily used application programs used by most
of the 150 active users. Specifically: SOS, Mail
Systems, and
document preparation systems (RUNOFF, PUB, SCRIBE). -
About 60 users
make significant computational and disk storage loads
on the system. - On a typical afternoon, about 60
persons are logged in
at any
moment. - For short one or two weeks bursts, single
users will use up to
20%
of the machine. - Users can be roughly clustered into 5 or
6 distinct
research areas.

2. PRESENT COMPUTER SYSTEM AT CMU:

- Three PDP-10's; 2 KA10's; and 1 KL10. - Half a dozen PDP-11's directily
support the PDP-10's as comm. front
end, high-quality printer controller, graphics
processors, etc. -
Slightly over one Gigabyte of online disk storage. -
Magtapes used primarily
for failsafing disks.

The above computing system is viewed as severely underpowered for CMU's
current needs. The 50-odd PDP-11's acattered about CMU s
part of C.mmp, Cm*,
IUS machine, etc. are serving dedicated, systems research
investigations and
are of no real hlep in serving the general computing needs.

3. CMU'S VISION OF ITS NEXT GENERATION COMPUTER SYSTEM

A- Based on a machine architecture with a much larger
address space
than the PDP-11 or PDP-10. (The one Megabyte virtual
address space

of the PDP-10 is already a serious problem in the image processing application. CMU sees its other applications growing well beyond a Megabyte in the near future. - Main need is for "Interaactive MIPS".1979 needs is estimated at about 5 MIPS (say 3KL10's or 6 VAX-11/780'). Derivative of needs seems to track technology, i.e., about 30% per year.

- Want some guarantee on responsiveness of computing system. I.e., the current situation of teh PDP-10's bogging down to a slow crawl in the afternoon and evening is considered a serious hindrance. - Central, MultiGigabyte file system. Concept of personal libraries of floppy disks or TU58 cassettes seen as a step backwards. Very high data integrity required of this logically central fiel system. Assume such techniques as journalling and/or shadowing will be used to guarantee integrity of data. - General consensus that next generation systems ill provide its interactive MIPS, as opposed to file storage, via "personal computers" distributed around the organization. 40 to 60 of these personal computers needed, assuming that of teh 150 people in the department, 60 of them make significant use of computing power. - Whatever the distributed/centralized organization of the system, the user should see a consistent niterfact. I.e., editing with a VT100 on a central machine should not look any different than editing on a personal computer (aside from the response to some of the editing commands.) - Department makes extensive use

of home terminals
and would like to
continue to do so. Unclear how this dimension of needs flow into
the scheme of things until personal computers are really cheap enougoh
to be home computers. I.e., two personal computers per researcher

- Ultimate value of system to CMU is in the software systems it suppoprts.
Raw compute compute and disk storage without software systems
of no use. This translates into conclusion thatmovement off of
the PDP-10's will cause a major glitch in productivity and will entail
several years of software systems building rather than basic research. -
Graphics seem as critical to future applications at CMU. Areas already
seen: CAD, more powerful editors, image processing ressearch.
2500 characters, 30 times a second seen as the scope of the graphics
performance needs. - Candidate machines: VAX, Prime 500's, Z8000's, Lisp Machines
(from MIT).

* At another time it might be interesting to look at the entire CMU
computing environment; it might provide a good example of a mid-sized
university committed to teaching computing concepts across many of its
education programs.

the scheme of things until personal computers are really cheap enougoh
to be home computers. I.e., two personal computers per researcher

- Ultimate value of system to CMU is in the software systems it suppoprts.
Raw compute compute and disk storage without software systems

of no use. This translates into conclusion thatmovement off of
the PDP-10's will cause a major glitch in productivity and will entail
several years of software systems building rather than basic research. -
Graphics seem as critical to future applications at CMU. Areas already
seen: CAD, more powerful editors, image processing ressearch.
2500 characters, 30 times a second seen as the scope of the graphics
performance needs. - Candidate machines: VAX, Prime 500's, Z8000's, Lisp
Machines
(from MIT).

* At another time it might be interesting to look at the entire CMU
computing environment; it might provide a good example of a mid-sized
university committed to teaching computing concepts across many of its
education programs.

Command:

EMS 13-MAR-79 11:37:41 420 1

To: Per Hjerppe, Gordon Bell, Ulf Fagerquist
From: John Jorgensen
Date: TUE 13-MAR-79 11:37:41 EST
Subject: CMU Visit on 8 MAR 79

The purpose of the visit was to join Pete Smith in reviewing 4300 Series
presentations recently made to CMU.

1. IBM is aggressively targeting Education with their 4300 series. CMU
is apparently on a list of 25 universities IBM is

committed to
capture. Cary's review of a 2050 proposal to Stanford in his role
on their BOD apparently triggered this new thrust.

2. CMU believes IBM has targeted DEC time-sharing as what they must
have to succeed in interactive computing. Their current half-duplex
approach still falls far short of TOPS-10/20 for program development
problem solving, and the novice user. Tom Boardman's recent visit
to Waterloo revealed that IBM is aggressively pursuing series one to both
compete directly with VAX in cost performance (Tom saw actual IBM charts
with their products positioned relative to VAX) and as high performance
communication/network front-end for the 4300 series. Tom believes these
front-ends will be the key to IBM's improved interactive capabilities
which are targeted to compete with TOPS-10/20.

3. We should investigate how UNIVAC took over the RCA base and lost so few
customers as a possible model for retaining our TOPS-10/20 base
through the move to VAX.

4. CMU is having aggravating intermittant problems with our 2050 series
since last November.

5. Dick Van Horn is eager to re-new our three year working agreement with
CMU. He felt the focus should be through Jack McCredie for both the
compu
ter center and the computer science research. As an aside, he noted that

system availability was top priority for them. VAX perceived as very reliable.

6. I had an unscheduled discussion with H. Wachler on the subject of Allan Newell's recent proposal. The distributed multi-processing work they are doing with 11's is extremely interesting, in particular, I was very pleased to learn that they are dealing with:

A. How the system manages itself for the achieving of transparency to the user.

B. How to interconnect a homogeneous complex with a non-homogeneous complex. OF PARTICULAR INTEREST IS HOWARD'S INTENT TO QUICKLY INTERFACE THEIR KL TO THE VAX NETWORK VIA A ETHERNET TYPE INTER-CONNECT AT ABOUT 5 MEGABAUD. This implementation could be very key to providing "add-on technology" to move our installed base to providing VAX products for their future computing.

C. Howard also is prepared to look at the language compiler issues relate to making a VAX network look like a much bigger machine through the use of parallel processing single programs. I believe this is also critical to our ability to provide growth for our customers through distributed processing.

In conclusion, CMU made it clear that IBM is targeting DEC's interactive capabilities and our low end cost performance. They

indicated it was 2-3
years before IBM had what we have today in TOPS-10/20 and VAX. We must get
our key developers in tune with CMU distributed processing research and
immediately lay out very aggressive plans to have competitive leadership in
this area and provide the facilities to move our high-end customers to this
technology i in the 1980's.

Command: REA

EMS 22-APR-79
18:55:39 520 1
To: Jim Bell, Sam Fuller
CC: Mary Jane Forbes
From: Gordon Bell
Date: SUN 22-APR-79 18:55:39 EST
Subject: cmu meeting

Jim call Pete Smith of edu so as to co-ordinate.

I am going to cmu next monday to work with dan. At that time, it would be
worth having a first meeting with cyert, mccredie, newell and csd dept so as
to get on with the possible project. Can you, someone from edu, the sales
person, and possibly sam (or however will be the offical liason) come with
me?

I communicated the notion that the 2m was for cmu, not cds, and it didn't go
down well. I want to understand this better too as to just what you and
witmo
and puffer and sam had in mind. We should meet before we go in there.

Let's really start writing this down, as Allen is talking to both me and to
sam, and we can get awfully confused if we get out of sync. I had said the 2m
was for csd, and independent of any other deals that we might make, etc. Also,
the deal was with engineering. Tonite, we talked about the attitudes of
 sw prices and I would believe we don't want to include sw in the allowances,
since we don't want them writing sw that we have because the price is too
high. In this regard, they are part of engineering, and get sw licenses free
so as to base future programs on what we have. From an IRS standpoint, I
would hope we could deduct any expenses we incur due to this.

Allen would like a look into our futures so as to know what to buy. I think
f

now, we simply confine it to 780's and other standard parts that are known by
them. This is somethting we ought to work out on next monday there.

They want to go with us, but are looking at ibm (given they ordered the 100
4331's...and ibm is selling and finding out how badly they need cmu to work on
the interactive computing environment for them. Prim and Pascaltos are the 2
other alternatives.

EMS   23-APR-79
09:03:31 000 1
To: Gordon Bell
CC: Jim Bell
From: Sam Fuller

Date: MON 23-APR-79 09:03:31 EST
Subject: cmu proposal

Gordon: Would the meeting at CMU be in place ofthe meeting we have been
trying to have here before May 5th?? One of the necessary discussions early
on is an interaction between CMU and DEC on the contents of the proposal. If
we do this at CMU, we will need to send a number of techn ical people from
DEC to CMU.

You are right we need to write stuff down. I will write a memo this morning.
With Mike Campbell, local DEC salesman in Pgh, leaving DEC, for Harris, the
person I had been counting on to coordinate things is now out ofthe picture.

It seems to me we are already beginning to reap some benefits from the CMU
proposal. Howard Wactlar gave a presentation at DECUS on what he saw the
future of computing to be: i.e. $10,000 personal VAXes. There was alot of
interaction with other DEC customers and I think a number of ideas were
planted/re-enforced in some of DEC's larger customers.

Sam

EMS   23-APR-79 12:13:29 320 1
To: Gordon Bell, Jim Bell, Bill Johnson, Bob Puffer
From: Diane Secatore
Date: MON 23-APR-79 12:13:29 EST
Subject: CMU Proposal (From Sam Fuller)

Gordon, in his EMS note of April 22nd, asked someone to write

down what is
happening on the CMU proposal. Here is a quick dump from my perspective.

February 7, 1979.

Bill Johnson and Sam Fuller visit CMU and discuss the future computing needed
of the computer science dpartment.

March 12, 1979.

CMU, and more specifically, the computer science department at CMU,
submitted a proposal to DEC via Mike Campbell, the local DEC salesman. Bottom
line: CMU is asking for 112 VAXes over a 5 year period to construct a
distributed system of personal computers.

April 11, 1979

CMU is getting nervous about proposal (it needs more machines soon and if DEC
is negative it wants to get serious with some other vendor)

and Gordon Bell calls a meeting with : Jerry Whitmore, Bob Puffer, Jim Bell
and Sam Fuller. The outcome of this meeting was the following::

1. In principal, DEC likes CMU proposal and wants to "do something". 2. The
proposal has to be scaled down. On the order of 15 to 18 months,
$2,000,000 of MLP equipment at a 50% discount. 3. The equipment is limited to
"32-bit systems". 4. President Cyert should coordinate

between the two
prinicipal computing groups at CMU: the computer science department (which
submitted the proposal) and the computation center (I.e., McCredie). 5. DEC
should not send DEC software engineers to CMU, but rather DEC should set up a
software adv. development group in-house that will work to complement and
monitor the CMU work. Undecided where and who this group should be. Might be
the R&D group, might be somewhere in software engineering. 6. Witmore
effectively argued CMU should separate its immediate need for 2
VAX-11/780's from this proposal. If it really wants the 780's, it should
order them now. Whatever the agreement turns out to be, these 780's will be
part of the agreement. If the agreement dies, then CMU will pay full MLP for
the 780's. 7. This should be a contract, not a grant to CMU.

April 16, 1979

Mike Campbell delivers a letter from Gordon Bell, inviting Cyert and DEC to
discuss details of the agreement. Mike was unable to see Cyert at the time
and so could not deliver the verbal messages we needed delivered:

1. Scale of contract: 18 months, 50% off on $2M of MLP. 2. Regret if
DEC-imposed time crunch in March caused disruption at CMU.

April 23, 1979

Mike Campbell has now left DEC. Rich Pearlman and Bob Bonecourt (salesman)
visit CMU. General coordination vist to keep ball rolling following

departure of Mike Campbell.

April 30, 1979

Gordon Bell plans to visit CMU. Opportunity for some yet unplanned meeting.

May 5, 1979

On this date the semester at CMU ends and a number of key faculty and staff
members leave for several weeks to a month. CMU hopes we can tie down the
major points of agreement prior to this date.

Professor A. N. Habermann
Department of Computer Science
Carnegie Mellon University
Pittsburgh, Pennsylvania 15213

Dear Nico:

I would strongly support Mario's promotion to Senior Research Computer Scientist. He has constantly produced important results since he has been at Carnegie Mellon. Although a substantial amount of the work has been surrounding the ISPS language, there has been a diversity of activity from automatic design to computer verification and evaluation. The work has also been very deep since ISPS has been used externally for specification and simulation at several sites and for different purposes. This demonstrates both a breadth and depth. Furthermore, I believe the work on automatic design will become important in the next few years. I am deeply indebted to Mario for making ISP into a diverse, working tool used rather than just another notation or poor register transfer language. Without this work, there would not be the acceptance of this style of description and design.

Quite apart from the ISPS work, Mario has earned a great deal of respect in other phases of Computer Architecture including MCF evaluation and specification, and Conlan.

I can't speak to his work on ADA, but his other work on SPICE and networks is very solid.

I hope you can keep Mario there and provide an environment for him to continue to be productive.

Sincerely,

Gordon Bell

<u>Customer Segment Letter</u> - <u>Sample Only</u>

Professor Jack McCredie
Vice Provost for Computing
Carnegie-Mellon University
Schenley Park
Pittsburgh, PA 15213

Dear Jack:

This note is to confirm my comments on your future direction as we discussed on the sixth. In essence the situation at

CMU is:

1. The computation center has: three TOPS 20 Systems for administration, educational computing and research; two RSTS Systems for Business School computing and document preparation; and two VMS Systems for physics and chemistry research computing. You also have a very high performance, high quality printer and plotting facility. Also, there are three billion bytes on line.

2. There are many distributed, departmental mini and micro computers, some of which are timeshared. There are floppies galore too on all systems.

3. There are administrative data entry and word processing systems.

4. The Computer Science department has: three TOPS 10 machines, two experimental PDP-11 multiprocessors (16 and 50 each) and there are various minis for dedicated functions (e.g., terminals, speech i/o). An ARPA Tip interconnects the 10's to ARPA-net and the department would like a better interconnection scheme.

I was impressed with the arguments you gave me on how, by incremental purchasing, you acquired resources as needed such that the University has the most cost-effective system (as compared with various sister institutions and compared with a single large machine purchase). It's now clear our recommendation to replace the 360/67 with one or two TOPS 10's, in 1971, would have saved several million dollars had the University acted on it!

Now to confirm our discussion about the future:

1. It's imperative that the network get installed so that the many mini and other users (e.g., word processing, data entry) are able to take advantage of the impressive central filing, printing, plotting and processing facility. Furthermore, this will

allow various work to be migrated among the machines at the center over a longer term on the basis of economics, performance, data base location etc.

----

2. I agree that you need not install any more TOPS 20 Systems, although the existing ones should be upgraded to be most cost-effective. This is not meant to imply that we won't be building 20's, but rather the VAX-11 line will be implemented as various sizes (including 11's), in higher volume, and should generally be more cost-effective than the 10/20 line.

3. VAX's of varying sizes should be added to the "center" and new applications would be placed on them. Here, users could be assigned to machines in any way you decide. You might decide to distribute the center out to your users along the following work assignments for "off loading" the currently more general 20 Systems:

a. computational, FORTRAN production work in science and engineering

b. COBOL production for the administrative work

c. student environment, especially that involved in teaching PASCAL, FORTRAN, BASIC, and COBOL.

In this way the 20's can be run fully general purpose using the large language and application software base (e.g., APL, BCPL, COGO, CPL, GPSS, Simula SPSS,...,ZOG) that is not now available on VMS.

4. You might choose to move one of the 11/45's somewhere else (e.g., a department) and migrate their workload under the VMS/RSTS emulator. This will be more cost-effective and it will have more language and array size capability for the MIS programs.

This approach, I believe, will continue to give CMU the most cost-effective computing well into the mid 80's, and for now, it's hard to see beyond this time frame.

Sincerely,

Gordon Bell

SUBJECT: PLEASE HELP BILL WULF AT CMU... TODAY!

Allen Newell just got a call from Bill for me to read my
mail.
I did. A copy follows. In order to get them out of the
woods,
would you get the person who is maintining Bliss to call Bill
and to take the Source down to him this weekend and to stay
there untile the first level modifications get put in?

I assume there is some sort of clause that says they will not
use the source code on any other machine. I'm sure Bill will
sign whatever you think is needed for our protection. Please
call me in the morning on this at once.

The note from Bill:

type mail.box
?^Q?
.type mail.box

Date: 5 October 1980 1122-EDT
From: Bill.Wulf at CMU-10A (X390WW17)
To: Gordon.Bell at CMU-10A
Subject: Bliss
CC: Allen.Newell at CMU-10A
Message-Id: <05Oct80 112242 WW17@CMU-10A>
Origin: X390WW17 at CMU-10A; 5 Oct 1980 1124-EDT

Gordon,

Tonight I spoke to Allen about our continuing and severe
problems
with Bliss. He said that he plans to call you, and I
volunteered to
write down some things about the factual side side of things.
You may
read this either before or after Al gets you on the phone; if
its
after you'll already have the context -- if before, well,
maybe you
should try calling him.

First, some generalities:

I decided a coupl?{?years ago to use Bliss/36 for PQCC
rather
than Bliss/10, SAIL, LISP, etc. I was motivated by a desire
to not be involved in compiler maintenance as well as the
main
line research -- and I wanted an acceptably efficient
product
(thus eliminating LISP, for example).

That decision has been a disaster!   CMU is a "field test
site"
for Bliss/36 because of Mario's work on ISP. The people
responsible
for Bliss at DEC had no contact with us during the original

development of Bliss and have no interest in PQCC. Although I suspect that we are treated no worse than other field test sites, we are definitely third priority -- behind any internal DEC problem as well as behind anything, such as ISP, for which the field test site agreement was granted.

Over the past 18 months, I have lost at least 6 to Bliss problems. I will give a few examples below, but the frustration here is monumental. We devote endless hours to working around problems, trying to explain/justify our requests, and just plain sitting on our hands because we are blocked. Fixes come, if at all, in the "next release" -- typically months apart. Frankly, I will never again use Bliss -- or any DEC product -- for a research project. I will never again allow the progress of my research to be controlled by morons who see no need to fix our problems because "that feature isn't used at DEC" (the most common reason for not fixing problems).

I want to repeat what I said to you as well as to any number of people at DEC to whom I have spoken before. I want to do my research. Nothing more. Bliss is a tool to that end. I need a tool that works. From time to time we have problems with Bliss; to get my work done I need those problems fixed. I do not care whether you do it or we do -- in fact I have a preference for your doing it. BUT, I need some sort of guarantee that problems WILL be fixed. Promptly! In the past, at least, no one has been willing to give me that

guarantee. In fact, all the evidence is to the contrary. We have
problems, serious problems, that are well over a year old and are
unfixed. The most common reaction is a rquest is to tell us that
whatever-it-is can't be done.

Given that you are unable/unwilling to fix our problems, I need to
be able to fix them myself -- that is, I need the sources for Bliss.
Frankly, given that they are largely cribbed from Bliss/11, I think
you should have given them to us in a spirit of cooperation several
years ago. I consider it something of an affront that Bliss
is here only because ofMario's ISP. (I was denied it, by the way,
when I asked for it.) But "ought to have been" is not the issue. I
am faced with practical problems and a lot of pressure. Many of the
problems we have been working around are ones that cannot even be
tested at DEC (see CMU-PPNs below). If you would prefer putting
someone here to fix the problems (without the endless arguments about
whether in DEC's view they are problems), and not give us the sources
-- that's fine. But I need solutions NOW.

I have about eight weeks to a major demo?? do not have time for weeks
of promises, arguments, and no-action.

OK, so much for the plea. Let me try to capture some of the kinds
of problems we've faced.

1. CMU PPNs. As you know, we use these strange non-DEC PPNs.
You may also know that Bliss has a "require" declaration --
it snarfs in a file into the source stream and is an
invaluable
aid in structuring large systems. Bliss, of course, vomits on
a
CMU-PPN in the require fil?pecification. Since we have done
it
in Bliss/10 and Bliss/11, we know this involves a one line
change
to correct. It has been outstanding since we first got the
compiler.
To patch around the problem I have spent a couple of man
months and
a kludge int the TOPS-10 monitor.

But, alas, the compiler is not the only place where Bliss has
fixations
about PPNs. They appear in the EXPORT package (i/o routines
and the like)
and in library requests. We have completely rewritten the
low-level
i/o routines and no longer use EXPORT; had we had the
sources, it would have
been a one-line change and we would still be compatible with
DEC.
To solve the library problem took more creativity (??). We
now have
a program that scans over REL files and patches over the
erroneous
PPNs placed there by the compiler. Total effort involved,
around a
man-month. It would have taken 10 minutes of someone's here,
either
here or a DEC to do it right.

2. Empty blocks. In its wisdom, the Bliss group decided that
 begin end
that is, an empty block, must be a mistake on the part of the
programmer.
I agree. Alas, much of our Bliss code is written by programs,
not by people.

The programs are emitting a regular structure that is very hard to
"turn off" if the actions involved happen to be nill -- so lots of
empty blocks get generated. So, fine; the compiler gives us only
warnings -- not errors -- and we proceed. Alas, the number of warnings
per PQCC phase is several hundred. Real errors are lost in the trash
floating across the screen. Each of us has wasted days searching
for bugs that were really caught at compilation time -- but were
hidden from us. So, we asked for a way to turn off the warning
message. NO, is the answer. The manual says its an error, says the
answer. Live with the problem, says the answer.

3. Bad code with debugging enabled. The compiler generates incorrect
code for SIGNALs when debugging is enabled. We have had no response on this
one -- but we have on similar ones in the past -- "no one at DEC uses
the SIX12 debugger and therefore we won't fix bugs having to
do with its linkages". Actually this is typical of a couple of things.
First, we can expect two weeks before getting a preliminary answer to
anything. Second, the 80% probable answer is that its not really
a problem (for DEC) and hence won't be fixed. Sometimes with long
discussions we can convince someone that there really is a legit
issue. Sometimes. [Sorry, but I'm gonna be a snob for a minute.
The guys maintaining Bliss are reasonable enough. I kinda like
Lupton, for example. They are not super bright, however. They

have very
little perspective. They know relatively little about modern notions
of software engineering, and they know zip about what we are
doing. They are not qualified to tell us how we should design/code
our system. I have had my gut full of pious crap about why they
can't do something or another because of thier miscomprehension
of software engineering. If it weren't so frustrating, it would be
funny to observe how often a misunderstood version of my own
design principles have been used to justify why I can't be allowed
to do something.]

4. Wrong code for timing package. We have a performance analysis tool
called the "timing package". It used almost?ut not quite the same
linkage as the debugger. We asked for a change to support it, and
offered to help make the timer available at DEC in return.
The answer was NO. No need/use/demand for such a thing in DEC
(after all, who would want to find out how well their program
performs?). I had an undergraduate spend the entire summer trying
to adapt the timer to the only linkage available. He failed.
Faced with a demo last week at which we had promised performance data,
I had to divert Newcomer from the main line research to the timer.
He managed to kludge around the problem eventually, but as a result,
although we had performance data, one of the major modules of the PQC
was not functional.

5. Various "out of storage"?roblems. I have not tracked down all

the details on this one -- but a number of our modules have been
switched into assembly language because of storage limitations in
the Bliss compiler. I believe only recompilation of the compiler
is necessary with some bounds increased -- but ....

6. Use of LINKAGE declarations with various optimization levels.
Some of our automatically generated phases must be compiled with
optimization-level zero (no optimization) becuase of obscure
interactions with the LINKAGE declarations. Unfortunately, the
LINKAGEs were installed precisely to improve performance.
We are allowed our choice of ways to lose. This one has been on the
list for at least 9 months; I don't know why it hasn't been fixed --
except of course, we are very low priority.

7. Manuals. I'll mention this one, not because it something that matters
in the next 3 month time frame, but only because it is SO typical of every
aspect of interaction with DEC wrt Bliss. It is only within the last
couple of months that everyone on the project has gotten his/her
very own Bliss manual. Many of us, however, still don't have language
guides for B/36, including me. Below is a note that Joe sent me before our
last infusion of manuals ...

" We are in worse shape now for Bliss manuals than we were way
back. Because Bliss is now a product, distribution is handled
via the standard DEC distribution center. When I called and

ordered manuals, and gave the manual number, a VERY offensive person told me that I didn't have a copy of that manual, couldn't have a copy of that manual, it was illegal for me to have a copy of that manual, and that I had better destroy it before somebody at DEC caught me with it. I tried to explain about being a field test site, and she informed me that this was irrelevant, that the manual number clearly indicated it was DEC internal only. I explained that the software was now a product, and the product manager (Glenn Lupton) had told me that morning that he had an order on his desk for the manual release dated something like a month before. No luck; I was clearly trying to do something evil and disgusting. What she did not have the creativity to suggest is that the manual would have everything the same except the letter suffix (and she could have checked on this letter suffix). I had to call Glenn back, he had to spend time to find out what the manual number was (just the suf???change) and I called back to order them. No luck, not in stock. Back order? Obviously I was kidding. I can say a lot about the customer service at DEC, but none of it is very complimentary, let me tell you right now!"

N. Vax? Of course, the granddaddy of them all is why we aren't
running on a VAX. One of the original reasons for using Bliss/36
was so that we would be able to move to a VAX. Well, IUS, etc.,
decided to use UNIX; clearly, by implication we are dangerous.
And ISP, the rationale for any sort of Bliss being
at CMU, was on a /10. PQCC?, who/what's that?

It goes on and on and on and on ......

Please don't think this is the whole list or the source of all the
frustrations. I picked a few that were at the top of my stack. As I
recall, there is a 9 or 10 page list of outstanding items; this list
does not include the requests that were rejected out of hand, only
those that are "open". I would guess that for each item on that
list, 2-3 have been summarily rejected (mostly, in my view, for
blatently stupid reasons).

Let me repeat my basic plea. I have a major demo in 3 months. I am
wedged into using Bliss/36; a wiser manager would have reverted to
Bliss/10 a long time ago, but I believed the promises and now its
too late. A subset of the problems MUST be fixed if I am to make the
demo date. Nothing will recover the time already lost, but I cannot
lose ANY more. And I need control. I can no longer have the

progress
of the whole PQCC project depend on the whims of some low-level
managers within DEC. I would have preferred a cooperative relation.
Its too late.

Finally, this is REALLY urgent. I want some sort of solution this week!
It all seems like a very simle decision to me, so give it to us quickly.
I need to make plans. If the answer is NO, fine. I would rather have
that answer this week than "yes" in a month. And if its yes, then for
God's sake, let's get the files down here this week too. I just can't
overstate how tight we are running or how high the frustration level is.
Everything about the research looks SO good, and we can't demo it because
of the damn Bliss system (compiler and people). Delay has been so characteristic
of our experience; I can't recall when the v.125 compiler was promised
to us -- sometime in the summer -- and it is other places, but not here.
PLEASE hear.

Bill

Professor Nico Habermann
Carnegie-Mellon University
Department Head, Computer Science Dept.
Schenley Park
Pittsburgh, PA 15213

Dear Nico:

I'd like to present the enclosed honorarium to the department for some worthy cause.

As a co-author, albeit not a very energetic one of the forthcoming Siewiorek, Bell, and Newell book, Computer Structures, I would like to have the royalties go to some appropriate CSD fund.

I'd hope this would amount to $10K over a 10 year period. Please suggest something, and I'll sign the papers.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

Subject: cmu..talk with allen newell tonite

MJ please send a copy to dick echouse and j witmore.

Allen is impressed with the interaction with rich. The

interaction with our
salesperson is down in quality and quantity. Is there an alternative?

Allen described the dilema..good for them that assumes vax's of price and
performance rations of 1 (for 780), 1/2, 1/4, 1/8, 1/16 (and assuming a base
of 240k, gives 120, 60, 30 and 15K for the personal machine in 6 years. This
means that a reasonable mix for them might be 8, 8, 16, 16, and 64. This says
they have little to buy in the final years, or we put up lots in the front
end. Allen also pointed out the reasonable price of doing r and d there at
less cost per person.

He described the meeting on the 22 and since I'll be out of the coutry until
the 28 and then at stratton, I hope things will go well. Although he wants
out, sam can be useful at getting this sort of information via informal
channels, provided all gets co-ordingated. (he's better here than I am,
because my phone nods often get taken as commits.) If there is a sticky
problem, then it might best wait until I can help (hopefully).

When we visit there on the 22, it seems we have to get off to a start where
there is involvement with 2 critical groups of development. The LCG Eng will
be doing much of the co-existence, networking and compatibility. Tewksbury
should be there because there will be concerns about VMS, and we need a rep
there... has anyone been appointed yet?

They are counting on the two machines and are pleased that they are coming.

Al believes that if we get the first machines in there, then the course will
in fact be set so there will be no way out.

I am still enthusiastic about the project, particularly after getting around
to reading about web and knowing we want to get it in place and that it will
take a lot of work. This insite/pressure on the timing and need to plan
machine sizes, performance and configuration can really help our planning

Thanks for the machines Jerry.

Good luck.

SUBJECT: CMU SPICE AND YALE AND PPA

Professor Raj Reddy wants to jointly do a Cm* or c.mmP with ARPA. I say absolutely yes! Let's get ARPA to pay for PPA! We all want big address multiprocessors. As a side effect, "leaking" microVAX in this way is going to have an incredible effect on slowing down the 68,000 landslide. Let's go do PPA this way with a very aggressive schedule . . . and get CMU and other universities to do software for us. What you say?

We've got to have a DEC effort at CMU simply to monitor IBM work and to search out new opportunities.

Forest points out that we must get CMU the microcode for the 750 so they can put Spice on VAX. This is essential for tracking the IBM work and operating system. This will also aid the LISP work. They want to provide portability with Spice . . . let's constantly test this.

It would seem to make sense to have a full time DEC Scholar there plus a small engineering group doing LISP, etc.

At Yale, I found much interesting work, especially in compilers for parallelism. They're working at building a very parallel machine with one, very long instruction and multiple data ops.

I see this computer as great for data flow and for multiprocessors. They'd be an ideal test site for 784, and alternatively the PPA.

Howard Wactlar
Computer Science Department
Carnegie-Mellon University
Pittsburgh, Pennsylvania

Dear Howard:

Thanks for the update on SPICE. I enjoyed reading the proposal, but will refrain from giving the numerous comments that it evoked. I hope that we will be able to somehow work things out so that the goals of the proposal can be realized, because I view we are one of the very few organizations that can engage in the partnership and provide the results you are proposing. It is probably good to take the next six months to a year implied in the proposal to interact because it will get everyone further along in their thinking. We have made amazing progress toward the proposal already because of the interaction.

Attached is a copy of the note announcing our museum for internal use. The purpose in informing you of this is two fold: visit it; and I would like to have parts from C.mmp and possibly Cm* and C.vmp for inclusion in an exhibit area called the Computer Classics Gallery. I would especially like a bit slice of the 16 x 16 switch, a photograph of C.mmp, an original reprint of the paper by Bill and I a diagram of the configuration, a copy of the book draft and a bibliography on it. This would be put in a 2' x 3' collage frame or some other structure to describe it. As you look at the 16 boards that form the switch, they could probably be replaced by dummy boards and then given to the various people and institutions (eg. ARPA, NSF, DEC (I hope), Bill Broadley, Bill Wulf, Sam Fuller, etc.) I also need other information like dates (when operational goals achieved), significant events (firsts), costs, performance levels, etc. I would make up a description and layout a collage exhibit for CMU like the one for us, if you send me all the poop and artifacts...provided you can live with Digital Computer Museum format.

I believe it is also important to decide on what part of C.mmp you are going to preserve, and then keep the machine intact in a roped off area in something of a secure fashion. Similarly, the C.vmp, and Cm* breadboards should also be kept in this form, perhaps along with the first Graphic Wonder. As I get involved in building this museum, it seems important to somehow keep artifacts.

It was good to interact again, and I hope I can visit in the Spring, but for longer.

Sincerely,

Gordon Bell

SUBJECT: CMU. THANKS BILL KEATING ET AL. LET'S KEEP IT UP.

Am glad to forward the attached from Bill Wulf. Thanks Bill Keating and your Bliss crew. I want us to really get a better
relationship going there in the next year so we can interact with them for languages, personal computers (they have perqs0,
etc. Also, we should send someones to the Cm* review on Nov. 7
and I'm sorry I can't go.

Note the attached form Bill and Anita:
Date: 16 Oct 1980 0909-EDT
From: ANITA.JONES at CMU-10B
Subject: An Invitation to the Cm* Review
To: bell at CMU-10A, fuller at CMU-10A, dickman at CMU-10A
cc: jones at CMU-10A
Origin: QNET at CMU-10B; 16 Oct 1980 1828-EDT
Via: CMU-10B; 16 Oct 1980 1856-EDT

Gordon, Sam, and Lloyd,

I am planning to have a review of the Cm* project.
I would like to invite each of you to attend. If you want to bring a couple more DEC people, they are likewise invited. Tentatively,
the review is scheduled for 7 November. The date may change to
accommodate people's schedules.

As of 1 January 80, Cm* joins the roster of "CMU facilities".
I have continued along the path of developing it as an experimental
laboratory. We have been relatively successful. Experimentation,

such as that reflected in Jarek Deminet"s chapter of the comprehensive technical report, continues.
?jo, pausing to review the project at this point is just right.

I very much hope that each of you can attend.

Please let me know whether or not you can attend, and whether
the 7th presents any scheduling problem for you.

Regards, Anita

Gordon,

I just got a message from Al saying that the "attached message"
wasn't.
Seems to have been a glitch of some sort in the readmail program
... because
now my mail file is trompled-upon and under the tender care of
the wizards
who attend to such things. Fortunately, I have a file with a slightly
earlier version of the note; except for fixing a couple of typo's
what
I sent was ----

Glenn and/or Al,

As you probably know by now, the Bliss sources arrived, Topher
came
down and helped us build both /10 and /20 versions, and the new
compiler has already solved some of our problems (like a module
that
wouldn't compile before). Also, Bill Keating was here yesterday,
and
he and I spent the???W??part of the day discussing the issues on
both sides. I consider the meeting was a good one, and I am hoping it
is the beginning of an improved relation on many fronts.
I am aware that you were not in favor of our getting the sources,
and
I believe I appreciate your reasons. I also fully realize

that
the
manner in which I precipitated getting them has the potential
to
increase the tensions in an already strained relation. If I
had
not
believed that the situation here was critical, I would have
preferred
an approach that did not have that potentially harmful side
effect.

My purpose in sending you this note is not to explain, or
apoligize
for, my method. I do believe the situation is critical, and I
did
not
percieve another way to resolve it. Rather, my purpose is to
see
whether we can now proceed to generate a constructive
relation
that
is beneficial to both parties. There is, of course, now the
opportunity for us to go our separate ways -- for the Blisses
to
diverge in unnecessary ways and for there to be suspicion and
antagonism between us. That need not be, however. We could
also
try
to forget the past, to try to recognize and respect our
different
needs and goals, and to collaborate where it is mutually
beneficial.

I would much prefer the second possibility. I will try to do
my
part
to make that happen. I deeply believe that closer ties
between
universities and industry in general, and between CMU and DEC
in
particular, works to the benefit of both. Beyond generalities

like
that, however, I have no desire to become a Bliss maintainer.
For
the
most part Blis36, Bliss16 and Bliss32 are improvements on
Bliss11;
you have done a good job, and, frankly, I want to ride on
your
coat?x??. At the same time, I think we have things that we
can
contribute to your efforts. Sometimes our contributions may
just
be
ideas -- often having nothing to do with Bliss. Other times
we
may be
able to implement things in and around Bliss that are
difficult
for
you to justify doing, but represent positive contributions to
the
overall Bliss effort.

As I said, I want to do my part in trying to resetablish a
good
relation. I have some specific things in mind; you may have
other
suggestions.

First, security. The Bliss sources will be protected as well
as
is
possible on TOPS/20. Only a few people from PQCC will be
authorized
to touch them. Among other things, it is strongly in my
interest
to
have minimal deviations from DEC's Bliss (see below), so I do
not
intend to allow random hacking.

Second, bug reports. We will continue to send you bug

reports,
but we
will filter them first to be sure that they are present in
your
version too. We will also try to attach a meaningful
indication
of
their severity; if we can 'code around' them, we will -- and
will
tell you so. If, in the process we happen across the
(likely)
cause,
we'll tell you that too.

Third, accessibility. We will make all of our changes,
whatever
the
purpose, available to you. You may not want to use them --
that
is
your choice -- but they will be available.

Fourth, "enhancements': It is strongly in my interest from
several
perspectives, to make our 'enhancements' both as compatible
as
possible and as few in number as possible. I plan to put a
strong
filter on proposals for changes. If we deem a change is
sufficiently
important, we'll go through a design review process before
implementing anything. The design (or at least sketches of
them)
will
be sent to you by net mail. We would appreciate your
comments
and
suggestions. I can imagine that some of them will have no
interest
for you (eg, CMU PPNs). Others, however, may be of interest
in
various ways. Where at all possible, I want to be consistent

with
DEC's philosophy and conventions -- both for the language and its
implemtation. I can well imagine that various functionality
requirements we have could be implemented in ways that are
inconsistent -- while another approach would be consistent or would
make it possible for you to utilize our change. Tell us! Its usually
the funtionality we're after -- not the details of its realization.

Back to my theme. I regret that an adversary relation has been
building between us; in times long past we had a 'special' relation
with DEC that, I think, was beneficial to both. I would like to
see
whether we can reestablish such a relation. I will do what I can.

Bill.

Loc.: ML12-1 Ext.: 2236

follow up 9/22/78

I just got a glimpse of the massive spec on the PDP-10 COBOL 79. It's hard to believe this approach to design specification is useful since the spec can't be further decomposed to code and because it sits away from the code (and will become obsolete) and because it's too big to verify or work with. (There's already progress on the VAX COBOL without such a document.)

Could we get a project review, maybe by the supervisor and chief architect (programmer)?

Why can't we have a combined COBOL language group? (I would believe we need some compatibility among our COBOLS and this is the only way I know, based on the BASIC +2 experience to do it.)

SUBJECT: REGARDING ROGER SHANK'

I spent the day in New Haven and found interesting work.
Also, they'd
like to interact with us.

PARALLEL COMPUTATION

Prof. Josh Fisher is heading this. They have three
interesting
activities:

1. A compiler for building dataflow graphs that can be
executed
in parallel. I see this as an interesting program
for our
own PPA. They are currently using it to compile
fast
microcode for the FPS 164 (see below). The source
is T(iny)
Lisp, and eventually Fortran. Also, they compile
ELI as it's
designed.

2. The ELI (Extra Long Instructions) machine is being
designed.
Consider it as either an ILLIAC IV-like machine with
control

of all units or a microprogrammed machine. A long, 500 bits or so, instruction controls several (say 20) arithmetic/primary memory units. They want to finish the design and then get someone to build it. I said we might want to build it if someone would pay us to do it, providing it looks good.
(Incidentally, we need to build much, much more hardware to get the experience and learning curves!)

3. CAD is exciting, different but similar to our work on the 2080. It's written in LISP and starts as a data-structure. They're doing display programs that "view" and operate on this structure as needed. This is totally different than our CAD which starts with a display input. Also, they're working on automatic design across levels.

LISP

John O'Donnell (203-432-4666) heads their center and is remarkable in his understanding of hardware and software. His group is doing T-LISP, and they are quite concerned about a really good LISP on VAX.

They may be a resource.

PROF. MARTIN SCHULTZE (APPLICATIONS)

Is doing programs for Numerical Analysis of Scientific problems (CAD, CAM, Scientific Dataprocessing) including VLSI. ESG's supporting his work. They're building a large memory for the FPS 164 and it also attaches to VAX simply. He said the problem with a Cray is simply not enough memory. He thinks an FPS (or even a VAX) with 100 Mbytes will outperform it due to I/O limitations. This means PPA should have 128 Mbytes! (Only a $128K at current prices.)

He's like to work with us on microcode for the 780. Their compiler really addresses the difficulty in programming the 164. Shouldn't we simply build the large primary memory for the system, and market: a 780, large memory, the FPS 164, and their compiler?

ROGER SCHANK, DEPT. HEAD (436-0606) AND AI RESEARCHED

ROGER SCHANK, PRESIDENT, COGNITIVE SYSTEMS INC. (203-773-0726)

They have 15 or so programmers and want to build and sell an AI-based Small Business System. They're leaning toward Appollo. Julius had better get Bob Daley, Bill Noyce, Norma Abel, John O'Keefe et al there to persuade them to use our VAX (LISP) since he wants to decide within a month. The goal is a less than $50K system for 6 users and LISP and a good database system. The Appollo will be down to $20K in a year. Let's sell VAX!

The breadboard of this system is quite impressive and convincing!

MESSAGE ID:
5180564403

SUBJECT: A UNIQUE OPPORTUNITY TO USE AI AND GET A JUMP ON SM
BUS COMPUTER

Roger Schank, head of the CS dept at Yale and President of Cognitive Systems Inc, 234 Church St., New Haven, 06510 203 773 0726 (Yale= 203 436 0606), is one of the major developers of natural language programming and has a company with 15 people who are dedicated to producing and marketing an AI program to help the small business by allowing the people to interact in english.

They have an incredibly impressive breadboard that runs in Maclisp and are moving it into the development environment on the 750, and then on to a particular computer for sale. They have to make a choice in the next month because they need to select the bread and butter database etc so as to finish the application.

Roger believes that 50K for a 6 user system is the outside price, and we can do this with a 730, even though his technical
folks are worried about the performance.

Currently, he's tending toward Appollo because they'll have a 20K system in July.

I said, no way, we have a super system with a big disk (which they need), plus we have a commitment to get LISP running competitively, plus we will market the hell out of their great, unique product. All they have to do is to write the program and to stay out of the marketing and distribution nightmare.

Here's a group that has much very good technology, and would like to show the world. They want the product out in droves. Let's help them (and us). This could really establish a high water mark(et), if we do the right thing.

Could you guys go visit them and look at it and see how we might interact?

(PS.
I'm a raving advocate for using AI to solve some of these really messy heretofore intractable problems.)

Harold Cohen
University of California, San Diago
LaJolla, California 92093

Dear Harold Cohen:

I was happy to receive your letter; in particular, the piece with your wife began to give me an idea of this work. The drawings just came and I'm really grateful for them. One will be hung in a prominent place in my office.

I'd like to explore the possibility of adding your work as a panel in what we call the DEC Distributed Museum. Here, we'd have a short (about 10 minute) recording together with slides. A brochure would include some of the slides together with the text of the voice. How much would you charge to make such a tape, with a few slides?

As to whether we had any quid pro quo, either explicit or implied: we clearly did not. I expected nothing, aside from some good will, from the venture...I don't want to jeopardize that by my actions now. The misunderstanding is two way: I was recently reprimanded by our Contributions Committee because you had implied that I had offered to continue support. To this I said: 1. We had one satisfactory deal, 2. I would hope that you would get the money to buy a computer from us somehow. (I had forgotten how badly universitites administer themselves in regard to capital equipment and salaries. This is probably compounded by proposition 13.) I didn't comment on whether we should support you or not, only that I would hope you would try to buy a DEC machine.

To: Harold Cohen July 12, 1978

Let me urge you to go through Ron Masulla, and get Dave Williams and Noordhuisen to write letters of support for a contribution. Ron should propose to help you as he sees fit. I know we support the Boston Museum of Fine Arts, and I believe your work is a lot more relevant to art and us. The work is really great and I support it too.

I hope this clears things up a bit and that we can find a way to help you.

Sincerely,

Gordon Bell
Vice President,
Engineering

Dear Bernard,

re: The Computer Comes of Age

Not being an historian, but being an engineer, the number of errors in this book were extremely troublesome. However, the biasses and lack of a very wide view of computing were even more annoying, and the end, made me very unhappy. Errors and biasses of this kind only compound the problem of history. I feel further at a loss for not reading French so that I don't know if the errors crept into the translation or were present in the original work.

The work does provide some source material and information on French computing that is not otherwise easily available, but because of the incredible inaccuracies and biasses, one would be foolish to trust it for anything other than a rough guide to references. This is the strongest positive statement anyone could make about this book!

The troubles started at the first sentence of the preface. Most American's think the "Mark I" and the "Harvard-IBM machine" are the same thing, when from the later context one learns that the author must be referring to the Manchester University Mark I.

Then on the first page of the introduction, the last sentence of the second paragraph is misleading. The term "computer science" had yet to be coined by Perlis and Newell in the letter in Science where it was first argued in 1967.

Now, let me just take a few instances at random.

Page 20. Most authorities use 1887 the year of the patent for the date of the Felt Comptometer (not 1885). And Burrough's patent was 1888, although The Science Museum catalog notes that he was working on a machine as early as 1880.

Page 61. Engineering Research Associates, ERA (not Electronics)

Page 65. The first "ideas" (not use) of "magnetic" cores was made by Forrester for Whirlwind in 1949. In fact, these were a Deltamax material, not the ceramic derivative from Philips that was ultimately used.

On the same page, "But RCA was never able to make this work". If "this" refers to the Selectron it is incorrect. If "this" refers to the Selectron for the IAS machine it is correct. Either way the translator has created confusion. Since translator's note were included about random ideas, then one on An Wang's contribution would have been appropriate.

Page 91. First paragraph is full of mis-information. It is probably very dangerous to call the SEAC the first computer to use transistors. While it may have had a few transistors, it had no effect (that anyone can trace) on the full-scale use of transistors in computers. Were the transistors in the SEAC from the beginning? added later? What were they used for? The debate that we have on the "firsts" of the transistor machines are (1) Bell Lab's Leprachaun, 1956, (2) Lincoln Lab's TX-0 (project start in 1955 and operational in 1956) to test the Philco SBT100 surface barrier transistor (costing $80 each).

The Philco story itself is not told well: What is the project start and delivery of the TRANSAC S-1000? The Philco 210 (predecessor of the 212) and delivered in 1958 is omitted. Also there's Cray's first machine at Univac that he designed for the Navy which was operational in 57. Who built the Atlas Guidance Computer Model 1? Another claimant is the Siemens 2002 and the transistorized machine built by Ziemanek. The final sentence about CDC discounting and delivering product in 1958 is unbelievable. Somehow, about 1957, the summer in which both CDC and DEC were incorporated, it became clear that transistors were the next technology for computers and then the question was designing, retooling, and getting to the market with a product.

The next paragraph is again confusing. "the design of the CDC 1604 was the work of the founding members, Seymour Cray." (The word "one" must have been left out.) Should the appropriate company name be Sperry Univac rather than Remington Rand? The evolution of company names is important too. The CDC 1604 was not available until late 1959 or early 1960, not 1958. It could more logically be added to the listing at the end of the second paragraph on page 92.

p 92-102 is poorly organized for what should just be a description and commentary on three interesting machines. I would hardly put the Gamma 60 in the same class as the Stretch or LARC in terms of either power or influence. It was an interesting machine, but virtually unknown to everyone from engineers to historians. In writing Computer Structures, I looked at it carefully and could find no real influence on any successors. It was clearly sort of interesting, but naive.

Pages 104-105. The section about DEC probably has the most errors. This is doubly embarrassing since the source is given as The Computer Museum, but Gwen can find nothing in writing. Usually The Museum refers such authors to the book, Computer Engineering, a history of DEC's computers that I compiled in August 1978.

The names of the machines are PDP-1, PDP-4, etc., always with a hyphen. The company was incorporated in 1957 (this mistake does not fit with his data on the second page.) The D in PDP is Data, not Digital. I was the project engineer of the PDP-4, not, Gordon Hall. The memory capacity of the PDP-4 was not the same as the PDP-1. 45 PDP-4's were built, not 65. Ken Olsen's name is spelled with an e.

His brother is Stanley. Harlan Anderson was a co-worker at Lincoln Laboratory. (There is no d in Harlan.) John McCarthy did not design the PDP-1. The first one was sold to Bolt, Beranek & Newman (not company), not built for them. John McCarthy was consulting for BBN at the time, and developed his ideas for time sharing from working on the PDP-1 (and I'll be happy to tell you that anecdote some day.) One of the first papers on time sharing lists McCarthy, Boileu, Fredlein and Licklider. (It was Boilen, and Fredkin, which was misspelled several times and ways.)

I would have happily checked the data on DEC, and Fredkin is an MIT professor, so there are probably people there to check MIT facts. There are errors surrounding the MIT people and work.

Page 106. Title The CAB 500. (No dates of project start or first delivery so it is hard to argue.) "These were the minicomputers, so named to contrast them with the top-of-the-line machines." The word was coined and used in the mid-sixties to denote a very specialized kind of machine, not to contrast them to large machines in the same line. The whole issue of upward compatibility is quite different. Ralston's Encyclopedia has several pages defining the characteristics of minicomputers and this is totally a misuse of the word. The IBM 1620 along with the G-15 and LGP-30 while small do not fit the definition of minicomputers.

Page 132-3. Under memory it is confusing to use the word "ferrite" to mean core. Drums are also coated with a "ferrite."

Outside of the errors, a basic problem of the book that makes it useless for any historical work is summed up on page 166:

"PAF vanished with the CAB 500, but it had a famous descendant,
BASIC, produced in 1965. Even if the authors of this language did
not know of PAF, BASIC had the majority of its features."

The facts here might be correct, the intrepretation I give is: "let's rewrite history as it might have been" is inexcusable, especially by anyone who has a title of

Scientific Director. BASIC had characteristics that were taken from a variety of languages, including Algol, Fortran and JOSS -- people were working on the same problems at the time. But Kemeny and crew made BASIC work. If they had stolen the whole language of PAF without reference, then the story is different. The section on PAF as a descendent of Fortran does grate on the reader, in light of the lack of data. The two source books I use, Sammet (Programming Languages) and Wexelblat (History of Programming Languages) don't mention PAF.

All of this may be excused, providing good clean fun for the nitpickers of this world to correct, but the conclusion on p 196 is the most offensive statements I've read in a long time:

"It is no exaggeration to say that there has been no fundamental development in computer science since 1963." (p. 196)

As an official Computer Pioneer, this would be nice to believe, however, since that time, I count fundamental developments in timesharing, packet-switching, artificial intelligence, distributed computer systems, algorithms and high level languages. For example, MIT and Harvard spend a lot of money trying to advance computer science. Moreau's statement says they've failed. This statement, which the book fails to either posit or communicate, shows the author's ignorance is only exceeded by his arrogance.

The standards for a history series cannot allow so many spurious errors and misinterpretations, especially published under MIT's label.

A recall is in order -- the book is filled with defective parts and harmful to our health.

Cordially,

Gordon Bell

SUBJ: The Colorado/Disk Issues

To: Phil Arnold, Bob Jack, John Kevill, Demetrios Lignos, John Meyer, Bob Puffer, Mike Riggle, Grant Saviers

Date: 5 JULY 78
From: Gordon Bell
Dept: Office of Development
MS: ML12/A51 Ext: 2236

I wouldn't have believed there could have been such a change in attitude by such a separation so quickly, but there is and we have to work hard to avoid it affecting us. The Colorado Engineering team is very good, and with the close coupling to manufacturing, we should produce some great products. The issues:

1. The Mass Storage Strategy-It's good to get Grant back here in working the strategy. This has to include an overall idea how/why more should go for more Mass Store. IF we can get the NDS thing together, that's an avenue, because it'll relieve some funds that would have been spent on handlers. This is going to be even more difficult in the event of any further downturn of sales or the economy.

2. Tape Problem-This belongs to us all. What is the right strategy in light of increasing costs in field service, the Springfield plant, and the engineering budget? When I look at the reliability figures for TU 10,16 and 45 I shudder; however, is the TS04 going to be any better? We have to get a reasonable fix through DMT. Given the TU77/78 fiasco, we have to have something. Somehow cutting a project that could potentially produce revenue seems bad...on the other hand cutting a project that could be a continual engineering drain if the mechanics are fundamentally poor is smart. This will have to wait until we have DMT, design and TU77/78 licensing

etc. information.

3. RL Futures. This one is clearly Phil's to drive. Mike has some independent funds to do things he feels are necessary, plus any support from Phil. It is up to Phil to get a plan in place that makes sense with the resources (including Mike and Fred). I'm leary about already deciding what the product should be at this time. I would like to see the space of alternatives and see them plotted on a 3 dimensional surface (you have the equipment there to do this). The things I'd like to see include time plots of development cost (including the cost to get the unit into production), product cost, number of bytes, cost/byte. The plots would be for a number of alternatives, not just the ones the customers think they want today. Phil, when can we have a look at the alternatives? Wouldn't a cursory view like this be the basis of an advanced development plan since each of the alternatives would have a set of components on which the alternatives were based?

4. AZTEC. I'd sure like to understand it as an advanced development project as it relates to the possible various alternative projects. Mike, is this plan available?

5. R81. The same is true for the R81 as for the RL04, but with one major exception...we don't have an R80 yet. This work has to be coupled even more gingerly so that the R80 is not disturbed. Demetrios has the driving responsibility, when he is ready. Until then it is clearly Mike"s.

6. Overall location of Mass Storage engineering. This is something we all have to work. Given the large number of engineers who are working in the mill and who don't want to go to Colorado, I don't want to force this. We are going to have to have meaningful work in both locations. I've been disturbed at the rate things have moved contrary to what I believed was right or what I thought I agreed to. The R80 was one case, and more recently there has been the case of the NDS.

7. NDS. At least at this point it appears to have a user. There are no agreed on specs, and at this time, the concept hasn't yet been made to work and still deliver the performance. I thought I said no movement of people until a prototype and till the specs which could be built exist. Neither of these conditions exist. Furthermore, the architectural team has only produced what seems like a rat's nest of components interconnected in an ad hoc fashion. The current approach to architecture (adding more people) will only result in higher costs and more kludginess. Therefore let me reiterate:

> No one is to move to Colorado on the NDS team until there is a spec, a working breadboard at the necessary performance level, and an architecture (interconnection of components) that I consider reasonable.

We have the potential for great products now. Let's not blow it by bickering. There's more work to do than any/all of us can do. Let's focus on this, not the charters!

SUBJECT: COLORADO VISIT (AND SOME COMMENTS)

GB5.54

Thanks for the hospitality and lively interaction on Tuesday. I promise it won't be so long till the next visit, which will hopefully be on a scheduled review. It should be more lively after I recover more and get back into the product contest.

Some comments:

1. You folks sure have a full plate and exciting time ahead with the aggressive product plan.

2. The 4-HSC/12-780 Cluster under test was really impressive. The team is to be congratulated for getting this all to work. Two of Bean's observations should be acted on immediately: special training is required to install and operate a cluster; and diagnostic hardware of some kind is required to monitor transactions in order that complex system faults can be located. (These predominantly software problems almost require a time stamped log of CI messages. Maybe this could be a special microcode package in one of the 780's.)

3. I hope you'll declare the HSC a combined hardware/software system and start following Software Engineering design, releases and support procedures -- which are well documented. Unless this is done, there'll be no one field trained and capable of solving HSC problems. It's clear the HSC is a major, evolving software system that is only slightly smaller than VMS and TOPS. Also, this would mean that project management is software and systems-based rather than what appears to be part hardware with lots of "microcode".

4. I would like to see the latest articles you're submitting or planning for the HSC. Bill Strecker, Sam Fuller and I are writing a book on the overall architecture. The HSC is a key chapter. Can you send us the articles? (We may want more written on it.)

Could you also send the Hughes slides which show the number of processors, programs and speeds of the various parts of a cluster -- together with measurement data that reflects various loads?

5. QDA is critical to both Seahorse I and II (MicroVAX version) I believe. Unlike Gutman, I don't think we can wait 3 years! (We really do need it within a year -- and that's 6 mos. after Seahorse starts shipping.)

6. I strongly support the plan for an early ship of a combined file/database server based on Seahorse, Seaboard, and JRD. Why can't you declare that you're building this server? The only weakness is there's no disk (QDA) for it!

CHALLENGES IN GENERATING THE NEXT COMPUTER GENERATION

Even before the Japanese told us about the Fifth Generation, Computer Generations have been of interest--what they are, why they happen and especially the next one. This fascination surrounds a computer structures taxonomy essential for The Computer Museum and understanding computer evolution. The Museum must have a way to contain and segment ideas: by generations and by information processing structures. Observations from our past and present will help in creating our future.

WHAT IS A GENERATION, now that we need one?

A generation is simply the convergence of:
need (in this case--threat of military and industrial annihilation) which frees resources;
technology, science and ideas to build from; and
organizations to build
new computing structures.

Finally use will confirm a generation after the fact.

The whole process is like a cyclotron and a generation is one or more trips around. The concept to "do a machine" is injected into the accelerator at some stage... I'd like this to be needs driven to a large extent. Technology is the first stage, architecture and design are down stream, followed by the actual construction and manufacture. System software further accelerates the electron. Algorithms and use with critical evaluation, which we often ignore, provide the final stages... and of course by now, the particle has gone around once. And now it is ready to be accelerated again and attain the critical energy level necessary for real use or for going around again. For many generations, going around twice constitutes a new generation. The first time around a new structure is formed, and the second time around it is made more useful and gains market acceptance. Clearly the Personal Computer (PC) was like this: the very first PC, the LINC, now in the Computer Museum, cost about $40K in 1965 but not until 1975 with the microprocessor was it viable from a market perspective. The PC actually took about three trips around to reach the high energy level characteristic of a Generation. The Apple and IBM PC characterize the second and third times around the ring. Now a trip around takes less than 2 years. This process is highly evolutionary with all parts of an industry acceleration.

Richard DeLauer, of DARPA, claims the U.S. is working on the Nth generation, and I believe that the Fifth Generation is already cast, even though the Japanese are laying claim to it.

WHAT IS THE NEXT GENERATION?

Last week Alan Perlis spoke at The Computer Museum, and in passing gave a number of his pearls:
"If a computer understands English, it must be Japanese."

My concern is that the Japanese have already won the race to the next generation. In the past, no one was interested in a race, contest or game. In fact our strength was the independent, uncoordinated inventors of board games, physical skill games, simple intellectual games like Chess or complex ones like Go. Now as a guerilla warfare army, we've been drawn into a contest where we seem to be forced to compete and where we have no knowledge of the rules. We have no notion of how to pick teams or whether the game is played with teams or individuals, and whether more or less resources count. In the midst of all this, many forces are moving people among institutions.

The Japanese evolutionary approach to engineering and their leverage of the world's research has been impressive. They understand the notion of long term processes and learning from the past. We also can learn from the past.

Observe how the Japanese understand this notion of generations and evolution. The concepts of AI and AI workstations have existed for years in the lab. They started with a DECsystem 10 and are making the very best workstation hardware they can to execute LISP and Prolog at a factor of 10-20 times the large system! In parallel, they're working on significant real applications and trying to develop the engineering discipline. Finally, they'll use and evaluate their applications and workstations in order to go around again at a much higher performance level. They plan about two more evolutionary cycles by 1990: use with critical evaluation, re-architect, build, deploy, then repeat the use and evaluation stage to start around again. The important thing is to start with use NOT revolutionary new structures!

In a recent talk, Mike Dertouzos of M.I.T. says there are 4 ways to beat the Japanese in the forthcoming race:

1. $100-200M to develop high speed computers with AI functions
2. an open policy toward foreign workers in industry and academe
3. tax credit for long range and in accord with national policy
4. careful re-exmination of antitrusts to permit consortia

He also argues for foregoing the traditional short term gain at the expense of long term R and D.

The above 4 points do raise questions:

1. Where's a reasonable plan that would spend $100M in a coordinated fashion? Won't a large budget just serve to swap a fixed set of people from place to place? Postwar university research has been run as independent, decoupled projects. Can we change to a more coordinated, directed approach that a new generation requires?
2. Although we have been successful and probably need an open door policy, is this really a relevant success factor?
3. Where is a national policy or plan? R and D credit may just go right to the bottom line of a corporation to increase earnings. Similarly, few corporations are equipped to do either credible or useful research. Even Advanced Development can be a conflict because few managers understand the differences between product development and product enhancement, let alone concepts of basic and applied research. There is poor understanding of these activities and we clearly can't manage the flow of ideas through the stages. The Japanese are masters at moving world research into products.
4. We have several consortia but they have taken a long time to establish; antitrusts may not be the issue.

Now, we must learn from Japan about how to define, establish and then execute projects. The Japanese Fifth Generation effort appears to be 3-5 years ahead of us because they understand large scale, long term interacting processes and they have a plan that started in 1980 and based on the world's research.

For example, in contrast to the Japanese directed and evolutionary approach, we have many projects aimed at designing and building revolutionary machines at various universities to exploit fine-grain parallelism. All, violate the historical notion of evolution since they start with a structure that looks interesting to build with new technology and not science, programming technology or a problem.

They all involve incredible personal commitments. How many revolutionary computers can we really afford to build to completion with analytical use? Are we prepared to run these 10 year, very high risk experiments?

WHAT IS THE FIFTH GENERATION WE'RE ENTERING?

The need is intercommunication.
The technology is VLSI which permits powerful microprocessors and Local Area Network interconnection.
The technology permits building: Personal Computers, powerful personal workstations, multiple processors for fault tolerance and performance.

WHAT IS THE NEXT GENERATION?

The emphasis is on Artificial Intelligence applications with voice and natural language communication, built with VLSI and ULSI and predicated on a high degree of parallelism. Furthermore, the new structures will supposedly be revolutionary!

For any generation, we need a clear view of the target and the problems standing in the way. Although fuzzy, the Japanese appear to have a view and an approach. Finally, the notion of revolution is not consistent with a next generation.

Only a handful of real AI applications, including "expert systems" are in operation. A future predicated on parallelism is equally risky based on past results. Thus, a computer can't be evolved unless a model of use exists. Revolutionary machines usually fail even though they often provide useful by-products. Breadboard of the real structure usually operate in a previous generation. Do these structures now exist?

THE PLAYERS

Even with all the caveats participation is required by everyone provided we can have a more focussed approach. Even a guerilla army needs some leadership. In the past, DARPA has indirectly provided this leadership and science for industry in the form of timesharing, speech understanding, graphics, packet switching, and most recently VLSI.

Universities played the key training and scientific discovery roles in the past. The university role is vital because the science of parallelism is underdeveloped, ULSI is too hard and we have little understanding about communication with people.

Jay Forrester, who headed MIT's Whirlwind and invented the core memory, made several comments on building machines in Universities that still hold today:

"Experimental equipment merely for demonstration of principle and without inherent possibility of transformation to designs of value to others does not meet the principle of systems engineering".

This lesson should govern building new experimental machines: Unless a machine provides about an order of magnitude more power to the individuals who may use it than is available to them, there will be insufficient pull to attract users and test the basic idea. In other words, don't build toys. However, building experimental systems today appears to be even more difficult than in the past.

WHAT CAN BE LEARNED FROM PAST EXPERIMENTAL MACHINES?

Table I shows several university-based computers in the first-fourth generations. Nearly all were useful in training engineers and scientists. Some machine not only were especially useful, but in addition trained users and provided insight into various algorithms.

Harvard's Mark I played a role in the search for the computer. The main architect, Howard Aiken was not particularly gracious in acknowledging IBM who actually designed and built the Mark I, which might be considered an impossible to build machine were it not for IBM's impressive engineering. The later Marks weren't near the state of the art, and none were as influential. However the most important by-product was to train individuals who have influenced computing.

Columbia was influential when Wallace J. Eckert got IBM to build the SSEC computer, a first, pre-computer generation machine composed of relays and vacuum tubes and using many of the techniques derived from the Mark I.

At the University of Pennsylvania, ENIAC was the truly revolutionary machine because it provided several orders of magnitude more performance than the Marks or the Bell Labs relay machines! The stored programs concept came from the ENIAC. The work lead to EDVAC, IAS, the University of Illinois' ILLIAC I, and then indirectly to the computer industry.

MIT's machines were evolutionary in structure, but revolutionary in technology with Whirlwind. Later on the TX-0 and LINC were also successful and influential. TX-0 took about a year to design and then was in use over 10 years. The well engineered, state of the art circuits were the basis of starting Digital Equipment

Corporation.

A machine rarely pioneers more than one aspect of computing: current technology, architecture, on application (use).

UNIVERSITY OF ILLINOIS

Illiac I was built in the IAS and von Neuman architecture. The real contribution was the detailed circuitry and logic that permitted copies to be made at various laboratories. The machines had a long life resulting in contributions to knowledge and use about software and applications.

Illiac II, a transistor circuit-based machine, operated three years after the start of the second generation.

With a new architecture, new circuits and logic, the machine, was completed three years after significantly better industrial machines, e.g IBM 1401, 7090, CDC 160/1604 and DEC PDP-1, were available.

Because there were so many new, risky parts, conservative and obsolete technologies were selected (i.e. germanium versus silicon transistors, discrete wiring versus printed circuits), creating an unwieldy machine. Furthermore, asynchronous logic and a small memory were used to further slow down the system. Although the machine was designed to be a very high performance computer, the industry moved past Illiac II and hence the notion of building experimental machines at universities was squelched for sometime.

Illiac IV came out of the Solomon project described in 1962. Illiac IV, a truly revolutionary machine, was put in service in 1975 and operated at 250 million operations/sec. with a total of 64 parallel processing elements controlled by a single instruction stream. A memory hierarchy for the processing elements of 1 Mbyte (RAM), 2 Mbyte (core), and 139 Mbyte (fixed head disk)--clearly violate Amdahl's constant of 1 byte of memory for each instruction per second.

Dan Slotnick, the designer of the Illiac IV commented:
"Most machines come about through evolution and that's counter to the notion of original research which is supposedly the basis of

university rewards." The activity of building a machine for study entails major engineering; this too can conflict with the emphasis on science.

"I'm convinced that universities can't and shouldn't build machines. There are too many ideas, too much democracy and too little discipline. I used to have to stop the flow of ideas on interconnection every week when we were designing Illiac IV. There is also too much bureaucracy. In a state university it takes 90 days to get an IC."

Larry Roberts, who headed DARPA then, claimed that it was absolutely clear that the machine should have been done with TTL and not ECL technology. "People complain bitterly, but in the end, conservative technology seems to work out better." (This is what I like to define as a tradeoff of instructions per second versus instructions per month. Not getting an operational machine limits its life and delays the essential purpose of the original design--which should be to understand if the structure can be useful!

The contributions of Illiac IV were mostly as by-products even though it did operate as the world's fastest machine for some problems until the Cray 1 came into production. A number of people began working on parallelism at Illinois and elsewhere. The fast semiconductor memories that resulted from the effort were essential for all machines including the Cray 1. Illiac IV may have stimulated TI's ASC, CDC's STAR and the CRAY 1.

CARNEGIE-MELLON UNIVERSITY'S MULTIPROCESSOR

CMU's machines, designed to obtain experimental results about parallelism were more evolutionary and had more side-effects for a smaller cost than Illiac IV.

Multiprocessors are intriguing to an engineer because performance is obtained by replicating a simple design instead of massive design. We must understand them so they can be applied to real use. Furthermore, multiprocessors represent another form of parallelism whereby multiple instruction streams operate on multiple data streams.

Multiprocessors were studied at CMU in the late 60's, and Bill

Strecker's 1970 thesis computed the performance for p processors accessing a common memory of m modules. This main reference work for multiprocessors was rejected as the first paper on these structures because it wasn't relevant at the time. There have been dozens of subsequent theses and papers during the last 10 years which embellish the model, and all reference the Strecker thesis.

Today's research on switching structures which focuses on thousands of processors and memories seems to be completely irrelevant because we have no evidence that over a few processors can operate in parallel on a single problem. In fact, in a recent visit to the University of Illinois one researcher stated to me that he wouldn't work on a project of only 32 processors if it couldn't be extended to 1000! This prevailing attitude which focuses on the exotic completely masks the more difficult job of building and what may be the impossible job of using such a machine. Thus we have a paradox: we have no real demonstration or understanding that more than 10 processors can be used effectively; on the other hand, the researchers who must provide this fundamental understanding have no interest in developing an understanding because of the focus on finding switches for several thousand processors.

The issue is not the switch performance, nor finding exotic switching structures, but simply: getting on with finding out whether multiprocessors can work together on a single problem. This is a combination of architecture, system software, language and algorithm design. I believe that if anyone can demonstrate that a small scale multiprocessor of say 10 can work routinely in production, we can extend this to a large scale multiprocessor of 100 and then to 1000. Note, the Japanese Fifth Generation project is predicated on parallelism.

<u>C.ai</u>, a multiprocessor with 16 processors for AI research which had a one gigabyte, very high bandwidth memory called C.ai was proposed in May 1971. <u>C.mmp</u>, a much simpler design, was in place using 16 PDP-11 processor modules in August 1971.

The project had two goals: a capability based Operating System based on changing the PDP-11 and to examine the use of multiprocessing. The addressing problem using the PDP-11 became a major issue and problem.

The project is well documented including what was learned in Wulf's book on Hydra. Maximum speedups were hard to obtain. It is unclear why C.mmp wasn't used enough for applications, but on the other hand we know that any machine must provide more computation than is available by other means in order to be attractive for users. By 1978, the CMU computing environment had more machines which were easier to use. Ironically, not everyone on the project learned about the small address problem when they went on to design the Intel 432.

Cm* is a set of computer modules which permit building a medium scale multiprocessor of 50 processors in an open-ended fashion.

Cm* was an evolution of C.mmp, and foresaw the notion of functional multiprocessors that is used in Intel's Multibus. Cm* used the same C.mmp operating system concepts. Even though any processor could access any memory, there was a preference to a local memory, or to other processors within a cluster of 10, and finally to memory outside the cluster. Thus, the machine is problem idiosyncratic because the access time varies whether data is in local, in the cluster or external to the clusters. The structure of computation and data with respect to particular physical structures is being understood using Cm*.

Significant work is needed before these machines can work together harmoniously without extensive hand tuning of programs. The evolution of Cm* from C.mmp paid off.

For Multiprocessors, the progress has been slow. In each generation, there is renewed optimism in the concept. In the mid 60's with large computers and mid 70's with minicomputers, I felt multiprocessors were the best way to provide more computation. Now since the smallest unit is the very high performance processor with the characteristic that the smaller it becomes, the faster it goes, multiprocessors must be an important way to increase performance. Also note that many companies are finally offering multiprocessors in all product ranges: supercomputers (Cray X-mP, Dennelcor), superminicomputers (ELEXSI), and micros (Synapse).

Maybe there are reasons why multiprocessors have not been used

appreciably:
. we always find a simpler way using technology or instruction set (e.g. vectors) to provide high performance
. engineering has been too conservative
. operating systems and languages haven't supported or encouraged them
. too many other ideas are present and in use

no market because users may not be able to program them/no product to test a market

With the advent of several commercial multiprocessors, it is critical for universities to become involved in use and providing understanding.
Human organization theory doesn't seem to help the work on parallelism except in an anecdotal fashion. More than a decade ago, Melvin Conway wrote that people build computer structures like the human organizations they know. This explains why n people build n-pass compilers; IBM build hierarchically structured protocols like SNA; ARPA has to have a store and forward net independent of its users; Digital builds democratic (anarchic) structures like Unibus, Ethernet, DECnet and multiprocessors.

If we could use human organization theory it might shed light on parallelism from structures that are connected together in particular ways. It might also explain, like humans, why its difficult to get more than six processors to work together--unless totally top down directed with clear goals (like, capturing a beach or hill). For now we need to concentrate on the general case of multiprocessors because it has the ultimate in connectivity via the memory. Slow or restricted networks such as LANs, trees, hypercubes, etc. can come later after we understand the general case.

Some general observations about the experimental machines:

1. nearly all the machines were useful in training computer engineers and scientists

2. early machines tended to be built for use, not understanding and hence had longer lives.

3. machines with long gestation risk a long life or being useful

due to obsolescence from competitive approaches

4. later machines tend not to be used because other production machines are available as such their contribution has to be to science

5. unless a machine is used, its contributions to understanding algorithms won't happen

6. a single machine is unlikely to pioneer more than one aspect of architecture, technology

7. revolutionary machines such as Eniac, Illiac IV and C.mmp provide understanding and by-products that are more important than the use.

Given the concerns, but yet the need for research, there are several ways to do this work:

1. cheap labor of graduate students... brilliant, but unpredictable. Not recommended unless the machine is easily assembled from well-defined industry standard modules or computers!

2. professionals within the university which create a second culture. This structure is somewhat difficult to manage and unstable, but essential to building a system within a university. This is what has been done at the CMU projects.

3. jointly with a company. A hardware/software split may be the right division of labor whereby universities do software. This was used in the PC generations. Why not do it again? It's being used at CMU with IBM for products. The Japanese companies build machines for the various universities, especially at the University of Tokyo.

4. as a separate company outside the university and fueled by venture capital.

Contrary to popular opinion, I believe large amounts of money will cause excessive swapping of people and further perpetuate the erroneous economy-based notion that money can be traded off for science ideas, and talent! The money comes from two sources:

1. The government. This acts to simply churn the small number researchers moving them from place to place. The nice effect is to raise everyone's salary.

Since these research projects are large, they require professors to be good project managers in a university environment designed for teaching. Large projects diminish freedom. By becoming managers, the reaction after a few years may be: why work at sometimes lower pay, lack of freedom and without adequate engineering resources. This provides a target for industry to scoop up kernels of the nation's "seed corn."

2. The Venture Capital world which draws people from established industries and academe into often mundane and low tech products because of the risk. For example, one high tech company started up in March and were shipping your generic 68,000-based UNIX product in 9 months, the standard gestation time. A company of 4 recently, built one board and assembled a UNIX product. Others build NOTHING but merely assemble.

Many believe that entrepreneurism is the way to beat the Japanese because it unleashes such an incredible amount of focussed energy--but I wonder if the Japanese are going to feel threatened by 123 different kinds of 68,000 based workstations! On the other hand this system has funded really creative technology, e.g. Amdahl's Trilogy Corporation.

Today the result of several recent dissertations at Stanford has been a chip, program, algorithm or system capable of starting a company. Recent examples at Stanford include Clarke's Geometry Engine the basis for Silicon Graphics; the Timing Verify of Widdoes/McWilliams, the basis of the Valid Logic Company; and the SUN terminal, the basis of SUN Microsystems. So finally people can rapidly progress through the cycle from freedom to fame to riches.

I don't know what the final answer to the question of how do we continue to generate interesting generations. But it is clear we've got to get organized. Or in the words of Pogo, "we have met the enemy and he is us."

SUBJECT: COMET MCA

Sounds like we might get somewhere.

A crew of Rothman, Armstrong and Melanson and possibly Hanneman if we need to push the packaging density very high could get us the information quickly as to whether this is a crazy idea or not. The back of the envelope notion of scaling says: Comet has a 2 ph clock of 140ns each. If we scale by a factor of 5, then each phase is 28 ns across 5 boards for the cpu. The roms are about 60 ns, and when scaled to ecl gets us 12 ns (which is also available).

Maybe it's all crazy. All I know is that Venus looks very good as a design right now. The numbers of bugs to be found looks real according to Ulf's model... and we aren't yet in a mode of finding them with the simulator very well yet. Competitors are coming out of the woods daily for the Venus and we need a product bad. Bob and Ulf have managed to get a design without the continued slip (only a month is 6 months, versus 6 months in 6 months). The machine still looks 27 months away.

LSG has a factory to design pcb's, backplanes, and mca's.

Surely that could be used to get a machine quickly if this turns out to be a reasonable approach.

SUBJECT: MCA750

I've just released the new version of our router and am now between projects. (except for bug fixes that may be be needed).

What's happening on the exercise to put comet into MCA technology?? I got a note from you about a month ago to convene
a group to look at this, haven't heard anything since. Rothman
called me the other day to find out what's happening. I haven't started
doing anything yet.

I"ve recieved an analysis done by Steve Jenkins/Don McInnis last
August that proposes an MCA Comet design and makes it look very unattractive.
How is this different from what your exercise is aimed at??

I've tried to call a couple of times, no luck. Let me know what
you'ld like to do.

bob

CC: OOD, Marketing Committee

The review was to the point. Please convey my congratulations to the presenters and groups who are doing a really fine job with COMET so far.

As I tried to point out in the review:

1. We intend to ship at least 50 COMETS/week at $80K/machine over a 50 month period.

2. The product has a fixed end of life, hence any slip, cuts the NOR by the amount slipped.

A one-week slip causes $4M loss in NOR.

Let's keep the schedule!

I just saw the list of features that were requested in VMS release two and find that most of them were of the above type. I'm sure every operating system has the same list! We have really failed in our design technology and now have to rely on hand-crafting components. In reality, no real intellectual talent has been applied to automate this. Although we do have other parts of engineering that are as art-based, let us move immediately to understand what the task is involved in these designs so that we can move to a more engineering oriented endeavor. In fact, given that ATT is offering to support 500 terminals in ACS, they must know something we don't.

It seems to me that design of a communications line handler (complete with tests and diagnostics) ought to be fully automatable from the specification in much the same way a compiler front end is generated from the syntax spec. Failing this, we have to find some other way to get out of this abysmal hole we've dug. (In the case of VAX, I would assume there is some method to put it fully in the user space so it doesn't have to be done in such a hand-crafted fashion requiring stand alone time.)

Would you first meet and figure this out, and then get me together with some of the right, bright people that are responsible for and rely on this work and propose what you are going to do?

Now that you're taking on a focus by business, who's looking after the DDP-type product sales channel?

Are you depending on the OOD process to do most of the product definitions in this area?

There seem to me to be countless product opportunities...like we never had before, and I feel we're going to really blow them without this market focus. To name a few:

1. Products that support DECNET in a very low cost way. Shouldn't we have made DECNET versus SDLC chips?

2. Significant Comm. products based on fewer chips like the 8080 microprocessor based products that are LSI-11 based? (These might flush the LSI-11 package?)

   a. Time division multiplexors (i.e., concentrators).

   b. RJE terminals (DECOPS? front end).

   c. Store and forward networks such as the one we need and are planning internally. (Our customers are asking if they too, can easily build their own ARPA nets.)

   d. Protocol changers. Dedicated hardware may get us around some of the complex software.

Based on our latest product pricing approvals, I don't believe we're leading here.

Can we answer some of these questions this Red Book?

Our customers appear to be using DECNET. Rather than taking the laissez-faire attitude toward it, could we really aim toward it being the standard?

follow up 1/22/79

Having spent time plowing through the MDC morass of crappy, information polluting market surveys on ACS, and getting some idea about it:

1. We ought to assume ACS is going to happen, even though the development appears large and the demand (hence installation delay) is enormous. (However, they aren't spending that much on development.)

2. Given the demand, we could/must provide back-fill and compatible products. Here, our ACS-watchers aren't doing an adequate job! George, will you:

   a. Really tell us what ACS is and the penetration vs. time.

   b. What products built by us, our OEMs and users does it impact.

   c. Propose what ACS-compatible products for the large, in-house use market would look like. (This is equivalent to ACS-PBX.)

3. The impact on us of ACS, etc. could be large because:

a. IBM will do the job through the 8100's with AT and T providing copper.

b. AT and T doesn't do it and creates demands and standards.

c. AT and T does it and much business goes away.

4. For now, I don't classify ACS as having significant data processing even though it does have memory and data-conversion (transduction). Because it just:

a. converts from any character - oriented through batch terminal to any other terminal format for entry into a computer including time multiplexing of multiple lines. (Note how much of our business is in front-ends for this purpose?);

b. stores and forwards messages from terminals to other terminals and/or computers (how much business is in message switching?);

c. interconnects computers for message switching.

Only b provides more than Telenet, even though a is more extensive.

5. AT and T has an abysmal record with providing cost-effective communications for computers! They'll probably screw this up too. Can't we win in its wake, chest thumping and promises by offering a working, ACS compatible alternative?

Dear Jon:

I have not made detailed comments, but here are my impressions after reading it a couple of times.

Overall, the book needs to be published very rapidly. The situation is that a number of universities and companies are building multiprocessors and there is no theory, experimental data or framework to support the efforts. This book provides real data from one of the three, large working multiprocessors -- so it's badly needed. Also, the classification (taxonomy) of parallel processing is quite good.

I see it as a book that a number of people will want in their libraries because of the myriad of experimental data, the framework and definitions. It is clearly an advanced treatment and would be either the main text or the principle reference text for a course on parallel processsing (pp). The figures, equations et al are fine. I see need for all kinds of courses to support the multiprocessors that are beginning to emerge in droves. It would be used within DEC for their parallel processing, by professional seminars (several should soon be devoted to the topic... this is an idea for DEC Educational Services), and graduate courses or seminars.

Right now, I see it as a 6, but it could get to 8 or 9 with some work. What I want is a little more concreteness: I would like to see the syntax/semantics of what the user actually programs in either the text or an appendix. Also, it is necessary to show the time for the various operations like send / receive, statements, floating point, etc. There should be a chapter on a real live example (one that was highly successful) which gives the code, measurement, comparison with say a VAX, etc. The process of breaking the code down for parallel processing would also be useful and covered in the example chapter.

I'll be happy to write a jacket statement on the next revision.

Sincerely,

Gordon Bell
Vice Chairman, Technology

GB14.20

cc: Dan Siewiorek
Thoughts stimulated by the Poduska/Apollo 13 December 1983 talk:
Apollo... has gone for quality people who have a very good understanding of the industry. The only thing to stop them in getting to $1B by 88 is IBM, when it gets the workstation... it seems determined to get. DEC is clearly no threat even though there are a few tiny islands of competence in a sea of incompetence.   DEC is the source of people... just as Honeywell staffed DEC in the 70's.

This is another clear indication of a generation: the new structure surpasses the old, a new industrial layer is formed and the high output people leave an organization to build a new one. Honeywell folks left to come to DEC. The good folks of Prime, DG and DEC now leave to form the next generation based on Micros: Masscomp, Apollo, Sun, Sequent, Dataflow, etc.

IBM... which I believe was based on the OEM market models of the old DEC. IBM also learned about university interaction from DEC. IBM is fundamentally structured around Independent Business Units which are entrepreneurial centers. IBM has quality folks who can manage.

PRIME... all fouled up and probably irrecoverable until it gets a new head. Options are to be a marketing company. It's technology is nil. Henson's experience of service was wholly inadequate for running a company. Prime's success came from unique products in the early days which allowed building a total oranization. Finally, its success was its sales force being incentivised and in effect being the entrepreneurs of the company.

DG... looks quite good! The new IBMers, Chapman and Miller are impressive and have brought in a deeper understanding of the industry, management, computers, quality, manufacturing, and technology. The power has been distributed in an entrepreneurial fashion. DG will grow at a substantially higher rate than DEC or Prime, but not at Apollo's.

DEC... is unworkable and headed nowhere. There's no overall control system given the destruction of the Product Line structure which, in the past, provided a product check on engineering AND MANAGED the field (because sales was not incentivized). Now, no one manages the field sales. The company lacks entrepreneurs, and top management lacks basic understanding of products, industry, and quality (as say compared to DG). The large functional organizations (sales, engineering, manufacturing and marketing... whatever that is now) place responsiblity squarely and solely at the top! It can now only prosper by divisionalization of some sort. It is too large to be a functional organization like it prospered on. Lack of checks on Ken as President, CEO and COB together with a nil board means more stockholder suits... I'll bet Caldwell will leave the board soon. There is clearly no successor to Ken.

I agree and support this, in principle. Right now we have made deals with: Cal Tech Craig Mudge is there and we give ~ 100K/year in equipment discounts; Stanford discount (mainly for CS work); MIT (wants some LSI-11's); and now Cornell.

These 4+ CMU and Cincinatti are the only schools I know of doing anything in LSI. We Need them. I only worry about the interface, priorities of which to use and the value received.

For Cornell and others, the important output has to be getting graduates.

The sources of funds are: microproducts, other development groups, a product line and a corporate contribution.

Dick Clayton, Bill Green, Bob Puffer, can you get a policy/plan together here to address the problem?

It's up to you to get the money for Cornell, although I can't see giving them money unless:

1. we get something in return;

2. someone interacts with them; and

3. they put up half the money!

I hope you took from the Stratton Mountain meeting the fact that we really need LSI for this product strategy. Also, let me encourage you to get the tapes and show them to the LSI group because there is a strong dependence on LSI for the interconnect structure. The backplane interface can not be done without it and if we don't have this, then we get a whole bunch of non-compatible computers all done in an ad hoc way.

Regarding our Tiny versus Pusart discussion. Since I didn't especially favor doing either of them, I can be neutral. However, independent of the outcome which I trust you will measure, there is a significant difference in the two. Tiny, is an 11 and it interfaces to a well-defined industry standard bus and it will let us build systems we could not otherwise build. Pusart, is a cost reduction and we can get similar and probably even better parts outside. In no way do I believe there will be any products built with it that could not have been done with off-the-shelf parts. Thus, it violates the first law of make versus buy for DEC: We make what we sell, not what we buy...or don't make it if we can buy it.

In contrast, doing the Squid interface would have gotten us higher payoff in terms of use, allowed us to build systems that could not otherwise have been built by getting rid of lots of parts, and it would have been just as challenging. Alternatively, getting an interface to the industry standard chips that a version of Squid might have been would have had still higher payoff.

Somehow having gone over our discussion and thought about it some, I believe our thinking is at odds and I believe, because you have some power and influence in what we are LSIing we had better get together. I have some direction in mind for the parts we need, and your logic is such that these parts will be precluded. Maybe Jim and Joe should join us, or I'd be happy to come to WZ and discuss viewpoint with rest of the group too. This might be worthwhile because I'd like to congratulate the group on the Fonz and the Comet and encourage them to lobby to get us into the high volume business by having us get 23's out in the volumes that Intel and Motorola does on their 16-bit chips.

Your move.

THE AVAILABILITY OF ONE OR FEW CHIP MICROPROCESSORS WILL CAUSE TMR SYSTEMS TO BE BUILT AS THE STANDARD. THE LARGE ADDRESS SPACE OF THE 38 WILL (COULD) HAVE SOME BIG EFFECT ON PRODUCTIVITY. THIS REALLY SHOULD EFFECT OUR DATABASE WORK.

STANDARDS COULD REALLY BE IMPORTANT, AND THIS WOULD BE A BIG CHANGE (NON-EVOLUTIONARY).

THE VOICE I/O COULD REALLY HELP IN THE DOCUMENT PREPARATION (LETTERS, MEMOS) AND HIGH VOLUME TRANSACTION PROCESSING (BILLING, WAREHOUSING, ORDER PROCESSING). IT WILL COME IN TO A LARGER DEGREE.

THE AUTOMATED OFFICE IS GOING TO NEED A STANDARD INTERCONNECT SO VARIOUS
PARTS CAN COMMUNICATE. WITHOUT THIS STANDARD, A REVOLUTION WON'T TAKE PLACE.

THANKS, GORDON FOR THE IDEA. IF YOU HAVE MORE, PLEASE KEEP THEM COMING. I AM
VERY CONCERNED THAT WE ARE FAR TOO INTROSPECCTIVE IN OUR PLANNING, AND THAT WE
FAIL TO LOOK AT ALL THE THINGS THAT COULD HAPPEN FROM COMPETITORS AND NEW
PEOPLE ENTERING THE MARKET. FIVE YEARS AGO YOU WOULDN'T HAVE FORCASTED THE
AVAILABILITY PUSH THAT TANDEM REPRESENTS ... AND THAT IS MINOR COMPARED WITH
SOME OF THE POTENTIAL FROM THE JAPANEESE.

DO YOU HAVE ANY FEELINGS ABOUT THE ROLE OF VOICE REPRODUCTION AND VOICE
RECOGNITION THAT MAY EXIST EITHER NOW OR IN FUTURE. I AM CONCERNED THAT
T.I. IS DOING FAR MORE IN THIS AREA THAN WE ARE, AND I AM SURE THAT IBM HAS
STUFF ALREADY DESIGNED. THIS MIGHT BE A MAJOR CHANGE IN THE USE AND
APPLICATION OF SYSTEMS THAT COULD MATERIALLY CHANGE OUR CONCEPT OF THE
AUTOMATED OFFICE.

I WOULD LOVE TO HAVE YOUR VIEWS ON THE AUTOMATED OFFICE CONCEPT ALSO, IF AND
WHEN YOU HAVE THE TIME.

THANKS.

THE ONLY THINK I CAN THINK OF IS GETTING TOGETHER A VERY HIGH VOLUME, HIGH
QUALITY TERMINAL COMPUTER AND MUCH FORWARD PRICING! A JAPANESE CONSORTIUM
WITH TV PRODUCTION COULD DO IT, BUT I DON'T THINK THE JAPANESE ARE THAT SMART
YET. ALSO VIDEO DISK AND LOW COST, LARGE DISKS WOULD BE USED FOR READ-ONLY
AND READ-WRITE DATA BASES. POSSIBLY TI'S LOW OST THRUSTS WILL TAKE AWAY SOME
OF OUR MARKET.

THUS, WITHIN 5 YEARS, IT COULD BE VERY HIGH VOLUME EVOLUTION (INCLUDING
DISKS) FORWARD PRICING AND GOING AFTER FULLY DISTRIBUTED SMALL RELATIVELY
PERSONAL MACHINES. SOFTWARE WOULD BE DONE THROUGH A MASS PUBLICATION
ENVIRONMENT TO REDUCE COSTS. FIVE YEARS SEEM TOO SHORT TO SOLVE THE PROGRAM
PROBLEM EXCPET IN THIS FASHION.

SUBJ: DEC then and now; Should we have a commission plan?

TO: Al Bertocchi, Win Hindle, Ted Johnson, Andy Knowles

Date: 7/10/78
From: Gordon Bell
Dept: Office of Development
MS: ML12/A51 Ext: 2236

I just talked with a friend of about 16 years and who has supplied DEC a service primarily to the sales organization for the last ten. One of his relatives has just reapplied to work in the sales force here and is now deciding whether to work at DEC or Prime. As a salesperson who sold several 10s he is heavily biassed toward Prime because:

1. He believes life at DEC is too soft and there is no real incentive to make the numbers. He thinks a commission plan feels better.

2. Prime sold themselves and moved fast and is confident. In contrast, it took three weeks for us to return a call, and even longer to make up our mind...even

though the credentials were in order.

3. He viewed the internal structure as political versus results oriented.

4. As a former salesperson, he disagreed with whether they should go after a sale. His management tended to not go after sales unless they were really easy. (Don't go after it if it looks like too much work.)

5. We have this really long (years and years) backlog, and DEC is soft because of it, and there's really no big challenge to bring in the sales. (Ted this must be the supreme sand bag...cause I sure don't know about the backlog. Do you?)

My friend apologized because their relative was awfully hard-driving and probably wouldn't fit in anymore.

As a separate issue, he was asked to bid on a service (through Al's organization) and never heard back. I told him that's the way big companies operate and you don't have to be polite. We were really doing him a favor by asking for bids. The issue was whether an outside company could supply for $8/unit what it costs DEC internal $10.50 to supply and he had bid $8.50 on.
I said we found someone for under $8 (I assume), and we'd be back next year after they went out of business.

Overall, he felt the quality of people and the esprit de corps had declined, but was resigned to it because that's what all big companies are like. He has been impressed with the people overall and believes we should do well because of the people in the management structure. Still has the euphoria that DEC is great, though mature now.

Subject: **Our Commitment to NEC; Future Dealings with them as an OEM**

To: Don Frost, Yu Hata, Carl Jansen, Ted Johnson, Julius Marcus

Date: July 28, 1978
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

CC: Ron Smart

We had cordial meetings with NEC regarding our supply of 11/70's for what seems like a joint venture into minis into the NTAA (IRS). As an Operations Committee member I voted to support this. Now, I hear us weaseling out of this and it seems like we can jeopardize the success of the system because they can easily misapply IAS, DBMS and DECnet. We have to keep close enough to know when this is happening and we must inform their management too!

I invited Dr. Ishii, the head of this group, to visit Carl and Julius and Ken in Maynard to confirm the support and reaffirm/clarify the commitment we have. We also have to discuss any concerns vis a vis their plan to take our technology (DECnet, IAS, the 11/70). I suspect their only interest is in DECnet...and that should be copyable from the published documents.

I also suggested they simply buy 11's (for their mini) and backward integrate using the 11 by making memory, attaching their peripherals, etc. This gets them a full mini line quickly without the expense of manufacture. Currently they build Level 6, and this seems like a waste of resources when they could buy cpu's from us. It's possible this could be another Plessey, but I doubt it. Instead, we get a supplier of 11s in end use.

As an aside, I suggested we tell MITI to adopt the 11 as a standard, just as they have with the 320 for minis. This is clearly intriguing.

28 February 1982

Dr. Peter Friedland
Dept of Computer Science
Stanford University
Stanford Ca. 94305

Dear Dr. Friedland,

Sorry we've had so much trouble communicating. Here's some information that will be called to you. Some people/places:

Companies:
Appollo, Bill Poduska;
Three Rivers, Brian Rosen or Ed Fredkin;
Ungermann- Bass, Charlie Bass;
Xerox Dave Liddle, Burt Sutherland, Adele Goldberg, Bob Spinrad, Butler Lampson (really interesting);
IBM, Lewis Branscomb, B O Evans, Herb Shorr;
Intel- Noyce or Gordon Moore (maybe preferable) on semiconductors, also Ted Hoff (one of micros people who is now working on speech;
Dupont, very good use of graphics and computation for chemical synthesis, Dave Pensak;

DEC:
Bell, Sam Fuller on LAN's and perceived impact;
George Champine, Graphics and large personal computers in science Avram Miller, low cost personal computers;
Jack Gilmore or Bob Travis, Office Automation (word

processing, typesetting, electronic mail);
? or me, LAN's to distribute processing to control and accumulate data -- here we have a breadboard system that I might talk about or it could be a seperate session (I can get a good speaker); Maurice Wilkes, a computer pioneer is with DEC now and responsible for building the Cambridge ring system;

Univerities:
NY Institute of Technology has by far the most impressive graphics, their head of CS Dept. (who I can't remember) might be a great keynoter or graphics Dave Denniston can find out;
U of Rochester on LAN's good on theory, Jerry Feldman;
Stanford has an impressive lan plan and some good work;
MIT has the largest operational network;
CMU is building the Spice network in CS, and Al Newell can point to the right person or give the talk

Government labs:
I've been impressed with the work at Los Alamos and Livermore vis a vis their extensive local networking, graphics, and functional computing. These are probably the lead institutions. George Michaels at Livermore and Dale Sparks, head of LASL would probably do a good job. Alternatively they can point to someone.

One of our persons in marketing, Dave Denniston, 617-467-6960, has agreed to be available with ideas to talk with you. Here, he's suggested people at Dupont (Dave Pensak, above), CMU Brookhaven, Chemical abstracts for data base, Yale, and Washington U for lab automation. I recommend working through him to get ideas for some of the more advanced systems.

I believe Meade has the best overview about VLSI and its impact. He is also stimulating and imaginative. Could be a keynoter.

I'd be happy to give an overview talk on LANs as the pivotal emerging computer structure of the 80's. This would be as a computer architect, computer scientist interested in computer structures and computer historian (I'm the curator of the Digital Computer Museum).

I'll be back in town on Monday 8 March.

Sincerely,

Gordon Bell
Vice President of Engineering

Subject: **Communications and Networks Product Line Reorganization and/or Field Focus**

To: Operations Committee, OOD,
Bruno Durr, John Holman,
George Plowman

Date: 2 MAY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

Summary

We have the basic communications and network products, but there has to be a way to get them to the customers, and currently there is a very noisy, high impedance, low bandwidth path. Our future of Distributed Processing depends on the expertise we have to help design (in the field), install and support these products. Let's really clean this one up now as it represents a true product and set of people resources that we need and can capitalize on!

In our deliberations about P/L reorganization, as I visit the field, and as I listen to our own internal development group, I would like to plead that we must have a field-oriented organizational entity that worries about the development, marketing, manufacture and support of communications and network products.

I can restructure the development to focus the hardware, software, and terminal support aspects even though there are many interfaces within engineering, but I am concerned about our lack of field focus. For example, building a simple network requires a highly intelligent customer to be highly dedicated and take a high risk! There's no one there to help him very much. We have people internally, who if organized could provide a unique sales opportunity.

History

In the past we have vacillated about whether there is any such thing as a communications market because so much of our equipment has communications options on it. Now with networks, nearly all products connect to existing computers or to systems through communications equipment. The old DDP product line started out this way, but got attached to selling some equipment to bankers for funds exchange and suddenly they thought they were in the financial marketplace, knowing essentially nothing about banking except that they used computers to transfer information. At this point they stopped selling products that were strictly communications and we have lost much of the field expertise to understand and sell communications.

What a Communications Market Looks Like

Technically, a communications product is only concerned with the transmission and switching of information, and possibly only a minimum amount of information storage of information. That is, products do not look at what they transmit except to route it in rudimentary ways.

The Customers

There are many OEMs who buy equipment for this purpose, including our largest, TELCO, who is devoted mainly to this use. Others include Rockwell who builds message switching, time division multiplex voice switching, and call unit trunk switching. Others make central office and PBX equipment. The unique aspects of this market are RAM parameters (reliability, availability maintainability) plus expandability because all systems are built to cover a wide range of applications, and occasionally there are some interfaces to terminate digital or analog communications lines, although most of the OEMs do this themselves.

This market also includes the OEMs who will sell either software or services for electronic mail (e.g., Computer Corporation of America). There are also OEMs such as Telenet that might buy our machines to provide a communications message switching service or function.

Finally there are all of our end users who must solve complex communications problems (e.g., terminals multiplexing) or who are now building DECnet systems to interconnect their computers. With a really great DECnet, this market is now ripe! We somehow have to have the people in place who can most often add the necessary interfaces, install the software and add the message switching hardware to allow our computers to communicate with one another in the way they should. In some cases, we don't have equipment -- and this has to be factored in!

Alternative Organizations

0. Make it part of TELCO.

1. A separate product line could be put in place which would couple with engineering to really focus products (and the interface with other P/Ls would have to be carefully spelled out to stay away from hassles...I think it could be).

2. We could put the strength

into software support. They have this now for DECnet, but there are lots of hardware issues too, and I don't see this happening very well. Also, I believe there are so many sales/field organizational and inefficiency problems that work probably has to be taken out of these organizations, rather than increasing their size.

3. CSS is already in the field and could get a group that helps design and install these systems.

GB6.5

I'd be happy to discuss the products--will you set up. I'll send some memos of about 3 years ago when I was trying to figure

out what a VT-phone should be. As I recall, it needs a plugable rom--to add functions,
battery backup, ability to be a speakerphone. The functions it
needs to carry out to unclutter the desk are: VT (1 or more virtual ones), phone, clock, alarm clock (with lots of stops/ messages, phone directory and calculator.

In addition a user should be able to instantly switch contexts.

Haven't thought about the switches for awhile, but wouldn't mind.

"CC" DISTRIBUTION:

FU 6/24	BILL AVERY	JIM CUDMORE
KEN OLSEN		

GB3.S1.4

Just read the Distributed System plan for the 80's and don't believe we have competitive communication options when one considers the cost per line and the processing overhead associated with communication handlers. For example, combo cost/line = $150 in .1hex, and PLUTOS = $300 in .5 hex/line. Furthermore, we have no understanding of whether PLUTO will increase or decrease communication overhead in VMS. Also, we are really spending a disproportionately large amount for dist.sys., getting further behind, and losing people. Do we have adequate understanding about our position?

Note that many COMM options including the CT (regular COMM and TMS), VAX combo, modems are either done or funded outside the Distributed System group. What is the interia and push for good COMM?

Reading has to take a short term view of providing gateways within VMS, since we can't build our longer term gateways because we have no low cost 11's. Also CSS builds cost effective options for lots of applications. Since the schedule on this software is also so far out, it would seem like CSS, UK Reading, MK or TW hardware groups could get us suitable hardware for making cost effective gateways. Why not move aggressively to get good low cost QBus options so that we can build gateways? Note that there are a substantial number of chips that provide for levels 1 and 2 in hardware. With the new 64K chips, one gets an 11/23 processor and 128 Kbytes on a dual! Thus with two duals, we could build most gateways as standalone products. Furthermore, they could even be mounted in a VT100 as the box, console, and power supply. Bernie, I think you have to get with Bill and Mike (and then CSS) and address our whole Distributed Systems needs and then parcel out clean charters so we can start winning.

EXT: 223-2236

LOC/MAIL STOP: ML12-1/A51

SUBJECT: EXECUTING THE COMM., NETWORKS & INTERCONNECT STRATEGY

BACKGROUND

It's clear we have to change our plans for communications, networks and interconnects, as several of us (VMS, Comm./Nets,
Small Systems, and Interconnect) discussed.

The combinatorials are getting us and are going to get worse:

8 operating systems (vms, 10, 20, m, m+, rsts, rt, ssc) x

4 types of hardware (programmed or dma) on Q and U busses x

2-4 line types (asynchronous, synchronous) x

(DEC + IBM + 7 x X.25 + ?) Protocols where
 DEC= versions of DECnet + various terminal protocols + NI
 IBM= terminal + bisync + impending versions of SNA
 7 X.25 dialects, all of which will evolve
 ? = other vendor interfaces

If there were only 1 protocol, this would get us only 64 different versions or variants of software! However, protocols are emerging as we sit here.

To make matters worse, we have declared to the world that we are going to build Ethernet networks for local interconnect, yet we have no really significant product plans. Too little, too late.

PROPOSAL

Stop all hardware options for Unibus, and build options that can be used on Qbus systems and as a Qbus Concentrator/Gateway, QCG's

Don't do Mercury on CI, as it is not part of the eventual plan to distribute communications on the NI. Build Mercury ASAP as the higher end, reliable QCG. In some way get a QCG now, using a 23.

Accelerate NI interconnects to all machines > 44's, such that QCG's will be used for all comm., terminal, and gateway support for all systems. Introduce no new support on these systems.

Begin to cost reduce the QCG's when the software requirements are adequately known to address the systems on the 44 and

smaller.
... in short, INTRODUCE, THEN COST REDUCE! .....

On very small systems, support only a limited set of direct terminals, and protocols and rely on the NI as the world gateway.

ACTION

I want to get a task force together now, to explore this rough plan...or another one that is in line with the strategy we put forth 2 years ago. We are doing so many interim products that we never get to execute the basic strategy.

Bill should get us together to see how we might proceed.

What you think?

<>slide of product segmented/level of integration stratified
This generation is based on a large set of product segmented industries that are organized by levels of integration strata. Entrepreneurial energy fuels the individual companies of the product industries.

<>Venture_Entrepreneur_Cycle
Using the basic instincts of fear and greed, entreprenurial energy and venture capital greed and fear drive the company formations... these supply the critical needs that free resources in what now appears to be a never ending cycle like

a perpetual motion machine. The release of this energy and capital can only come about if the basic technology supports new products. This generation has been on a long, steady role since the development of the microprocessor and may continue for awhile as long as technology progresses.

<>Slide of 4G
This generation, which is called the fourth, independent of whether we call the next one the fifth, sixth or simply the next one is based on standards. Note it is an evolutionary one based on evolutionary semiconductors especially the microprocessor and large semiconductor memories, magnetics and communication technology. Use is evolutionary too, providing much more access to interactive computing by using Personal Computers instead of shared systems. This wide use creates a a massive interconnection problem which the generation must solve. This in turn demands the use of all kinds of Local Area Networks and the necessity of standards. Like other generations, we won't understand the real nature of generations as measured by useage until 10-20 years from now.

Previous products provide the critical goals for what are mostly evolutionary products at lower cost and much higher demand. Demand for minicomputers doubled each time the cost was reduced by 20%. Occasionally, revolutionary products emerge based on new technology, but these are surprisingly rare. Though semiconductor technology evolves rapidly, measured by speed and density, it is evolutionary.

<>2 slides of structures made possible by the micro (AEA/Rodgers)
Unlike the previous generations where the processing element and memories constituted a large fraction of the size and cost, with the microprocessor, these parts are a comparatively small part of a system. Thus, many more structures are possible.

Previous generation products are the goals. For example, most business plans start with the goal of building a better VAX at a lower price using one of the three microprocessors or they combine micros to build a higher performance or higher availability machine at the same price. The final section of the plan lists a VAX 750 as capital equipment. This is the ultimate form of capitalism. I feel like the capitalist who sold the rope to hang himself. As a startup now, my PC at Encore Computer is a VAX 730 and most of the Encore companies have 750's.

To beat the VAX is an important goal, but constraints are also important because they help focus. Standards are the constraints for finding the target or at least defining the class of games or race courses we run. Defacto and industry standards allow the statification by permitting incredible parallelism in the development of products. In this way one can build new systems quickly by assembling lower level standard components quickly.

I intend to explore, in a somewhat rambling fashion, the nature of standards, and ask that the next COMPCON be completely devoted to standards because they form the constraints necessary for both evolutionary and revolutionary technology, processes and products. The conference would ask

- what kinds of standard and what are needed for the future -- without constrating creativity
- what are the goals and constraints for various standards
- what are the responsiblities and behaviors of various organizations, manufacturers, professional organizations, governments, academe
- how do standards form, ie timing
- when do you leave things alone, when do you evolve, and when do you throw out and start a new path

My obsession about standards lies in a belief that the lack of standards at various levels of integration has been both costly, is simply non-productive and impedes technological progress more than any other factor. At least 50% of our efforts seem to go into supporting redundant work. One of the questions such a conference might examine is the economics of supporting multiple standards.

We can observe the effect of having a good standard in the case of the IBM PC. It came at a propitious time-- concurrent with a processor capable of accessing a megabyte of memory, the 64K chip, widescale availability of 5" floppies, and just prior to the availability of 5" winchesters. The great progress or rather explosion in software came about because people could work on applications instead of reinventing and porting operating systems for various hardware idiosyncratic PCs.

A guiding principle should be:
either make the standard or follow the standard!

On the other hand, a caveat about following de facto standards:
be prepared to react quickly and follow!

Those who follow the IBM standards might observe that IBM does change as in the 360/370 transition... ask the Amdahl corporation about this. We will soon see a repeat of this as the next IBM PC obsoletes a current product by providing a fully upward compatible product, but offering more capability. One can fairly accurately guess about the characteristics by looking at the 286 architecture.

Setting de facto standards such as the Unibus are important, because they are first and establish the way for succeeding product generations. To form an officially approved standard in 1970 for interconnecting computer components to form minicomputers just wouldn't have had any takers. Today, everyone recognizes the importance of the bus in building computer systems. Every company, consortia and many academics try to get one more standard bus or feature to ride the bus specification. Having too many alternatives such as the set forming 802 simply delays work on building networks and distributed computing systems.

<>Guidelines for standards
Given the desirability of standards, let's look at some heuristics governing them.

The first rule is to have someone (person, persons, a company, several companies) responsible for defining, implementing and caring for the standard. This is called responsiblity. Preferably the standard has to work in order for the individuals to be successful. Let me cite Ethernet as an example of this. All of the companies needed it: Xerox and DEC as the backbone of their produt strategies, Intel to sell chips. Rarely will we see such an important interconect need as the LAN. How it is implemented is moot-- the modulation and topology whether busses, rings, trees, or centralized switching is quite irrelevant except that it completely consumes us and hence we can't work on building the systems.

An equally important part of making a standard based on existence proofs is the ability to test conformance. This is another responsibility of the sponsor.

A standard must be real. The best way to insure reality is that it has been implemented before designing it with a committee who are sure to make it unimplementable. Unfortunately, when engineers get hold of a particular implementation, the temptation is to look at the implementation as a template, throw out the old, and extend it... not just use it in an upward compatible fashion.

Again, Ethernet is a good example. It took almost ten years to get a standard called 802.3 after the original Ethernet operated. The upgrade provided almost a factor of 4 performance improvement, but the delay in starting the understanding as to what is really wanted in Local Area Network was quite long. We should have simply used the old one to get more real experience. Here, a guiding heuristic:

> if you haven't lived with a new computing structure, use an
> arbitrary structure in order to get the experience before trying
> to design the ultimate system or standard-- the standard is much
> less important than its existance (will return

to this on UNIX)

While we're on the notion of reality, it is occasionally useful to have models by which new standards may fit such as the 7 layer open systems interconnect model. Here, again we might invoke the rule that implementation is a necessity. Had this happened, there might only have been 4, 5 or 6 layers.... or even 8. Unfortunately, every real implementation that says it uses the 7 levels uses the levels like one uses a metric ruler to draw on 1/4" squared quadrille graph paper. The lines on the graph paper serve only as reference lines for the infinity of figures that one can draw using the ruler. About every 2.5 inches the two scales line up pretty well.

This brings up the notion of the necessity for having a sparse set of standards for two reasons: First having too many standards is like having NO standards at all. The current plethora of LAN standards, including various digital PBXen, which I also call a LAN, is a good example of too many, with no basis of experimentaion. Second, a standard is hard to specify it every detail: I consider the Unibus to be a good standard. It specified a way of interconnecting a whole set of different kinds of parts, not just a pair; furthermore it showed the way for this generation of buses and the future generation of micros. Yet, it took about 8 years after the bus was in operation to have a really complete Unibus specification... even though hundreds of engineers had designed hardware to attach to Unibuses. In this regard, the standard should be understandable in various levels of precision.

A finally role of the responsible organization is evolution. With expoential change in virtually every dimension of computing, changes are necessary. Ideally, the domain of a standard is specified a priori so that one knows when it should be extended. Many standards, such as Fortran, live longer than the sponsor thought or intended them to. As a result, ad hoc extensions occur because everyone makes extensions and no one is responsible. It was felt that Fortran, now about 25 years old was dead, so why evolve it or work on compilers for it? It turns out that many use it and it does pay to really work on it, but that's the final line in this talk.

Finally, standards should be timeless, and failing the test of time should simply remain static and hopefully then disappear. But they rarely can or do.

<>Levels of integration in this generation
Let's get specific by looking at critical standards associated with various strata and product segments. About eight levels of integration form the strata, half of which are hardware. A given level has many product segments, with a given organization ususally excelling in only a few groups. That is an organization has culture and cost structure that constrains its behaviour. Contrast this with the complete vertical integration in the first generation where a computer company designed and manufactured circuits, peripherals, systems, operating systems, languages and applications. Standards provide clear constraints for building products within a given strata and segment such as the Spread Sheet Industry. For example, it is enlightening that data format standards have evolved for these various packages built by different software companies.

SILICON WAFER LEVEL
Rarely do we think of the Silicon Wafer as a level of integration. It is certainly not a well publicized or documented level since processes have been tradtionally been the jewels of a semiconductor company. It is realitively safe to predict that in our fairly near future, perhaps even the real next generation, many of the systems will be a single chip with up to 1 or 10 million thousand transistors. Of course many or even most chips will continue to be "standard" or combinations of "standards" such as microcomputers, peripherals and memories all integrated on a chip or even a large chip.

The creative products will come from the use of silicon using the so called silicon foundry industry that Carver Mead advocates. A good example is a product like the Silicon Graphics IRIS, which uses a ___________dozen? 40,000 transistor chips which Jim Clark calls the Geometry Engine and computes at the rate of ________ Megaflops, which is roughly equivalent to the power of a _______________ computer. One can invision hundreds of these sorts of systems which operate on all kinks of pictures, voice, and mechanisms.

We are nowhere near being able to realize such a scenario with today's state of the silicon foundry, mainly due to lack of standards in foundries and CAD systems. Standards are needed for the various approaches whether gate arrays, standard cell or fully custom chips are used. Let me list a few interfaces:

high level system descriptions
specifications of structure and behaviour, including
simulation at all levels
physical information for processing wafer masks (such as CIF)
control for foundry processes, especially if processing steps
become optional
chip test, including automatic generation of test data
chip assembly including bonding and multi-chip bonding

We must target the development of standard interfaces to languages and datbases that are communicable via networks. Agreeing on these interfaces doesn't limit the competitiveness or creativity of a given company or product, it simply means that users don't have to spend all their resources in converting among different formats or worry about being locked into a corner. Standards would let users mix and match different CAD systems in a completely flexible fashion. This would still let every vendor build their own editors, timing verifiers, simultators, design rule checkers, etc. but a user could interchange data among the various systems. The market would expand much more rapidly because users could buy without fear of being trapped into a particular system or format. This is completely analogous to the pre-Cobol / pre-Fortran where every manufacturer was pushing different languages. Everyone got sick of the situation and rebelled by designing COBOL.

When going to the foundry and testing folks, the user is faced with an equally fuzzy and perplexing situation regarding the characterization of a process including testing.

To clarify: this is a message to the foundries, CAD companies and failing that to the users to specify what they should be demanding.

STANDARD CHIP: MICROS, MICRO-PERIPHERALS, MEMORIES
The first rule of standards, having a responsible organization is critical and not well understood by all semicomputer manufacturers. Since the Instruction Set Architecture is the bottom level of integration that includes substantially more hardware in the form of busses, boards and systems and goes on to include operating systems and languages, the responsiblity of the semicomputer manufacturer is quite large! I'd like them to acknowledge this responsibility.

The microprocessor is at the root of most of our redundant efforts. A micro's life seems so incredibly predictable, following a time worn path with respect to its ability to accesses memory. A recent article in Computer Architecture News suggested that there are about 20 measures of word length. Only one counts-- the amount of directly addressable memory. Of course there are a few embellishments like data-types when considering performance. In 1976, having lived through a moderate amount of hell in terms of trying to extend the 11 and well along on VAX, it was safe to warn future designers of microprocessors. I certainly did in two papers. They didn't listen.

Unlike semiconductor process evolution, all users are dragged along as one evolves a simple stack idea that started out in a Datapoint terminal, went on to become the 8008, the 8080, the Z80 (by another company), the 8086, 186, 286 and more. As someone who has sponsored using many of these parts, I have been able to relive computer evolution for a third time... and frankly, this is boring as hell!
In the late 50's the folks at the University of Manchester, using Mercury, Ferranti's version of their second machine, developed a system that allowed users to

treat both primary and secondary memory as one. By 1962, the University had a breadboard for Atlas operating with a 27 bit virtual address. Atlas also had a number of other ideas that people continually rediscover, for example, in the last issue of CAN someone reinvented Atlas' Extracodes. Let's call Atlas the 0th time through because it was a university machine and there were only a dozen papers written on it, the critical one was repubished in 1971 in Bell and Newell but it was in the UK, and Ferranti only sold a few.

Having erred in a similar fashion on DEC's early minicomputers by designing two computers which had only 12 bit addresses that immediately had to be extended to 16 bits, I architected the PDP-6, the forerunner of DECsystem 10, with a 20 bit address in 1964. This was concurrent with the 360, which though having a larger physical address, only really implemented a small address... that's why the two versions of the 370 came into existence 10 years later with 24 and eventually 32 bits of address. The DECsystem 10/20 and the 370 eventually ended up with 32 bits of address, complete with paging, just like ATLAS, but about 15 years later. The mainframe was the first time through.

As the PDP-11 came out in 1970 with the goal of solving the minicomputer addressing problem by having a 16 bit address, the first customer demanded a physical address extension to 18 bits. Eventually, the virtual address got to 17 and the physical address to 22. For many years DECs engineering spent thousands of hours trying to figure out how to address more memory. Users spent much more time encoding programs in small memories. In 1975, we finally gave up and built the VAX 32 bit architecture with an embedded PDP-11. Other minis followed essentially the same path for the second time around, but most were on the east coast.

The micro was born on the west coast with the 4004 and 8008 concurrent with the extensions to the 11. These had 12 and 14 bits of address, hence why I wrote the paper on the 11 about addressing in 1975. The leverage of doing it right the first time was very high. Subsequently, the 8086 was extended to 20 bits and most recently to 24 bits of physical and 30 bits of virtual address. It is ironic that information on addressing didn't travel from California to Oregon where the 432 was developed, but then again Oregon didn't become a state until 9 years after California.

Motorola's saga is similar. National took the high road and simply copied VAX without violating the patents. Another tragedy. If an exact copy could have been made several billion dollars worth of software could have been made available! And many resources could have been freed for doing something creative or otherwise productive. Finally, with the micro we have everyone going around three times. The saga is not yet ended as we understand the ramifications of greater than 32 bit address spaces.

There is an equally tragic story about an architecture called CFA, for Computer Family Architecture, which is the defense department's version of VAX. This time, they could have used an exact copy of VAX. Won't our enemies just use US standard micros, and get the parts and software at least 5 years earlier?

With shifts in relative speed and sizes of on chip registers, cache memory and control memory, it looks like a return to simple, CRAY type load/store architectures which are implemented without microcode may perform much faster than architectures oriented to processing the data-types of high level languages such as the 360. Since these so called reduced instruction set architectures trade off microprogram control complexity for compiler technology, it would be well to find and use a single one rather than continual evolution.

New architectures, especially those which have gone along well travelled evolution paths, have cost computing at least half of our resources. The glib answer of using C and UNIX to obtain machine inddependence is deceptively simple and errorneous. A compiler for C or a compiler written in C is only a starting point for a product...

not the end. An architecture pervades virtually every part of a system and database.

When an architectue should be copied, evolved or thrown out and started over is fundamental to the notion of standards because of the tremendous user program and database investments. Let's understand it.

BOARD: BUSES FOR VARIOUS PERFORMANCE, APPLICATIONS, ETC.

The board level is similar to the Instruction Set Architecture story, except that busses have longer lives than specific instances along the evolutionary life of an architecture. For example, the various species of the IBM channel buses are now 20 years old and will no doubt continue for another 20 years in their current forms, even though many of the functions that a peripheral might perform could be handled in the same amount of hardware as that required to interface the bus. The Unibus is almost 15 years old.

The IEEE is in the business of blessing these buses and I don't understand the politics of this process. One manufacturer already has an adequate unibus-type standard to build multiprocessor and multicomputer structures. Does the IEEE support a bus indpendent of whether there are any riders? How many more do we need or can we afford?

LANs and LANCs ANOTHER KIND OF SWITCH

<>Ethernet, the Unibus of the Fifth Generation

While on the issue of busses, this is a fine place to discuss another important switch, we now call a LAN which is used for interconnecting computers and terminals in a local area. This slide is one I used exactly three years ago. Several of us from Intel, Xerox and Digital including Bob Noyce, Dave Liddle and myself presented the case for Ethernet as a standard and to show that we were committed to use it. It was useful because I wanted to convince all of the engineers working on the project of its importance. I attempted to show the need for the bus for building new, distributed computer structures or clusters of computer. Let's call these structures LANCs.

<>Unibus,
Note that this computer structure and the LAN/LANC are nearly identical except they are seperated by 15 years. The unibus is used to build a single computer from constituent information processing components such as processors, memory, communications equipment and terminals. It was designed to travel about 15 meters. Ethernet, or rather IEEE 802.3 allows a user to build LANs and LANCs. It was designed to travel several kilometers.

Digital needed a LAN to interconnect computers into a network and to be able to interconnect terminals to computers in an open ended fashion. I was receptive to using Ethernet as the wheelbase when Bob Metcalfe, its inventor, proposed the standard and consortia to built it. At the time, two experimental LANs were operating within DEC. While Ethernet was proposed as simply a network interconnect the main motivation was a bus for the evolution of two types of clusters: first, a single shared mini or large computer would gradually be decomposed into functional server components; and the proliferation of PCs would require intercommunication into a cluster formed by aggragation.

The key reason for the standard was to allow us to get on with building LANCs, which only a few organizations understand experientially. To reitierate, to propose a standard, one should have lived with it for awhile and really understand it.

In retrospect, getting anyone outside of the three organizations involved may have been a mistake... had we simply built the bus, and offered it as a LAN standard, the process would have been done quickly. Furthermore, instead of engaging in debate about something we knew little about experientially, we could have simply designed and implemented it 2 years earlier. What appeared to happen was that no one knew they needed a LAN, but when they found out one was being proposed as a standard, then everyone had a design to try.

The IEEE tried to help with inventing 802 and now have .3, .4, .5 and .8.   .9 is needed for PABXen and we'll soon need a second digit to add to the new proposals--still LANs and LANCs don't exist to any degree.

802.3 was allocated for the CSMA/CD type, or Ethernet. Since others would like lower cost LANs of this flavor, then several folks took the basic idea and built fully incompatible versions. Alternatively, the same energy applied to cost reducing Ethernet would have made everyone win.

Of course, one would like to have some sort of LAN on broadband, using a token bus technique, so 802.4 was assigned with only 3 incompatible versions.

Another early kind of switch, the ring came out of early work at Bell Labs, Cambridge and other places. Prime built such a ring, and when these folks formed Apollo, took this basic religion with them when they moved 15 miles north. Because rings usually require some form of central controller, IBM grabbed the ring, hence 802.5.

Since one can obviously use fiber optics for building LANs we require a fiber standard, 802.8.

802.3 can be transmitted on standard orange or yellow Ethernet cable; for others who like a simpler installation and will give up distance, RGU 58 can be used if you call it cheapernet Bob Metcalfe calls it thin Ethernet; Codenol has a fiber optic system using the same scheme; for those who like broadband there is a modem. The purpose of all these media is to be able to get users to build LANs and not to wait for what is really quite an arbitrary choice of media, and one which only delays the critical use. Surely someone could take the controller / transceiver interconnect and build a transceiver to operate on a ring structure. I hope this could also be used to adapt to high speed digital PABXen as they become available.

While we're on switching, the forthcoming high speed PABXen will permit the same function as the LAN, and hence should come under the 802 perview. It is imperative to have conformance at the higher levels. Can I suggest 802.9?

These alternatives for standards to switch information at a modern, computer data rate versus a scheme that evolved from the Morse code allows everyone to avoid working on the essential problem of building networks and evolving into clusters. Again, the multiplicity of standards delays the introduction of structures at least five years!

The glib answer to multiple or no standards is gateways. However building gateways is often about as easy as having a single train that can travel on different gauge tracks. It's fine when you reach steady state, it's the transition among track sizes that kills you.

ELECTROMECHANICAL ASSEMBLY: DISKS, I/O, POWER, ENCLOSURES
The evolution of small disks and tapes has been very impressive. I remember meeting Al Shughart at the start of Seagate when his greatest concern was making sure of a competitive second source with the same interface and form factor, which in effect creates a complete industry. This is the same formula that he used in creating the floppy form factors, standards and industries. The standardization process might be understood by these examples.

We also see the effect of edicted, blind standards when looking at the issue of keyboard thickness. The IBM PC's keyboard is designed to pass a particular national standard, but has little legs that are raised that make it comfortable to use. I've never seen one in use without the legs.

OPERATING SYSTEM: COMMUNICATIONS (eg. WAN, LAN), DATABASE, SCREEN
In 1966, a user could have a 300 baud Teletype using a phone line. By 1980 the speed of the common dial-up line

had been raised to 1200 baud. This amounts to a a performance improvement of less than 10% per year, and I believe the connect cost rose. This is not the kind of improvement we're used to in computing.

During this period, through computer controlled switching, telephones have gained improved functionality. All of the telephones systems are incompatible with one another at the user level beyond the plain old telephone. All have a relatively large manual and training to get back to the capabilities we had with multiple button phones. The new phones are not user friendly nor do they pass the ease of use test nor are they particularly helpful about adding or deleting the appropriate one except to say that what you've just dialed in is wrong. If a system is knowledgeable enough to always give you the same error message, then it should simply always fix the error.

We have turned a large part of our future systems development over to AT&T for one of the key interfaces by adopting UNIX. In fact, it is the kernel of the system, just above the hardware. When the Justice Department was playing God, why wasn't UNIXCO separated? Maybe it's the only money making part, especially at the price AT&T charges for royalties. Given the simplicity of UNIX, it would seem completely appropriate to install a venture capital offices around the various Bell Labs in order to extricate and form an independent, responsive company to evolve UNIX. Are all you San Francisco based venture folks listening?

The UNIX phenomenon illustrates some principles of standardization and I'm sure we can learn from it. Like all operating systems, the only people who really love UNIX are its parents and those who only grew up with it. This is a large set. It also illustrates a recurring theme of standards:

in order to make forward progress, one has to regress for awhile

UNIX evolved along these lines:

. UNIX came from a reaction by Thompson and Ritchie to MULTICS, the large, joint MIT Bell Labs project of the late 60's. It was written for a DEC mini and evolved to the PDP-11 in the early 70's.

. DEC didn't give away operating systems to universities-- especially the source code; UNIX was essentially free.

. UNIX is by most measures a very simple operating system, to do anything useful requires other programs such as database access, special communications, programming, etc. Students and faculty could understand all facets of its internals and use. It was written in a high level assembly language, C, and as such could be modified. It was an excellent pedagogical tool. Universities embraced it and trained many students with it. A built-in market.

. UNIX evolved to be used on other computers by being transportable. A team of people could carry it to another computer system, provided a C language compiler was available. This was something that early high level languages were supposed to do, but never quite succeeded with due to extensions for calling the operating system. In turn, this created the notion that it might someday be possible to have a complete system that was machine and manufacturer independent. Users like this idea.

. Chip makers and system builders who had no means of building software were able to get a system relatively cheaply. Thus, we have more support and the beginning of a standard. The semiconductor industry knows about standards.

. Much work is required to have a system that supports 80's computing concepts. This is why I worry about the control in a bureaucracy. The extensions include:

.virtual memory. This function was worked out about 5 years ago and has been in operation for at least 4 years in the verion of UNIX for VAX called 4.1! Recall the notion of virtual memory was only invented 20 years ago.

. special functions for real time and transaction

processing. UNIX is being extended and adapted in incompatible ways by diverse organizations.
.human interfaces that are competitive with the PC. UNIX grew up in a timesharing world using dumb terminals. Windowing and fast interaction are critical.
.multiprocessing. With the micro, many companies started up to extend UNIX for multiprocessing.
. networks. Given the origin of UNIX in a communications, we should demand modern communications capabilities.
.fully distributed processing across a LAN to form LANCs. The Universisty of Newcastle, Berkeley and several companies have all implemented incompatible systems for fully distributed processing. Berkely 4.2, which is being distributed is a good starting point.

UNIXco must take the responsibility commensurate with their selling of UNIX as a standard operating system. The notion of a standard is good. But it must be evolved more rapidly than any single manufacturer. It can provided there is parallelism in the development using multiple organizations. If UNIXco is the single company doing and blessing all the extensions, we have simply subsituted multiple competitive companies with a single, behmouth! The system has to be evolved in a reasonable, not ad hoc fashion. I think this is the most serious problem we have in extending computing today.

LANGUAGE: INCLUDING EXTENSIONS TO APPLICATION LANGUAGES
With the very strong concern regarding UNIX, C is a weaker concern. C is at the heart of applications portability. It's time that C be treated like a serious language, complete with standard.

<>picture of ACM september with Japanese and US going toward 5g
All the languages could be enumerated with concerns especially ADA, are important for this next generation. LISP has been proven to be useful for Artificial Intelligence applications. Like the Japanese, I believe

these applications may be the basis of the next generation.

LISP was defined about 25 years ago by John McCarthy while at MIT. I was so enamoured by LISP 20 years ago that I put the critical primitives into the hardware that ultimately became the DECsystem 10... still about the fastest LISP computer. LISP branched and created many dialects. One path went west via BBand N to Xerox, creating INTERLISP. Many dialects evolved from the original MIT LISP: MACLISP, Zetalisp, NIL, SCHEME, TLISP, Portable Standard LISP and now Common LISP the later two are vying for standards status. Virtually everyone who gets inside a LISP compiler or interpreter creates a new language. These languages are incompatible with one another and thus one can't benchmark, or use common techniques to bootstrap extend the language in a compatible fashion. Much work surrounding LISP is to make applications development easier. But given the number of dialects and the number of extensions to make development easier, I wonder if anyone is working on applications. The effeciency for normal development is 0.5 due to redundancy. This is high for AI applications because there is no standard base.

To reiterate, in order to get on with the business of applying AI, we need some way of sharing information across the various different languages called LISP. A serious standards activity is long overdue.

In fact, the Japanese were so confused about LISP that they totally gave up and went to Prolog.

Having extolled standards now for sometime, there's a downside. A standard provides an interface or target by which systems can be compared. Recently, the Livermore Laboratory kernel becnhmark codes expressed in 25 year old Fortran, were run in Japan on the Fujitsu VT100, VT200 and Hitachi 810/820. Using very good vectorizing compilers, all machines ran at a rate of over 2 times a Cray XMP. There is virtue of understanding the old and evolving it.

A PRODUCT SEGMENTED INDUSTRY, ORGANIZED BY LEVELS OF INTEGRATION WHICH FORM STRATA*, FUELED BY ENTREPRENEURIAL ENERGY

        sell (company); {for 100 times sales}
        venture_funds := sale_liquidity;
        end
```

<>slide of product segmented/level of integration stratified
This generation is based on a large set of product segmented industries that are organized by levels of integration strata. Entrepreneurial energy fuels the individual companies of the product industries.

<>Venture_Entrepreneur_Cycle
Using the basic instincts of fear and greed, entreprenurial energy and venture capital greed and fear drive the company formations... these supply the critical needs that free resources in what now appears to be a never ending cycle like a perpetual motion machine. The release of this energy and capital can only come about if the basic technology supports new products. This generation has been on a long, steady role since the development of the microprocessor and may continue for awhile as long as technology progresses.

<>Slide of 4G
This generation, which is called the fourth, independent of whether we call the next one the fifth, sixth or simply the next one is based on standards. Note it is an evolutionary one based on evolutionary semiconductors especially the microprocessor and large semiconductor memories, magnetics and communication technology. Use is evolutionary too, providing much more access to interactive computing by using Personal Computers instead of shared systems. This wide use creates a a massive interconnection problem which the generation must solve. This in turn demands the use of all kinds of Local Area Networks and the necessity of standards. Like other generations, we won't understand the real nature of generations as measured by useage until 10-20 years from now.

Previous products provide the critical goals for what are mostly evolutionary products at lower cost and much higher demand. Demand for minicomputers doubled each time the cost was reduced by 20%. Occasionally, revolutionary products emerge based on new technology, but these are surprisingly rare. Though semiconductor technology evolves rapidly, measured by speed and density, it is evolutionary.

<>2 slides of structures made possible by the micro (AEA/Rodgers)
Unlike the previous generations where the processing element and memories constituted a large fraction of the size and cost, with the microprocessor, these parts are a comparatively small part of a system. Thus, many more structures are possible.

Previous generation products are the goals. For example, most business plans start with the goal of building a better VAX at a lower price using one of the three microprocessors or they combine micros to build a higher performance or higher availability machine at the same price. The final section of the plan lists a VAX 750 as capital equipment. This is the ultimate form of capitalism. I feel like the capitalist who sold the rope to hang himself. As a startup now, my PC at Encore Computer is a VAX 730 and most of the Encore companies have 750's.

To beat the VAX is an important goal, but constraints are also important because they help focus. Standards are the constraints for finding the target or at least defining the class of games or race courses we run. Defacto and industry standards allow the statification by permitting incredible parallelism in the development of products. In this way one can build new systems quickly by assembling lower level standard components quickly.

I intend to explore, in a somewhat rambling fashion, the nature of standards, and ask that the next COMPCON be completely devoted to standards because they form the constraints necessary for both evolutionary and revolutionary technology, processes and products. The conference would ask

- what kinds of standard and what are needed for the future -- without constrating creativity
- what are the goals and constraints for various standards
- what are the responsiblities and behaviors of various

organizations, manufacturers, professional organizations, governments, academe

. how do standards form, ie timing

. when do you leave things alone, when do you evolve, and when do you throw out and start a new path

My obsession about standards lies in a belief that the lack of standards at various levels of integration has been both costly, is simply non-productive and impedes technological progress more than any other factor. At least 50% of our efforts seem to go into supporting redundant work. One of the questions such a conference might examine is the economics of supporting multiple standards.

We can observe the effect of having a good standard in the case of the IBM PC. It came at a propitious time--concurrent with a processor capable of accessing a megabyte of memory, the 64K chip, widescale availability of 5" floppies, and just prior to the availability of 5" winchesters. The great progress or rather explosion in software came about because people could work on applications instead of reinventing and porting operating systems for various hardware idiosyncratic PCs.

A guiding principle should be:

either make the standard or follow the standard!

On the other hand, a caveat about following de facto standards:

be prepared to react quickly and follow!

Those who follow the IBM standards might observe that IBM does change as in the 360/370 transition... ask the Amdahl corporation about this. We will soon see a repeat of this as the next IBM PC obsoletes a current product by providing a fully upward compatible product, but offering more capability. One can fairly accurately guess about the characteristics by looking at the 286 architecture.

Setting de facto standards such as the Unibus are important, because they are first and establish the way for succeeding product generations. To form an officially approved standard in 1970 for interconnecting computer components to form minicomputers just wouldn't have had any takers. Today, everyone recognizes the importance of the bus in building computer systems. Every company, consortia and many academics try to get one more standard bus or feature to ride the bus specification. Having too many alternatives such as the set forming 802 simply delays work on building networks and distributed computing systems.

<>Guidelines for standards
Given the desirability of standards, let's look at some heuristics governing them.

The first rule is to have someone (person, persons, a company, several companies) responsible for defining, implementing and caring for the standard. This is called responsiblity. Preferably the standard has to work in order for the individuals to be successful. Let me cite Ethernet as an example of this. All of the companies needed it: Xerox and DEC as the backbone of their produt strategies, Intel to sell chips. Rarely will we see such an important interconect need as the LAN. How it is implemented is moot-- the modulation and topology whether busses, rings, trees, or centralized switching is quite irrelevant except that it completely consumes us and hence we can't work on building the systems.

An equally important part of making a standard based on existence proofs is the ability to test conformance. This is another responsibility of the sponsor.

A standard must be real. The best way to insure reality is that it has been implemented before designing it with a committee who are sure to make it unimplementable. Unfortunately, when engineers get hold of a particular implementation, the temptation is to look at the implementation as a template, throw out the old, and extend it... not just use it in an upward compatible fashion.

Again, Ethernet is a good example. It took almost ten years to get a standard called 802.3 after the original Ethernet operated. The upgrade provided almost a factor of 4 performance improvement, but the delay in starting the understanding as to what is really wanted in Local Area Network was quite long. We should have simply used the old one to get more real experience. Here, a guiding heuristic:

> if you haven't lived with a new computing structure, use an
> arbitrary structure in order to get the experience before trying
> to design the ultimate system or standard-- the standard is much
> less important than its existance (will return to this on UNIX)

While we're on the notion of reality, it is occasionally useful to have models by which new standards may fit such as the 7 layer open systems interconnect model. Here, again we might invoke the rule that implementation is a necessity. Had this happened, there might only have been 4, 5 or 6 layers.... or even 8. Unfortunately, every real implementation that says it uses the 7 levels uses the levels like one uses a metric ruler to draw on 1/4" squared quadrille graph paper. The lines on the graph paper serve only as reference lines for the infinity of figures that one can draw using the ruler. About every 2.5 inches the two scales line up pretty well.

This brings up the notion of the necessity for having a sparse set of standards for two reasons: First having too many standards is like having NO standards at all. The current plethora of LAN standards, including various digital PBXen, which I also call a LAN, is a good example of too many, with no basis of experimentaion. Second, a standard is hard to specify it every detail: I consider the Unibus to be a good standard. It specified a way of interconnecting a whole set of different kinds of parts, not just a pair; furthermore it showed the way for this generation of buses and the future generation of micros.

Yet, it took about 8 years after the bus was in operation to have a really complete Unibus specification... even though hundreds of engineers had designed hardware to attach to Unibuses. In this regard, the standard should be understandable in various levels of precision.

A finally role of the responsible organization is evolution. With expoential change in virtually every dimension of computing, changes are necessary. Ideally, the domain of a standard is specified a priori so that one knows when it should be extended. Many standards, such as Fortran, live longer than the sponsor thought or intended them to. As a result, ad hoc extensions occur because everyone makes extensions and no one is responsible. It was felt that Fortran, now about 25 years old was dead, so why evolve it or work on compilers for it? It turns out that many use it and it does pay to really work on it, but that's the final line in this talk.

Finally, standards should be timeless, and failing the test of time should simply remain static and hopefully then disappear. But they rarely can or do.

<>Levels of integration in this generation
Let's get specific by looking at critical standards associated with various strata and product segments. About eight levels of integration form the strata, half of which are hardware. A given level has many product segments, with a given organization ususally excelling in only a few groups. That is an organization has culture and cost structure that constrains its behaviour. Contrast this with the complete vertical integration in the first generation where a computer company designed and manufactured circuits, peripherals, systems, operating systems, languages and applications. Standards provide clear constraints for building products within a given strata and segment such as the Spread Sheet Industry. For example, it is enlightening that data format standards have evolved for these various packages built by different software companies.

SILICON WAFER LEVEL
Rarely do we think of the Silicon Wafer as a level of integration. It is certainly not a well publicized or documented level since processes have been tradtionally been the jewels of a semiconductor company. It is realitively safe to predict that in our fairly near future, perhaps even the real next generation, many of the systems will be a single chip with up to 1 or 10 million thousand transistors. Of course many or even most chips will continue to be "standard" or combinations of "standards" such as microcomputers, peripherals and memories all integrated on a chip or even a large chip.

The creative products will come from the use of silicon using the so called silicon foundry industry that Carver Mead advocates. A good example is a product like the Silicon Graphics IRIS, which uses a ___________dozen? 40,000 transistor chips which Jim Clark calls the Geometry Engine and computes at the rate of ________ Megaflops, which is roughly equivalent to the power of a _______________ computer. One can invision hundreds of these sorts of systems which operate on all kinks of pictures, voice, and mechanisms.

We are nowhere near being able to realize such a scenario with today's state of the silicon foundry, mainly due to lack of standards in foundries and CAD systems. Standards are needed for the various approaches whether gate arrays, standard cell or fully custom chips are used. Let me list a few interfaces:

high level system descriptions
specifications of structure and behaviour, including
simulation at all levels
physical information for processing wafer masks (such as CIF)
control for foundry processes, especially if processing steps
become optional
chip test, including automatic generation of test data
chip assembly including bonding and multi-chip bonding

We must target the development of standard interfaces to languages and datbases that are communicable via networks. Agreeing on these interfaces doesn't limit the competitiveness or creativity of a given company or product, it simply means that users don't have to spend all their resources in converting among different formats or worry about being locked into a corner. Standards would let users mix and match different CAD systems in a completely flexible fashion. This would still let every vendor build their own editors, timing verifiers, simultators, design rule checkers, etc. but a user could interchange data among the various systems. The market would expand much more rapidly because users could buy without fear of being trapped into a particular system or format. This is completely analogous to the pre-Cobol / pre-Fortran where every manufacturer was pushing different languages. Everyone got sick of the situation and rebelled by designing COBOL.

When going to the foundry and testing folks, the user is faced with an equally fuzzy and perplexing situation regarding the characterization of a process including testing.

To clarify: this is a message to the foundries, CAD companies and failing that to the users to specify what they should be demanding.

STANDARD CHIP: MICROS, MICRO-PERIPHERALS, MEMORIES
The first rule of standards, having a responsible organization is critical and not well understood by all semicomputer manufacturers. Since the Instruction Set Architecture is the bottom level of integration that includes substantially more hardware in the form of busses, boards and systems and goes on to include operating systems and languages, the responsiblity of the semicomputer manufacturer is quite large! I'd like them to acknowledge this responsibility.

The microprocessor is at the root of most of our redundant efforts. A micro's life seems so incredibly predictable, following a time worn path with respect to its ability to accesses memory. A recent article in Computer Architecture News suggested that there are about 20 measures of word length. Only one counts-- the amount of directly addressable memory. Of course there are a few embellishments like data-types when considering performance. In 1976, having lived through a moderate amount of hell in terms of trying to extend the 11 and well along on VAX, it was safe to warn future designers of microprocessors. I certainly did in two papers. They didn't listen.

Unlike semiconductor process evolution, all users are dragged along as one evolves a simple stack idea that started out in a Datapoint terminal, went on to become the 8008, the 8080, the Z80 (by another company), the 8086, 186, 286 and more. As someone who has sponsored using many of these parts, I have been able to relive computer evolution for a third time... and frankly, this is boring as hell!
In the late 50's the folks at the University of Manchester, using Mercury, Ferranti's version of their second machine, developed a system that allowed users to

treat both primary and secondary memory as one. By 1962, the University had a breadboard for Atlas operating with a 27 bit virtual address. Atlas also had a number of other ideas that people continually rediscover, for example, in the last issue of CAN someone reinvented Atlas' Extracodes. Let's call Atlas the 0th time through because it was a university machine and there were only a dozen papers written on it, the critical one was repubished in 1971 in Bell and Newell but it was in the UK, and Ferranti only sold a few.

Having erred in a similar fashion on DEC's early minicomputers by designing two computers which had only 12 bit addresses that immediately had to be extended to 16 bits, I architected the PDP-6, the forerunner of DECsystem 10, with a 20 bit address in 1964. This was concurrent with the 360, which though having a larger physical address, only really implemented a small address... that's why the two versions of the 370 came into existence 10 years later with 24 and eventually 32 bits of address. The DECsystem 10/20 and the 370 eventually ended up with 32 bits of address, complete with paging, just like ATLAS, but about 15 years later. The mainframe was the first time through.

As the PDP-11 came out in 1970 with the goal of solving the minicomputer addressing problem by having a 16 bit address, the first customer demanded a physical address extension to 18 bits. Eventually, the virtual address got to 17 and the physical address to 22. For many years DECs engineering spent thousands of hours trying to figure out how to address more memory. Users spent much more time encoding programs in small memories. In 1975, we finally gave up and built the VAX 32 bit architecture with an embedded PDP-11. Other minis followed essentially the same path for the second time around, but most were on the east coast.

The micro was born on the west coast with the 4004 and 8008 concurrent with the extensions to the 11. These had 12 and 14 bits of address, hence why I wrote the paper on the 11 about addressing in 1975. The leverage of doing it right the first time was very high. Subsequently, the 8086 was extended to 20 bits and most recently to 24 bits of physical and 30 bits of virtual address. It is ironic that information on addressing didn't travel from California to Oregon where the 432 was developed, but then again Oregon didn't become a state until 9 years after California.

Motorola's saga is similar. National took the high road and simply copied VAX without violating the patents. Another tragedy. If an exact copy could have been made several billion dollars worth of software could have been made available! And many resources could have been freed for doing something creative or otherwise productive. Finally, with the micro we have everyone going around three times. The saga is not yet ended as we understand the ramifications of greater than 32 bit address spaces.

There is an equally tragic story about an architecture called CFA, for Computer Family Architecture, which is the defense department's version of VAX. This time, they could have used an exact copy of VAX. Won't our enemies just use US standard micros, and get the parts and software at least 5 years earlier?

With shifts in relative speed and sizes of on chip registers, cache memory and control memory, it looks like a return to simple, CRAY type load/store architectures which are implemented without microcode may perform much faster than architectures oriented to processing the data-types of high level languages such as the 360. Since these so called reduced instruction set architectures trade off microprogram control complexity for compiler technology, it would be well to find and use a single one rather than continual evolution.

New architectures, especially those which have gone along well travelled evolution paths, have cost computing at least half of our resources. The glib answer of using C and UNIX to obtain machine inddependence is deceptively simple and errorneous. A compiler for C or a compiler written in C is only a starting point for a product...

not the end. An architecture pervades virtually every part of a system and database.

When an architectue should be copied, evolved or thrown out and started over is fundamental to the notion of standards because of the tremendous user program and database investments. Let's understand it.

BOARD: BUSES FOR VARIOUS PERFORMANCE, APPLICATIONS, ETC.
The board level is similar to the Instruction Set Architecture story, except that busses have longer lives than specific instances along the evolutionary life of an architecture. For example, the various species of the IBM channel buses are now 20 years old and will no doubt continue for another 20 years in their current forms, even though many of the functions that a peripheral might perform could be handled in the same amount of hardware as that required to interface the bus. The Unibus is almost 15 years old.

The IEEE is in the business of blessing these buses and I don't understand the politics of this process. One manufacturer already has an adequate unibus-type standard to build multiprocessor and multicomputer structures. Does the IEEE support a bus indpendent of whether there are any riders? How many more do we need or can we afford?

LANs and LANCs ANOTHER KIND OF SWITCH
<>Ethernet, the Unibus of the Fifth Generation
While on the issue of busses, this is a fine place to discuss another important switch, we now call a LAN which is used for interconnecting computers and terminals in a local area. This slide is one I used exactly three years ago. Several of us from Intel, Xerox and Digital including Bob Noyce, Dave Liddle and myself presented the case for Ethernet as a standard and to show that we were committed to use it. It was useful because I wanted to convince all of the engineers working on the project of its importance. I attempted to show the need for the bus for building new, distributed computer structures or clusters of computer. Let's call these structures LANCs.

<>Unibus,

Note that this computer structure and the LAN/LANC are nearly identical except they are seperated by 15 years. The unibus is used to build a single computer from constituent information processing components such as processors, memory, communications equipment and terminals. It was designed to travel about 15 meters. Ethernet, or rather IEEE 802.3 allows a user to build LANs and LANCs. It was designed to travel several kilometers.

Digital needed a LAN to interconnect computers into a network and to be able to interconnect terminals to computers in an open ended fashion. I was receptive to using Ethernet as the wheelbase when Bob Metcalfe, its inventor, proposed the standard and consortia to built it. At the time, two experimental LANs were operating within DEC. While Ethernet was proposed as simply a network interconnect the main motivation was a bus for the evolution of two types of clusters: first, a single shared mini or large computer would gradually be decomposed into functional server components; and the proliferation of PCs would require intercommunication into a cluster formed by aggragation.

The key reason for the standard was to allow us to get on with building LANCs, which only a few organizations understand experientially. To reitierate, to propose a standard, one should have lived with it for awhile and really understand it.

In retrospect, getting anyone outside of the three organizations involved may have been a mistake... had we simply built the bus, and offered it as a LAN standard, the process would have been done quickly. Furthermore, instead of engaging in debate about something we knew little about experientially, we could have simply designed and implemented it 2 years earlier. What appeared to happen was that no one knew they needed a LAN, but when they found out one was being proposed as a standard, then everyone had a design to try.

The IEEE tried to help with inventing 802 and now have .3, .4, .5 and .8.   .9 is needed for PABXen and we'll soon need a second digit to add to the new proposals--still LANs and LANCs don't exist to any degree.

802.3 was allocated for the CSMA/CD type, or Ethernet. Since others would like lower cost LANs of this flavor, then several folks took the basic idea and built fully incompatible versions. Alternatively, the same energy applied to cost reducing Ethernet would have made everyone win.

Of course, one would like to have some sort of LAN on broadband, using a token bus technique, so 802.4 was assigned with only 3 incompatible versions.

Another early kind of switch, the ring came out of early work at Bell Labs, Cambridge and other places. Prime built such a ring, and when these folks formed Apollo, took this basic religion with them when they moved 15 miles north. Because rings usually require some form of central controller, IBM grabbed the ring, hence 802.5.

Since one can obviously use fiber optics for building LANs we require a fiber standard, 802.8.

802.3 can be transmitted on standard orange or yellow Ethernet cable; for others who like a simpler installation and will give up distance, RGU 58 can be used if you call it cheapernet Bob Metcalfe calls it thin Ethernet; Codenol has a fiber optic system using the same scheme; for those who like broadband there is a modem. The purpose of all these media is to be able to get users to build LANs and not to wait for what is really quite an arbitrary choice of media, and one which only delays the critical use. Surely someone could take the controller / transceiver interconnect and build a transceiver to operate on a ring structure. I hope this could also be used to adapt to high speed digital PABXen as they become available.

While we're on switching, the forthcoming high speed PABXen will permit the same function as the LAN, and hence should come under the 802 perview. It is imperative to have conformance at the higher levels. Can I suggest 802.9?

These alternatives for standards to switch information at a modern, computer data rate versus a scheme that evolved from the Morse code allows everyone to avoid working on the essential problem of building networks and evolving into clusters. Again, the multiplicity of standards delays the introduction of structures at least five years!

The glib answer to multiple or no standards is gateways. However building gateways is often about as easy as having a single train that can travel on different gauge tracks. It's fine when you reach steady state, it's the transition among track sizes that kills you.

ELECTROMECHANICAL ASSEMBLY: DISKS, I/O, POWER, ENCLOSURES
The evolution of small disks and tapes has been very impressive. I remember meeting Al Shughart at the start of Seagate when his greatest concern was making sure of a competitive second source with the same interface and form factor, which in effect creates a complete industry. This is the same formula that he used in creating the floppy form factors, standards and industries. The standardization process might be understood by these examples.

We also see the effect of edicted, blind standards when looking at the issue of keyboard thickness. The IBM PC's keyboard is designed to pass a particular national standard, but has little legs that are raised that make it comfortable to use. I've never seen one in use without the legs.

OPERATING SYSTEM: COMMUNICATIONS (eg. WAN, LAN), DATABASE, SCREEN
In 1966, a user could have a 300 baud Teletype using a phone line. By 1980 the speed of the common dial-up line

had been raised to 1200 baud. This amounts to a a performance improvement of less than 10% per year, and I believe the connect cost rose. This is not the kind of improvement we're used to in computing.

During this period, through computer controlled switching, telephones have gained improved functionality. All of the telephones systems are incompatible with one another at the user level beyond the plain old telephone. All have a relatively large manual and training to get back to the capabilities we had with multiple button phones. The new phones are not user friendly nor do they pass the ease of use test nor are they particularly helpful about adding or deleting the appropriate one except to say that what you've just dialed in is wrong. If a system is knowledgeable enough to always give you the same error message, then it should simply always fix the error.

We have turned a large part of our future systems development over to AT&T for one of the key interfaces by adopting UNIX. In fact, it is the kernel of the system, just above the hardware. When the Justice Department was playing God, why wasn't UNIXCO separated? Maybe it's the only money making part, especially at the price AT&T charges for royalties. Given the simplicity of UNIX, it would seem completely appropriate to install a venture capital offices around the various Bell Labs in order to extricate and form an independent, responsive company to evolve UNIX. Are all you San Francisco based venture folks listening?

The UNIX phenomenon illustrates some principles of standardization and I'm sure we can learn from it. Like all operating systems, the only people who really love UNIX are its parents and those who only grew up with it. This is a large set. It also illustrates a recurring theme of standards:

in order to make forward progress, one has to regress for awhile

UNIX evolved along these lines:

. UNIX came from a reaction by Thompson and Ritchie to MULTICS, the large, joint MIT Bell Labs project of the late 60's. It was written for a DEC mini and evolved to the PDP-11 in the early 70's.

. DEC didn't give away operating systems to universities-- especially the source code; UNIX was essentially free.

. UNIX is by most measures a very simple operating system, to do anything useful requires other programs such as database access, special communications, programming, etc. Students and faculty could understand all facets of its internals and use. It was written in a high level assembly language, C, and as such could be modified. It was an excellent pedagogical tool. Universities embraced it and trained many students with it. A built-in market.

. UNIX evolved to be used on other computers by being transportable. A team of people could carry it to another computer system, provided a C language compiler was available. This was something that early high level languages were supposed to do, but never quite succeeded with due to extensions for calling the operating system. In turn, this created the notion that it might someday be possible to have a complete system that was machine and manufacturer independent. Users like this idea.

. Chip makers and system builders who had no means of building software were able to get a system relatively cheaply. Thus, we have more support and the beginning of a standard. The semiconductor industry knows about standards.

. Much work is required to have a system that supports 80's computing concepts. This is why I worry about the control in a bureaucracy. The extensions include:

- .virtual memory. This function was worked out about 5 years ago and has been in operation for at least 4 years in the verion of UNIX for VAX called 4.1! Recall the notion of virtual memory was only invented 20 years ago.
- . special functions for real time and transaction

processing. UNIX is being extended and adapted in incompatible ways by diverse organizations.
.human interfaces that are competitive with the PC. UNIX grew up in a timesharing world using dumb terminals. Windowing and fast interaction are critical.
.multiprocessing. With the micro, many companies started up to extend UNIX for multiprocessing.
.   networks. Given the origin of UNIX in a communications, we should demand modern communications capabilities.
.fully distributed processing across a LAN to form LANCs. The Universisty of Newcastle, Berkeley and several companies have all implemented incompatible systems for fully distributed processing. Berkely 4.2, which is being distributed is a good starting point.

UNIXco must take the responsibility commensurate with their selling of UNIX as a standard operating system. The notion of a standard is good. But it must be evolved more rapidly than any single manufacturer. It can provided there is parallelism in the development using multiple organizations. If UNIXco is the single company doing and blessing all the extensions, we have simply subsituted multiple competitive companies with a single, behmouth! The system has to be evolved in a reasonable, not ad hoc fashion. I think this is the most serious problem we have in extending computing today.

LANGUAGE: INCLUDING EXTENSIONS TO APPLICATION LANGUAGES
With the very strong concern regarding UNIX, C is a weaker concern. C is at the heart of applications portability. It's time that C be treated like a serious language, complete with standard.

<>picture of ACM september with Japanese and US going toward 5g
All the languages could be enumerated with concerns especially ADA, are important for this next generation. LISP has been proven to be useful for Artificial Intelligence applications. Like the Japanese, I believe

these applications may be the basis of the next generation.

LISP was defined about 25 years ago by John McCarthy while at MIT. I was so enamoured by LISP 20 years ago that I put the critical primitives into the hardware that ultimately became the DECsystem 10... still about the fastest LISP computer. LISP branched and created many dialects. One path went west via BBand N to Xerox, creating INTERLISP. Many dialects evolved from the original MIT LISP: MACLISP, Zetalisp, NIL, SCHEME, TLISP, Portable Standard LISP and now Common LISP the later two are vying for standards status. Virtually everyone who gets inside a LISP compiler or interpreter creates a new language. These languages are incompatible with one another and thus one can't benchmark, or use common techniques to bootstrap extend the language in a compatible fashion. Much work surrounding LISP is to make applications development easier. But given the number of dialects and the number of extensions to make development easier, I wonder if anyone is working on applications. The effeciency for normal development is 0.5 due to redundancy. This is high for AI applications because there is no standard base.

To reiterate, in order to get on with the business of applying AI, we need some way of sharing information across the various different languages called LISP. A serious standards activity is long overdue.

In fact, the Japanese were so confused about LISP that they totally gave up and went to Prolog.

Having extolled standards now for sometime, there's a downside. A standard provides an interface or target by which systems can be compared. Recently, the Livermore Laboratory kernel becnhmark codes expressed in 25 year old Fortran, were run in Japan on the Fujitsu VT100, VT200 and Hitachi 810/820. Using very good vectorizing compilers, all machines ran at a rate of over 2 times a Cray XMP. There is virtue of understanding the old and evolving it.

STANDARDS

SPECIFIES INTERCONNECTION OF TWO (OR MORE) MORE PARTS

VANITY: EXISTS WITHIN A SINGLE COMPANY

DE FACTO: ORIGIN IS A SINGLE COMPANY, EVERYONE FOLLOWS

...SOME STANDARDS ORGANIZATION MAY BLESS IT

INDUSTRY: EXISTS WITHIN A SINGLE COMPANY (IBM)

NATIONAL: (EG. ANSI, JSA)

GOVERNMENT BUREAUS: (EG. NBS VDE)

INTERNATIONAL: (EG. ISO, IFIP, ECMA, CCITT)

PROFESSIONAL ORGANIZATION: (EG. IEEE, ASME)

CONSIDERATIONS FOR FUTURE COMPCON ON STANDARDS

. STANDARDS ESSENTIAL TO PROVIDE A PATHWAY FOR THE FUTURE BUT DON'T CONSTRAIN CREATIVITY,

. NATURE OF GOALS AND CONSTRAINTS FOR FUTURE STANDARDS

. ROLES OF VARIOUS ORGANIZATIONS: MANUFACTURERS, USERS, STANDARDS BODIES, PROFESSIONAL ORGS., ACADEMIA

. TIMING IN RESEARCH, PRODUCT, AND USE LIFE CYCLE

. MAININTAINING, EVOLVING AND DISCARDING STANDARDS

. ECONOMICS OF SINGLE AND MULTIPLE STANDARDS

A PRODUCT SEGMENTED INDUSTRY,
ORGANIZED BY LEVELS OF INTEGRATION
WHICH FORM STRATA DEFINED BY STANDARDS

- FUELED BY ENTREPRENEURIAL ENERGY RELEASED BY VENTURE CAPITAL FUNDS

- SOFTWARE FORMS NEW PRODUCTS AND USES

- SYSTEMS ARE DISTRIBUTED IN MANY DIFFERENT WAYS

GUIDELINES FOR STANDARDS

. SPONSORED... NOT JUST A COMMITTEE OR COMMITTEES

. REAL (IMPLEMENTABLE AND TESTABLE)

. UNIFIED NOT ALL POSSIBLE SOLUTIONS FOR ONE FUNCTION

. PRECISE, UNDERSTANDABLE AND APPLICABLE

. TIMELESS, AND

EXTENDABLE IN A RESPONSIVE FASHION

CRITICAL EXTENSIONS TO UNIX

. VIRTUAL MEMORY

. APPLICATIONS: REAL TIME, TRANSACTION PROCESSING, ETC.

. MODERN HUMAN INTERFACE FOR WINDOWING, GRAPHICS

. MULTIPROCESSING

. WIDE AREA NETWORKS

. LOCAL AREA NETWORKS (LAN) AND CLUSTERS (LANC)

HEURISTICS FOR STANDARDS

. EITHER MAKE THE STARNDARD OR FOLLOW THE STANDARD

. BUT, BE PREPARED TO REACT QUICKLY AND FOLLOW WHEN THE DE FACTO STANDARD CHANGES

. SET NEW STANDARDS AT YOUR OWN PERIL, AND ONLY IF YOUR NEW ONE IS <u>MUCH</u> BETTER

. CHANGE WHEN IT'S CLEAR YOU'VE GONE DOWN A RAT HOLE

LEVELS-OF-INTEGRATION: THE STRATA

SILICON WAFER:

STANDARD CHIP: MICROS, MICRO-PERIPHERALS, MEMORIES

BOARD: BUSES FOR PERFORMANCE, APPLICATIONS...

ELECTROMECHANICAL: DISKS, I/O, POWER, ENCLOSURES...

OPERATING SYSTEM: COMMUNICATIONS, DATABASES, I/O...

LANGUAGE: INCLUDING APPLICATION LANGUAGES

GENERIC APPLICATION: WORD PROCESSING...

DISCIPLINE/PROFESSION SPECIFIC APPLICATION:

```
procedure
VENTURE_CAPITAL_ENTREPRENEURIAL_ENERGY_CYCLE

 begin

 while greed and not fear do

 write (business_plan);

 get (venture_MONEY);

 exit {job} ; start (new_company);

 build (product); sell (product);

 sell (new_company); {for 100 times sales}

 venture_funds := venture_funds + sale_liquidity;

 end
```

UNDERSTANDING EVOLUTION TO LEVERAGE THE LEVERAGE

Civilization has always been concerned with building tools to leverage intellectual processes. Although a few tools are revolutionary, most are evolutionary. Virtually all revolutionary tools (machines) fail, usually for simple reasons. What are the heuristics for success and failure avoidance?

INTELLECTUAL LERAGE: THE DRIVING TECHNOLOGIES

Hope of conference: point out symbiotic relationship between new technology, and applications made possible by new tools and applications made possible by new technology, and the advances in in technology made possible by ever more powerful tools.

The notion of intellectual leverage also conjures up the notion of working smarter and not harder. I fear we don't always do this, also it seems to me one of our greates frailties is reinventing while not learning. In one of the Turing lectures, Hamming pointed out: we have to stand on each others shoulders instead of each others feet.

WHAT ARE TOOLS?

.machines ala VAX 780 that are the basis of all startups... all of which aim to replace the 780 the good news is that most of them will fail and hence the competition won't materialize. I feel like someone who has just equipped an army to shoot me. A capitalist is a person who'll sell you the rope to hang him.

.machines such as DA that do work, where we always seem to need the next one to design what we are designing

.networks, (Conway cited ARPAnet for multichip project last year)

.mail nets

.organizations

.mathmatics, notations, ways of communicating, note slang that allow the bright students to communicate (rent,dren or ren)

.a methodology and training

.goals and constraints: eg Supercomputers, targets and standards

TARGETS ARE KEY

Generations are now the target. Two scenarios.

This generation is different for what is a new industrial structure.

STANDARDS ARE THE LEVERAGE BECAUSE THEY HELP DEFINE THE TARGET

This generation is different. It is based on standards. Instead of a completely proprietary vertically integrated industry, it is a product fragmented, strateified by level of integration.

Driven by entrepreneurial Energy.

We have a very good example in the PC. Doesn't have to be the best. It was though. It was easy and strictly evolutionary. It came about by being an open architecture.

I would like to see truth in labeling as part of product description. If an interface will be kept proprietary or not. If not, what is the policy for evolution.

WHAT SHOULD STANDARDS DO?

play together

be easy to use and understandable

be around for awhile (ren retyped logo for prefix to infix

be evolvable: note Datpoint>8008>8080>Z80>8086>186>286>386(Copy: national did, a good idea)

be real. ISO model is a model and not real. It's like quadrille graph paper with 1/4 squares and giving them a ruler marked in 0.1"... but at least it's in the same basic system.

be responsible and responsive

be few so designers know what to shoot at. Can't have 8 LANs or a new battery, every time a watch is built

be at right price

RESPONSIBLITY OF THE ORGANIZATIONS

Make them open by definition

Sponsor their evolution

Be able to test whether they adhere

Clear organization (name) in charge. with schedule.

No standard without an implementation

Standards meetings should contain implementers

CHIP-level... inability of foundry standards, communication of masks, etc. CIF established one.

Responsiblity of the foundries. Absolutely chaotic.

ISPA- is by definition a major standard and this goes even lower vis a vis access to bit maps. Responsiblity of the provider

Responsiblity for at least assemblers and mnemonics

What happened to CFA? DEC offered to give DOD the VAX. Didn't like it because they didn't control it. I'd rather have someone responsible controlling something than a committee anyday

We have a disturbing phenomenon around evolution to VM! Show the evolution of VA bits.

OS- UNIX now, with a new player that's hardly used to computer standards

Would like to have standards on my telephone so I can use they across different vendors. Telephones aren't standard!

Maybe UNIXco should be a seperate company, but may be the only profitable part of AT&T, given the price of royalties. I hope AT&T realizes the major lesson from UNIX: the reason it exists as a standard was that the price was right to universities: namely 0! The other reason was that it was small and simple enough for pedagogy, yet useful enough to attract and train students. Finally, it evolved to be somewhat transportable and that was due to C.

Progress has been slow 300 b in 65, 1200 in 80.

issues: V.2 + 4.2 with incompatiblities between 4.1 to 4.2.

shouldn't UNIXco have been split off... maybe the only money maker in AT&T.

VENCO may get the UNIX crew out of AT&T

Crucial to have networking, VM, file, tp, multiprocessing, window

Would like a body for defining and then testing adherence to standards!

Misunderstanding that if one simply has a Unix port to a given machine, this is an acceptable system. NO. Much to do in compilers

LANGUAGES- It is critical that we start to address parallelism!

C- just another version of an assembler, after BCPL and before D

LISP- an absolute zoo. Keeps AI back. The Japanese were so confused they went to Prolog

DATABASES-

Spreadsheets

LANs

A paradox: they can't exist until they exist

When is it appropriate to simply acknowledge a de facto and move on? or to approve a new ad hoc one (eg. 1 Mhz PCnet)

We need a set of high level protocols. Gateways are too glib... can they be done? 12 protocols within HP, hence a committee to standardize and then you have 13.

802.3 CSMA/CD most developed with base, broad, thin and fiber media; Omninet is 1 Mhz, PC net is 1 Mhz

.4 Token Bus, especially on cable TV; committee has 3

.5 Token Ring- Apollo, Primenet, Cambridge Ring, IBM/TI why is this man smiling?

.8 Fiber

802.n = PBXen... most folks believe this is WAN. Wrong.

MAIL
    3 standards plus lots of company ones

NOW THE BAD NEWS:
the US computer inustry structure will be overturned

Compcon: 70% Bay, 7% Japanese, 95% practitioners, 1.2Kp
committee wanted a discussion of Mail to improve technical excellence

SUBJECT: MONOTONICITY OF PAY - A PROBLEM?

Nowhere is there a policy that says a person's pay is to be monotonically increasing. However, I've heard from several colleagues they're worried about the pay derivative changing sign because they were granted generous options under the 68 plan, and finally these options have or are just about to have all lapsed.

My guess is this is one of three factors behind Leng's resignation. Shel, could you plot say x's total compensation (salary + stock) over the last ten years and see just what the story is?

I think we have a potential major total compensation problem in either the decline (phasing from stock/salary to salary) or setting people's expectation back to the market (where we've had policy to not use stock as compensation.) Our long term plan has come due - let's look at the issue.

SUBJECT: BEING A SUBJECT FOR XEROX ON SMALLTALK

You guys decide!
If you do, then the best way is to have whoever is going to run our project to write a confirmation letter to Bert Sutherland.
What you say?
(My feeling is that we should do it.)

When are you going to decide?

(I assume you are going to interface/tell Adele Goldberg, but with letter to Bert... or perhaps I should do this.)

As a seperate question, I think we ought to consider building it around a VT125 too on some system... perhaps write the interpreter in Bliss and try it on several of our systems. For this, we need a commitment from one of our small systems persons... but don't worry about it for this go around.

SUBJECT: COMPETITIVE COMPARISON OF DEC AND WANG WPS BY BETH ROSE

Had an enjoyable 2 hours with Beth talking about WPS. Looking at the Wang, certainly reinforced lots of beliefs about how we get better wps. Generally we're right. There is a problem which we ought to address: do we want to try and simplify the keyboard and interface design a lot? (I think we can, yet not change the semantics very much.) This would get a

cleaner,
less overbearing look that wouldn't frighten new users. Am already at work on it. Eg. dedicating more than 1 key for the whole search
seems like a waste and being overly complex. Making a character for
the marker and then having it ask which one seems right. Getting
rid of swayp also seems right. Some way to select the character
font from bold, underline, super, sup, seems like elimnating 4
keys. Menus associated with the ruler would be nice too, and for
the multi terminal, Beth raves about the operator statistics and
all the sort allowing here to do dp work.

Got a new perspective on full page! Have full page, but allow
a mode where BIG CHARACTERS are used so as to make it easier on
operators for other tasks (and especially older operators)!

All, in all, in prepartation for our meeting, I
am asking MJ to have Rose spend 4 days comparing the 78 with the
Wang stand alone; and comparing the DPD Text 11 with the
Wang shared system. Please welcome her. If you have a problem
with this, please contact me tomorrow (MJ has the number at
the OC Woods Meeting place).

SUBJECT: GETTING ORGANIZED IN ENGINEERING AND MANUFACTURING LIMITS TO FACE OUR FUTURE COMPETITORS [UPDATED FROM 10/26/79]

I'm still feeling good about our current and next few years of products; but I'm terrified about '83-'90 because I think we'll enter a more cost sensitive, commodity oriented market where emphasis is simultaneously cost AND quality. The challenge will be great in products-, process-, and manufacturing-engineering.

The four competitors of concern are IBM (everywhere), TI (only at low end and as a supplier), Intel (typifying the semiconductor revolution implicit in fifth and sixth generation computers of the early and late 80s) and the Japanese (Hitachi, Fujitsu, and NEC; also maybe others). Although each have some unique strengths and weaknesses, they have the following ordered strengths in common [our position is given []]:

1. Strong discipline in their engineering and manufacturing processes with relatively few, and aimed at volume. [Poor, lots with incremental evolution and freedom to define alternatives vs. use standard.]

2. High degree of plant automation. IBM may have the best understanding of robots and Japan is clearly the supplier! Also increased focus on productivity. Intel may not have this. [Poor, no activity outside of test. No automated material flow. Lower productivity per person.]

2a. Focussed factories with combined manufacturing and engineering industry process engineering [good in semis, part of disks. Poor in terminals, systems, cabinets, and power supplies.]

3. Very good internal source of semiconductors; all but IBM supply externally. [We only make a few of our needs.]

4. Very good disks (except TI who's now trying). Not Intel! [Need better mid/high end.]

5. Basic understanding of all kinds of materials. [Little or no work.]

6. Very large research groups, except Intel. All receive government grants for research! [Weak. External R+D to couple to.]

7. Aggressive engineering and product positioning. [Ok; many products.]

8. Strong emphasis on quality (here, I exlcude TI). [Ok; improving.]

9. Willingness to change and move rapidly whether it be product, pricing, or market method (e.g. channel of distribution) and manufacturing. [We're strong; getting older and conservative?]

10. Understanding of learning curves, market share and use of forward pricing (including IBM). [Ok; except too many products?]

11. Low inventories and willingness to drop products at end of life.

12. Significant worldwide engineering and manufacturing, especially Japan.

There are selective strengths and weaknesses(-) no particular order:

IBM

1. Very strong CAD/CAM tools and effort.

2. Disciplined processes and engineers who use a small number of PCB, Backplane, and common semiprocesses rather than evolving every possibility to get slight gains.

3. An incredible customer base and sales force capable of devouring most of any product.

4. Highly automated assembly lines with independent test and production flow controls.

5. (-)Many competing architectures and problems to

evolve networks.

6. Applicators programming knowledge.

Japan

0. Best overall technology understanding of semis, magnetics, speech, video, robotics, and comm.

1. Ability to quickly assimulate products or processes from others.

2. Experience with low cost products like TV sets that will be model for terminals, small business system, etc.

3. Strong concern for standards as a way to the market.

4. Large population of engineers, including manufacturing engineers.

5. (-)Channel of distribution.

6. (-)Programming. This is immaterial since software will be done by U.S. SW engineers in U.S.!

TI

1. Semiconductor strength.

2. Good terminal and low cost product base.

3. (-)Programming.

Our Strengths

1. The best general architecture/product position potential.

2.Product lines to focus on various users and channels of distribution.

3. Rapid turn-around, dedication of individuals to their plans. (Are we getting older and more lithargic?)

4. Strong Systems Programming to orient to generic, profession and other applications.

Mr. John E. Tyson, President
Compression Labs, Incorporated
2305 Bering Drive
San Jose, CA 95131

Dear John:

I enjoyed our meeting last week and hope we can get together to follow-up on some of the opportunities.

I am asking for a report on our current video teleconferencing, and how we might expand this network to cover all of engineering, with links to our manufacturing sites and to Reading, England. When we get this data, then I'd like to get someone from CLI to discuss your products with us.

We would like to discuss two other matters when you visit:

1. how our Personal Computers might interface to your system for transmitting and presentation of data

2. how we might build VLSI to implement your compression algorithm. These chips could be used in your equipment and by us for Personal Computer video input.

I'll send data as soon as possible.

Sincerely,

Gordon Bell
Vice President
Engineering

MESSAGE ID: 5191131320

SUBJECT: COMPRESSION LABS, INC.

GB4.S1.37

I met with John Tyson and Paul DeBaldo, President and V.P. of Marketing of CLI, San Jose.

They build an interesting video compressor that takes color video and
reduces it to 1.5 Mb/s (<T1), and they have an algorithm that gets
down to .75 Mb/s. Their product compresses and multiplexes video +
digital channels onto a digital channel.

They are also designing a unit (instrument) so that a room can be
converted to teleconferencing for a few users.

I'd like to invite them here and discuss:

1. their product futures and our use of them

2. how we can interface a PC to it for slide presentation

3. how we might be an experimental site for video

teleconferencing
between NH and Reading via satellite

4. how we might use their algorithms for compressing video for storage in our PC's. They also believe this should be useful for educational teleconferencing

5. Vlsization of the compressor for our PCs

Before they come, I'd like to send them:

0. A report on the current Teleconferencing

1. Plans (traffic matrix) for teleconferencing in the corporation, and special situations. What would a network look like for engineering? manufacturing? engineering and manufacturing?

I'd like to see a hardwired backbone net of MK - ZK - LT - HU - MR - FR. With these spurs: ZK-TW-Andover-Salem and Hudson-Maynard and MR-Shrewsbury. There might be special links: ZK-Reading, Maynard-CX, Maynard-Westfield, ZK-Seattle, TW-Augusta.

Comments please !

Are you interested in attending?

Could I get someone in telecommunications to organize information? .

WPS USERS - Leave HP mode and type <CR>

January 30, 1980

Elmer B. Staats
U.S. Comptroller General
441 G Street
North West, Washington 20548

Dear Mr. Staats:

I read your report 10-79-53 of September 21, 1979 and would like to commend you for recognizing the problem of United States - Japan Trade. The report definitely shows some understanding, more so than by any other individual in government.

It stimulated me to make the following comments, which I hope will add even more insight for you:

1. The fact that we spend twice as much on R and D is <u>very</u>, <u>very misleading</u> (and even wrong!) because:

   a. <u>The Wrong Direction</u> - most of our funding goes into military and health. These are fundamentally irrelevant to the trade problem. Rarely does a relevant idea get developed in these areas, and the chance is even smaller of it getting into the private sector for trade which your report addresses.

   b. <u>Efficiency</u> - we aren't terribly efficient, i.e. there's lots of overhead that the funding doesn't show. These include the funding agents (buyers), and checkers such as auditors, plus administrators on both sides that don't do R and D. Measure people <u>doing work</u>, not funds and I'll bet the picture changes! Also note R and D per capital and per GNP is higher in Japan.

c. R and D is World-oriented - much of our R and D goes directly to Japan - how many scientists have you ever met that aren't basically open, world citizens, and feel knowledge should be broadcast without restrictions? Hence, much of our R and D funding is "world public". So take much of the R and D and mark it for the world. Japan has an open, but closed society due to language barriers.

d. <u>Poor Process Management</u> - Japan does a really top job of managing the R and D flow of results from basic research, to product. We lose our results due to having a non-existent management process for this flow. Scientists, engineers, and product designers are all different and don't communicate very well.

e. <u>We don't understand effect of public vs. private R and D funding on trade!</u> A recent announcement by Frank Press to the members of the National Academy of Engineering noted an increase in govenment spending here of 3% (real growth). This basically should disturb us because we are constrained by people to spend it.

Money will not make researchers materialize. I trust that you never believe that money and people aren't instantaneously interchangeable like our culture, particularly sophomore economics, teaches. Therefore, an increased R and D budget will only raise salaries, which in 10 years might increase the supply.

In the short term, I believe it is safe to predict that increased federal R and D means: increased salaries; more attention to the irrelevant areas already over funded described above; <u>less</u> <u>development</u> <u>to</u> <u>address</u> <u>trade</u>; and finally decreased coupling between industry and academia. For example, the recent ARPA VLSI funding is likely to make it unnecessary for the current researchers to seek any industry funding when they can get completely on the government dole. Hence, they'll have one shop funding versus the two now--government <u>AND</u> industry!

2. The computer section requires beefing up to:

a. include semiconductors, the key primary industry for computers.

b. show that the future is bleak as projected, from any market survey.

3. Similarly, the auto section didn't address steel. Note the Japanese have the most efficient, and the most computer control in steel making. Again, this is not just capital, but lack of trained manpower and little investment in R and D in this industry! The steel industry isn't making it and I don't think it will without a major revolution in thinking, supported by trained engineers in process control. Maybe you can help.

Things are getting worse fast, especially in computers, because:

a. The Bureau of Standards is getting into the act to specify how to build products. Do you recall hearing about the forced use of the IBM I/O Channel within the Government? Isn't your organization behind this move: to limit our innovation, our ability to compute, to force some of the marginal mainframers out of the market? Note, this is a key standard for Japan to help them become a major supplier to the U.S. and the world. I find this report and <u>your</u> action on the I/O Standard mutually exclusive and contradictory!

b. We have become a stifling/control society versus an innovative/building society! For example, net output of lawyers versus electrical and computer engineers has recently changed.

Graduates/year

	<u>Lawyers</u>	<u>Engineer's</u>
1971	17.4K	17.4K
1979	34K	16.9K

Observe the high cost, both direct and in terms of using up our finite fuel supply, of a bunch of lawyers in Congress designing automobile catalytic converters. The Japanese have 15K lawyers versus our 450K, or 15 times the number per capital! Can we get our lawyers to sue the Japanese?

c. The situation of MBA's is about the same. These people are potentially more harmful than the lawyers in some sense because they mainly turn-on by return on investment and marketing. Manufacturing is a dirty word, a hard business, requires long term plans, people and real work, in short, money and a personal intellectual investment. Buying manufactured goods from Japan is appealing: look at some of this year's top roi performers: Subaru (U.S.), Tandy, and Amdahl.

Both of the disciplines further decrease output by controlling, finding (or tricky accounting) additional ways to spend when they enter politics, and merely promoting versus producing.

These professions (basically real or semantic accountants) detract from workers who could enter R and D and engineering and when could address our trade deficit at a fundamental level. As our Comptroller, I urge you to <u>audit</u> our pool of technical talent. This is the crux of the matter, I believe.

Enclosed is a paper by me on the Japanese situation which has other points you omit - especially the management of R and D to aid the flow of ideas (lacking in DOD, Commerce Department, NSF, etc. thinking). Hopefully, there are some actions to take, but if the past is any predictor. I'm sceptical.

I look forward to a helpful prescription. When?

Sincerely yours,

Gordon Bell

F/U 11/8

I talked briefly with a group at SRI doing computer conferencing (person-person). It's been based on the 10, and is now ready to apply using LSI-11's...but with different emphasis.

We want to get a system to use, but have someone else develop it so that it can be available to others. I asked them to look for an OEM, and failing that would get them to develop the software. Meanwhile I asked Doug Englebart to come here so we could exchange views (and we tell them about new products)...the base for the terminal. They can almost use the 11V03 now. Bell Labs conceivably might want to develop this [Jim/Roger, can we approach them?]

Jim, let's get a small group (you, I, Stan, Ken King plus?) to write down a spec and a design for a conference room terminal. Have someone who'll write the product spec/brochure and send us background reading first (e.g., Scientific American articles, papers). Although I don't know what's in it precisely, I'd like to see the terminal be the following ($20K) of equipment:

1. Full duplex data/voice links between the two rooms with voice and 9600 baud.

2. High quality voice, possibly stereo,...we can start with a conventional speaker phone.

3. LSI-11's with video at both ends.

4. Large TV monitors so everyone can see the screen.

5. Tablets and possibly the SRI mouse (Made by Cybernex in Menlo Park) so it is easy for participants to make sketches, yet not require full video transmission.

6. Hardcopy to get pages printed right there...typewriters with plotting will be superb! (A Versetec might be better.)

7. A CCD low resolution, camera with:

100 x 100 x 4 bits = 40K bits = 4 sec.; versus

500 x 500 x 8 bits = 200 sec.

(Used for Fax and for making slides of participants.)

8. Possibly a Fax, but the CCD camera with the proper lens would do the job.

9. Several keyboards to switch information and possibly each user might have a keyboard.

10. Tape recorder to allow non-attendees to watch later.

A conference would consist of 1 to N/2 people at each end (where N is smaller than our current meetings).

Any text or charts (e.g., schedules for schedule review, budget data, budget graphs) would be entered as text on floppies ahead of time. This would use standard WP or Editor SW. The overhead projector slides would be drawn such that the low resolution camera could transmit them easily. They should be entered ahead of time too.

The meeting would be conducted by a chairman/presentor who controlled the voice and displays. Note with 100 x 100, 4 pictures could simultaneously be displayed.

Dear Messrs. Affel and Tai:

Let me thank you and your engineers for taking the time from your busy schedules to discuss and demonstrate the CCI products. It was really enjoyable to see your high growth company in action and interact with you. I hope the discussion was of benefit to you; it certainly was useful for me to learn more about transaction processing applications.

Sincerely yours,

Gordon Bell

Subject: **A First Course Started That Uses Computer Engineering**

To: Bob Clark, Del Lippert

CC: Heidi Baldus, Marcie Kenah, John McNamara, Craig Mudge

Date: 28 JUNE 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 7/12/78

As you know, Digital Press is publishing the book, Computer Engineering, this fall (by me, John and Craig).

Craig may teach it at Cal Tech with the goal of developing a course study guide (with problems).

I believe we also have the opportunity of making companion video tapes -- where many of the authors would be the performers! (E.g., Alan Kotok has already delivered the PDP-10 paper.) I'd be glad to video tape some lectures too sometime, and I'd like to convince other authors to do the same.

How can we get one of the local universities to get a course started using it this fall?

Dear Monty:

Thanks for the questions and errata. They came in useful as we're just reprinting the book. Right now I can't help you with the requests, but hope to eventually. Some of the questions may be answered - see the attached notes on your question sheet.

How's the second edition of DPT&E coming? Is there some possibility that you'd want Digital Press to publish it? Are you writing anything else that they might be interested in? If you're interested, you might contact Heidi Baldus, acquisition's editor.

Again, thanks for the errata. I'm sorry I can't get more information to you just at this time.

Sincerely,

Gordon Bell
Vice President,
Engineering

SECTION I OVERVIEW AND GENERAL INFORMATION

The Computer Museum activities are divided into several major areas: Director's Office, Archives and Exhibits, Programs and Functions, Administration, and Store. This manual describes the functions of each area and gives information to accomplish the tasks asssociated with those functions.

The staff presently includes:

	Director	467-5004
Coordinator	Exhibits/Archives 4743	
Coordinator	Programs/Functions 7570	
Coordinator	Administration 4443	
	Business Manager 4084	
	Store Manager 7331	
	Archivist/Registrar 7076	
	Exhibits Assistant	
	Secretary 4036	

Store Assistants
Museum Technician

The collections are located in the Museum proper, the Twilight Zone, and Building WZ1 at DEC, Westborough.

SECTION II DIRECTOR

The Director is responsive to the Board of Directors following through on its requests and policies with the assistance of the personnel at the Museum.

The Director directly oversees the work of the Exhibits and Archives Coordinator, the Programs Coordinator, and the Store Manager. Much interaction is required in the programs area as new events and programs evolve requiring decisions unique to each.

A large portion of time is needed in the area of fundraising, writing letters and proposals and generally creating goodwill for the Museum.

The Director also oversees the publicaton of four reports annually. An assistant for Publications and Photographs will aid in the tasks of running down details, layout, proof-reading, and editing.

Approximately one day a week must be spent in preparing for the monthly meeting with the Executive Committee of the Board of Directors. The Director is a member of this committee which sets policy, watches the budget and generally keeps the museum on track in matters legal and financial.

The Director may assist in other projects as needed, give tours, and must be available to settle personnel problems as they arise.

SECTION III EXHIBITS AND ARCHIVES

The Exhibit and Archives Coordinator reports to the Director. Reporting to the Coordinator are the Archivist/Registrar, Exhibits Assistant and Museum Technician.

The Exhibit Coordinator is responsible for all areas of the museum collection.

A. Preliminary contact work for new acquisitions

1. Follow up with telephone calls to check out potential acquisition
2. Document in pending acquisition file
3. When piece is received, remove from pending file and add to new acquisitions list (B, D, or X)

B. Registration of new acquisitions (see page 30 for detailed accessioning procedure)

1. three seqential lists - B, D,, or X
    a. B= owned by Bells
    b. D= Digital Equipment Corporation artifacts only - gift of DEC
    c. X= free and clear gift from others (XB= moved out of B list for tax purposes; XD= pieces once held on D list which were not DEC equipment
2. Form letter sent acknowledging acquisition
3. Check accuracy of information on each new piece

C. Decisions on exhibits (in conjunction with Director)

1. Conceptual planning (2 major exhibits are Timeline and 4 Generations
2. Budget Planning
3. Long range planning

D. Design of exhibit and vendor contact

1. Specifying design work

2. Contacting and arranging for work to be done with typesetters, photographers, photo reproduction, exhibit builders, lighting consultants, lighting manufacturers, plastic and metal fabricators, and others.

3. Installation of exhibit

- supervise construction
- decide where things will go
- supervise installation by Museum Technician, DEC, interns
- write text for exhibits in conjunction with Director, others
- check accuracy of information for each exhibit

E. Supervision of Archives/Library and Video Tape/Photo Collection

Work with Archivist/Registrar to

1. agree on format
2. coordinate archival material with the museum artifacts on X, D, or B lists

F. Quarterly Report

Exhibit Coordinator is responsible for the content of the Summer Report which has mainly to do with the collection, listing new acquisitions and donors. The report must be ready for the annual meeting of the Board of Directors in May.

G. Public Relations

1. Solicit artifacts
2. Show appreciation to donors of artifacts or money

H. Supervision of Museum Technician

The Museum Technician reports to the Exhibit Coordinator. The main duties of this part-time job are:

1. assist in display setup
2. dust, clean, polish all displays
3. make minor repairs
4. general maintenance
5. asist in bulk mailings
6. run errands (to post offfice, etc.)
7. rearrange furniture for lectures
8. other

I. General management of the museum with the Director and in the Director's absence.

J. Floppies used:

1. Jamie P - mostly correspondence and forms to acknowledge a donation or loan, to thank for such, and for contracts
2. DCM006.12 - contains policy, collection, receipt for donors
3. X, D, B (3 separate) - listings of collection (kept in back pocket of Blue Book.
4. Typeset - text for present and future exhibits

ARCHIVIST/REGISTRAR

The Archivist/Registrar processes, files and documents all papers, manuals, books, audio and video tapes, photographs and other artifactual materials.

Archives

(See page 30 for detailed archival procedures.)

The collections are processed according to computer company and are then separated into series based on the individual computers produced and then by the manuals, prospecti. These materials are stored in acid-free folders, obtained from either Conservation Resources International, Inc. in Alexandria, VA or University Products in Holyoke, MA. If the volume is too thick for one folder they are divided at a convenient point into two or three or more folders. The folders are labeled as follows:

Company name/computer name or number/any subdivision within the company/title of the material in the folder, volume # (folder number if the material is in more than one folder, e.g. I or II/ year

If the year, month, and day are needed or the material covers a span of time the date is as follows: year, month, day - month, day, year.

The box and folder numbers are not on each folder because these collections may not be complete and should be kept fluid. Having the box listings on a floppy permits the archivist to move the box number along the list to match any additions to or deletions from the collections. Keeping the box list up to date will insure the materials being in their proper location.

The folders are stored in acid-free boxes. The contents of each box (and folders within) are listed on floppy ARCBOX.

At the beginning of each list is the following information which is listed in the abbreviation library <ar>:

COLLECTION NAME (in caps)

<id> AR + number
<na> Company name and collection name
<so> Source (if applicable)
<hw> How acquired (if applicable)
<lo> Location (range/section/shelf e.g. I/A/1)
<rf> Reference - X, XD, D, and B list numbers
<ph> Photograph catalog numbers
<at> Audio tape catalog numbers
< >

The box number is at the left margin. The first tab is the computer name
or number. A new line is begun at a different tab for each of the categories listed between //'s above. Therefore, the whole box list is in outline form. Each collection is a distinct document on the floppy. In this way anyone can access any collection directly.

The catalog numbers from X, XD, D, and B lists which applied to the Archives collections are entered in the <rf> field. The Archives catalog numbers are entered under <rf> on the above lists. These cross references will eventually allow retrieval of all information in the Museum on a given artifact.

Indexes have been developed for the current box list. One is an alphabetical list by company or collection name which includes the catalog number, the location, and the number of boxes in the collection. The other index is a numerical list by the catalog number which includes the company or collection number, the location, and the number of boxes.

In the storage room, the collections are located by Range (wall location), Section (within Range) and Shelf (e.g. I/A/1)

Periodicals are stored in acid-free boxes by Name and Volume # or Date.

Audio and Video Tapes

The audio tape catalog file is on the AUDTAP floppy. The fields in the catalog form can be called up with GOLD, Abbrev. AT and include:

<id> AT + # + year
<na> Name of speaker
<ti> Title of the talk
<da> Date the talk was given
<se> Series (i.e. Pioneer Lecture, Bits & Bites)
<cp> Number of copies of the

tape

<tr> Transcript status

<rs> What restrictions exist if any

<lo> Location

<rf> References (to other collections in the Museum)

<lt> Length of the tape or the talk

<bl> Blurb

The AT refers to Audio Tape, and VT refers to Video Tape. Nothing has been done yet with video tapes.

Future projects include transcribing all audio tapes.

In connection with tapes are two forms sent to speakers at the Museum once the transcript has been completed:

1. Letter to the speaker with which is enclosed a transcript of the talk

2. Permission form for the use of material in the talk in Museum publications.

Accessions

(See page 30 for detailed procedures.)

A system has been set up for keeping track of the incoming non-artifactual (three-dimensional) materials. Each group of materials from a donor or lender is accessioned as a separate abbreviation library on the ACCLOG floppy.

Once the accession has been entered into the accession list, an acknowledgment letter is sent and two copies of either a donation contract or a loan contract are sent. One copy is for the donor or lender and the other is to be returned to the Museum for our records. When the contract is returned to the Museum. it is placed in a file folder with the accession number on it. All other materials referring to that accession except the correspondence will be kept in this file. The correspondence is kept in the Correspondence File. Copies of these letters and forms follow:

Loan Contract

The Computer Museum has received on loan the following item(s) from <>.

Description

This loan is made with the following understandings:

1. That The Computer Museum will give this(these) item(s) every reasonable care using standard museum practices to protect and preserve it(them). The Museum does not assume responsibility for insuring the item(s) against loss through theft, damage, or destruction.

2. That is the responsibility of the lender to make arrangements to have the item(s) removed from the collection or renewed at the end of the loan period. In lieu of this the lender may turn the loan into an unrestricted gift to The Computer Museum, a non-profit organization under the Internal Revenue code 501(c)3.

3. That this loan shall be for <>days, months, or years and shall terminate on <>(in the case of years the loan shall terminate on December 31 of the last year). The loan may be renewed for a similar period with the consent of both parties and subject to a statement on the condition of the article by The

Computer Museum.

Loan Contract

I, <>, have borrowed from The Computer Museum the following item(s):

Description

This loan is made with the following understandings:

1. That <> will give this(these) item(s) every reasonable care and be responsible for it(them), its(their) replacement, or its(their) value in case of loss, theft, damage, or destruction.

2. That the loan will be for the term of _<>, to terminate on <>.

Name and Address of Borrower

Gwen K. Bell
Director
The Computer Museum

Date
<>

<<al>>

Dear <>:

The Computer Museum is grateful for your donation of the <>. As stated in our Accession Policy, the <>will become part of the Study Collections, significant historical source material.

The <>is an outright, unconditional gift to The Computer Museum, a non-profit, publicly supported organization under section 501(c)(3) of the Internal Revenue Code. You may take a tax deduction to the extent allowable under the law.

I am enclosing two copies of our Donation Contract and an addressed return envelope. Please sign both copies of the Contract and return one to the Computer Museum. The second copy is for your records.

You will be listed as a donor to our Study Collections in the Spring issue of the Computer Museum Report. If you are not currently a member of the Museum, and would like to receive the quarterly issues of the Report and learn of our activities, now is the time to join the Museum membership program. Your membership fee is important in developing the public support we need.

Thank you for your recent gift and your support of the Computer Museum.

Cordially,

Gwen Bell
Director

The Computer Museum

SECTION IV PROGRAMS AND FUNCTIONS

The Programs Coordinator reports to the Director and supervises the organization of programs, dinner functions, excursions and special events. The Programs Coordinator is also responsible for a large portion of public relations for the Museum.

I. Programs include:

A. Pioneer Lecture Series

1. 6 annually - 3 in Spring, 3 in Fall
2. held in Lecture Hall of cafeteria
3. for members or by special invitation
4. content of talks generally deals with pioneering developments in the field of computing and/or major contributions to the industry
5. checksheet for procedures has been developed to make sure everything gets done
6. most scholarly (and often technical) of all museum lecture programs and always archived for scholarly use.

B. Gallery Talks

1. usually held Wednesdays at 4 p.m. during summer months
2. one hour talks by local speakers or others who are in the area
3. talks relate to speakers' area of expertise, usually as it relates to a particular museum exhibit
4. Museum visitors, DEC employees and/or customers, interns and staff attend
5. talks are audio-taped
6. less technical and scholarly than Pioneer lectures but still for those relatively "initiated" into the world of computing

C. Bits and Bites

1. Sunday series of one hour talks by local speakers
2. Spring and Fall series with an average of 8 speakers each
3. free to the public; refreshments sold at modest prices
4. not too technical in approach; the lighter side of the computing world with a historical or artistic bent

D. Dinner Functions

1. held in museum galleries outside function spaces or lecture hall following lectures
2. by request for outside groups (connected to the computer field)
3. in connection with lectures or special events

E. Excursions

Trips to significant computer installations, or exhibits relating thereto, access to which might normally be difficult for general visitors

F. All Special Events

Past events include Babbage Play. Future event will be Archiving Conference in May 1983.

II. Another major area of responsibility for the Programs Coordinator is publicity and promotion through:

A. computer conferences both locally and nationwide--making all exhibit arrangements and occasionaly representing the Museum at conferences

B. developing press releases and acting as Museum liason for general level promotion (e.g. Boston Globe Calendar, Middelesex News)

C. liason to the membership association which functions as a resource pool for volunteers, to provide suggestions, and to act as a sounding board for prospective programs

III. Other Responsibility

A. Tours

1. Docent training - tour guides come mostly from the staff or DEC
2. Scheduling of tour guides

B. Other

1. Request donations for special events (e.g. champagne for play)
2. Some solicitation letters sent for fundraising when Program Coordinator is the

primary contact

IV. Documentation used in Programs Area

A. Floppy - Chris R. (correspondence, etc.)

B. Chronological list of major publicity since 6/10/82

C. Chronological list of programs since 6/10/82

SECTION V ADMINISTRATION

Part 1

COORDINATOR OF ADMINISTRATION

The Coordinator of Administration reports to the Director, to the secretary to the DEC Operations Committee and to a DEC Supervisor. Reporting to the Coordinator of Administration are the Secretary and Business Manager.

A. Management of office
   1. Supervise secretary
   2. Supervise Business Manager
   3. To ensure smoothly-running operations, act as interface to Digital service organizations such as Facilities, Field Service, Payroll, Personnel

B. Assist Director with Fundraising

   1. Goal - coordinate 100 solicitation letters per month (over $100)
      a. Director provides lists of persons/groups to whom letters will go
      b. edit Director's letters for format, accuracy, style
      c. input list into list processing
      d. mail letters
      e. copy to correspondence file
      f. copy to Office Manager's Monthly Solicitation file (green folder in O.M.'s desk by month)
   2. Month-end Membership Report
      a. for Executive Committee
      b. shows how many new members in each category
      c. includes list of all current solicitations
      d. who responded
      e. what results
      f. filed in Executive Committee Book (white book in Business Manager's Office)

C. Manage Annual Cost Center Budget
   1. WHAT -- $60,000 from DEC

a. includes O.M.'s salary
b. aviation expenses
c. supplies from Stationery
d. miscellaneous shipping
e. other

2. HOW --

a. make up budget
b. track it monthly
c. keep Director aware of status

3. Budget overrun -

new process to be worked out with Director to voluntarily reduce contribution from DEC to commpensate

D. General Assistance
1. mailings
2. travel arrangement
3. museum events and functions
4. others

E. Special Projects

Proposed installation and management of 11/45 computer connected to all museum users.

Floppies used:

A. GERI - correspondence and other
l. filed in O.M.'s office (2 drawer file, under Floppies)

B. BUDGET - Director's floppy
1. updated monthly
2. filed in Executive Committee Book (white) in Business Manager's office
3. contains Monthly Membership Report

C. SOLCI
1. filed in O.M.'s desk in "solicitation" folder
2. contains Update Form
a. updated monthly solicitation lists
b. positive or negative responses recorded
c. paper file - left desk drawer under "Project - Solicitations over $100

Part 2

SECRETARY

The Secretary reports to the Coordinator of Administration and spends most of the time in tasks related to the calendar, telephone, memberships and correspondence.

Calendar

- Daily updates the calendar which includes staff meetings, appointments, events, store personnel schedule, etc.

- One copy is posted, one copy each to Director and Store, and one copy is kept by the Secretary.

- Staff makes additions, deletions, corrections each day to posted calendar.

- Current calendar is kept on floppy SUESYS, document 0.5 and archive is on 0.10.

Telephone

- Museum's main numbers are answered by the Secretary

- Most calls are requests for information, for literature, or to schedule tours.

- A listing of all literature sent out is kept.

- Tour Information Sheet is filled out for tours and this information is added to the calendar.

Memberships

- All memberships are

processed by the Secretary.

- A monthly running total of members and money is kept. (See Secretary's Office Procedures Manual for details.)

- Floppy MBR00l contains information about memberships.

- Rolodex cards for all members contains work and home addresses, telephone numbers, and effective date of membership.

- Book called "Membership Lists" includes alphabetical and zip code lists, Founders and Corporate Founders.

Correspondence

- Processes most outgoing correspondence
- Kept on floppies CM001, CM002, CM003 in chronological order and a copy is also kept in correspondence file.
- See Secretary's Manual for detailed procedures.

Secretary's Office Procedures Manual

- New Members Procedures
- How To run labels, Rolodex cards, pull a founders list, do a member list, and procedures for correspondence file headings.
- Disk Index of floppies used by Secretary

Floppies

- SUESYS -- DECMATE System disk
- DEBBIE
- SYSMBR -- System disk for memberships
- MBR001 -- Membership List
- C001, C002, C003 -- Chronological correspondence

Part 3

BUSINESS MANAGER

The Business Manager reports to the Administration Coordinator.

The main function of the Business Manager is to free the Director, Exhibit
Programs and Administration Coordinators from bookkeeping and other money related chores.

From the Business Manager's viewpoint the Museum is divided into the Director's Office, Exhibit Center and Archives, Program Center, and the Resource Center.

The Business Manager performs tasks in the following areas: payroll, insurance, bank accounts, bookkeeping and accounting, budget, taxes, state and federal reporting, store management, bill paying, invoicing, money handling, preparing for audit, relations with vendors, petty cash, and fundraising. Also photography, report editing, and tasks for special events.

Payroll

o Shawmut Automated Payroll Service -- Contact is Thomas Chatelier, 292-2197.

o In Payroll File see sample forms for: New Employee Setup for both salaried and hourly employees; Employee Revision Form for any change e.g. salary change, tax status; Employee Prelist (comes from Bank each payday, to be filled in with hourly employees' hours listed.)

o Time cards are collected every 2 weeks. Employee Prelist Total is stapled to Prelist and must be into Bank by 2 p.m. on Monday following the end of pay period. Pay period is

Sunday through Friday, biweekly. Checks are processed on Tuesday and can be picked up at the bank on Wednesday a.m.

- All employees must fill out a W4 Form for Federal withholding tax and a M4 Form for State withholding tax. These forms may be obtained from the IRS Center in Holyoke.

- Other forms: Employee Reference Card from bank will verify pay status of a new employee or that revisions have been made to the pay status of an existing employee.

Insurance. Two areas--Museum Insurance and Health Insurance.

Museum Insurance includes: 3 polices with Johnson & Higgins, 3 Center Plaza, Boston -- Joan Goldberg 742-5300

- o Director's and Officers' Liability

  - Underwritten by Chubb: includes areas of Embezzlement, Limits on Personal Liability, and others.

- o Blanket Excess Liability Policy

  - Underwritten by Fireman's Fund: includes areas of Bodily Injury, Automobile Liability, Workman's Compensation, and others.

- o Commercial Insurance Program (biggest area)

  - Underwritten by Federal Insurance Co. (Chubb): includes areas of Property and Building Losses, Bodily Injury (visitors, accidents), Employee Dishonesty, Personal Property.

Health Insurance or more correctly called Small Group Insurance Plan includes: accident, hospital, dental, mental, surgical, $10,000 Term Life, long term disability, $10,000 accidental death and dismemberment.

- o Group # (or Employer #) is 26232.

o Plan Administrator is MSP (Multiple Security Program)

o Claim Office is John Hancock Mutual Life Insurance Co, St. Louis Group Claim Office, 13523 Barrett Parkway Drive, Building #2, Suite 250, Ballwin, MO 630ll, Telephone # 314/821/3002.

o Claim forms include: Statement of Claim (to Dr. or hospital)
Dental Claim Form
Group Hospital Insurance Form (to hospital)

o Contact at MSP (Plan Administrator) is Vivien A. Benning, Contracts Service Coordinator at MSP Insurance Trust, P.O. Box 786, Boston, MA 02117, Tel. No. 421-5000.

o To enroll new employee in plan, <u>two forms</u> must be filled out and mailed to Vivien Benning: John Hancock/ MSP Group Insurance <u>Enrollment Car</u>d and John Hancock/MSP <u>Statement of Health</u>.

Bank Accounts

The Business Manager maintains 3 accounts, writing checks, keeping registers , and reconciling bank statements for each.

- All are at the Shawmut Community Bank, Marlboro West Branch; Manager, Susan Smith 485-6697.

- A deposit account for VISA and Mastercharge sales. Account #294-4146.

- A membership account (checking) formally called Non-DEC Contributions;an interest bearing account; the general operating fund (the largest acct.) Account # 275-959-4

- Store and Events (checking) account; deposits from store, play, etc. Account # 275-960-8. Out of this account comes money for store inventory, food for special events, expenses for any money-making event.

For Investment Information the contact is Gail Chadwick at the Framingham Office, 620-1100 X362--info on IRAs, CDs, etc.

Bookkeeping and Accounting For each of four areas of museum there are income and expense records in file folders.

Budget Income and expenditures for all four areas.

- Monthly Budget Report shows Projected, Year to Date, For Current Month, Total, Deviation.

- Fiscal Year runs July 1 through June 30.

Taxes

- Federal ID # is 042-747-017 (also called Employer ID # and Tax ID #.)

- The most important filing is Tax Exempt Filings for Federal Form 990 and Schedule A; and for State Form PC. These are filed after close of Fiscal Year and a period of 5 months is allowed for filing. (The due date for the Museum is November 15.)

- Quarterly Sales Tax Form ST9Q (State form)

- Withholding Taxes: Federal--Form 941E--Quarterly Return of Withheld Federal Income Tax. (Museum has not yet filed with State in regard to withholding income taxes.)

- Museum is in an Advanced Ruling Period with the IRS until June 1984. The IRS will give permanent tax exempt status to the Museum at that time if in the probationary period it maintains a 2-l ratio (For every $2 that is contributed by corporations, there is $1 from the public).

Accounts Payable

Invoices come in and are

- grouped by when they are to be paid,
- o.k.'d by person initiating the expense securing as much info about it as possible
- paid out of correct account.

Accounts Receivable

- Use invoice form.
- Mostly for dinners done for groups.
- Copy goes in Receivables folder.
- When paid goes in account folders.

Petty Cash

- Taken out of membership account when needed.

o See Petty Cash file folder.

o Usually an expense voucher is filled out and must be ok'd.

Audit

o Coopers and Lybrand do the auditing (gratis) after the FY is over.

o The Business Manager supplies the raw data from the income and expense files.

o Contacts at C&L are Scott Eston and Ed Gillis, 1 Post Office Square, Boston (574-5000).

o All information should be given to C&L in September so that tax forms will be ready by the November deadline for filing.

Relations with Vendors

The policy of the Museum is to pay bills promptly when due. They may be potential members of the museum or possible contributors of money or goods for special events.

Keep track of fundraising

Important to watch the income and to go slow on outgo, keep expenses down, and process deposits quickly when income is less.

FLOPPIES

Floppies are stored in "Software" file folder and are as follows:

Budget — Monthly budgets.

TWIT — Archives expense voucher, purchase order forms, invoice forms, list processing, etc.

DHB 001 — Notes to financial reports (taxes), other tax information, receipt form, information about Report.

Procedures

File Folders contain procedures for payroll, preparing taxes according to printed instructions, accounting system, and charts showing:

- Processing Museum Store Sales
- Handling Money Given to Museum

- Museum Store Purchasing of Inventory and Supplies
- Handling Accounting for Functions
- Store Mail-Order Sales

Legal Advice

- Jim Davis at Bingham, Dana, and Gould, 100 Federal Street, Boston, specializing in legal affairs for non-profit organizations. (Expensive) Clerk of our Board of Directors. Send copies of any legal or tax filing to Davis for locating potential problems.
- Darman Wing, DEC Legal Department, Secretary to Executive Committee; also gives general advice
- Legal information is filed in bottom drawer of file cabinet.

Subject: **Computer Names Problem: Care in Using Mini and Micro**

To: OOD	Operations Comm.	Date: 6 JAN 77
PLM's	Dick Berube	From: Gordon Bell
Bruce Delagi	Del Lippert	Dept: OOD
Jack MacKeen	Allen Michels	Loc.: ML12-1 Ext.: 2236
Steve Teicher	Mike Tomasic	
		F/U 1/24

Background

Andy proposed some names and definitions which would be used. We need names/definitions for effective communication and identity! We must evolve the mini name/definition so that it doesn't limit us. E.g., IBM has been known as a large mainframe maker; CDC a super computer maker, even though it had minis; and we've done well by defining the minicomputer (it may have hurt the 10's by being between an 8 and 11...possibly 14-bits.)

I worked hard to keep the mini definition loose:

a low cost computer, between 50K and 10K for a system, usually employed for fixed tasks (even though it can be reloaded) and whose builders agressively employed technology to supply:

a. machines at constant cost and increasing performance.
b. machines at decreasing cost and constant performance.

Hence, mini also meant, by clause b, the mini(mal) machine that one could build at any time with the available technology. Alas, I lost the battle to include in the mini definition:

<u>microprocessors</u>* - the processor-on-a-chip that comes from LSI (i.e., > 1,000 bits/chip) technology from which one builds <u>microcomputers</u>** - the complete system built from a microprocessor, memory, and interfaces. It is most always employed as a fixed application (in read only memory), and costing $100 - $1,000.

The LSI-11 is a (high end) microcomputer that is implemented with a 4 6 chips processor (not 1). This is fine because we use LSI technology.

<u>The Problem</u>

Internally we think of ourselves as a (the?) leading mini maker. We have aspirations of being a leading micro maker too. Somehow we must establish an identity to include both mini and micro without losing mini. This would help our attitudes toward design and sales.

This is an internal/external issue. Who addressing it? Who should?

Dear George,

In response to your letter of March 26, the week of July 23, as of now, would work out well. I will tentatively hold some time on July 25.

Hope you have a nice holiday, and I am looking forward to seeing you.

Sincerely,

Gordon Bell

SUBJECT: RE: THE PROFESSIONAL MANAGERS DESK-TOP COMPUTER

I think the basic work is being done in the ofis program for this system. That program has a significant coupling already.

We can have all these people meet, frankly, I don't think it's worth doing. If we have the kind of resources to engage in this sort of bullshit, then I would rather take a few of them and put them to work implementing! I really don't think
the developers need any more of this content-free, marketing/user input. Peebles has a research program that we need results from to base some of our future work on. I don't want
him doing this.

The experiment you saw in ZR tells me that we are going to have the product base we need. The folks building it should go ahead, they should not be spending their time in educator mode.

I want the developers to work! They've got far more ideas on needs and what various persons want or think they need than we can ever implement or that can be humanly implemented because of the constraints (make it big versus make it little).

If I thought you were serious about this I would recommend that several professional managers got themselves a decent wps system, say like the shared one we are going to market with. Tie it directly into ems, and to one of our big shared systems. They would then start using it to find out what they really need and do: wps, ems, ability to typeset easily, a programming language or ttwo to do fancy desk calculating, a visicalc (there are several around), and then some programming help so as to be able to run experiments when there are things they want to do that they can't program (use) in these other programming/use styles.

Our developers, and development managers are flat out implementing what I think are the right set of products, based
on our knowledge of the market and how to build them. The thinking is sound, the ideas are ahead of the market as we see it now. We do have some dpeople running around trying to market the existing products: I WANT THEM TO GO INTO THE PRODUCT LINES, CAUSE I WANT OUR PRODUCT MONEY AT THIS STAGE TO GO INTO PRODUCTS AND NOT INTO MARKETING PRODUCTS WE AIN"T GOT!

I don't want our product people talking to dreamers who are basically non-computer users and who may never be about vacuuous ideas. If these people have ideas, then let them work them out at the terminal and then let's put em in. Si has the right approach toward identifying the product components in terms of sets of users. (We can all read the Apple brochures, and I don't think a group convened to read and extrapolate is what we need.)

Let's build breadboards not bullshit!

SUBJECT: COMPUTERS FOR MANUFACTURING

Apparently their program called Mapper is spectacular and the main reason they are selling in the factory. What about getting someone to write one on VAX?

Surely we could beat HP and Univac in this market. The key is buyout software though and knowing what to do.

Peter Christy has just installed a system to control our semiconductor manufacturing with a 780 .
The manufacturing people are quite enthusiastic about it as a next generation CAM. Also, I recently saw a whole 10M company running cam, mail, cad on a 780. They also had the underground version of Visicalc (Digicalc) that we all use internally.

I can't understand why we aren't the hottest in manufacturing, just like we are in ESG.

Ken has ask me to review your proposal on the new PDP-14 controller with him. My first reaction was quite negative because I think the world will be completely in a different place when you get there with it and I can't understand why you folks don't just put a compiler on your current system to do control (eg. booleans, ladder diagrams) and repackage as necessary? I also don't believe you understand that all the machine control will be integrated into the machines by 85 and the job is really a systems integration and networking job instead of letting old style engineers fiddle with relay controllers.   These industries who'll be automating the past will not have the bucks to spend because they are going the wrong way.

Bottom line:
The industries and machines that form them are shifting radically.
The old ones won't attract the capital and be competitive anyway.
The proposal was clearly the warmed over PDP-14 only 10 years too late. The big budget to get the vanishing market really looks flaky to me. I don't want to invest there.

Why not be the supplier for the factory of the 80's and 90's?

LOC/MAIL STOP: ML12-1/A51

cc: AL CRAWFORD

SUBJECT: OUR COMPUTING AND COMMUNICATIONS

In discussing this with Al, I came across several facts of interest, that you folks there in the hub of the mill might (re)consider:

Why Move the Maynard Datacenter (PK1)?
Al has been "ordered" out of PK1. This seems incredibly crazy, every way you look at it. Cost, having to do "make work" to move everyone/every machine, high risk in losing ability to perform (to be made up by even incredibly higher cost). It gets us nothing, except higher traffic density in Maynard because of the relatively low density of Al's operation. We are already distributing much of our computing, but there will always be some corporate piece like RCS, a few EMS nodes, Corporate Acct/Control/MIS, the Maynard support for groups like personnel, there and putting them somewhere else will merely further increase our costs. The 2080 should give Al enough capability to stem the tide while we distribute computation throught the other parts (which may turn out to be in PK2,3, PMR, ML, etc. ... which would be bad, as Al has the space).
As an officer, stockholder and person concerned with our computational ability, please let me implore you to rescend your edict ... or help me understand the decision criteria so I can defend the fact that we do try to manage in a rational fashion? In other word, HELP!

Teleconferencing Is Still Needed
I seperately came across some information that says IBM has teleconferencing links of various types between about 8 of its facilities. Furthermore, these rooms are reported to be in use from 7am to 6pm and they are building more. I had hoped we would have teleconferencing going between ML and MK so we could go into the design of a full scale network. We are still building the link, ever so slowly, but I'm equally confident that it will turn out to be an important capability. Can we get these folks on a more aggressive planning track, assuming that it will work?

Telecommunications Backbone Network Needs
A seperate, but related part of teleconferencing is

to get a substantially more aggressive plan for communications
among our NE facilities. The links needed for teleconferencing
also give us decent data communications and more voice traffic.
There is clear evidence that with distributed processing
we will need more bandwidth here. Here, I'd like to ask Al to
have us go for a first class interconnect that would be
substantially cheaper to operate AND it would give us the
experience we need to make products for what I think customers
are going to want in the pre-dawn of the 21st century?
We have the laboratory, which ma bell is well on her way to
forcing us to finance. Let's take advantage of her.

Hub, how about better direction rather than just going around?

SUBJECT: CONGRATULATIONS AND WHAT IS THE CHARTER HERE?

Am delighted to see that Jim Milton has joined Brian as
Systems Engineering Manager.

Do have some concerns about whether we are going to get more systems than we want or need that are specific to the Commercial group, and hence segmented from the Technical group.

I am deathly afraid of where we are in the systems domain now because of the situation in Manufacturing where everything is put together on an ala carte basis in FAT. I don't want to perpetuate this, and I'm afraid it will. We have to have as a goal Customer Mergability where more than one entity forms the system!

By seperate memo, Mary Jane will send you a note which I want to use to segment the systems classes.

Could you folks get together and segment who is doing what and in what class system?

HENK SCHALKE LOC/MAIL STOP: ML12-1/A51

SUBJECT: CONSOLE COMPUTERS IN VENUS & JUPITER

I suggested several times that we use the same control computer for these two systems. With a module costing something like .25-.5M per crack, this would seem to make sense. Also, I tried to no avail to get you to use a standard computer like the 11/23 which had all the engineering done. Frankly, I can't see how you can afford to engineer two special computers, complete with RLV11 controllers. Traditionally, everyone who has copied the RLV has gotten nailed, since it is a very tricky circuit.

What I'd like to see:

Use a standard computer for both. On the interface into the rest of the machine, use the IEEE 488 interface, especially that one to the MPS. We should use industry standards where possible.

In this way, when CT comes out, you can simply replace the cabinet with a table top box and to the IEEE bus, and get a size and cost reduction.

What you say? Why not save a megabuck in the project?

Maybe I was at a different meeting. I do recall Jack Smith saying that he
thought the technique had more payoff possibly in other than Central Engring.
I also recall a vote out of which came direction for me to go negotiate with
Hendricks a deal wherein he would be providing us the consulting services in
analyzing Central Engring in trade, more or less, for some standard DEC
hardware. To preclude any embarassment or wasted motion, we obviously need
confirmation of what is expected to happen.

No, nothing now. I haven't had a chance to even read info.

I talked to Gordon who believes he made a commitment to LOOK AT it for
Engineering, but not necessarily DO it. I also talked to Jack Smith who says
he heard Gordon say the above and that he (Jack) DOESN'T feel it would best be
used in Engineering but would be much more applicable to Manufacturing.

I'll let you know more when we've discussed.

Subject: The Hendricks Study

I wasn't aware that we (engineering) were obligated to spend $93K for this
study. I feel it is quite a lot in time...which I believe will be beneficial.
However, given money, I ain't so sure.

Can we have a new organizational principal within DEC? Engineering is willing
and able to stand any study and scrutiny by whatever, whoever (but not
necessarily whenever) people want it. However, in these proctoscopical
examinations the examiner must:

1. supply there own proctoscope (funding); and

2. wait till the examinee has the time

3. wait till there is room for the next proctoscope.

Digital **Interoffice Memo**

Subject: **Consultants and Other Outsiders We Can Work with on Miscellaneous Problems**

To: Distribution

Date: 1 NOV 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

F/U 11/8

This is a list of consultants and cooperative R/D efforts who we might utilize effectively on some problems. Can we try to start in the near future (next week or two)?

Secure (Protected) Operating Systems

Peter Neumann, Larry Robinson at SRI - Secure Operating Systems. They would look at STAR in these terms. Roger Gourd, what do you think?

Clark Weisman at SDC has done similar, but more empirical work.

Bisby at USC/ISI is also a system breaker (the group may not be secure).

Bob Abbett at LLL would probably do it free.

Performance Monitoring, Analysis, Understanding

Ed McCluskey pointed out that one of his better students, Liba Syovadoba, is an MIT Assistant Professor. Let's get her at DEC one day a week. Rollins, will you do this to help Ralph and Ulf?

This area is especially frustrating to me as the list of questions I think we ought to answer about systems (11/70, System 20) is growing faster than our ability to do anything but babble...which seems constant or declining. Let's assume the worst...our customers and engineers really would like to understand their systems, and there will be vendors who can satisfy this need (e.g., H.P.). Furthermore, someone may even sue us for false advertising when we say that an 11/70 can be used by 64 users!!

Fonz 11 (and other MOS) Chip Designs

Carver Mead at Cal. Tech. is doing some excellent work on MOS chip layout. Furthermore he has taste in design. While he consults at Intel and uses their furnaces, he's a professional, and any design critique would be secure. Conceivably anything we have in our design would ultimately get taught and used elsewhere.

I believe he could teach us (and possibly even Bill Roberts) some MOS techniques. We could learn this partially by going there and having him explain his design to us. On the other hand, I'd like him to review Fonz. Steve will you and/or one or two drop by there and see whether you believe he has something to add?

Reliability Modeling Program

We tried to get this done this summer with a CMU student (Kini) and failed. Ed McCluskey has a research associate who would be interested in working on it. Dick, can you get a users manual so that we could see whether he would want to work on this?

Memory Chip Evaluation

Harold Shattuck, V.P. of Engineering, Amdahl Corporation would be interested in exchanging reliability, performance, etc. data on memory. They've evaluated ECL and MOS RAMS. If interested in exchange, call Harold, or Lin Wu at 408-735-4011.

SUBJECT: BOOZ ALLEN; BUYING (AND GIVING) COMPETITVE INFORMATION

We undoubtedly got lots of useful stuff from them and I hope we got farther along on the issue of what to make vs what to buy. I learned a new word, virtual integration of a connection
that I already understood. I may have learned a couple of more tidbits about IBM. It seems to me we are in real trouble
if we get a big response that says the lectures were worthwhile.

Ken recently did a neat thing by asking various persons to present topics like these as lectures at a full day meeting. In general, they were very, very good. The presenter learned a lot, and the audience got about the same amount as with a professional presenter.

The real thing that bothers me about Booz, Allen Barf is that I consider them to be basically unethical. I would bet they have consulted to IBM, and the mapping of the IBM strategy and
organization is fundamentally a form of paid, industrial espionage they do for bucks. They probably already sold this pitch to the Japanese and to everyone else in this industry.

Fortunately, they have us down in the bottom 25 with the also rans somewhere near GE, and hopefully won't both getting the same kind of shit together to present to IBM. Their concept of thinking they are building advanced systems when they do anything for the govt in comm or computing, means they don't really understand the whole thing. (I'm on an NRC panel that's looked at the govt use of computing).

Frankly, I'm confident we gave them more than we got by

our questions, attitudes about who are the real competitors, who is quality, etc. We should have been able to get the same poop from a book or DEC lecture.
I'd propose that we interact with them via closed ckt video as a way to limit information flow. No way should they have been party to any of our thoughts on strategy.

As for the espionage, I found it as unsavory as the characters
who presented it. Maybe we are at war and I don't recognized we have to employ spys by the hour. Clearly this is kind of presentation is not new to us, Gideon Gartner's Garbage presentations on IBM (and I understand he has a DEC presentation that he gives to IBM) are another type. Somehow, I
have trouble adapting to the style. I know Japan works this way, and at one level, mapping an organization and their direction is a lot of fun. Clearly we do a lot of this with our
competitive analysts. Walking inside and talking to the folks
is like shooting fish in a barrel though. Can we get a set of
the slides they are presenting to the outside about us?

Can you all tell me this is the way the world is? That it is something (like having the responsibility for the mill) that's basically ok and builds character?

I talked to Paul at the MIT Visiting Committee meeting last week. He seems enthusiastic about consulting for us and getting a good linkage between here and MIT. One of the issues was getting APL there so he could use it for developing design aids. Since he will be working for us in this regard, lets get the program there with the provision that it either be for his exclusive use and his group in this area, or if it is used widely, then let's treat it as a gift. In this later regard, I only see giving it, if it is not going to be used widely within the department for other purposes outside this work. On the other hand, it may be possible to give it and deduct the cost. Note, the cost is the amount to produce it, plus the residual amount to maintain it. Let's do this quick, so we can get the group committed to working with us and getting Paul focussed here this last part of spring and summer!

Follow Up 4/20

At the MIT visiting committee last week, Larry Roberts suggested we "give"
computer time, and then get the appropriate tax deduction.

Telenet would supply free time off hours and suggested we do the same.
Currently MIT uses the horrible MULTICS system at $20/hr. or $5/hr. off peak.

How much time could we make available after hours? How much could we deduct
for it? Is this a crazy idea? It feels like we could make money doing
this...unless it takes away a sale.

1. Is it crazy idea? Probably not crazy, but not wise. Issue here is
ability

to service additional customer on top of inhouse loads. 2. Make money/deductions. The only deductions the company gets are for actual cost
expended, not "notional" cost or equivalent costs saved. To extent company
provides use of existing facilities, there is no incremental deduction for
providing the service. Clearly you can't make money.

Suggest you work with Bob Puffer to determine whether we should go forward.

Top of the head: we do have some excess capacity during 2d and 3d shift.
Non e at all during prime shift. I suppose we incur some security risk by
inviting student wizards to come on board. Admin cost would probably not be
too great, in that we already account for detailed consumption of machine
time--at least in the IPC and CAD systems.

If the contributions and tax guys say to pursue, I will dig into feasibility
some more.

Subject: CORPORATE CONTRIBUTION OF COMPUTER TIME - CAN WE DO IT?

MIT is not the first such organization to request contribution of computer
time. We have in the past received requests from local towns, school systems
and the community colleges. I can recall several discussions of this at the
Contributions Committee where we concluded that we didn't want to get
involved. Although in principle it would bbe easy, in practice it turns out
to be quite difficult since the "for free" customer expects the same level of
service and support as does the customer. The "free" customer is not willing
to be thrown off at our whim whenever we want to rejuggle loads or

reschedule
internal jobs. The admin- istrative costs of keeping the "free" customers
happy are perhaps in fact higher than servicing our regular customers in
house. I think it is a good way for everybody to lose since the odds are that
the "free" customer will be unhappy and will feel hassled.

One exception we have made in the past was when an employee was doing
charitable work using our system, for example, Tom Stockebrand doing the
Boxborough voting lists. I think our past policy is a good policy, and we
should not change it.

SUBJECT: PLEASE FUND HAROLD COHEN... BUT I CAN GO TO THE OC IF NECESSARY

History
Gwen asked Andy, head of MR and the Technical Product lines for
an 11/44 for Harold Cohen. Harold will do more paintings with
his new program. Andy agreed, and Harold is waiting. Therefore,
I don't see any way out of doing it. I want to do whatever is
necessary to fund it, including seeing the Operations Committee.

I see these alternatives for funding Harold:

1. Andy fund it or load it out in his past job.

2. I get some funds from engineering and support it that way. Larry, what you say?

3. Technical and Engnineering do it.

4. Operations Committee. Since 6 is out, I'll go there, very sheepishly with the request.

5. If none of the above, then I see no alternative but for Gwen and I to fund it personally or we assist Harold in getting a computer somewhere else.

   Harold had offers from others, I asked him to stay with us because I had confidence in this work and that we would benefit. I believe Intel, Motorola, HP or IBM would fund Harold if both of us asked them.

Andy and Bill,
What you say?

If no, then I'll go to the next Operation Committee meeting.

6. The Corporate Contributions Committee would fund it when

hell
freezes over. I don't see why they didn't fund it.

Harold's at the University of California/San Diego. The machine will be available to others there. I don't know what the issue is about it being his or theirs. At any rate, I believe this point could be gotten around. Given the strange overhead associated with organizations, having Harold responsible for it sure makes good sense. Given that Harold travels around for shows and sabbaticals, I don't think the University should own it. (The rule about not supporting people is idiotic. Organizations don't do anything, people do! All real work is funded to people.)

Digital directly benefits in many ways. It is good AI research. His paintings are in our buildings and the results of this larger program will be a larger painting. His students are exposed to our computers. We get the benefit of his publicity. His painting of the MR2 building was on the cover of Datamation. His next work is resulting in many shows including the Tate, etc. The 11/44 and GIGI will occupy a predominate point in the exhibit! We'll get more PR from this than 50% of our spending in this area. Thus DIGITAL directly benefits!

As a commentary on our values, I think funding Harold is much more important than the self serving, glossy brochure that extolled our contributions. This was clearly designed to make the committee feel good because it had no substantive or useful information, but was a complete waste of resources.

November 30, 1981

Dr. Joseph Capowski
University of North Carolina
Medical Research Wing 206 H
Chapel Hill, NC 27514

Dear Dr. Capowski:

I certainly appreciate your predicament due to NIH cutbacks. We have not given funds for staff in the past so I don't believe we could help in this regard. Normally our assitance has been limited to equipment grants and exchange of equipment for research.

Funding proposals should be addressed either to George Chamberlain, our treasurer who also handles corporate contributions or to Joel Schwartz, head of our Laboratory Data Products Marketing group.

Sorry I can't help.

Sincerely yours,

Gordon Bell

The VT100 appears to be going well. I'm happy that the customers like it because this will stimulate our sales and marketing to pull. I believe the LA34 and LA120 should also do well.

Let me officially congratulate you on the progress in Advanced Development. For the first time in the last year, I feel good about the long term engineering for terminals -- having been away six weeks and walking around the lab. There's a good base of knowledge and good packaging concepts. Thus, I think we can quickly design and build about any terminal that's needed...this puts some pressure on defining specifically what's needed in the product/market domain (e.g., an electronic typewriter).

I hope we'll get Hong Kong into manufacturing to cut costs, and you have people motivated and capable to get us the low cost, high quality electronic typewriter for typing, word processing, as a terminal and for electronic mail. The possibilities for a great analytic/display smart terminal calculator are there and I want to stay with this one personally because I need/want one. Let's keep these people motivated. These breadboards also form an essential media for marketing interaction and product definition.

The work in Ed's area is really nice, especially considering the position only 10 months ago.

We're selling 10's and 20's to many of the universities that do semiconductor research. CALTECH just got theirs and we are interacting with them and expect to share programs, etc.

(MIT, CMU, Washington, also are involved and have machines).

Why isn't Cornell a target user for CAD equipment for VLSI?

Have you talked with them?

Have our semiconductor people talked to them/been there?

Ms. Debbie Hall

and

Ms. Ann C. Neumire
Consumer Service Dept.
Corning Glass Works
Corning NY 14830

Dear Ms. Hall and Ms. Neumire:

In early March I sent Ms. Hall an order for <u>6 liners</u> for the TR-1 Coffee On Demand Carafe. I enclosed a check for $57 to cover the cost of the <u>liners only</u> at $8 plus $1.50 for shipping, per Ms. Hall's letter to me (Ref 535-003, 20 February 1984) where she quoted the price.

Last week I received 6 complete TR-1 Carafes at a price of 180, and an invoice (c 032991, March 21) for the excess which was $136.10
(180 + 9 sales tax + 4.10 shipping - 57).

<u>I only want liners NOT complete Carafes!</u>

I have taken the liners from the six Carafes, which I assume you wanted to use as shipping containers and am returning the six Carafes, <u>without</u> the liners, to you. I am not charging you the additional shipping costs to return the liners or the cost of my labor for removing the liners from the Carafes.

Sincerely,

Gordon Bell

SUBJECT: CORP REPORT CARD/PARAGRAPH FOR YOUR LETTER/MSG TO TROOPS

Glad you asked. Note the following:

WHAT I'D LIKE TO SEE IN THIS ISSUE TO ALL DEC EMPLOYEES:
0. NO CORPORATE REPORT CARD OF THE FORM GIVEN
1. Your letter which you've asked me for a paragraph for
2. Take the milestones calendar and have a paragraph and picture
for each entry, or some quotes from various people
3. Possibly a page from each function, giving its milestones...
note I have included mine below in about a dozen paragraphs
(The new facilities would be described in this section, if
someone can rewrite it in something resembling english.)

NO CORPORATE REPORT CARD

No way do I believe we publish the "Corporate Report Card" ...
like all things done by a committee, it is awful! At most, it
is our report card, and perhaps that of our direct reports. The
screw-ups I know about are also known about by those who screwed
up. If we say all those bad things about product introduction,
I'll lead a witch hunt to get to the bottom of every one and I
don't think this is very productive. Also, I think it is pretty
lenient in areas where I think there is no leadership or sheer

incompetence. Do we really want these out in the open?

I don't know how this'll help the masses, especially someone who's just produced all the terminals they've been asked to and then we tell them they've missed commitment. If it's for everyone, then let's make sure it targets them. Mostly, the report card as proposed is totally irrelevant to most employees.

Let's put out a very positive message for employees in a big issue of DECworld, really descriptive and aimed at communication, not winning photo or artistic contests. Content, not Form!

ENGINEERING (in one paragraph)

For the first time, our computers can be connected into large networks, with any terminal on any machine interconnected with any other machine. Also, these DECnetworks can be connected to the developing international X.25 standard-based networks. DEC's engineers have the advantage of being interconnected on a 100 node computer network spanning from Reading, England, to Colorado Springs, allowing them to work co-operatively, exchange programs and ideas via Electronic Mail, while located with their appropriate manufacturing and marketing groups. This year semi-conductor engineering and manufacturing moved into a new plant in Hudson, Mass., the new RM03 and RL02 disks were designed at the Colorado Springs plant where they are manufactured, and the commercial software for VAX-11 was developed in conjunction with the Commercial Systems marketting group at Marrimack, New Hampshire. Together with Xerox and Intel, Digital has proposed an international standard for interconnecting computers which will allow us and our users to begin to substitute communication for transportation, saving energy.

ENGINEERING (IN A DOZEN PARAGRAPHS)-excuse the rough draft

We celebrated the tenth anniversary since the introduction of the Model 20 PDP-11. Since then we have introduced 15 basic models, including the recent 11/44 System. We also celebrated the fifth anniversary of the VAX project which produced the VAX-11/780, introduced in 1978. The DECsystem 2020, introduced in 1979, won an IR 100 Award. We use a significant number of computers in our engineering in applications from word processing and electronic mail to checking whether the computers we design meet the specifications we originally intended for them. The network connecting our main engineering computers became operational, and now includes 100 machines.

NEW PRODUCT INTRODUCTIONS

The 11/44 System based on the RL02, 10 Megabyte disk was introduced in November to provide much more capability then the 11/34-based system we introduced in 1976. It allows a main memory of ? Megabytes, performs at about ? times the 11/34, but includes the Commercial Instruction Set. With remote diagnostic capability, it has lower basic monthly maintainence charges. When running the various timeshared or multi-process systems, we expect an installation would get more than ? times the use, for a constant workload.

The Commercial software was introduced for the VAX-11,

permitting
users to have a single computer type for either technical or commercial applications. This provides a VAX-BASIC, COBOL, PL/1,
and the existing languages, together with a powerful data management system, and a unique Sort capability. We believe the
performance and capabilites in this important application area
will be as significant as VAX-11 was for technically oriented users.

DECnet, Phase III was announced, permitting larger networks to be
built with the ability to pass information among nodes and the
ability to have a terminal on a given machine to be connected on
any of the machines. This enables true networks to be built, versus those which we believe will be limited because they are
based on a hierarchy. Also, we introduced the ability to interconnect DECnetworks to the emerging versions of the international standard X.25. Finally, we are working with Xerox
and Intel to specify and build a local network interconnection
standard based on Xerox's Ethernet, which will be capable of interconnecting computers and terminals within a connected radius
of ?? Km. and transferring information at a 10 Mhz. rate. We have proposed this standard to the various standards organizations.

ENGINEERING ORGANIZATION AND FACILITES

Two, significant engineering facilites have been opened this year at Spitbrook Rd. in Nashua, New Hampshire for system's software, and Hudson, Massachusetts for semiconductors. In general, engineering is co-located to be part of a critical business unit either on the basis of a manufacturing technology or for a critical market. For example, the RM03 and RL02 disks, and the Commercial software for the VAX-11, are engineered at the Colorado Springs disk plant we opened in 1977, and the Commercial Product Group at Merrimack, New Hampshire, established in 1976.

We have run several experiments on video teleconferencing and are using crude teleconferencing (based on the best available technology) between Maynard and Colorado Springs. Our annual engineering conference used teleconferencing to extend the coverage to all the sites, thereby doubling the number of attendees. We are emphasizing our ability to communicate electronically, as a means of increasing productivity.

WE USE OUR OWN COMPUTERS
Computers are the tools of our engineers. We have over x terminals for word processing, provided by dedicated (WPS 200/WPS 78 series) and timeshared facilities. These also are connected to various typesetting systems. In addition, they connect into both the corporate-wide Electronic Mail System and the 100-node Engineering Network stretching from Colorado Springs to Reading, England. As one of the largest computer networks in existence, it is used for: interperson communication via its own electronic mail systems, as a communications network for virtual terminals permitting a user on one system to access another system, file transfers among persons or to unique facilities (eg. typesetting), for load levelling, program updates on a network-wide basis, and as a laboratory in terms of networking

facilities.

System software is developed using the BLISS language, which originally came from Carnegie-Mellon University. We believe the BLISS compiler helps produce the highest, quality most efficient programs that are possible. The compiler runs on larger computers (10/20/VAX-11), but has been extended and standardized for use on nearly all our computers. All applications software is developed in an appropriate higher level language. We have introduced a software management system to hold all documentation, management information and modules for programs in order to assist the programmer team.

The use of on-line systems for drawing logic schematics has increased, and in some areas we can draw, simulate, and go on to automatic layout of chip or printed circuit board. A significantly better simulator has been introduced, with the capability to do automatic generation of production test patterns. For the first time, we can verify that a given hardware implementation of a design meets a formal specification.
The various computer aided design programs have been developed to handle the improvements in the technology processes described below. We now have a facility permitting the mechanical designer to describe a part on a CRT, to simulate the use of the part observing various vibration modes, and to mill the part.

Two significant developements which aid the user to design a computer have been introduced. XCON, developed at Carnegie-Mellon University, takes a collection of options and specifies the bill of materials and how to build the system. Formerly, this required a person up to two days to do for complex systems. A DECsystem 10 configurator, allows a customer to interact with, and specify a configuration together with the parts and system price.

MANUFACTURING PROCESSES TO BUILD COMPUTER SYSTEMS

Of course tools to design are nice, but for us, the manufacture of the design is essential. We now have production lines for terminals and low cost disks that must attain the volume of consumer oriented units. These lines operate with computer assistance for tracking and controlling flow, testing, measuring quality and productivity. In our basic technologies, we have recently introduced a line to manufacture all the media for our high volume RL01/02 cartridges. In semiconductors, the Hudson facility is now operational and producing both MOS and bipolar parts. We are able to produce significantly higher density printed circuit boards for the one board microprocessors and also for high performance machines, although the later require multiple layers with controlled impediance to handle the high speed signals.

We are extremely happy that the product quality goals set several years ago for products are now being attained, in what we called our "Dock Merge" program. This enabled parts such as disks and terminals to be inventoried in our Final Assembly Test plants and shipped directly to a customer without the necessity to test the system as a whole. We have established a new goal, "customer site merge", which permits us to hold parts at each of the high volume plants or in distribution warehouses, and to have them field merged. We believe this will permit much lower inventories

by eliminating the final staging we now go through. This program
is a combined effort requiring better control of product flow,
together with high quality.

Although the quality of the products we are designing is
improving, we also have to reduce our product introduction times,
for what to us, are much higher production rates. This combined
effort requires teamwork across plant, manufacturing processes
and product engineering.

Pls excuse this last section, as it is a draft and shouldn't be
widely circulated. Somehow if you adopt the first suggestion,
it would be used, otherwise, we would publish it in some form
just within engineering as a letter from Larry and I.

Hope there is something here you can use.

the commercial software for VAX-11 was developed in conjunction
with the Commercial Systems marketting group at Marrimack, New
Hampshire. Together with Xerox and Intel, Digital has proposed
an international standard for interconnecting computers which
will allow us and our users to begin to substitute communication
for transportation, saving energy.

ENGINEERING (IN A DOZEN PARAGRAPHS)-excuse the rough draft

We celebrated the tenth anniversary since the introduction of the

Model 20 PDP-11. Since then we have introduced 15 basic models,
including the recent 11/44 System. We also celebrated the fifth
anniversary of the VAX project which produced the VAX-11/780,
introduced in 1978. The DECsystem 2020, introduced in 1979, won
an IR 100 Award. We use a significant number of computers in our
engineering in applications from word processing and electronic
mail to checking whether the computers we design meet the
specifications we originally intended for them. The network
connecting our main engineering computers became operational, and
now includes 100 machines.

NEW PRODUCT INTRODUCTIONS
The 11/44 System based on the RL02, 10 Megabyte disk was
introduced in November to provide much more capability then the
11/34-based system we introduced in 1976. It allows a main
memory of ? Megabytes, performs at about ? times the 11/34, but
includes the Commercial Instruction Set. With remote diagnostic
capability, it has lower basic monthly maintainence charges.
When running the various timeshared or multi-process systems, we
expect an installation would get more than ? times the use, for a
constant workload.

The Commercial software was introduced for the VAX-11, permitting
users to have a single computer type for either technical or
commercial applications. This provides a VAX-BASIC, COBOL, PL/1,
and the existing languages, together with a powerful data
management system, and a unique Sort capability. We believe the
performance and capabilites in this important application

area
will be as significant as VAX-11 was for technically oriented users.

DECnet, Phase III was announced, permitting larger networks to be
built with the ability to pass information among nodes and the
ability to have a terminal on a given machine to be connected on
any of the machines. This enables true networks to be built, versus those which we believe will be limited because they are
based on a hierarchy. Also, we introduced the ability to interconnect DECnetworks to the emerging versions of the international standard X.25. Finally, we are working with Xerox
and Intel to specify and build a local network interconnection
standard based on Xerox's Ethernet, which will be capable of interconnecting computers and terminals within a connected radius
of ?? Km. and transferring information at a 10 Mhz. rate. We have proposed this standard to the various standards organizations.

ENGINEERING ORGANIZATION AND FACILITES

Two, significant engineering facilites have been opened this year at Spitbrook Rd. in Nashua, New Hampshire for system's software, and Hudson, Massachusetts for semiconductors. In general, engineering is co-located to be part of a critical business unit either on the basis of a manufacturing technology
or for a critical market. For example, the RM03 and RL02 disks,
and the Commercial software for the VAX-11, are engineered at the
Colorado Springs disk plant we opened in 1977, and the Commercial Product Group at Merrimack, New Hampshire, established
in 1976.

We have run several experiments on video teleconferencing and are
using crude teleconferencing (based on the best available technology) between Maynard and Colorado Springs. Our annual engineering conference used teleconferencing to extend the coverage to all the sites, thereby doubling the number of attendees. We are emphasizing our ability to communicate electronically, as a means of increasing productivity.

WE USE OUR OWN COMPUTERS
Computers are the tools of our engineers. We have over x terminals for word processing, provided by dedicated (WPS 200/WPS
78 series) and timeshared facilities. These also are connected
to various typesetting systems. In addition, they connect into
both the corporate-wide Electronic Mail System and the 100-node
Engineering Network stretching from Colorado Springs to Reading,
England. As one of the largest computer networks in existence,
it is used for: interperson communication via its own electronic
mail systems, as a communications network for virtual terminals
permitting a user on one system to access another system, file
transfers among persons or to unique facilities (eg. typesetting), for load levelling, program updates on a network-wide basis, and as a laboratory in terms of networking
facilities.

System software is developed using the BLISS language, which originally came from Carnegie-Mellon University. We believe the
BLISS compiler helps produce the highest, quality most efficient
programs that are possible. The compiler runs on larger

computers (10/20/VAX-11), but has been extended and standardized
for use on nearly all our computers. All applications software
is developed in an appropriate higher level language. We have
introduced a software management system to hold all
documentation, management information and modules for programs in
order to assist the programmer team.

The use of on-line systems for drawing logic schematics has
increased, and in some areas we can draw, simulate, and go on to
automatic layout of chip or printed circuit board. A
significantly better simulator has been introduced, with the
capability to do automatic generation of production test
patterns. For the first time, we can verify that a given
hardware implementation of a design meets a formal specification.
The various computer aided design programs have been developed to
handle the improvements in the technology processes described
below. We now have a facility permitting the mechanical designer
to describe a part on a CRT, to simulate the use of the part
observing various vibration modes, and to mill the part.

Two significant developements which aid the user to design a
computer have been introduced. XCON, developed at
Carnegie-Mellon University, takes a collection of options and
specifies the bill of materials and how to build the system.
Formerly, this required a person up to two days to do for complex
systems. A DECsystem 10 configurator, allows a customer to
interact with, and specify a configuration together with the
parts and system price.

MANUFACTURING PROCESSES TO BUILD COMPUTER SYSTEMS
Of course tools to design are nice, but for us, the manufacture
of the design is essential. We now have production lines for

terminals and low cost disks that must attain the volume of consumer oriented units. These lines operate with computer assistance for tracking and controlling flow, testing, measuring quality and productivity. In our basic technologies, we have recently introduced a line to manufacture all the media for our high volume RL01/02 cartridges. In semiconductors, the Hudson facility is now operational and producing both MOS and bipolar parts. We are able to produce significantly higher density printed circuit boards for the one board microprocessors and also for high performance machines, although the later require multiple layers with controlled impediance to handle the high speed signals.

We are extremely happy that the product quality goals set several years ago for products are now being attained, in what we called our "Dock Merge" program. This enabled parts such as disks and terminals to be inventoried in our Final Assembly Test plants and shipped directly to a customer without the necessity to test the system as a whole. We have established a new goal, "customer site merge", which permits us to hold parts at each of the high volume plants or in distribution warehouses, and to have them field merged. We believe this will permit much lower inventories by eliminating the final staging we now go through. This program is a combined effort requiring better control of product flow, together with high quality.

Although the quality of the products we are designing is improving, we also have to reduce our product introduction times, for what to us, are much higher production rates. This combined effort requires teamwork across plant, manufacturing processes and product engineering.

Pls excuse this last section, as it is a draft and shouldn't be widely circulated. Somehow if you adopt the first suggestion, it would be used, otherwise, we would publish it in some form just within engineering as a letter from Larry and I.

Hope there is something here you can use.

follow up 1/22/79

Do you have a responsibility to make it clear just what the strategy/policy is for interconnecting to our terminals? In my first use of the LA34, I was appalled to find it connected via a kludgy acoustic coupler that we didn't even supply. The LA120 and VT100 are the same step backward from the LA36 with its built in coupler (even though the coupler is relatively poor).

Sometime ago, I asked to have this question looked at, prior to the time we came out with the terminals. I found that virtually everyone agreed that we wanted to provide adequate connections, including modems, phones, phone lines, separate modems and computers including 20 ma loops and the 2 EIA standards, but there was no plan. Also, DCG felt strongly that we should do nothing because their customers buy in volume and provide their own interconnect to get maximum added-on value (what/how do they connect?) Apparently, the only people we listen to is DCG, as opposed to our end-users. Nor do we bother figuring out a "right" solution.

Note the quote from our December District Manager Report:

"Steve Mahoney/Mike Rogosin, Sales Unit Manager, Washington, D.C.:
VT100 with built-in modem
The VT100 will be one of our most successful products. If we offered an optional built-in 1200 baud modem with the VT100, we could:

- Reduce the total cost a customer may pay for a terminal and separate Bell modem.
- Offer a one-vendor (DEC) maintenance solution to remote terminals. Currently, our customers are concerned because DEC will not maintain their 1200 baud modem."

This case is a classic one in which "Marketing says" thinking (in this case a whisper) dominates and we conspire, by neglect to screw the users and in the process minimize our revenue. As engineers, shouldn't we know how to use and connect terminals? Until there is some knowledge we'll continue to be data and content-free driven! In asking about this, I found we don't want to (and now can't) build in acoustic couplers and/or built-in modems because:

1. there's too much competition, we can't make any money on them, and no one buys, (how about the LA36?, or how much would one pay for the convenience of a single vendor? a clean seller interface?);

2. all phones come equipped with the new connection (how many old phones are there? Have we tested this interface? Is a DAA still needed? What about phones with in-set dialers?);

3. all terminals are hardwired (what is the experience now? projected?);

4. European phones are different (what about modems?);

5. some of the above;

6. none of the above.

Why can't we get some data and do the "right" thing here?

Subject: **CPU/System Upgrades and H/S Bus**

To: Dick Clayton, Bill Demmer,   Date: 78 AUG 15
    Ulf Fagerquist   From: Gordon Bell
                                        Dept: OOD
                                        Loc.: ML12-1
Ext.: 2236

Users certainly like the notion of Field/CPU upgrades. The 34-->34/A is an example they'd have liked. The answer may be a trade in. Clearly they want to use all peripherals, etc. Make minimum changes to get the new capability.

People say look at the Datapoint Serial Bus. That's the way to interconnect peripherals!

GB:ljp

CRAFT GENERATION

By 1620, the beginning of the craft generation, the abacus and counting table devices were in use for calculating, but a need existed for a device that would supplement the memorization of the multiplication tables. Although movable type was available, the complementary printing and paper industries were very rudimentary. In this context, John Napier of Merchiston, a mathematically oriented scholar who conceived the idea of logarithms in 1614, was bent on making long multiplication "free from slippery errors. In 1617, he invented an inscribed set of rods or bones with number series that could be carried in the pocket and used as a look up table for multiplying. They immediately became quite popular, distributed through the network of seafaring, mathematically oriented traders. Since addition still needed to be carried out, sets of bones were sometimes paired with an abacus or a slate. Although Napier's bones are classified as manipulable tables, they may have stimulated ideas for mechanical calculators.

In 1620, Gunter placed the logarithmic scale on a rule and then a sector, and these devices rapidly came into widespread use satisfying the growing needs of exploration and trade. With developing trade and exploration and the ease in which they could be copied and crafted, the speed of adoption of such devices was rapid. These two devices, the bones and the development of rules with logarthmic scales, mark the beginning of the craft generation that was to last about 200 years.

MEMORY

The ability of machines to either write or read on memory is the primary distinction separating these devices.   Napiers bones is the unique example of such a device that was neither machine writable nor readable, was etched by hand. They held a full multiple digit multiplication table in a box that could fit in the hand and easily be carried in a pocket. These small units were short lived, dying out with the wide spread availability of printed books of tables. Memory devices that are either writable or readable by machine, include species that are still with us. The final group, memories that are both writable and readable by machine, did not develop until the electro-mechanical generation and are central to the development of computers and automata.

NEITHER MACHINE WRITABLE OR READABLE

FIXED PHYSICAL STATE

NAPIER'S BONES

TABLE - MANIPULABLE

P   Napier's bones act as tables that can be reconfigured. Each rod is inscribed with a set of numbers facilitating the multiplication and division of large numbers.   John Napier, Laird of Merchiston in Scotland, invented the rods and described them in his RABDOLOGIAE, (1617). He wrote that the multiplication and division of great numbers is troublesome, involving tedious expenditure of time, and subject to "slippery errors." His tables reduced these difficulties to simple addition and subtraction, and won immediate recognition. A set of Napier's bones is usually made of boxwood or ivory and often contained in a box or case that would fit in a pocket. A set usually contains 10 rods, plus extras representing squares and cubes.

Use. To obtain a product of 224 x 44, the rods 2, 2, and 4 are put alongside each other, and the result is read off by combining the numbers in the fourth row

-- 0/8, 0/8, 1/6 -- adding on each diagonal for the correct answer 896. This is repeated and the two partial products added together to give 9856. The bones are sometimes paired with an abacus to provide a store.

Napier's Bones, ca 1700, 8x6x2 cm, Wood, (B27.79).

"SUMADOR CHINO", 7.5x20x30 cm, Brown, Green, Paper, Wood, Glass, Loaned by Jim Rodgers (X10.80)

A set of Napierian rods incorporated with a reusable surface.

WRITABLE OR READABLE MEMORIES

PAPER WITH RANDOM ACCESS

BOOKS

The technologies of movable type, paper, and printing presses certainly all affected the development and utilization of books. However, their widespread accessibility certainly did not come into being until the seventeenth century. Of particular interest to this collection are the books of computed tables. Many of the very first computers were invented to produce such books: the ENIAC was commissioned by the Army to produce ballistic firing tables; Harvard's Mark I was justified as being able to produce tables of Bessel functions; and Babbage had the calculation of tide and navigational tables in mind when applying for grants to develop his machines. The books of tables and other reference works are being replaced by calculators and computers.

The listing below, of books of tables, is a sampling through the generations to give some representative idea of their scope and evolution, prior to extinction.

P
TRIGONOMETRIA" by William Oughtred, published by R. & L.W. Leybourn, 1657, 14x18x3.5 cm, Original leather binding, (B160.81).

The original set of logarthmic tables and their explanation as made by William Oughtred, who made significant improvements on the slide rule.

P "Table of the Products and Numbers" by Charles Hutton, 1781, 28x42x1 cm, (B2.76).

Compiled in 1781 by Charles Hutton, this early book of mathematical tables contains the products of the numbers 1 through 1000 by the numbers 1 through 100. It also contains squares and cubes of numbers and conversion tables for units of measurement. One of the main problems with handcrafted books is the number of errors. On one page alone, every figure is off by one thousand.

"The Oriental Calculator or Tables for the Calculation of Interest, Exchange & Commission" by Dorabjee Hormusjee, Thomas Graham, 1860, India, 15x23x4 cm, Green, Paper, Third Edition, Good condition (B177.81).

Part I contains Interest Tables in Rupees, Dollars, and Sterling from one-half to 12 per cent per annum. Part II contains tables for the conversion of rupees, into sterling and dollars; and sterling into dollars. Part III contains commission or Inland Exchange Tables; Key showing indirect exchange between England, India and China; Tables showing the comparative rates of exchange for sight bills, and tables showing the estimated value of one pound of cotton with all charges and varying exchange rates.

In the preface to the third edition the author states, "The rapid sale of the previous Editions of the "Oriental Calculator" and the pressing demand for it, are evident proofs of the utility of this work in mercantile circles; and the production of the Third Edition is the result of the liberal patronage and support the author has been favored with."

"The Model Ready Reckoner with Tables showing the value of any number of articles, from one to thirty thousand from one-thirty-second of a penny to twenty shillings; including interest, commission, population, exhange, bank rate, stamp duties, wages, weights and measures, commerical forms, etc., London, Frederick Warne and Co., 1881, 288 pp., Loaned by Peggy Sullivan (X30.81).

The publishers' preface states, "The Model Ready Reckoner having passed through the hands of numerous editors to insure its correctness and completeness, has, in this Thirty-Second Edition, an entirely revised Table of the Relative Values of the Coinage of the World and Bank of England Rates of Discount for 30 years included in its additional contents."

"Handbook of Chemistry and Physics, A Ready-reference Book of Chemical and Physical Data," Thirty-first edition, Charles D. Hodgman, Editor in Chief, Chemical Rubber Publishing Co., Cleveland, Copyright 1910, Thirty-first edition 1948. 2737 pages.

The "Rubber Bible," as it is affectionately known among physical scientists who used it, was an institution for half a century. First published in 1914 by the Chemical Rubber, it was revised with each subsequent edition. For example the preface to the 31st edition notes, "Among the important tables added to recent editions is the very complete table of isotopes giving the percent abundance, type and energy of radiations and half-life for about 900 natural and artifical radioactive isotopes and stable isotopes." (p. iv)

"Handbook of Mathematical Tables and Formulas" compiled by Richard Stevens Burington, Handbook Publishers, Inc., Sandusky, Copyright 1933, 1940, 1948, Thrid Edition, 1949, reprinted 1950, 196 pp. The publishers include the following note "To the Student who uses this Handbook: As a student of mathematics you are studying the subject, either because you have a liking for it or, because it is required subject in your professional training -- happily, if for both of these reasons. The subject is one of the fundamental natural sciences and perhaps the most fundamental of all. While a mathematician may not necessarily need to know of engineeringing, physics, chemistry, or other natural sciences, yet to every engineer, physicist, chemist, or other scientist, mathematics is a necessity.

Unquestionably you will many times in later life need to know the formulas and the numerical data to be found in this Handbook. These, if not forgotten completely, will be recalled then so hazily as to be subject to doubt. Since mathematics is an exact science doubt can have no place in its applications.

The contents of this Handbook were carefully selected by one who has had many years of experience in the applications of mathematics and in teaching the subject to prospective scientists and engineers. You have become familiar with its contents in your own use of it. Where could you possibly find a more handy and reliable source for the information which it presents and which you need?

The subject matter is not ephemeral but everlasting -- as true in the future as it has been in the past. By all means, retain this book for your own reference library. You will need it many times in years to come."

NOMOGRAPHS

"<u>Transmission Line Calculator</u>," P.H. Smith, Bell Telephone laboratories, Jan 1939 and Jan. 1944 Electronics, The Emoloid Co., Inc., Hillside 5, N.J., loaned by Clifford H. Hafen Jr., (X29.81).

The calculator relates the series components of imppedance at any position along an open-wire or coaxial transmission line to (1) the impedance at any other point, (2) the standing wave amplitude ratio (SWR), and (3) the attentuation. It also relates the impedance to the reflection coefficient and to the admittance and, in addition, provides a means for determining the equivalent parallel components of impedance. If the power (PP is known the voltage and current at any position along the line are readily calculable from impedance information obtained.

Use. All impedances are read on the resistance and reactance coordinates on the central disc. The rotatable "wavelengths" scale around the rim provides the means for translating impedances at a given point along the line to another point a given distance away. Attenuation in 1.0 db steps and current or voltage SWR scales are plotted on the rotatable radial arm (nearest index) together with scales which are a function of SWR.

ANALOG CALCULA

Analog calculators work by analogy, that is, they create a physical model of a mathematical problem or a physical model of another physical system. Many physical situations can yield mathematical results, provided they can be interpreted properly. The extent of a lateral or a rotational movement of a mechanism or the voltage on a wire are examples of quantities that can be used to represent numbers. The most important breakthrough for analog calculators came with the invention of logarithms by John Napier in 1614. This allowed the processes of multiplication and division to be carried out by addition and subtraction at distances along a scale. The results are interpolated between the marks on the rule. Other types of analog calculators include devices used in drafting, measuring and integrating, e.g., planimeters, pantographs and harmonic analyzers.

The families in this order, which spans several generations, are divided according to the complexity of the mechanism itself -- single part, two or three part, and many part. This reflects a rough evolutionary development with multiple part devices not developing until mechanical tooling was improved in the early nineteenth century.

SINGLE PART

DRAWING INSTRUMENTS

Drawing Instruments, ca 1800, 15x17x30 cm, Brass, Wood, Marble, Cornelius Conklin (owner), (B92.80).

Drawing Instruments, 20x11x4 cm, Steel & Brass, (B19.78).

Cased

English drawing instruments made in the

second half othe 19th century. Brass and steel instruments, ruling pen with ivory handle; 13 separate items in lift-out tray. Small boxwood rule in space below. Rosewood veneered case and instruments in fine condition except that the large compass is missing its pivot locking nut and the brass has become a bit dull.
p
<u>Drawing Instruments</u>, ca 1850, 16x7x2.5 cm, Green, Shagreen Case, Brass, Steel, Ivory, Silver & Ebony, (B106.80).

<u>Drawing Instruments</u>, ca 1900, 6x16x2.5 cm, Black Case, Brass, Steel, Wood, Cardboard, (B130.80).

<u>Drawing Instruments</u>, 7x15x2 cm case, Wood, Fabric, Brass, Steel, (132.80).

<u>Drawing Instruments</u>, 10x19x4 cm box, Wood, Brass, Velvet, (B133.80).

FIXED RULE

<u>Parallel Rule</u>, ca 1870, 45x6x1 cm, Rosewood and Brass, (B24.78).

<u>Parallel Rule</u>, W.H. Harling, ca 1890, 4x33x8 cm, Steel, (B20.78).

Cased presentation of an English rolling parallel rule. Pasted to the inside cover is the presentation certificate, "Bradford Technical College Prize Awarded to Fred Inman at the Annual Examination, 1893, by order of the Lords of the Committee of Her Majesty's most honourable privy council on education."

<u>Parallel Rule</u>, T.S. & J.D. Negus, 8x45 cm, Brass, Inscribed with Degrees (B104.80).

<u>Parallel Rule</u>, ca 1890, 3.5x15x.2 cm, Ebony and

Brass, (B122.80).

Proportional Rule and Protractor, C.W. Dizey, New Bond St., London, ca 1890, 4.3x15.2x.2 cm, Ivory, (B120.80).

A protractor and architect's proportions are inscribed on one side; engineer's scale and vernier on the other.

Proportional Rule and Protractor, United Chemical Engraving Co. Ltd., 1932, 15x5x.2 cm, Cream, Plastic, Inscribed D.A.E. Carter, (B121.80).

Protractor and table with set scales at 1/20,000, 100,000, and 250,000 inscribed on one side. The other side has scales of one half inch and one inch to the mile, a scale of 1/20,000 in meters and listing of metric equivalents.

Rolling Parallel Rule, 6x46x2.5 cm, Brass, Patent No. 160100, (B105.80).

Rule and Ruled Compass, 3x12 cm, Metal, "W.B.Pierce Co. Civil Engineers", (B138.81).

GUNTER RULE

About 1607 Edmund Gunter devised a scale that was to be the predecessor of the modern slide rule. In 1623 he published a description of this scale that is composed of two scales of the logarithms from 1 to 10 placed end to end.

Use. A pair of dividers is used to measure a distance (the multiplicand and the multiplier) along the rule and add it to another distance, the multiplicand, forming the combined distance, the product, on the rule. The accuracy of an answer is limited by the length of the rule and the user's ability to interpolate between numbers.

P Gunter Rule, ca 1800 5x60x.5 cm, wood, (B4.76).
Gunter Rule, 15x3x.5 cm, Boxwood, (B41.79).

Navigator's Gunter Rule, ca 1800, 5x60x.5 cm, Darkened Boxwood, Minor Warping And Edge Chipping, (B54.80).

SECTOR

The sector is used to solve problems of proportion, working on the principle of similar triangles. Sectors were made with a variety of scales for use in calculation by navigators, surveyors, gunners, and draughtsmen. At first sight they look like jointed rules usually made of ivory, brass, wood, or sometimes silver. First described by both Galileo in Italy and Thomas Hood in England the sector was in use by 1600.

Use. A pair of dividers is necessary to read the relationships on all sectors. This sector is marked: "Chords, Sec, Lines, Tangents, tan, Ver Sine, Sines, & Num." The scale layout permits this sector to be used as a Gunter rule as well, although it is not laid out to follow any of the five editions of Gunter.

P

Sector, ca 1623, England, 9 inch, 24x5x.5 cm, Brass, (B176.80).

Nine inch brass sector as described by Edmund Gunter (1581-1626) in 1623. Unsigned by probably made by Elias Allen in 1623.

Navigator's Sector, 33x6x1 cm, Boxwood With Brass Hinge, 21 Scales On both Sides and Outside Edges, (B21.78).

Navigator's Sector, 4x16 cm, Cream, Ivory and Brass, Chipped, (B102.80).

Navigator's Sector, 1800c, 16x3.5x.3 cm, Ivory, Lee & Son, Portsea Engraved, (B119.80).

Navigator's Sector, ca 1880, USA, 3.5x16x.3 cm, wood (B168.81).

Navigator's Sector, ca 1880, USA, 3.5x16x.3 cm, wood, (B169.81).

SLIDE RULE

In 1654, Robert Bissaker made the first real slide rule in which the slide worked between parts of a fixed stock (Pugh 1975). The term slide rules applies to all instruments designed so as to allow relative motion between the indices and the scales. The classification used here is that established in the British Science Museum Catalogue i.e., straight, circular, spiral or cylindrical, and log-log. The collection illustrates the improvements in slide rules. The rules were originally made of boxwood, brass or ivory, in 1886 Dennert and Pape started to use scales on strips of white celluloid to give much greater distinction in reading. The spiral and cylindrical scales allowed an increase of effective length, hence accuracy, without equivalent increase in size. The collection shows the diversity and specialization that resulted from peculiar needs at particular times.

STRAIGHT SLIDE RULES

Slide Rule, Dietzgen, 26x3x1 cm, Wood and Paper, (B145.81).

"Slide Rule 689", KEUFFEL & ESSER, ca 1950, 32x6x1 cm, (B32.52).

Slide Rule, Foto-mem Inc., 2x14x.5 cm, (B37.79).

Slide Rule, KEUFFEL & ESSER, Gift of Dick Clayton

(D50.76).

P
Coggeshall Slide Rule, ca 1800, 4x33x.5 cm, Boxwood and Brass, Hinged with Two Slides, (B109.80).

A modified Coggeshal type slide rule with one brass and one wood slide. Navigational scales including meridian, chords, latitudes, and hours are inscribed. Freeth and Co. Brimingham is overstamped.

Coggeshall Rule, Stanley Rule and Level Co., New Britain, Conn, 32x4x.4 cm, Wood and Brass, (B146.81).

"Measuring Made Easy: Or the Description and Use of Coggeshall's Sliding Rule", by J. Good, much Enlarg'd by J. Atkinson, Sen. London.", W. Mount and T. Page, at the Postern on Tower-hill, 1744, 10x16x1 cm, , Paper and Leather, 96 Pages with 2 folding Engraved Plates. Portion of Spine lacking but still tight, without fly leaves., (B139.80).

Taylor (1966) lists John Good (1706-33) as a mathematical teacher and notes a 1751 edition of this work edited by Atkinson, A maker of slide rules. The first plate illustrates Coggeshall's Sliding rule.

Coggeshall Timber Slide Rule, Richardson and Co., Middleton, Co., 4x31.5x.3 cm, Boxwood, Brass, and Steel, (B147.81).

Coggeshall Slide Rule, ca 1850, USA, 4x33x.5 cm, Wood and Brass, No makers name, wood cracked, shows signs of real wear, (B170.81).

"Hydralculator", Lewis & Tylor, Limited, ca 1940, 7x19x.5 cm, Cream, Cardboard, One Rule on one Side, (B113.80).

"Hydralculator", patent number 396,533, published by Lewis & Tylor Ltd., Gripoly Mills, Cardiff, the manufacturers of "underwriter" super fire fighting hose, for the use of their "Friends in the Fire Service."

Use. To find the quantity of water discharged for any given nozzle and a known pressure, place pressure on scale "b" opposite nozzle on scale "a", and read discharge through window in slide. To find height of jet for given pressure and nozzle diameter, proceed as above and read opposite arrow in center of slide, the height given on scale "d" for the appropriate nozzle.

Inland Revenue Slide Rule, Dring & Fage, 1825, 60x5x1 cm, Boxwood, One ink Stain, (B55.80).

The rule is specially arranged for the use of excise officers and maltsters in gauging computations. Slide rules for this purpose were first devised by Thomas Everard in 1683, and modified by Vero, Leadbetter and others. In this example, four scales appear on one side and the other side is blank.

"Leadbetter Slide Rule", Dring and Fage, ca 1800, 31x3x2 cm, Brown, Boxwood, Four Sided Slide Rule with Slides on each Side, (B108.80).

"Musketry Rule of 1918", Metallograph Corp., ca 1918, 3x13 cm, Black, Metal, (B83.80).

Teaching

Slide Rule, Welch, 2x23x125 cm, Black, Masonite, With Hangers, (B103.80).

"Thomlinson's Equivalent Paper Slide Scale", J Thomlinson Ltd Glasgow, ca 1940, 8x58x1.5 cm, Brown, Wood, One Sided with Two Moving Rules, (B107.80).

This specialized rule was designed for the paper and printing industry. The A scale indicated length, B scale the breadth, and area in square inches was read off the C scale. The D scale was used to read off translations of inches to centimeters, kilos to pounds, 480 and 500 sheet reams, and various weights of different standard paper cuts.

Timber

Slide Rule, L.&I.D., ca 1800, 60x5x1 cm, Boxwood, (B30.77).

Use. On one side, the A line on the rule and the B and C lines on the slider are each numbered twice from 1-10, reading from left to right. The fourth line E is inverted, and is so arranged that 144 is opposite 1 and 10 on the A line. So that if length in feet on E be set opposite thickness in inches on C, the volume in cubic feet is read off on B opposite width in inches on A. The B line is subdivided into tenths, while the A, C, and E lines are subdivided into fourths. On the other side of the rule are A, B and C lines with the girt line (marked D) numbered from 4-40 and bearing various gauge points. The A and D lines are subdivided into fourths. The two edges of the rule bear scales of inches divided into quarter-inches.

Timber

Slide Rule, Stanley Rule & Level Co., 4x30 cm, Brass and Warranted Box Wood, (B99.80).

Timber Slide Rule, Stanley Rule & Level Co., 4x30 cm, Brass and Warranted Boxwood, Cracked, Warped and Stained, (B100.80).

CIRCULAR SLIDE RULES

P

"Boucher's Calculating Circle", Manlove, Alliott, Fryer & Co., (B52.79).

"Circular Concise Slide Rule", ca 1960, 8d cm, White, Plastic, No. 28; Reverse has Standard Equivalency Tables, (B114.80).

Circular Slide Rule, The Cleveland Twist Drill Co., ca 1920, 8d x.3 cm, Cream, Plastic, Printing worn off, (B125.80).

This specialized rule is copyright 1911, The Cleveland Twist Drill Company.

Use. The rule indicated drill speeds for wrought iron, machinery steel and soft tool steel. One side shows revolutions per minute for diameters ranging from one-sixteenth to three inches for both high speed and carbon steel drills. The other side shows tap and drill sizes and the decimal equivalent for inch divisions.

"E.A. Sperry's Calculator", KEUFFEL AND ESSER, 6d x2 cm, Pocket Watch Style, (B97.80).

"Fowler's Calculator", Fowler & Co., , 6d x1 cm, (B59.80).

"Fowler's Textile Calculator", Fowler & Co, ca 1900, 6.5d x.7 cm, Chrome, Glass, Paper, Two-sided Circular Rule, (B112.80).

Short scale type of "Fowler's Textile Calculator" with two scales on one side. The other side holds a table equivalency for weft, looms, and reeds.

"Fowler's Calculator", Fowler's (calculators) Ltd Sale, ca 1920, 6d x1 cm, Chrome, Glass and Paper, Long Scale Calculator, (B124.80).

"Fuller's Computing Telegraph," J.F. Fuller, 1847, 28x28x.5 cm, Cream and Black, Cardboard, "Palmer's improved by Fuller Computing Scale" and "Fuller's Time Telegraph" is on the reverse, (B110.80).

"Palmer's Computing Scale" patented in 1843 by Aaron Palmer was improved and produced by J.E. Fuller in 1847. This model is printed from the original Palmer plate with Fuller's name and own patent added to the engraving, done by George C. Smith, 186 Washington St., Boston. The reverse side, "Fuller's Time Telegraph" was patented in 1845.

Use. The first note to the user is, "The Numbers on this Scale are arranged accoding to their Logarithmic Values and occupy the same relation to each other in space that they do in value." "Palmer's Computing Scale" was used to calculate square measures, cubic measures, timber measures, grain measures, liquid measures and interest rates from 3 percent to 10 percent on a daily and monthly basis. "Fuller's Time Telegraph" (on the reverse) was used to calculate time lapse in days or weeks between any two given dates. In concert these two measures would be useful to dealers in grain, alcohol and other commodity trading.

"Fuller's Computing Telegraph," with complete instruction book, from the collection of I. Tomash

(X25.81).

"HALDEN CALCULEX", J. Halden & Co., Ltd., ca 1910, 6 cm diameter, Metal ring with glass discs covering paper scales, (B158.81).

Cajori in his "History of the Logarithmic Slide Rule" (1909) lists this unique instrument as No. 211 and notes the manual.

Lord's Calculator, R. Waddington, Coventry, 7d x1.5 cm, Chrome and Glass, (B123.80).

P SPIRAL SLIDE RULES

"Fuller's Spiral Slide Rule", Stanley, 1902, 9x9x33 cm, Cardboard, Mahogany, Brass, (B5.76).

Designed in 1878 by Professor George Fuller, the logarithmic line is arranged spirally on the surface of a cylinder. The logarthmic line is in 50 turns, giving a working length of 41 feet 8 inches. All numbers of four figures either have a mark upon the scale or are midway between two marks, so that results accurate to four figures are easily obtained.

Use. By means of movable cylinders any length of spiral line may be at once transferred to any other part of the scale, and multiplications and divisions containing a series of factors can be worked with facility. Logarithms of numbers are given by means of a scale on the longer index arm together with a circular scale on the first cylinder, so that powers and roots are obtainable. The surface of the middle cylinder bears printed tables of decimal equivalents, natural sines, etc.

"Fuller's Spiral Slide Rule", Stanley, ca 1880, 33x10x10 cm, paper, wood, metal, (B51.79).

"<u>Thacher's Calculating Instrument 4012</u>", KEUFFEL & ESSER ca 1920, 13x13x63 cm, Wood, Varnished Paper, and Brass, (B29.77).

Patented in 1881 by Edwin Thacher, the instrument is described in an 1884 instruction book notes, "The oridinary rule in use is 12 inches long, with radii of 11 and 5 l/2 inches, the divisions of which are cut by hand, copying from a machine divided plate. In the present instrument the radii are 60 and 30 feet, the divisions of which are printed directly from machine divided plates. Those plates contain over 33,000 divisions, calculated to seven places of decimals from Babbage's tables by using a common multiplier, every line being subjected to correction for error of screw and temperature variations, so that possibly every line center is within .0001 inch of its true place."

The instrument consists of a cylindrical slide, which admits of both rotary and longitudinal movement within an open metallic framework of 20 equidistant triangular bars. The bars are connected to rings at their ends which admit rotation within standards attached to the base. Upon the slide are wrapped two complete logarithmic scales, each of which is divided into 40 parts of length equal to half that of the slide. The parts follow each other in regular order around the cylinder, and the figures and divisions which constitute any part of the right are repeated on the left, one line in advance.

<u>Use</u>. By the rotary and longitudinal movement of the slide any of its divisions may be brought opposite to or in contact with any division on the fixed scales. The divisions on the upper lines are transferred to the slide by means of a pointer fitting over the bars, which is also convenient for

retaining the position of any division on either line while the slide is being revolved into the required position. Near the commencement of each scale on the slide is a heavy black mark designed to catch the eye.

"Thacher's Calculating Instrument", KEUFFEL & ESSER, 1925, 16d x58 cm, Wood, Brass, And Varnished Cardboard, (B56.80).

LOG-LOG SLIDE RULES

"DIETZGEN MULTIPHASE STYLE-M IMPROVED DECIMAL TRIG TYPE LOG RULE", EUGENE DIETZGEN CO., 1954, 5x32x.4 cm, Aluminum and Plexi, (B144.81).

Slide Rule, Post, #803182, Loaned by Clifford H. Hafen Jr. (X28.81).

Slide Rule #405171, Pickett & Eckel, Inc., 1960, USA, 31x6x3 cm, Yellow, Aluminum and Plexi, Box, Case, instruction pamphlet, and guarantee, (B172.81).

DMCAT1.3f

May 14, 1984

Dr. Earnest F. Gloyna, Dean
College of Engineering
The University of Texas at Austin
Austin, Texas 87812-1080

Dear Earnest,

I am delighted to respond to your call, and I strongly support Harvey Cragon as a member of the University of Texas faculty. Harvey is one of the outstanding computer and digital system designers / architects in the field today.

It is difficult to add anything to the great letters of recommendation by Ted Glaser and Jack Kilby you sent and to the acknowledgements of his accomplishments by the IEEE and the National Academy of Engineering. His accomplishments are truly signficant.

Harvey would be a great addition to the faculty in many ways, including his ability to understand, teach and mentor. His ability to both engineer and mentor is proven at TI, and these qualities are essential for helping graduate students, current and new faculty, and most of all -- experimental research projects. He would significantly increase the quality of ANY computer science, computer engineering or electrical engineering department faculty that I know!

I also think he is critical in order to have the kind of department that you promised MCC. I know of no one who is better qualified to this task and have no hesitation in recommending him for a named or chaired professorship.

Sincerely,

Gordon Bell

Dr. J. Craig Mudge
Dept. of Computer Science, Mail Code 256-80
California Institute of Technology
Pasadena, California 91125

Dear Craig:

I've talked with Marcie, Heidi and Del regarding your concern
about royalties. I can't support your request, but will see

I am appreciative of your effort as a co-ordinator with Ron, Sam, Dan and John. Without this, I'd have spent more time and much of this time would have fallen to Mary Jane and Heidi, or the book would have taken longer. Certainly our discussions were helpful to the writing.

Like the issue of whether we'd write books together again, I think it's inappropriate for you to ask to make this change.

Overall, I'm happy with and proud of the book and you should be too. It will reflect equally (or poorly) on all of us. I look forward to our continued personal and professional interaction.

Sincerely,

Gordon Bell

SUBJECT: CRAPPY PRODUCTS:THE SIDE EFFECT OF SLIPS AND VOIDS

THE EFFECT
Nature (the market) abhors a vacuum... when there's a product
void, all available resources rush in to try to fill it.

Usually the products targetted as interim hole fillers are
crappy
and we don't get the market. Worse yet, the product hole
issue
consumes vast resources at all levels and all parts of
Digital.
Many of us are spending much time on what are trivial, me-too
products that contribute no long term gain. The only
justifi-
cation is that they fill a short term product hole.

Several times we've all swore that we would design NO MORE
CRAPPY
PRODUCTS. Occasionally, we design bad products from scratch,
but

mostly it seems crappy products are the side effect of slipping a
schedule and then we go all out to fill the void. There's a
similar effect around not having a critical component when the
market demand it (eg. a 32-bit microprocessor), and then having
to do a number of projects that try to fill in this vacuum.

SOME MORE DATA POINTS
OPERATING SYSTEMS ON THE 11 initially- DOS caused many other
operating systems: RT for one user, RSTS for timesharing with
BASIC-only, and RSX -11 A,B,C,D,...M,M+, MUMPS for databases,
UNIX for the university timesharing users who wanted gp and
performance and didn't want to pay high prices, and IAS was
unsuccessful at filling the general purpose, interactive void
until M was extended more and till it went away with UNIX.

SOME OF THE DISKS HISTORICALLY (eg. RM05 for RP07 slip)-
Fortunately we're better now... good people and much
management.

VT's- Our whole VT series since the VT100 (eg. VT101, 192, 18x)
is nothing but a series of short term products with incremental
cost reductions that try to make up for having a good product.

PC's- A never ending serialized saga beginning with PDT and
PDP-8.

OFFICE TODAY- The commitment was a product now that ran on VAX
and little CT. We failed and the result is many other products
to fill the void: extension of EDT on EMS for wps, the CT middle

level editor, DECword on RSTS (and externally available on M and
VMS), DEC? on Dibol, and Europe's DECTEXT. The OC, European Managment, field, several market groups and office engineering
all spend more time and energy to find a way around the void than
it would take to do the product right in the first place.

THE LOW END VAX- The state of the art is clear! Motorola has set
it with their chip and bus standard and we want to be there now.
Many projects aimed at taking NEBULA down in price: single user
workstation to protect against APPOLLO, repackaging NEBULA to get
lower base systems cost for a lower performance single user,
starting the whole MicroVAX architecture early using NEBULA as a
starting off point, etc. The trick is which ones.

THE HIGH END- The state of the art is clear, a 3-5 mips mini. We
have to do: CI clusters (both for performance and for reliability
like we promised), NI clusters, microcode, mP's (beyond 782).
Many of these are committed independent of the high end.

WHAT DO WE DO?
0. Realize when we're in the situation.

1. Design critical products and then manage them without slip.

2. Avoid doing ALL the backups. Some are essential, but

having
all of them which in turn have their own slips, turn us into
a
dangerous short term, downward spiral of crappy products.

3. Look at whether we really need the mainstream product.
Sometimes we can simply get out of an area we're floundering
in
and maybe one of the backups is a better alternative.

SUBJECT: CRAY GROUP WHO WANTS TO BUILD A VAX

I certainly don't want to believe this, nor do I want one
more
problem or opportunity to deal with. The attached seems to
good to be true. Somehow, I'd like to listen to the story
in order to see if and what they know that we don't. They
may suffer from illusions from being near the master, but
not really understanding the killing details of how to really
do it.

Is there some way we could at least listen?

Bill and BJ,
What you think?

Is there a way we could get the lab to go for R and D money and we could buy their output if they are that good?

The Japanese or IBM are fools to not pick them up.

Subject: CRAY RESEARCH LABS

I spent the day (1 April) at Cray Research Labs recruiting. As you know, Mr. Cray cancelled the project that was aiming to develop a machine 10 times the performance of CRAY 1. A team of about 50 people were told they can seek other opportunities. The recruiting went very well.

My purpose of writing to you is not about making recruiting successful, but to explore the possibility of an adventure.

The people in Boulder don't want to split up. They want to stay together and make a very high performance machine. They would like Digital to sponsor them. I must say what they have to offer is exciting and may be worth your close attention.

Here is what they can do when:

- A VAX machine that is:

  - 500 times the performance of 11/780.

  - A uniprocessor with 8 MB of main memory.

  - Built with existing ECL process (500 picosec delay).

  - Packaged in a 10" x 16" x 24" box that needs approximately 50 KW.

- Schedule--assuming start in Q1 FY'83:

- Architecture defined -- Q1 FY'84.
  - Working prototype -- Q4 FY'85.
  - Production starts -- Q4 FY'86
- Budget--they need to accomplish the above:
  - FY'83 -- $3.5M
  - FY'84 -- $6.0M + capital
  - FY'85 -- $7.0M + capital
  - FY'86 -- $7.0M
- This machine would sell for about $2M.

Obviously, this does not cover VMS, diagnostics, peripheral adaptors.
But I was fascinated by the knowledge of an undertaking within the time mentioned.

I am not exposed to the perspective you have but I would guess that there may be some customers out there who would love to have a machine like that. How would you like to have a program done in 6 minutes that an 11/780 would take 50 hours to run. We need such a beast today for system simulation.

The six people I talked to were the best I have interviewed in a long while. They possess excellent knowledge of their field. Some are multidiscipline experts. They are sincere and open. They love Boulder and they said if DEC sponsored them not one of them would leave. They formed a cohesive, dynamite team who teach, help and care for each other. I asked about management philosophy. They said, the organization was formed with small groups where managers participated at the technical level. They said, they went out of their way to get critics of their design and came up with the most state-of-the-art machine. They believe in themselves and in what they can do so much that there is not the slightest doubt in their minds whether this project would be successful.

Admittedly, I am all charged up with what I heard and what I saw in people's faces. I urge you to look into the matter and listen to them. We heard a rumor that an aerospace company was ready to write a check to buy the outfit. It may be the E-beam facility they are buying.

From where I sit today, it looks like a golden opportunity for Digital. If it can be done, it would take a half a dozen DEC folks and a VAX architect to go to Boulder and work with them. Boulder is such a beautiful place I don't think we'd have difficulty in finding volunteers for a hot project like this.

Please call on me if you'd like to know more.

OT:clc

GB3.S4.33

In this year's strategy update, I identified developing our skills as #2 in the top 10 list, just below sorting out what work we have to do and who does it.

During the last few weeks I've been exposed to several projects which are mainstays of the product strategy, and find:

> THERE'S NO WAY WE CAN IMPLEMENT CRITICAL PRODUCTS IN THE PRODUCT STRATEGY <u>WITHOUT</u> SIGNIFICANT ON-THE-FLY TRAINING OF ENGINEERS AND THEIR MANAGERS!

Frankly, I'm stumped, and think we have a stalemate and are not addressing training. EMC members seem to want no part of education for two reasons:

- your people are adequately trained for the current work, and your particular work environments are actually quite nice. Hudson and Marlboro fall in this category. Littleton's improving. I don't know of other acceptable environments.
- the situation is hopeless, and you're hoping the problem will go away. Pockets of the mill, some A/D, and Tewksbury are typical

WHAT IBM DOES
Erich Bloch, VP who built and operated Fishkill for many years, is in charge of their education. They just have to have an edge because:

- technical people take about 4 weeks per year in new courses
- managers take 3 weeks per year including one week of required technical education

EMC AGENDA ITEM
I'd like to discuss this critical item for a few minutes at EMC because the number of poor projects has reached epidemic proportions as measured by our performance against schedules (measured in being 1-2 years late) and simply by looking at the projects (and feeling my gut).

A long awaited task force report is in process, but it is not aggressive enough in time, effort or direction.

Mostly, I want several projects very badly, but I don't believe they are possible with the current people as trained and managed.

(DRAFT) COMMENTS ON

(CONVENTIONAL, NUMERICAL) SUPERCOMPUTER DEVELOPMENTS

DRAFT NRC/OSTP BRIEFING DOCUMENTS

Gordon Bell
Encore Computer Corporation
15 Walnut Street
Wellesley Hills, Massachusetts 02181
617-237-1022

SUMMARY
I believe the report greatly underestimates the position and underlying strength of the Japanese in regard to Supercomputers. The report fails to make a substantive case about the U. S. position, based on actual data in all the technologies from chips (where the Japanese clear lead) to software engineering productivity.

The numbers used for present and projected performance appear to be wildly optimistic with no real underlying experimental basis. A near term future based on parallelism other than evolving pipelining is probably not realistic.

The report continues the tradition of recommending that funding science is good, and in addition everything be funded. The conclusions to continue to invest in small scale fundamental research without a prioritization across the levels of integration or kinds of projects would seem to be of little value to decision makers. For example, the specific knowledge that we badly need in order to exploit parallelism is not addressed. Nor is the issue of how we go about getting this knowledge.

My own belief is that small scale research around a single researcher is the only style of work we understand or are effective with. This may not get us very far in supercomputers. Infrastructure is more important than wild, new computer structures if the "one professor" research model is to be useful in the supercomputer effort. While this is useful to generate small startup companies, it also generates basic ideas for improving the Japanese state of the art. This occurs because the Japanese excel in the transfer of knowledge from world research laboratories into their products and because the U.S. has a declining technological base of product and process (manufacturing) engineering.

The problem of organizing experimental research in the many projects requiring a small laboratory (Cray-style lab of 40 or so) to actually build supercomputer prototypes isn't addressed; these larger projects have been uniformly disastrous and the transfer to non-Japanese products negligible.

Surprisingly, no one asked Seymour Cray whether there was anything he wanted in order to stay ahead. (It's unclear whether he'd say anything other than getting some decent semiconductors and peripherals, and to be left alone.

Throughout the report I attempt to give specific action items, and the final section on HOW TO FORWARD gives some heuristics about projects together some additional actions items.

I have commented on the existing report, using its structure because of a personal time constraint. Hopefully, my comments don't conflict too much with one another or are too vague. If they are, I apologize. I would like to rewrite the report to make it more clear and concise. Or in the words of somebody: "I wrote a long letter because I didn't have time to write a short one".

(COMMENTS ABOUT THE) INTRODUCTION
The second two sentences are fallacious and unfounded; from them follow faulty conclusions. Supercomputers aren't that fast today, nor are they increasing in speed rapidly over the last decade. The report lacks substance and detail, e.g. it doesn't differentiate between MIPS, MOPS or MFLOPS and the notion of peak and average. Note these data:

	DF	LLL	Av	Pk	Min	Year	% / yr. increase
Cray X-MP	33	53	150	3	83	8%	
Cyber 205	25	40	80	2	82		
Cray 1	18	38	83	3	75?	32%	
FPS 164	1.3				84		
7600	3.3				69	52%	
6600	.4				64	(base)	
Fujitsu VT200			132	190	5	84	
Hitachi 820		100	240	4.2	84		

DF Megaflops- Dongarra's Double Precision LINPACK
LLL Megaflops- Livermore Kernels of 14 as of Jan. 84

The above data <u>should not</u> be used for conclusions without more basic understanding; it is all I had immediately available. If the Crays run at a much slower then the above average rate, averaged over an entire day, then this would strongly argue for simple, cheap 10 mip machines to front end and offload everything that can't run in a highly parallel fashion.

The committee was very unclear about what kind of operations are desired. Is it having:

- .the greatest MIPS for just a few problems and national prestige?
- . a much larger number of MIPS for researchers who now get by sharing a Cray?
- . or is it simply having some reasonable fraction of a Cray at a much lower cost?

In general, I took the problem to be one of national prestige and having something that computes faster than anything else. On the other hand, if it's to provide lots of effective cycles, I would urge us to terminate all existing, complex architectures used for building microprocessors and to make available a simple, very fast, hardwired processor such as Hennessey's MIPS or Patterson's RISC chip but with floating point and memory management.

It is quite likely that the basic approach to multiple pipelines to increase M (in SIMD) is risky when you look at delivering either more or the most cost-effective operations. Given our poor understanding of multiprocessor for parallelism, much work is needed in order to get anything reasonable out of a multiprocessor, let alone a multi-processor, multi-pipelined machine. Based on large differences among peaks and long term averages, much basic and applied work in compilers needs doing now; as such research is required.

ACTION: Data suggests there are at least these problem areas:

- understanding about existing machine performance,
- fundamental work on compilers to utilize current pipelined machines (especially for non-floating point work), and
- alternative machines and structures to get around what appears to be poor utilization of expensive resources. (Here, I think several startups may be addressing this.)

ACTION: Given the Fujitsu and Hitachi are IBM compatible and should perform very well for a more general load, particularly ones requiring a large virtual memory, I believe we should urge the National Labs to take delivery of one of these machine at the earliest possible time in order to proceed with this understanding. Time should be available for computer science.

RISKS IN PREDICATING THE FUTURE OF SUPERCOMPUTERS ON PARALLELISM:
While I concur, the report is unconvincing because results to date are sparse. Note:

Existing Pipelined Computers. It would appear that fundamental work is still required in order to design and exploit these computers, especially when multiple pipelines are used.

Real, Experimental Machines. The only, experimental evidence for parallelism (that I'm aware of):

. C.mmp and Cm* multiprocessors at CMU showed that many problems could be solved giving near linear speedup, but NO general results were obtained; Several multiprocessors are entering the market (Dennelcor, Elexi, and Synapse), and many more are coming, based on the commodity micros. Clearly the Dennelcor machine should have produced some useful results to demonstrate parallel processing; I know of now.

. Manchester's Dataflow machine works for a few "toy" problems that were laboriously coded; I am unconvinced that general purpose Dataflow Machines will provide high performance-- i.e. be useful for supercomputers. I am completely convinced that it will NOT be cost-effective. Dataflow structured hardware may be the right way to control signal processors! It may be possible to use a Dataflow language to extract parallelism for pipelined, multiprocessors and multicomputers --- but alas, NO ONE is working on what should be the first thing to understand about dataflow!

. Fisher, at Yale has a compiler that can exploit the parallelism in array processors; He is continuing, by building a machine along these lines which he believes will provide parallelism up to 10 using a single, wide instruction to control parallel execution units. The work is convincing--and he may have a reasonably, super, computer.

. IBM built the Yorktown Simulation Engine and showed that logic simulation can be run with a special purpose multiprocessor oriented to simulation; and

. Fox and Seitz built a 64 computer Hypercube which has been used for various physics applications. This looks extremely promising because the machine hardware is so trivial. Larger machines are in progress. We need to understand its general applicability.

<u>"In Progress" Machines That Promise Great Parallelism</u>. These include:

- MIT's Connection Machine being funded by DARPA and built at Thinking Machines Corp; This is a fascinating SIMD machine that has 64K processing elements with extensions to IM. While originally designed for AI, it appears to be suitable for arithmetic calculations.
- Systolic Array Processors; Several machines are in progress, including one by Kung. It is unclear whether a systolic organization of a dozen or so pipelined processing elements can either be controlled (programmed) or have a rich enough interconnections structure for more than a few applications.
- MIT Dataflow Projects; The whole dataflow area needs review.

<u>Inoperative or Poor Experimental Machines</u>. There are at least twice as many machines which yielded either poor or no experimental evidence about parallelism. Some are published, but few describe the failures so that others may profit from their mistakes. Some that are continuing should be stopped to free valuable resources!

Conjecture Machines. There are at least a factor of ten more machines that are irrelevant for anything other than tenure and miss-training graduate students.

Especially distressing is the work on large scale and ultra large scale multiprocessors with thousands of processors because we have only sparse data and no understanding now of whether multiprocessors really work. Resources are needed to work on both the general problem and specific applications involving a dozen to a hundred using <u>existing</u> machines. We can always build a 1000 processor system if we can find out that they "work."

(1) PURSUE ALL DESIGNS LIKELY TO SUCCEED IN ANY BIG WAY
This simply is and can not be implemented. We have two cases:

- our potential talent is being wasted on examining structures that look interesting because they can be built using VLSI; and

. we are not working on the structures that must be built and understood, or those which we have but don't understand well enough to apply broadly.

Poor Work. There's probably no way to outlaw or manage poor work, but funding for it could be stopped. The only reason to worry this is that there's so much real work to do! I would like to take a budgetary "chain saw" to cut tree, grid, and other partially connected structures, as well as banyan and perfect shuffle switches etc. that claim to provide anything useful for computing. None of these have either systems software or applications understanding behind them; they are only interesting because they may some day be buildable and are publishable. This work (similar to associative memory research) yields about 10 to 20 micropapers per research dollar with absolutely no use for any future (10-20 years) timeframe. The work can be easily re-invented anytime, by anyone and usually is in every 5-10 year increments.

Potential, Good Work. Supporting a major supercomputer project within a university or government laboratory across hardware, software and systems applications has shown to have been impossible. A major, large project of this type requires on the order of 30-40, focussed, well-led researchers and engineers. The machines are important to build; universities have many of the "right" people to build them but lack leadership, hardware and software engineering discipline, skills and facilities to build them. Companies have few people with the vision (willingness to accept risk), or ability to do much of the research to carry them out. A combination of the two institutions is somehow needed. The IBM-CMU Development Laboratory is one interesting experiment for building large systems. Also, Entrepreneurial Energy, released by Venture Capital may be an alternative way to carry out these projects... but Venture Capital alone is very un-venturesome.

Great Individual Researcher or Small Team Work. Universities are incredibly cost effective for building systems where a single professor or group can work on a project with a dozen or so students. The work on non-microprogrammed processors

(RISC and MIPS), Cal Tech's Hypercube, the SUN Workstation forming SUN Microsystems, Clark's Geometry Engine forming Silicon Graphics, the LISP Machine as the basis for Symbolics and the LISP Machine Company, Scald as the basis of Valid Logic, etc. are all examples of this kind of work.

Nearly ALL of the great ideas for modern CAD on which today's VLSI is based seem to emenate from the individual professor-based projects (Cal Tech, Berkeley, Stanford, MIT ... Mead's VLSI design methodology, the silicon compiler, Supreme, Spice, etc.). This software has either moved directly to use (eg. Supreme, Spice) or been the basis of a startup company (eg. Valid and Silicon Compilers) to exploit the technology.

ACTION: I would like to limit poor work, fund the great work in small projects where results and people are proven, and find someway to address the large projects where past results have been almost universally disastrous and poor. It is essential to get small projects surrounding large systems; these are likely to produce very good results.

(2) GET DESIGNS INTO THE HANDS OF USERS NOW
ACTION: I concur. We need to immediately engage in working (experimentally) on parallelism at the systems software and applications levels right now, using real, existing computers. Both multicomputers (the Seitz-Fox Hypercube) and multiprocessors (Dennelcor, Elexsi, Synapse) can be placed in universities almost immediately to start this work.

(3) ACCELERATE COMMERCIAL DESIGNS INTO PRODUCTION
Several methods can be used to accomplish this provided there is anything worth producing:

- Great, Individual Researcher doing seminal work (works well)
- Cray-style Laboratory (untried, except by Cray)
- Large project in small scale research environment (typical, but poor)
- NASA-style Project (multiple, interconnected projects) (used effectively by DARPA for very well-defined, focused projects... requires a prime contractor)
- Consortia of multiple companies or universities (current fad)

- Industry-University Partnership (on premise or dual labs) (Could be effective, provided universities permit them.)

The committee could have examined these alternatives and developed some heuristics about the kind of projects that are likely to be successful based on real data about past work.

(COMMENTS ON) SPECIFIC TECHNOLOGICAL AREAS

The report examines the constituent technologies for supercomputers in a less than quantitative, friendly, fashion. The US has only one, unique resource for building supercomputers, Seymour Cray; hopefully the ETA Lab of CDC will be a backup. Without him, supercomputers wouldn't exist. In order to provide backup to the well funded, well organized, super hardware technology based Japanese efforts, much fundamental AND applied work is required, to be followed by exceptional hardware, software and manufacturing engineering.

CHIP TECHNOLOGY

U. S. chip technology available through conventional semiconductor companies and computer companies outside of IBM doesn't appear to be relevant to supercomputers. Chip technology lag with respect to Japan is increasing because all major Japanese suppliers are working hard across the board in all technologies, including significant efforts in sub-micron research. Note:

- basic CMOS for RAM and gate arrays; Japan is several years ahead because suppliers were slow to make the transition from NMOS to CMOS. America's only serious gate array supplier, LSI Logic is Toshiba based.
- high speed circuits based on HEMT, GaAs and conventional ECL; The Japanese continue to increase the lead in today's ECL gate array circuits, and they continue to build and describe the highest speed circuits (ISSCC).
- state of the art, microprocessor peripherals; While not directly relevant to supers this does indicate the state of the art. Many of the major chips are designed in Japan such as the NEC graphics controller for the IBM PC.
- conventional microprocessors. These are dominated by U. S. "Semicomputer" manufacturers quite likely because the Japanese are unwilling to make the investments when the leverage is so low. These architectures are clearly wrong for today's systems. All manufacturers need to abandon their current architectures! This would provide much more scientific operations than any

supercomputer effort.

. Computer Aided Design of VLSI. This area has been developed by U. S. Universities. The programs move rapidly across all borders, creating an even more powerful industry in Japan. This work aimed at small systems could be extended for supercomputers.

ACTION: It is heartening to see real research being carried out at the chip level now by Berkeley, MCNC, MIT, and Stanford. Unfortunately, all of this work is aimed at lower cost systems. A U.S. supplier of high performance chips for supercomputers is needed.

PACKAGING

Packaging is vital for supercomputers. Cray's creative packaging has been in large part, the reason why his computers remain at the forefront. IBM is able to fund the large "Nasa-style" projects for packaging large scale computers, but it is unclear that this packaging is suitable for building supercomputers. It clearly cannot be used outside of IBM. Hopefully, Cray will come up with something again.

ACTION: With the demise of Trilogy's Wafer Scale Integration, we have lost the possibility of a major lead. If it is important to have Wafer Scale Integration, we should encourage Trilogy to work with the Japanese. If we are concerned that Cray's next package is inadequate, then an effort should be considered.

ELECTRO-OPTICAL TECHNOLOGIES

The report omitted this important area. This offers potential both for computation and for interconnections.

DISK TECHNOLOGY

The report fails to acknowledge the fact that the U. S. is only leading in the production of low cost, 5" winchester disks. A recent, innovative U. S. designed disk is in the process of being transferred to Japan for manufacturing because U. S. manufacturing technology is lagging.

ACTION: The Fujitsu Eagle provides the greatest real density. Only a few universities such as the University of Minnesota are doing fundamental work in magnetics; the Japanese have graduate students in these labs. We simply need research in magnetics to regain the lead coupled with a major effort in manufacturing engineering.

ACTION: It was heartening to learn that a very high speed optical disk would be available in the next few years. However, one should point out that the current optical disk was invented by MCA, but had to be taken to Europe and Japan for manufacture. My skeptical guess is that it is just a demonstration, like the vast number of past demos by large, military contractors whose main goal is funding, not science or products. If, indeed there is a "breakthrough" optical disk, then we should make every effort to support and exploit it.

CURRENT AND NEW COMPUTER ARCHITECTURES
The first statement of this section claims:

> "During the next five years, new types of machines based on large-scale parallelism ... thousands ... will appears along side today's high end computers ... these machines will progressively supplant present designs in some market sectors."

This statement finally destroys any of the report's remaining credibility through wild optimism. Although I strongly believe in an emerging class of multiprocessors and multicomputers using possibly a few hundred processors, I don't see this as a serious alternative to supercomputers for general purpose computation in the next 5 or 10 years.

The section on New Parallel Supercomputer Designs leaves open the door to magic whereby with a small amount of intellectual work, one obtains vast payoff, leaving the "competitor" surprised. Unfortunately, any design of this type that emerges quickly is easily replicated, and either doesn't work at all or works for only a limited set of applications. There are no easy roads to success. All the parallel machines are going to be tough to build and program. Selected, special purpose function machines can be useful and should be encouraged as an alternative path to understand generality. For example, a dataflow controlled multiple (array) processor may be able to deliver vast amounts of ops or flops, but for selected functions.

SPECIAL PURPOSE COMPUTING
The ability to rapidly construct systems in silicon may be the best way to provide cost-effective solutions to a wide range of problems. This process, I call VLSIzation is coming along nicely, but should be better understood and extended to high performance technology.

COMMUNICATIONS TECHNOLOGY
LANs will cause higher speed LANs to be required. With the widescale availability of Ethernet, hopefully other standards that operate an order of magnitude faster will be forthcoming. These will require significantly better interfaces between the link, processor and various levels of system software. In affect, this is "spatial parallelism" or distributed processing.

Clearly we need an upgraded ARPAnet to carry large files and videoconferencing.

ALGORITHMIC AND SOFTWARE ISSUES
This section of the report underestimates the need for changes to languages to express parallelism, including the possibility of using a Dataflow language. Also, neglected is the possibility of using expert systems for organizing problems for parallel execution... but in order to accomplish this, we need much more experience.

EFFORTS ABROAD
We need to couple into the British for ideas and fundamental advances, and could couple to the Japanese for semiconductors, other hardware technology, manufacturing, and engineering.

ARTIFICAL INTELLIGENCE ISSUE
This effort needs to be co-ordinated so that the fixed resources capable of building fast systems can be effectively employed toward either or both numeric and/or symbolic

problems. It should be pointed out that the Japanese manufacturers are well along in having both fast and low cost LISP Workstations.

HOW TO MOVE FORWARD (Bell Heuristics)

In general, I believe it is important to:

1. Narrow the choice of architectures that are to be pursued. There are simply too many poor ones, and too few that can be adequately staffed.
2. Fund only competent, full-time efforts where people have proven ability to build hardware and software systems. These projects should be carried out by full-time people, not researchers who are servicing multiple contracts and doing consulting. New entrants can spend a year or two to demonstrate competence by actually building something!
3. Have competitive proposals <u>and</u> projects. If something is really an important area to fund in the first place, then have two projects with forced intermediate progress information exchange.
4. Fund balanced hardware/software/systems applications. Doing architectures without user involvement (or understanding) is sure to produce useless toys.
5. Recognize the various types of projects and what the various organizational structures are likely to be able to produce.
6. A strong infrastructure of chips to systems to support individual researchers will continue to produce interesting results. These projects are not more than a dozen people because professors don't work for or with other professors very well.
7. There are many existing multicomputers and multiprocessors that could be delivered to universities to understand parallelism before we go off and build really large multi's.
8. It is essential to get the Cray X-MP alongside the Fujitsu machine in a computer science setting in order to understand the two approaches and also to work on the parallelism associated with multiple processor, multiple pipeline machines.
9. Build "technology transfer mechanisms" in up front. Transfer doesn't happen automatically. Monitor the progress associated with "the transfer".

Subject: **Cross Product P/S Programs**

To: Distribution

CC: OOD
Joe Smith, ML8-3/T13

Date: 7/3/79 Tue
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up: 7/17/79

I recently reviewed some of the Cross Product Power Supplies under development in the Central Power and Packaging Group in Maynard. A matrix of these products, comprised of Power Suppliers and Enclosures is attached.

Products of this type can play an important role in Digital's future effort to reduce overlapping product mix, development costs, new product start-up (NPSU) costs, tooling costs, inventory costs and Field Service costs.

I strongly suggest you use products from this matrixes unless there is an overwhelming financial advantage to designing a custom cabinet or supply. Remember that transfer costs does not include the Digital investment to introduce and support a new product, nor money to stock spares.

Please discuss your plans for new applications of power supplies and enclosures with Joe Smith at extension 223-8793.

Some specific possibilities I wonder about are:

MPS - HSC50, HYDRA, MERCURY, VENUS, 2080

LEM - NEBULA "M" RAM MEMORY, TM78 (FY82), 11/24

LVPS - TM78 (FY80,81) NEW LOW VOLUME REQUIREMENTS

PC - 30: VENUS, 2080, MERCURY, HYDRA
10: NEBULA, COMET, (EXP), 11/44, RL02 OPTION CABS, 11/24, TS11, TU78, 11/23

H9640 FAMILY - NEBULA, 11/44, 11/23, COMET

H9610, H9614 - RL02 OPTION CABS, TS11, 11/44, RM80, RA80, R81, VENUS, MERCURY

BBU - NEBULA, 11/24, VENUS, 2080, "M" RAM MEMORY

Can each of you tell me or Joe why not?

Australia

Dear Mr. Paltridge:

This is in reply to your letter of 21 January 1983.

Sorry, I am going to be in Colorado at that time. I would really like to talk to you about the 100K gate chip you are designing and whether you might do something for us. I have asked Walt Tetschner and/or Bob Supnik to meet with you in Hudson in this regard.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

Do you know about a CSS controller for an RL01 to make it look like Diablo?

Why is it done there (no training, difficult) versus in Colorado? It could be a good product, especially with RL02. We need the volume! Let's not jeopardize it by a high cost, low volume, unreliable product.

SUBJECT: CSS YOUR CALL RE: CHARTER TO BE H/W PRODUCT FOCUSSED

As your hardware engineering and manufacturing organization has always known, there are always product holes and overlaps. These are now ripe for partitioning and charter, especially given the pressure to get out of customer special systems. What may be possible:

Graphics - Compatible architectures with Regis at the high end assuming we ever do Gigi, and VT125 to start the low end. Currently CSS has the VSV, VT30, VS61, and higher end Megatek stroke based system but according to no pattern/theme/architecture.

Communications - holes in 780, and other areas. Here you seem to select every possible hardware hole, to partially fill it but with inadequate software.

Line printers - open ended. I'd like all line printers to be put on serial lines ASAP. Needs co-ordination.

Process I/O - Much overlap within CSS, MDP, and CSI. Why not make this your highest priority.

We have to discuss this and understand the real opportunities. Can you talk independently with each of the engineering groups?

Loc: ML12-1/A51 Ext: 223-2236

Follow-Up: 6/15/79

Having just talked with various salespersons in Germany let me pass along their frustrations in an amplified fashion:

1. Our process I/O is really poor! There are at least 3 solutions--P/L (1 or ??); CSS-Germany, CSS-Canada--and all are inadequate! Note the similarity in terms of our former product strategy when

we were aggressively extending the 10/20 up and down and building new high end 11's all to be competitive with each other - none of which would ever get finished. Why can't we just pick the base, have this down in one place and stop the rest? Don't we have to be really good here?

2. The process world is still doing its own thing and now its based on microprocessors. A good, high volume, low cost standard line is important.

We have the best microprocessor architecture in the 11/23 and let's build on it and get the process I/O! The user's perceive we're getting out of this business - now's the time to get in!

3. CSS do no SS anymore because they are too expensive. Furthermore, CSS has to supply low volume products in order to get enough profit as a bribe to take on CSS real work. Special Systems and Systems Management are required and could be provided somewhere in the company. Should this function be in the services organization?

4. The field badly needs a protocol converter for the myriad of special communication systems. They asked, like I did, why this can't be compiled automatically? Failing automatic generation of handlers, they would like 11/03-based hardware, with special converters, which would convert among all the odd-ball DEC and other protocols. This can be the solution until we can get all these protocols into the DECnet framework, which we may get to in the post '85 time frame. Why can't CSS be specialists in providing these products?

SUBJECT: SURVIVING BUILDING GM'S KLUDGE IN CSS

We should make the best out of this situation by doing a really thorough review of their logic and by really high quality construction to give a large MTBF! I hope that we could avoid a redesign,

do only
minor changes and not spend precious resources even in Phase
II in
designing anything for GM.

The complaint by Field Service of poor diagnosability,
resulting in
poor MTTR, can be ameliorated to a large extent by making
MTBF large.
While the design by the GM Research Group is likely to be
poor in
engineering terms, since it's probably built by a group of
computer
scientists, it can be incrementally improved to give high
payoff in
MTBF.

Finally, assuming the bad timing and electrical problems have
been
fixed, the best way to improve MTBF is by high quality
construction.

Don't wirewrap. Use only tested burned in ceramic IC's, and
high
quality power supplies.

SUBJECT: OC REVIEW OF CT/VT FAMILY: IT DOES MEET THE ORIGINAL GOALS

The attached memo outlines our first meeting on CT, which we first named KO.I believe the project has stayed completely on the target we outlined then. Note the key features:

.modularity to form a complete range from dumb terminals up to a Wini based personal computer

.two basic engines to drive it based on Fonz and Tiny

.several alpha and graphics options

.the basic list of modules we outlined are being built

The tuning recently has sharpened things and put us back on the modularity ... THIS MUST BE THE KEY THING WE SELL, AS IT ALSO HAS TO PROTECT OUR TERMINAL BASE AND GIVE US A BASE TO BUILD ON IN THE FUTURE.

The new bus is somewhat of a red-herring, as other efforts to build terminals require a complete new set of options in order to be competitive. The bus is essential for:

.user installability, maintainability

.cost, especially as it is applied for use in a terminal

.ability to adapt to future industry standard chips

The change to integrate Tiny with graphics in order to get cost as in the CT25 does seem appropriate.

Clearly we are all disappointed that we can't match human gestation times for products. However, I will be delighted if the product is operating and is defined and truly ready to be produced in the 9 month period (ie. by May 28, 1981).

I believe we have an exciting set of products coming up for approval on Tuesday.

SUBJECT: CT CONNECTORS USING MODULAR JACKS

Little did I know that we would go off and tool special modular
jacks so that each connector on CT is unique for the phone, the
headset, the printer, the keyboard, etc. My original thought
was to use the STANDARD modular jack or the 4 and 6 prong ones
so that a user could be compatible with the standard cables and

hence could get cables anywhere. By having many different ones, he has to buy from us, and more than likely, he alsways has the wrong ones.

I don't know how to decide on what is right here, based on the conventional payoff to us, or costs to users. My instinct
says that the path chosen is higher (with more engineering and
manufacturing parts numbers), and it is more expensive for the
user too.

The chosen path does offer us the chance to lock 'em in, to charge higher, to be unique, and for the user to maybe make fewer mistakes in terms of pluggin things in.

Is there anyway to say pick a locking scheme so that a 6 prong
connector/cable can substitute for any of the other types? In
this way, we might be able to have our cake and eat it too.

SUBJECT: A CT FOR WPS? CAN WE GET TEH 278 BETTER?

It was clear to me that we have a major problem either in the understanding of the performance or the real performance of ct for wps. We must get these groups together tor resolve.

I side with the wps folks as I have in the past. I'm typing at a marginal product right now, and CT will be worse vis a vis its ability to deliver real user cycles.

I want the design approach to be to put in the dma, and then to test the breadboard this way, taking it out if possible.

We don't have an adequate understanding of this point, nor do we have a decent model. My gut (and this 278) says we are way shy of cycles. The 278 simply isn't a competitive product for anyone who has typed on other wps systems (Burroughs,
Wang, IBM ... which I did on Wednesday at NCC). Furthermore, I'd expect Apple 3 to be quite good too.

Some reasonable benchmarks should include being able to emulate
a terminal at at least 9600 baud, at least gigi speed for graphics, 1200 baud transmission from floppy and keeping the screen up to date, background printing on a la24 or la120 while
not seeing degradation on the screen for editing, virtually instantaneous cursor position of lines, characters, words (versus where we are in the 278). Here, I want the wps folks to say what the benchmarks are, what performance they expect and
what it means to the total system design.

The groups had better get together. Right now, I would advocate
building something around the vt134 alpha approach and scrap the ct approach. Given that there is no dma, then the 134 approach
can't be used, so we have a dilema.

There are other issues too: the operating and file system, the keyboard and whether there is a need for an interim ni.

The real question is, whether the WPS folks can use CT. If not
it, then how much is it going to cost to get a system that can
be used? who can take it on? etc.

I want to get these questions posed and answered quick!

(The wps folks have to write down what their product tree is going
to be over the next few years too: the minimal floppy only, the
server based one, the big one with wini, graphics, the shared
versions, etc.)

    LARRY PORTNER

SUBJECT: CT FY'82 SHORTFALL

THIS MEMO IS FROM LARRY PORTNER, AVRAM MILLER, SI LYLE, AND GORDON BELL

****

Since the start of the project there has been a shortfall in the FY'82
budget for the CT Program of some 4.5 million dollars' even after a

shift of 5.6M from other projects and activities. We have found
sufficient funds for the CT Program in FY'81 and FY'83. It does not
appear possible to cover this shortfall out of FY'82 Central
Engineering funds without adversely effecting a number of major
programs which could potentially have a significant impact on
corporate NOR. Furthermore, we have investigated and concluded that
no significant reduction can be made in the CT budget without totally
jeopardizing the program goals. It is our opinion that this would be
equally disastrous to the corporate strategy since we are of the
opinion that personal computers, personal computer clusters and
intelligent terminals for VAX Systems play a key factor in continued
corporate growth. The OFIS plans are extremely dependent on the CT
project. Product lines are considering products which layer on top of
the CT, in terms of hardware and/or software.

The CT100 must play an important role in many of the product line
plans.

1. Technical Products Group
    Recent discussion with the Technical Products Group would indicate
    that CT-150 (Winchester based product) would play an important
    role for ESG (selling to such corporations as Boeing), ECS (as a
    GIGI II candidate and as a mini host for GIGI 1.5 products), LDP
    (as a base for TLC), MSG (for small DMS systems) and government.
    It is not yet clear to us whether or not TOEM plan to

market the
CT100 as a desk top scientific terminal and/or a hardware value
added package. In our opinion the CT100 is a perfect candidate
for a low end TOEM offering. Especially if ones considers that
the architecture permits the video monitor and the video
controller to be removed from the kernel package and therefore the
CT could be an ideal vehicle for machine to machine type
interfacing.

Avram has made a proposal to TOEM for developing documentation and
testing which would allow the CT to be made available to TOEM
customers. We understand to meet the Technical Products Group
medium resolution graphics option supported by Regis is mandatory.
We are committed to provide such a option for the CT. Avram has
been working deligently with his group and has made a great deal
of progress in this area. He will be ready within one or two
weeks to come back with a concrete proposal which he feels
confident will meet the Technical Products Group's needs with
respect to graphics. The GIGI 1.5 work can and must be brought
within the family spectrum and marketed as a full member of the
family. We're all busy working with Joe Meany on this.

2. Commercial Products Group
It is still unclear whether or not the Commercial Products Group
will market the CT computer as a personal computer to any extent,

although, it would seem likely CSI, TIG, MDC might consider this...especially when it is clear that clusters replace timesharing. COEM has been working with the CT Program Office in order to understand the possibilities of layering both hardware (for serial multiplexers) and software (RSTS) in order to use the CT as a base for low end CTS 500 systems. If it turns out that it is not possible to support RSTS on the CT150 configuration (because of the limitation of the 5 megabit disk) we understand that COEM is considering releasing CT300 on that hardware configuration. Furthermore, the CT Program Office is planning to incorporate Aztec into the CT family hardware offering in order to develop personal computer clusters (shared file facility). We believe that this will allow CT/AZTEC based version of the CTS500. Furthermore, the CT Program Office is attempting to understand the long term implications of personal computer clusters and how we might migrate RSTS customers onto personal computer clusters and/or the use of CT's coupled to VAX. In this area, the primary concern are around language, file capabilities and migration tools.

3. Computer Products Group
The CT100 family is clearly a mainstream product for word processing and RPG. It seems clear that the CT120 and 150 can meet the needs of such major distributors as Sears, etc. CSS has

shown a strong interest in the CT Program. It is our understanding that they are currently considering writing application software which they can market for the CT family.

While there is still a great deal of contention about whether or not the CT100 could take the place of the VT134 project for TPG, TPG has indicated that follow on versions would definitely replace the VT134 and has also shown a definite interest in marketing the CT100, as well as the VT134.

As I noted earlier, the CT100 is a necessary ingredient in our entire OFIS strategy, which I believe plays an important role in many of your product line plans.

In order to resolve the funding issues around the CT Program, in an expedient way I am asking each one of you if you are prepared to provide 1.5 million dollars worth of incremental funding towards the CT Program in FY'82. In order to make sure that there is no confusion with respect to expectations, the deliverables of the CT Program are:

1. FY'83 Deliverables

    a. CT100 (F11/128-256KB, floppy based, Winchester and video monitor, and controller with medium resolution graphics option, color monitor option and telephone management system.

2. FY'84 Deliverables

a. NI adaptor
    b. AZTEC subsystem and file server (Scenario B, if
accepted).

3. FY'85 Deliverables

    CT200 family based on J11, new mass storage offerings and
full
    page video subsystem (VT200 components).

What the funding for CT does not include is the proposal
which Avram
has made to COEM for a serial multiplexer to allow a four
user CGS
system to be configured. It also does not include the money
required
to document the CT Bus for TOEM should they decide to market
it as an
added value hardware product.

I would like us to resolve the funding issues before the 1st
of April,
if at all possible. We are all available to answer any of
your
questions in full detail. We would appreciate having your
feedback on
this very important question as soon as possible.

SUBJECT: RE: CT REVIEW AND APPROVAL

Fine.

Let's make sure they are all portable, including the ones that
are pedestal ones! They should be
shippable by ups, (not as console tv sets you send via truck or
large station wagon), and they should be
customer installable (ie. the various parts and options can
be put together without a serviceperson). New options can be
sent to the user and he can build it up.
THESE ARE ALL SATISFIED BY CURRENT APPLES+, AND ANY FUTURE
REASONABLE OFFICE COMPUTER IS CLEARLY GOING TO BE DONE THIS
WAY!
(Thus pedestals are fine as long as they don't imply
this very high support cost of handling that the Pedestal 278
has.)

We must not make the small one bounded. Again,
the apple folks set the floor. NO CURRENT MACHINES ARE
BOUNDED,
that I fear this approach implies. Note Gigi suffered at intro
immediately with the need for some version that has rom,
ram, extra floppies, modems, etc. Frankly, I'm concerned we
will design another one of these kinds of products. Again,
the competiton doesn't do it, so why should we? (I also
might add that are terminals suffer from being non-expandable
and not being able to have integral modems, extra rom,
ram or mass store, etc. (Maybe we should use the Apple cards as

our I/O options to get the peripherals????) We should be able to make them cheaper than Apple according to Jack Smith.)

SUBJECT: YOUR FIRST CT

Received your comment on marketing vis a vis channels, customers,
applications (a layering product) and completely concur.

Jack Smith is going to discuss alternatives with you to try to
get you out of the current mood, but more importantly get the right set of activities so that we can go balls out to market CT. Agree you could go out and build another product now, but
this would be a waste, given that this one is so good and we ought to be pushing it.

I think many of us (Ken, Andy, Jacks, and Win) all feel committed
to making the organization right so it can succeed.

What do you think is the best way to organize and do the marketing for maximum impact?

What do you want to do in this?

Certainly my own biasses as an engineer have been to not want to
have you waste your time on this, but to go on creating. I realize you have different motivation and drive, so let's make
things right for you and more the maximum company good.

Want the input and to resolve in right way.

DEPT: ENG STAFF
EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: RE: TUESDAY, APRIL 28 DISCUSSION OF CT

Have absolutely no problem with this memo. Why would you think
this would bother me?

Am looking forward to get the positioning done on the various CT's and VT's and want to get on with it. I think Avram is showing us that we can hurry. We do get boards turned around in 2+ weeks and the excitement and push is worth it. Frankly this is ideal for us.

We must be careful to ask Avram and Si to do it when they have the information... not the hunches. They are working very hard to get us a product. Think what they could do if we trusted them and that we didn't ask them questions every day, .

The product phase review is designed for this. Namely, in the current phase, there aren't big comits. When they go into phase 2, we do start this. I believe they are not yet at this stage (or shouldn't be) until we see that working breadboard.

Frankly, I've learned a lot in watching Avram and the WPS folks:
give them a charter, stand back, and then review them at the right project times.
So far, these both seem right by all the measures I can think of.
Also, they are doing exactly what we outlined in the August 28 meeting. The office folks are building the architecture designed to get us a really competitive WPS!

Let's have a new slogan:
Let bodies in motion remain in motion, until they reach certain predefined points. At that time, then let's either let them remain in motion, deflect them somewhat, or stop them!

(Another plaque for crowded walls.)

SUBJECT: RE: CT100 FUNDING

After your presentation today, and after our performance in recent product design, I am firmly convinced that we have to get the VT resources applied to some sort of winning product.

Your goals of time to market, high cost, high performance at any cost, and building what is basically an alternative to the CT and to the VT is going to take us down the tubes.

No way do I intend to let this product stand as is.

We need to get something that is going to win, and you are heading for the fourth or so loss (ignoring your part in doing these idiotic cost reductions on the VT100 and block mode VT13x'x). The VT134 will probably not be quite as bad as a PDT cause you started with a few more winning components, but the costs will be high and the market need is clearly questionable in light of the good Personal Computers.

I repeat,
you must work with Avaram to get these together along the lines outlined by Ken. Failing that, and failing Stan's and my ability to resolve the issue, I am remiss in not getting this issue raised higher.

As a seperate issue, I hope you will consider the VT125 and Gigi as alternatives to help your revenue problem. If you need another copy of my note on how you might use GIGI for fixed function terminals, I'll resend.

Let's get this settled this week.

SUBJECT: PETE'S CONCERN ABOUT TIMING OF A 32 BIT PC

I worried and want to have some answer to this. Since you are all pretty flat out, I'm not urging you to answer orr comment. Still, it is pretty frightening, and I think w e should advise the company just how much risk we are taking with the 11. Pete and I are hopefully really very technically
oriented and we won't have that much of a problem for that long.

Still, we do need Suvax bad.

LOC/MAIL STOP: ML12-1/A51

SUBJECT: RE: CT AND 16 BIT ARCHITECTURE

Peter,
Thanks for writing a memo that shares my very deep concern. Frankly, I don't know what the answer is here. The one I have rejected several times is taking on another architecture,
cause I think it would kill us... unless we found someway to be truly architecture independent, say like embracing UNIX, along with everyone else including the Japanese!

My best answer is get the concern raised higher so we can get a terminal based vax earlier. Go like hell to get the 11 based one and make the applications not get into the 32 bit space. Also go like hell to get Suvax and sell it as a high end machine, possibly at a lower markup. Thus we cover the range but have a gap in performance
where appollo, perq, etc can enter. But sell vax as the family range so that users will buy the upward end versus going to appollo. Work to have VAX applications that no one else can touch with the 22 bit micros.

The other alternative is to look at cost per terminal much harder and see what we can do, based on Nebula and nifty terminals to get the cost down, and then sell performance and cost/terminal... this is going to be the issue in the near term. When the PC clusters are introduced the issue is going to get even hairier.

Can you run some numbers projecting what you think the costs are going to be on various PC and shared systems over the next few years including scorpio and gemini vax? Then let's get some folks together and review them to see if there are any ways out. Then we'll issue a more wide scale document that shows the dilema (at certain points in time).

I don't think people realize how fast we move. Recall:
70-72 we were just introducing the 11 and rsts, and the
10 was becoming really good? Six years ago was the
vax anniversary and it's only been sold for 3 years.
It's mind boggling what I'm projecting in 90:
A cray for 250K, a shared rsts system for about 1.2K,
a 780 for 16K (actually looks the easiest), a 2.5K and
6.25K VAX should have been on the market for several
years (if we can get the chips).

Look forwarrd to some work and interaction on this critical
issue.
Gordon

SUBJECT: KNOCK OUT: AN APPLICATIONS TERMINAL AND SMALL SYSTEM

Knock Out: Attentive Modular Personal Applications Terminal
...
Small Computer System

The following describes a system of building terminals and small,
personal computer systems. It is based on the current

LA/VT200
and PDT efforts, assuming compatibility between them. It is
also
the results of a Woods Meeting of Ken, Stan, Avram Miller,
Bernie
Geaghan, Don Gaubatz and I. Bob Daley, Bruce Stewart and Bob
Travis came later and discussed the software options with
respect
to WPS. It is a project that Ken would like to do in 9
months
and we need maximum support from each group.

We will discuss the product on Tuesday at the Operations
Committee to enlist maximum support

PROBLEMS THAT KO SOLVES:

.a small system based on the 11, concentrating programming
.lower cost, faster time to mkt. small system
.competitively sized (ie. desk top)
.competition from personal computer systems for WPS and
business
.competition of new, stand alone WPS products
.concentration of scarce resources (eg. communications) to
get
one good, versus multiple marginal, later products
.unreasonably long vt/la product introduction date
.all capabilities in proposed VT/LA200 applications terminals
but
with earlier, first introduction based on common, highly
modular,
customer merge and customer replacement approach to repair

PRODUCT RANGE AND APPROACH:

Introduce a common set of modules from which the range of all
existing and proposed terminals and small systems can be
built,
including: VT/LA200 series, fixed function editing VT's,
GIGI,
PDT's, and RX's. Also includes the 11/03 and 11/23 with up
to

256 Kbytes of primary memory and 10 Mbytes of secondary memory.

Aimed at evolving dumb, with increasing smart (pre-programmed function) functions, to intelligent (programmable) terminals and
terminal based small systems for both stand alone and host coupled applications. Aimed at competing with personal computers
and being alternative to using semicomputer company micro for application terminal, but able to extend to larger system application for the single user.

Point of manufacture with customer merge by actual user (eg. secretary) and customer repair by replacement. Assembly requirements similar to Hi Fi. Modularity is a a key selling point, using a combination of rom on modules and floppy based ram
for achieving goal.

Market is anyone wanting to use the base modules and the supporting software for applications (eg. WPS, single user small
system as in a DIBOL machine, technical person's work station,
small business system)

GOALS:

Nine months till first product introduction, followed by a constant stream of new module introductions permitting the building of terminals and small systems with the capabilites well
beyond that envisioned by LA/VT/PDT plans.

Introduce and evolve by adding new modules and capabilities in
what is similar to approach used in the evolution of Unibus 11

Introduce, then cost reduce based on technology opportunities!

Maximum use of off the shelf one chip VLSI peripherals and other peripheral approaches to get low cost. Use personal computers as a model of the approach. Be prepared for all opportunities and attendant incompatibilites and new interfaces such as wands, light pens, joy sticks, etc.

Base the architecure on semicomputer company architectures

Be as compatible as possible with current DEC peripherals, but trade-off to get cost, sacrificing i/o compatibility in an explicit basis

Trade off cost for performance subject to inability to build fast access mass storage based products or highly interactive systems

Support a physical address space appropriate to memories

Target applications with implied bounded software, not general purpose use with implied compatibility, unboundedness, sys gens and support of all operating systems.

KO IS AN APPLICATIONS TERMINAL- the alternative is to try and build such an application using the control microprocessor instead of an 11 which is now the controller

KO IS A COMBINED CONTROLLER AND SMALL SYSTEM WITH BOUNDED MASS STORAGE AND INTEGRAL CRT CONTROL (for performance and cost) for writing large applications programs such as WPS and small business systems. Our competitors use micros and IBM uses the 8086. It is not a gp 11!

Main target application: WPS and OFIS-type products with very good filing capability, sorting, list processing and table manipulation. Visicalc!

MODULES:

Large computer module based on Fonz processor, 256 Kbytes user
ram, system ram, rom, serial port for printer, and standard serial EIA port (US and European use, up to 9.6Kb, EIA data only
lines would connect to local systems)

Small computer module based on Tiny processor, 65Kbyes user ram,
system ram, rom, serial port for printer, and standard serial EIA
port

Rom/ram cartridges for specialized software packages

Telephone interface with 300/1200 baud modem, auto answer, auto
dial, phone line in and handset or telephone out. Ability to dial out for data or voice use.

Ethernet interface sans modem, but includes any necessary rom and
ram to operate interface

DECnet interface, X.25 interface, SDLC/HDLC interface using appropriate ram and rom for protocols

Dumb terminal mux with multiple standard serial EIA ports

Combined controller for T/E 5" diskette and 5 Mbyte Winchester

Controllers handle combinations of the following monitors:
    .BW, RS 170 Composite video and European std giving 240 lines

.BW, 2 x 170, 480 lines (40 lines)
.BW, 4 x 170, 960 lines (full page, 80 characters)
.RGB Color, 240 lines
.RGB Color, 480 lines

Each controller will handle BW with intensity or simple color and
keyboard interface. Multiple virtual terminals with ability to
assign split screens to various terminals. Four versions:
.240 line, VT100 compatible, character only
.960 line, full page black and white, character only
.240 line, bit map, two plane, GIGI oriented
.480 line, bit map, two plane, high resolution color

Serial printers with serial port and bus interface such that processor can be used in non-dumb versions. (It is unclear that we should add anything to base printer cost in order to provide for computer modules.)

Keyboard- probably should go to standard serial format

WHAT A USER MIGHT BUILD:

VT200 starter- small computer module and 24 line char gen, keyboard, printer option, telephone option, or Ethernet option

VT200 Basic WPS- above plus floppy. Deluxe WPS editing would include full page monitor

Remote hard copy unit- printer, small computer module, telephone option, keyboard ... unclear what characteristics should be

Student starter- small computer module, floppy, telephone interface, bit map, monitor

Single user deluxe WPS or Small system- large computer module, dual floppy and Wini or 2 Wini, comm option if in a large organization, appropriate printer.

Clustered system with shared single user database- above with serial interface to dumb terminals or multiple crt/keyboard/monitors

SOFTWARE:

Single user, operating system with well defined interface and including all aspects of language, file system, terminal (screen), and communications.

Able to be interconnected to DEC systems and write terminal emulators to other systems by applications or field programmers
using some form of state table or higher protocol description language

Able to be interconnected easily with other single user systems
of the same type for file and message transfer
Explicit decisions made on i/o compatibility, both now and as we
proceed with deign. We have three architectural alternatives:

.fully 11 compatible, which is most likely to be uncompetitive
from cost and performance standpoint

.incompatible i/o, which is marginally competitive based on 11
chip set, but requires modifications to selected handlers

.semicomputer company architecture (eg. 8086), language and operating system to get lowest cost and highest performance, but
may not be able to be brought in on a timely basis.
Unfortunately, our competitors such as HP and IBM are using this
approach! If we can not make changes in our own i/o ISP

architecture, we must go this route. (Simple analogy to IBM's introduction of 360 like Series 1 instead of modifying 370 architecture)

PEOPLE:

.Avram Miller is driving overall program to get the product defined and resources assigned to implement it
.Ken is architecting the packaging
.Don Gaubatz (and I intend to be involved) will take on the responsiblity for the PMS and ISP (i/o) architecture, together with Bernie Geaghan who has the implementation responsibility for the modules necessary for terminals. ? has the implementation responsibility for PDT.
.Bruce Stewart is driving the WPS project
.? has the responsibility for implementing the base system software including an special handlers, the operating system, language and file system

OUR PLANE CONVERSATION

1. SWE contracting/interfacing other groups is hard. There are too many requirements. Funding is separated for layered products. This means "Joint" goals. A buyer/seller might work. Alternatively, why not simply let the buyer have the code? In the case of layers for OFIS, let's simply obtain other's code (eg. Cobol, Basic) and use it as a black box.

2. CT. We must have a common o/s. This implies one organization.

3.CT. There is no process or person to interface with on critical issues at critical times.

3a.CT. Graphics decision needs all alternatives including NEC, VIM, VT134 and Hampton Saylor Alpha.

3b. CT Keyboard. No time

3c. CT Performance. What is it?

4. CSSE. Can't ship software ever. How can we get reasonable goals for products?

5. OFIS. Is now a language and O/S group. Who will do the applications for OFIS?

6. P/L. New base is a bitch! How can our old customers use it?

7. OFIS $

8. WPS278 is a study in very slow motion.

OUR PLANE CONVERSATION

5. OFIS. Is now a language and O/S group. Who will do the applications for OFIS?

6. P/L. New base is a bitch! How can our old customers use it?

7. OFIS $

8. WPS278 is a study in very slow motion.

We've got to look at the packaging of 11-based systems in light of the CT (both as a system and a VT). In particular, I've got the following questions:

1. Is the design of CT adequate to serve our terminal needs in the VT200 (1/2 - 1 page)?

2. How are we going to handle the very large number of CT/VT system types we may potentially design or need?

3. How are we going to package Q-bus based system?

4. Can we move to eliminate further Q-bus/U-bus systems? Using CT for most?

<u>CT's and VT's</u>

We're committed to MANY! CT mother boards to meet the various cost performance, graphics, and possibly form factors (if the CT cost is too high, requiring a separate VT effort in order to avoid jeopordizing our terminal business). The inevitable CT's CT-Fonz/VT100+; CT-Tiny/VT100+; CT-J/?; CT-?/VT200 (1/2 page); CT-?/VT200 (full page); plus any other mother boards required as part of a VT-only effort. As an operational guide, it seems like we would declare:

1. The CT and VT are one in the same. We are on a tact of offering increased functionality first, then possibly reduced cost.

2. The CT200 is a high resolution terminals/system to come out ASAP and use the CT box, PS and options. This is the VT100 replacement! Possibly it should be the first J-based product. Note there are 3 efforts that should be used for this: Tewksbury's SUVAX graphics, the Research Group's Gigi II, and the VT200 A/D.

3.

Any look at a T-based VT or CT should offer a drastically reduced cost. Quite possibly it should be packaged as an integral unit using the option boards. However, I'm skeptical that it has much to offer over a PDT 150 unless it is an extended graphics and terminal architecture.

U-and Q-bus Based System Products

Given the move to a different form factor for disks, it is ludicrous for us to perpetuate the 19" rack!

We must move now to make our future 11-systems site merged with parts arriving by UPS! By packaging, I want to eliminate Type IV systems (11/03 - 11/34 where there is a CPU box and disks in a single cabinet so as to eliminate FAT.) We need to decided on the form factors for the 23B, and how it will be packaged based on the systems configurations and their use. I see them as:

1. Multi-terminal systems going head to head as an alternative to the personal system. Alternatively, it might be ideal if personal systems could grow to shared ones...but this doesn't seem possible.

2. Diskless as concentrators and gate arrays. (CT doesn't seem suited yet.)

3. Evolution to Q-and U-bus based systems. (Here we might use the 19" rack.)

Aztec

Aztec has the performance to let us build a very nice multi-terminal system, but by putting it in a 19" rack, we don't get the main benefit.

I don't understand why we don't design a package for single Aztec which will be somewhat universal. Free standing with power (I don't see an economy of showing with another box) that can be used anywhere (CT, Q-bus, Nebula or as an add on). Possibly a number of these could be mounted in or "stored" within some other frame so as to minimize floor space. Since Aztec only requires front access, then why can't we make a frame to hold/stack several?

In this way, we get Aztec to be a fully customer site merged product. Nebula, would contain a frame or housing for inserting one or two side by side.

<u>Overall</u>

I hope we can look at these packaging questions in the next few months and build some protos before we slip into what's the easiest (19"), by the worst path for the future.

Dr. Glen Culler, Chairman
Culler Scientifici Systems Corp.
100 Burns Place
Santa Barbara, California 93117

Dear Glen:

It was nice to see you at the workstation conference on the 9th of January. I've just looked at some of the material on the Culler 7 from Jeffrey Simon, and want to congratulate you and your team on producing an exciting new scientific computer.

I am writing to begin to enlist your support of The Computer Musuem, and enclose some material describing it. Although I would eventually hope you might contribute important artifacts, I believe it is essential to visit The Museum in order to appreciate what it does. Therefore, let me simply invite you to join as a member so that you get its material, and then come for a visit. Gwen, my wife, is it's founder and president and is usually tending the "store". Either of us would be delighted to give you a tour.

Please give my regards to Gerry Butler.

Sincerely,

Gordon Bell
Trustee

EXAMPLE OF A "MAKE VS. BUY" ANALYSIS

This section presents the issue of high-end disk investment as a case study for "make vs. buy" analysis. The following memos illustrate the complexity of decisions about backward integration.

CURSORY THOUGHTS ON HIGH END DISKS by Gordon Bell

While I support investing in mass storage technology, I don't believe we should build higher end disks, because:

1. It stretches our range, and level of integration farther, and I believe it is too large for the money we are investing. I think we should try harder to cap our systems at $250K.

2. There are two low end threats to our traditional mid range business that are going to require resources: the personal computer involving both floppies and hard disks; and the small shared system is now sub-19" rack and will require hard disks.

3. We are biting off too much: floppies, Smaller winis, Aztec, Pinon, and evolving the R80, through the 81 and beyond. We're doing too much to get in manufacturing: T/E (2.5K), 5" wini (6.25K), Aztec (16K), Pinon (100K), R81/TU78 (>100K), and RP07 (in mfg.).

4. These disks take a disproportionate share of engineering resources for a disproportionate part of the revenue. Also, they are technically the most difficult to do. Given our limited engineering budget vis a vis the Japanese, HP, and IBM, I believe we have to select.

5. It is more important to have a better system range and to fund the important generic applications, such as the OFIS program than to backward integrate into this part of the system range.

6. We are not a dominant part of the market in terms of units, and hence we will not get the costs vis a vis the BCG learning curves. CDC (NPI), Fujitsu, Nippon Peripherals, STC and IBM all cover us.

7. Maybe there is a joint venture that would be satisfactory such that the facility would get market share.

8. We are not a dominant supplier in this part of the business and hence will not get the volume to make the investment worthwhile. Note the small number of RP07s ordered.

9. If we ever start looking at roi/roa, there's no way to justify this investment. Buying out or joint ventures will be much better...provided we don't handle them to death in our multi-FAT sites.

10. We should get our better cost/megabyte by going after more aggressive mid-range system disks and then putting several of them on the larger systems.

11. Our successful products are those that go across both end user and OEMs. This would only go into the less profitable end user segment.

12. From a general direction standpoint, I think we should consolidate the range of products we have and

invest in layered software together with the networking, while only manufacturing the parts where we make a dominant volume of the market needs, i.e. the mid range. This is the make criteria to be successful in the OEM business.

COMMENTS by Grant Saviers

1. It stretches our range: Our average 11/780 system is selling now for >$250K. Venus is certain to raise the ASP even higher. If Venus is to be a major system from a revenue viewpoint, we must have competitive, profitable disks. An alternative is to market Venus as a CPU, allowing others to integrate the systems and or sell the disks. This might be an acceptable strategy for a small market at the extreme of our range. Two major risks to this strategy are the willingness of customers to deal with multiple suppliers and lack of account control (sales and service).

2. Low end threats: We are expanding our range downwards with CT and agree that this extension is requiring additional disk products.

3. Biting off too much: We (development) believe that 25% to 30% year to year real growth is a realistic management limit. At current inflation rates this translates to 35% to 40% funding growth. The manufacturing growth rate has been 5% to 10% higher because of the rising percentage of NES in storage and continuing increase in the make/buy ratio.

4. Unfavorable ROI: Our large disk analysis indicated a favorable ROI. Our FY82 large disk only (no systems, controllers) NES is about $300M. Our current investment (fully loaded) is about $2M/year. It appears that any disproportionate investment is elsewhere.

5. Generic applications and systems breadth are more important integrations: It would seem that making what we know how to sell in high volume (large disks) has lower

risks.

6. We have a small market share: We buy more disks than <u>any</u> other systems manufacturer in the world. IBM, CDC, Univac, Burroughs, NCR (via joint venture), HIS (via joint venture), Fujitsu, Hitachi, NEZ make their large disks. We will purchase about 8,000 large disks in FY81. This is more than MRX's or ISS/Univac production. It is about 3X Fujitsu's or Hitachi's production rate. CDC and STC produce about 10K-15K per year. IBM's 1980 annual report states "ten's of thousands of magnetic disk files... are being shipped to customers annually". Our large disk usage has been growing at an annual unit rate in excess of 40%. If we produced our current products, we would be a major producer.

<u>DEC's share of OEM shipments* (Non-captive)</u>

1. Pack Drives (>100 MB)

	CY79	CY80	CY81	CY82	CY83
A. CDC	7500	13000	16500	18000	17000

NOTE:IBM large disk products are typically about 30
units per year.

7. Joint venturing looks attractive: We have given this considerable thought and see the guidelines for joint venturing as:

Why we might be interested:

- We can't afford it, but need it
- Skill need beyond our abilities
- Acquisition of a technology base
- Political/tariff/government pressures
- Economical facility too large for DEC
- Only game in town

Hygenic factors:

- Our value added is elsewhere
- OK for competitor to have it
- We can work with the partners
- Adequate control of the results
- Partners contribute value

8. Small number of RP07's ordered: The Product Line requests are disappointingly low. We see this as a consequence of the earlier 300 MB cancellation, the RM05 introduction, large backlogs, and risk aversion.

9. Buy out or joint venture, don't FAT: Buyouts will always find the test of being competitively profitable unless we can market at 1.8X markup. 25% of the $150K and up systems costs (current large disks) could be shipped to customers from the volume factory (ours or suppliers). This should be done in any case.

10. Multiple mid-range disks to cover our large needs: This appears attractive and may be a viable solution. However, it requires a competitive technology base (hence investment). We are carefully examining this alternative as it may give us fewer better products.

11. Successfull products go OEM. Large disks "only go into the less profitable and user segment". We want to sell OEM and today have products that are saleable. We only build OEM competitive storage products. If end user is less profitable, why enphasize "generic applications" (#5)?

12. Invest in layered software and networking. Make only in the mid range. My view is to invest in a few key hardware technologies and leverage these technologies into products across our range. This should maximize ROI/ROA and establish adequate volume/market share to be competitive.

E. Kantorowitz of Technion's Computer Science Dept. (and formerly a Naval Architect) was with a group of people coming through investigating the purchase of a VAX. We were selling, and hopefully they will buy...hence we can't use this one until we make the sale. I assume this is a detail that the Edu Product line will soon take care of.

Anyway the quote was something like: " I think the VAX architecture is great. For a university, it is important to have the best examples of design so that students can learn the right way".

This was a worthwhile visit from a customer! We are a preferred vendor of minis. IBM and Univac supply big machines and HP, terminals. They really want 1 vendor for a given system. Some of his comments obvious, some subtle. All worth attending to!

VAX PERFORMANCE
They're getting 1.6-2.6 times a 780 out of a 4341 benchmark. Though they prefer VAX because of the programming environment and DCL, in which they've invested much programming, he stated: "Tell us to go buy from Big Blue or to keep the faith". They need a factor of 10x780 in 1985, not 2.5. They have some 10's and want to go to Tops 20 and want the 2080, but they want transparent movement of programs to the 2080 from VAX. I hope we can:

1. Get at the issue of increased VAX performance via microprogramming.

2. Get Rose Ann and Pete Hurley to visit there to see how to address the offloading of VAX to a fast compute engine.

3. Get a plausible plan to get a fast VAX.

CABINET FLOORSPACE... A NEW CABINET or AN INSTANT BALCONY?
They complained about the low cabinet density since space cost like $40/year. An extra cabinet costs in the range of $1000 per year plus installation. Fundamentally, they want some scheme to get equipment in tall cabinets OR they want a scheme to make balconies so that equipment can be stacked on top of each other.

4. Dick, Ken, Why can't we solve this one somehow? It might be a special CSS request, but virtually anything is cheaper than retrofitting a room or more floor space.

GRAPHICS
They want a high performance graphics device so that every chemist at DuPont can have one in their office. He likes the 512 x 512 x 8 Adv. Elec. Design system because it can work either on a Unibus or via a comm. line. Should we consider them as a supplier? What about buying the company? They like HP

5. George, we should be able to do this too with our own design.

6. He complained that the VT125 must be able to interpret the Tektronix protocol. I complained too. Let's just do it Bill!

HIGH LEVEL SELLING
We don't, we aren't known and it's difficult to be there in the IBM camp. He sees several needs:

7. Some kind of course for very high level managers to be taught on how to manage the high growth of computing. Their expenes in computing are growing at 40%/year.

SCIENTIFIC APPLICATIONS CENTERS ALA IBM
He proposed we set up something similar to the IBM Scientific Applications Centers. I completly concur with this.

8. Pete Smith, Bill Long, Win Hindle, What about working

out an arrangement where we could do this between engineering and the technical group? I propose that we hire someone to set up something of this nature. It would be operated within Technical marketing and the purpose would be both applications and marketing support. This would permit us to hire some really good locals and do real software engineering.

SCIENTIFIC ADVISORY PANEL
DEC needs one. A systems or research journal would be nice.

April 22, 1981

Professor Gerald J. Popek
University of California, Los Angeles
Computer Science Department
School of Engineering and Applied Science
Los Angeles, CA 90024

Dear Professor Popek:

Thanks for the letter on the 780. I don't know what can be done, however, I've sent a copy of your letter to Al Avery, the Product Marketing person and Jack Shields, head of Service in the U.S. Joe Meany has the market responsibility for your account. I don't know what can be done to help now, but it's clear we all need to do more since we have not experienced this kind of performance with other VAX's running VMS.

Sincerely yours,

Gordon Bell

Are any DECwest ideas applicable here? somewhere else?

to: emc

cc: Cutler, Ken

Visiting DECwest and talking with Dave, on their organization of 24:

Dave-(writing microcode, worked on O/S, etc., manages group)

Secretary for the group

Bob Friedman- facilities, produrement, also for California,

Reid Brown + Ron Parson in ZK for Product Managment

Roger Heinen + 5 programmers for the O/S and SEApascal

3 technical writers for hardware and software (2 for hardware)all of which have a Xerox STAR for manual production

Larry Coppenrath-interface with manufacturing and service

Peter Schnorr-head of the hardware design and designer

Bob Short and Bruce Butz, engineers

Ken Abramson-simulation and microverify, on board diagnostics

Diagnostics person (hardware and software)

1 technician, 1 technican from Burlington for checkout

1 representative from CSSE

1 Mfg. person

They get help from personnel with what amounts to about 1/4 time, and they're getting their boards layed out in Colorado Springs. Also, Burlington Manufacturing is taking on much responsibility.

SOME OBSERVATIONS:

0. All the effort is directed to their products. Both of which look great! The group size doesn't require meetings and travel for resolution. There are almost no surrogates and "process/staff" folks.

1. Only 5 people, two of which are non-engineering, don't work on the product... for a staggering 79% efficiency! Note, that in a hierarchy with a span of control, s, and number of layers, l, where only the bottom layer works, the loss due to management overhead is roughly 1/s! The main loss of direct, product output is through the large number of "process" workers: CAD, testing, publishing, etc. versus direct product workers. Within DEC, as one of the overhead, I estimate we lose at least 25% in "management" overhead, that is, only 1/4 have to work because they aren't managing. I'd also estimate we have only 10-20% directly working on products. (This would mean about 600-1200 for all of engineering, of which 19 are in Seattle.)

2. By taking on more responsibility as individuals, and by buying out Process tools, and a chip they're able to DOUBLE what amounts to productivity by NOT having a CAD group! For example, the CAD groups for Venus, Nautilus and Scorpio are at least as large as the group doing the work on the product, immediately halving the group output. (Presumably this is corrected for by inordinately higher productivity of the designers.) I should point out, however, that the Nautilus CAD group of 70, is doing a trivial amount of work compared with the Trilogy CAD group. Also, Nautilus appears to have 2-3 times the designers that Trilogy has for a machine that has about 1/10 the number of gates. (I also think Nautilus

is one of our best projects.) We also ought to buy out more of our CAD tools now that startup companies are doing so much in this area!

3. By using STAR workstations to do publishing, the whole manual editing and publishing group is unnecessary. This may give a factor of 3 improvement. The writers always see the page layouts, do all the work, eliminating the publisher (where 1/2 the people are) and this interface time (negotiation, surrogates for both sides).

4. Diagnostics are done mostly by the design team. Here again, there's a large number of people who are often not accounted for in the project costs, but cost at least as much as the design.

5. Special VLSI is being bought out, reducing the number required, and the associated management requirements.

6. By living small across the board, an extra management layer is eliminated, thus cutting out a whole set of meetings where turf is described, discussed and divvied.

7. Note there's only one secretary. We managers require many secretaries to sustain the paper blizzard.

8. There are no draftspersons. This is a major breakthrough, and the way I remember doin engineering, because the documents are the only things that engineers produce.

9. The team had a product and use vision and built it. (We're spending many times that of DECwest on VT chips, and there's only a fuzzy future product vision, and no way to attain it. The effort to produce the UNA at 1/2 the performance twice the cost and 2 years after it had been done

outside is legend; and probably the biggest single reason that Ethernet won't some into significant use.)

10. Cray's laboratory has always been about 30 people for supers.

In going on to Colorado, I was similarly impressed, and would be curious to see a comparison.

The revelation was that we ought to look at the whole notion of quality and individual responsibility in a different light so that as Dave says- we must drastically raise our expectations as to what can be accomplished by an individual... because they can. In doing this, the quality of the product would get very, very high (never mind the fact that engineering could produce 5 x what it does today). We probably should be trying 5 x as many ideas as we do now, some of which might fail because they're too daring. Those settlers in the west seem to have only one care- getting a product; not their careers, training, processes, tools, interfaces, etc. which we spend our lives worrying about here in New England.

I doubt that we can change the bureaucracy we've created, but I think it's imperative that we try and create at least one more group of the same size and quality because we need more high quality products so that the empire (and the mediocre products) can be sustained.

Any candidates for another remote group?

.

SUBJ: **CX Review and Dock Merge** Date: 7/26/79
From: Gordon Bell
Dept: OOD
MS: ML12-1/A51 Ext: 223-2236

TO: Dave Brown, CX
Dick Clayton, ML12-2/E71
Bill Demmer, TW/D19
Ulf Fagerquist, MR1-2/E78
Sam Fuller, TW/A08
Mike Gutman, ML3-6/E94
Dave Knoll, ML1-4/P14
Andy Knowles, ML10-2/A52
Bob Puffer, ML1-5/B94
Grant Saviers, ML3-6/E94
Jack Shields, PK3-2/A58
Jack Smith, ML1-4/A54
Will Thompson, ML1-4/P14

Overall very cooperative atmosphere between HV Manufacturing and Engineering. It really felt good. Missing was an interaction with FAT necessary to get anywhere in the Dock Merge Program. Jack Smith and I might do the next review jointly to encourage communication plus give some overall direction that we want Dock Merge and Field Integration. We must establish a much more healthy, supportive attitude to get dock merge to work (and to get the benefit of these good products). The concern of DM ability in CX and with me is that we wink, nothing matters and business as usual forever with never Field Integration. The RL never has been <u>off</u> the DM list, I'm told, even though the FAT organization says it isn't <u>on</u> the list.

I asked about PR making DMable controllers. They don't now. My intuition says that this should happen - this as a PR, CX, and Manufacturing Engineering problem. The RL cartridge isn't on the DM list, yet the majority of the cartridges go through AS + G with customer merge. Note the Alice through the looking glass world...we DM non DMable products; we don't DM the DMable products.

OPENING RL BOXES AND TESTING THEM IN FAT PLANTS, ESPECIALLY FOR THE ADD-ON BUSINESS, ONLY ADDS DELAYS DUE TO TRANSSHIPMENT, ADDS COST DUE TO HANDLING AND DELAYS, AND LOWER YIELDS BY HANDLING, BREAKAGE AND RETESTING!

RM05

This could be depressing:

0. We need twice the parts numbers due to the need to show a cabinet between two devices.
1. All the parts (MBA and CDC drives) have gone already through DMT/PMT yet there's no way to get parallelism in this testing and reduce the time to market.

2. The flow within manufacturing doesn't allow for the potential cost savings inherent in the structure of the drive and its free standing interface. I predict we will:

a. Partially build (non-DM) the MASSBUS Adapter (MBA) in PR.
b. Get the MBA and make it work with the cabinet in CX.
c. Unpack the drive, test the MBA with it, and disassemble the MBA and drive; pack, ship them to FAT plants.
d. Unpack the whole mess and reassemble for both systems and add-ons. Probably we will first test as a sub-assembly.
e. Disassemble, pack, ship, unpack, and reassemble at customer site.
f. Make it work again in the field, if it isn't broken beyond repair given this <u>sixth</u> test!

3. To minimize transshipments and costs; let's:

a. Get CDC to ship to a DEC depot which holds both FI and Customer add-ons!
b. Get the MBA made at DM quality in PR.
c. Ship MBA's to CX, test on an AQL basis, put in cabinets and transfer to the depot.

<u>RL0X's</u>

The fixed and removeable RL04 as we have been working at doesn't yet feel right. However, there are now many interesting possibilities being explored that gets more bytes, the same costs as the RL02, a shorter schedule and are based on the existing tooling/assembly line. I am really encouraged here.

<u>UDA</u>

I'm concerned that there's enough error detection/correction, and diagnostic hardware in the design. Sam Fuller and I must get out the Recommended Guidelines for the (Hardware) Design of system quickly so that people building these complex devices have a baseline.

<u>HSC</u>

We spent the last full day on this and this is covered in a separate document.

R80

Going very well. Anxious to see how we do when Manufacturing builds this next lot. It was good to move ahead and decide not to do the R80 in the corporate cabinet.

Product Strategy Planning

I went through an exercise with a small group. The planning technique must be carried out under the system/disk group sponsorship. I want a first pass of this output for this years Redbooks!

Mr. Dan Bricklin, Chairman
Software Arts
27 Mica Lane
Wellesley Hills, Massachusetts 02181

Dear Dan:

Enclosed is a copy of the Capital Campaign brochure and also the letter I wrote about a year ago on why support the Museum. The Core Membership program is descibed on page 11, and I hope you can make a personal pledge for the four years, but if this time is not right, then I certainly understand.

Your observations today were helpful:

1. The east coast is the right place to record the history, because it has been involved much longer is probably the best answer we can give. The west is still plowing up farms to get space for building new companies and is hardly stable enough to consider recording what they do. Also there is a tradition

about learning from the past here, near Europe.

2. The Museum is a place where one should see a number of ideas that were explored before the right techological time. The best example is the Babbage machine which not only could not be programmed, it couldn't be built. The technology was about 100 years too late for Babbage.

We see lots of modern day examples, including the tremendous surge of multiprocessor now made possible by the Micro, whereas the B5000 and PDP-6 tried, but the economics weren't right. I'll start scouting around for a copy of the design notebook for Multics, including Daly, Jim Mills, Mike Spier, etc. as another example which, no doubt, will contain ideas.

3. We see inspiration from early artifacts which were personally created by today's leaders such as Kemmeny, Kurtz, Olsen and Wang.

4. There are lots of funny gadgets for the time, such as the fire extinguisher for the Sage.

The Museum will certainly appreciate receiving your pioneer, videotape library.

Also, I look forward to the scheduling of a talk this spring at the Thursday evening or Sunday afternoon lecture series. Someone from the Museum will contact you.

Sincerely,

Gordon Bell

CC: Gwen Bell
June 18, 1984

Mr. Dan Gregory
Greylock Management Corporation

One Federal Street
Boston, MA 02110

Dear Mr. Gregory:

I enjoyed meeting you at the Museum Pre-Preview party last month.

A first rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the computer and the image. Predictions are that we should have attendance of over 200,000. This world-class, international Museum should be a major attraction and asset for the high tech and computing community.

The enclosed brochure describes the Capital Campaign. Now I want to enlist your support as a leader in the venture capital community in this first round which will result in opening the Museum, November 12:

1. Greylock's "core" membership in the Capital Campaign at the 4K level, Since we've also talked with Bob Henderson, I hope that the company is convinced and can justify this investment. The Museum will be available for company functions.

2. your personal "core" membership, and

3. assistance in the capital campaign to reach world-class status.

I'm also enclosing two articles: a letter which attempts to justify why I think the Museum is a good investment in the future, and a paper on the micro-based industry, which is drafted for publication in November. I hope both will be of interest to you.

I'll call you next week and hope that we can have lunch soon at The Musuem to discuss your support.

Sincerely,

Gordon Bell

Enclosures - 3

ENCORE COMPUTER CORPORATION

RESEARCH AND DEVELOPMENT IN

HIGH PERFORMANCE AND FAIL SOFT MULTIPROCESSORS FOR PARALLELISM;

AND SYSTOLIC ARRAY PROCESSORS FOR SIGNAL PROCESSING

March 10, 1984

Encore Computer Corporation
15 Walnut Street
Wellesley Hills, Massachusetts 02181

Contact: C. Gordon Bell
Phone: 617-237-1022

FOR DARPA USE ONLY- PLEASE DO NOT CIRCULATE

1. INTRODUCTION

ENCORE OPERATING PHILOSPHY: Encore Computer Corporation was founded in July 1983 with the principle of forming and supporting, very high-quality autonomous product companies. Each company has its own development, manufacturing and market support groups. A single sales, service and finance company is responsible for distribution -- the only economy of scale we can identify in computing today. Companies are tied together by common strategic goals and standards.

Although Encore currently consists of approximately 100 individuals in six companies, the central staff is limited to 15 individuals (including secretaries) who have the responsiblity to help the operating companies. Each member (see personnel section) of Encore Central has an average of nearly 25 years experience in computing. The staff's role is:

- serving as members of internal boards for each company
- strategic marketing and product positioning
- supplying capital for each company
- providing help with critical and technical decisions
- reviewing operating plans

Aside from the products, the most important aspect of Encore for DARPA is our ability to establish VERY HIGH QUALITY companies rapidly and to build rapidly using the natural Entrepreneurial Energy that exists today. We believe these companies can provide results an order of magnitude faster, cheaper and better than large companies. Also, we believe our companies will out perform conventional venture capital financed companies.

Unlike today's conventional startups who use the venture capital approach, Encore Entrepreneurs move more rapidly from design to prototype and to production, freed of the hassle of building a larger, full-scale company. Such a company requires expertise in financing, marketing, field sales and service. As such most startups rapidly become inefffective and ultimately fail. (For example of the 100 companies who formed in the early 70's to build minicomputers, only 7 are successful now. Seventy percent failed.)

RESEARCH AND DEVELOPMENT PHILOSOPHY FOR MAXIMUM DARPA SUPPORT

Encore's research, development and product goals are to provide the broadest possible range of technically excellent products by using multiple, high performance 32-bit microprocessors. Over the past decade MOS technology has enabled processors to evolve at a rate of over 60% per year; in contrast bipolar technologies (TTL and ECL) have evolved at less than 20% per year. Within two years these zero cost MOS (and CMOS) processors will exceed the performance of TTL-based computers. Instead of using micros as simple uniprocessor replacements for today's computers we are predicating all of our products on multiple processors to give much greater performance, reliability and cost-effectiveness. The ultimate aim of the product line is full parallel processing.

We believe Encore is uniquely positioned to be of vital assistance to DARPA's research because of our expertise and commitment to parallelism and products. We have several approaches to transfer research results to commercial and military products in minimum time.

2. RESEARCH, DEVELOPMENT AND PRODUCT COMPANIES FOR PARALLELISM

. HYDRA COMPUTER SYSTEMS is building a medium scale multiprocessor for high performance computation. HYDRA is a large multiprocessor which can operate with up to 16 processors sharing a common 32 Megabyte primary memory and interconnected via a very high speed switch with data transfer rate of approximately 100 megabytes per second. The price will be less than conventional mini-computers.

Highest performance and the most cost-effective computing will be supplied by using properly loaded, shared HYDRA Computers which are interconnected to high performance, high resolution terminals (see below). With the proper configuration, a user can be guaranteed much greater performance at lower costs than are possible with today's ill-configured workstations.

The large number of processors provide very high interrrupt capacity for interfacing specialized real time equipment such as speech, video and other signal processing devices. This simple computer could be the basis of much of DARPA's work in real time and AI.

. ULTRA SYSTEMS is a laboratory in Pittsburgh currently under the direction of Dr. Siewiorek. ULTRA is building higher performance and higher availability computer system using the HYDRA multiprocessor cluster as the basic building block. ULTRA computers will have over one hundred processors in the basic configurations and the ability to access up to a Gigabyte of primary memory.

The construction of high performance, fail soft signal processing multiprocessors requires a team with expertise in a number of widely varying disciplines. The Encore staff involved in this effort has over 100 man-years of experience in architecture, hardware development, logic design, operating systems, programming environments, signal processing, fault tolerant design, reliability analysis, and computer aided design.

. RESOLUTION TERMINALS AND WORKSTATIONS is building high resolution terminals for various shared systems. These terminals will rapidly evolve to standalone workstations as sufficient processing and memory technology is available to provide cost-effective computing.

. FOUNDATION COMPUTER has the responsibility for all languages to insure compatibility across the entire product range. In addition, Foundation has developed a Fourth Generation Language, Ally, for accessing data via reports coupled with rapid forms entry. This environment appears to be ideal for generating command and control applications. Foundation is also responsible for commercial and office applications software.

. TECHNICAL AND AI SOFTWARE SYSTEMS DEVELOPMENT has the responsiblity for technical software applications in the CAD/CAM and technical/scientific area. Encore is currently examining various research and development group proposals to implement environments for AI languages including LISP, Prolog and Production Languages.

. SYSTOLIC COMPUTING LABORATORY AND PRDOUCTS. Encore supports and would like the opportunity to help develop

Systolic Processing with Professor H. T. Kung by the formation of a laboratory and product company in Pittsburgh aimed at producing systolic processors. Our relationship with Professor Kung is described below.

. A network company is being formed to take the responsiblity for concentrators, gateways and interfaces to other computer vendors and telecommunication suppliers. A primary function of the network is the interconnection of high performance terminals and workstations to our large, shared systems. In addition, each product company is responsible for its own network needs.

. We are actively persuing companies who could provide better architectures for increased performance using parallelism and by simpler, Cray-type (load/store/operate) architectures.

3. RESEARCH, DEVELOPMENT AND PRODUCT EXPERIENCE

Encore personnel have been actively involved in multiple and parallel processing for nearly twenty years. This experience includes the design and construction of nine diverse multiprocessor and multicomputer structures--including local and wide area networks.

PDP-6 (circa 1966): one of the first multiprocessors. Initially a master-slave processor in the early 70's, it evolved to a fully symmetric multiprocessor system. PDP-6 was initially designed to execute LISP effectively, and even twenty years later continues to do so.

C.ai: a very large multiprocessor for AI research was posited in 1970 in response to a DARPA request for significanlty more computation for AI research. Several special LISP language processor designs were posited. Both the Stanford S1 and CMU C.mmp were direct descendants of this work.

C.mmp: Computer - MultiMiniProcessor. C.mmp was motivated by the need for more computing power to solve speech recognition and signal processing problems and to understand the multiprocessor software problem. Until C.mmp, only one large, tightly coupled multiprocessor had been built - the Bell Laboratories Safeguard Computer. C.mmp is the classical multiprocessor, with 16 processors sharing 16 memory modules through a cross-bar switch. The Intel 432 is the nearest descendant of this work and unfortunately suffered from inadequate addressing.

C.vmp: Computer - Voted MultiProcessor. C.vmp is a triplicated microprocessor system designed for realtime control environments. Major design goals included the use of off-the-shelf microprocessors and software transparency (ie. the fault tolerance is achieved without modification to operating system or application software). C.vmp is composed of three separate machines capable of operating in independent mode executing three separate programs. Under control of one of the processors or an external event, C.vmp can synchronixe its redundant hardware and start executing a critical section of code.

Cm*: Computer - Modular,MultiMicroprocessor. Cm* was designed to be an "open" architecture with no fundamental limits on the ultimate size of the system. The actual system consists of 50 LSI-11 processors divided into five clusters. Each LSI-11 has a 64K local memory which resides in the global address space of the system. A local switch determines if a processor produced memory request is destined for local memory or a memory outside the Computer Module. If outside, the request is handed to a cluster controller. The cluster controller may find the data resident in its cluster or hand the request to the cluster where the data resides. Two operating systems were built for Cm* as well as an Integrated Instrumentation Environment which allows users to rapidly develop and monitor performance of their applications code. Modern microprocessor busses such as Multibus I, II, Futurebus and VME all use the concepts developed in Cm*.

PDP-11/74mP: The PDP-11/74mP was motivated to improve reliability, availability, maintainability, and performance for the PDP-11 family. The system consists of four PDP-11/70 processors attached to a four-port shared central memory. I/O devices are either dual-ported or attached to multiple buses through a bus switch. Each processor had a write-through cache. An Interprocessor Interrupt and Sanity Timer provided the RSX-11M executive software with interprocessor signaling and a fault tolerant clock. Although 100 11/74's were manufactured, only a few were delivered since the VAX market success did not require the additional product revenue.

PULSAR: PULSAR was a 16 LSI-11 multiprocessor designed to investigate
the cost-effectiveness of multiple microprocessors as an alternative to building a single large machine. It covered the performance range from a single LSI-11 to greater than a PDP-11/70, but at a cost less than the 11/70. The processors communicate with each other, a common cache, and I/O
via a high-bandwidth, pipelined, synchronous bus.

11/784: A 4-processor multiprocessor version of the VAX-11/780.

VAX Clusters: Up to 16 VAX computers can be interconnected in a close area network (100 meter radius) with message passing and process to process interconnectino of 2 x 10 Mbytes/sec data-rates.

4. PUBLICATIONS

The Encore staff has published over 200 books, papers, articles,
technical reports and patents in this area since 1970. Following
is a brief list of representative works.

Siewiorek, D. P., C. G. Bell, A. Newell, "Computer Structures:
Principles and Examples", McGraw-Hill, 1982, 960 pages.

Siewiorek, D. P. and R. Swarz, "The Theory and Practice of Reliable
System Design", Digital Press, 1982, 770 pages.

5. PERSONNEL

Kenneth G. Fisher is President and CEO of Encore Computer Corporation. Mr. Fisher was President and CEO at Prime and under his leadership Prime grew from $7 million to $350 million during the period 1975 to 1981. Mr. Fisher has over 25 years experience in the computing industry and was responsible for various field marketing and sales operations at General Electric and Honeywell.

C. Gordon Bell was Vice President-Engineering for Digital Equipment Corporation and the firm`s chief technical officer for the past eleven years. At Digital he was responsible for all research, design and development activities in computer hardware, software and systems. Among other products, Mr. Bell was responsible for the VAX line of 32-bit super minicomputers. He also headed computer design at DEC during 1960-66. From 1966-1972, Mr. Bell was a member of the faculty of Carnegie-Mellon University and a consultant to DEC during the formation of the PDP-11. He was one of the principal architects of C.ai, C.mmp (a 16 processor system) and Cm* (a 50 processor system). In 1981-83 Bell led the Alpha-Omega definition group of the Microelectronics and Computer Corporation. Bell is on the faculty of Carnegie-Mellon University (on leave) and a member of the National Academy of Engineering.

Henry Burkhardt is Treasurer and head of Corporate Development at Encore. Mr. Burkhardt was a founder of Data General and a member of its five person board until 1982. At Data General he was the principle architect of the NOVA. He lead the software development, was the Chief Financial Officer and eventually headed the manufacturing organization before he left DG.

Ed Fredkin is currently a full-time consultant to Encore. Professor Fredkin is interested in parallelism, computational physics, the human interface and the application of computers for Artificial Intelligence.

Julius Marcus recently joined Encore after 13 years at Digital as one of three Senior Marketing Vice Presidents.

Marcus has extensive experience in marketing and engineering products for real time and office products. He began his career at Digital with responsiblity for markketing the PDP-11.

Robert Puffer spent 15 years at Digital in various enginnering and manufacturing capacities at the Vice President level. Most recently, he headed all of the Mass Storage manufacturing, roughly 1/3 of DEC manufacturing.

HYDRA COMPUTER SYSTEMS

David J. Schanin is President of HYDRA Computer Systems and was employed at Digital Equipment Corporation where he was generally recognized as an expert on interconnecting multiple microcomputers. He was the architect of the Professional 350 computer and responsible for implementation of Digital's multiprocessing architecture for microcomputers.

Steven E. Chapin was Manager of Operating Systems Software Development and Manager of Distributed Systems Architecture at Prime Computer. Prior to Prime, he was at Data General where he designed one of the firm's operating systems for its current advanced MV computer series and was a member of the Advanced Architecture Group. Mr. Chapin is in charge of Software at HYDRA as Vice President.

Russell L. Moore was Manager of a CPU development program at Prime Computer where he was responsible for one of the firm's future generation super minicomputers. For the nine years prior to 1981, Mr. Moore held numerous positions at Digital Equipment Corporation including responsibility for engineering on the PDP-11/74 multiprocessor, various peripheral switches and multiported memories for high relibility configurations. Mr. Moore is a graduate of Carnegie Mellon and is Vice President of Software at HYDRA.

RESOLUTION TERMINALS AND WORKSTATIONS
Charle' Rupp is the President of Resolution. Dr. Rupp has nearly 20 years experience in building display systems of all types including high performance military simulators, commercial terminals. Most recently he was responsible for Digital's Research in Graphic Terminals and Workstations and was the principle designer, while heading the research group, of ALL of Digital's Graphics Terminals.

Ike Nassi is the Chief Technical Officer of Resolution. Dr. Nassi has extensive experience in software including the implementation of one of the early ADA compilers. Most recently, Dr. Nassi was Vice President of Development for Visual Technology Incorporated.

ULTRA AND SYSTOLIC LABORATORY COMPANY PERSONNEL
In addition to it`s regular employees, Encore retains critical consultants who are working on more advanced parallel processing including:

Professsor Daniel P. Siewiorek Carnegie-Mellon University faculty. His accomplishments at CMU include leadership responsibilities on the Cm* project that culminated in an operational 50-processor multiprocessing system and construction of C.vmp, a triply redundant high reliability computer. Dr. Siewiorek, currently on leave from CMU, heads ULTRA Systems --the laboratory responsible for the large scale multiprocessor. Dr. Siewiorek intends to return to Carnegie-Mellon to resume his position as a senior member of the faculty. Encore fully supports this position.

Ivor Durham, a candidate for the PhD at CMU is the principle system software designer of the large scale multiprocessor at ULTRA. Mr. Durham implemented the principle operating system for Cm*. Mr. Durham intends to join ULTRA as a full-time employee at the completion of his dissertation.

Andrew Wilson, a candidate for the PhD at CMU is the principle hardware designer for the ULTRA multiprocessor. Mr. Wilson has extensive hardware design experience. His dissertation is on the design of a very large scale multiprocessor. Mr. Wilson intends to join ULTRA as a full-time employee at the completion of his dissertation.

Professor H.T. Kung is a member of the faculty of Carnegie-Mellon University. His accomplishments originally in numerical analysis now include the invention, theory and development of programmable systolic processors. He is the architect of numerous VLSI chips and systems for various special purpose systolic processors for signal processing. WARP: a Versatile Systolic Array Processor for high speed signal processing is the latest of these systems. Encore has offered to establish a product laboratory (perhaps initially co-located with ULTRA) for Prof. Kung in Pittsburgh so that the research results at Carnegie-Mellon can be transferred to a product as rapidly as possible and under his direction. It is our intent to facilitate the formation of a company in which Prof. Kung could play a major leadership role. We believe it is in the best national interest that Prof. Kung remain a full-time professor at CMU. We also believe that Encore can provide the best environment for transferring Prof. Kung's work to practice in the shortest, most expeditious fashion.

6. PRIMARY AREA OF RESEARCH INTEREST

With the amassed experience in the areas of multiprocessors, reliable computing, and signal processing the time is ripe for the design and construction of a very large Fail Soft Signal Processing Multiprocessor (FSSPM). The FSSPM should combine recent advances in high speed signal processing with the flexibility of a general purpose multiprocessor. The program development environment and operating system should allow efficient generation of application software that fully exploits the architecture. Furthermore, the inherent modularity and replication of basic hardware and software components provides the basis for constructing a reconfigurable system which can adapt to failures while maintaining the required application throughput.

The FSSPM will be constructed by integrating the HYDRA cluster currently under development with the WARP designed at CMU. In addition, ULTRA will use conventional multiprocessing techniques pioneered at CMU to give on the order of 100-fold parallelism.

A significant amount of our research will be aimed at specialized hardware and software to fully exploit the architecture of HYDRA and ULTRA. In particular, we want to supply versions of LISP, Prolog and Production Languages.

Kung's work on Systolic Processing is vital. It is essential to build and evalutate these processors. The key questions are generality and programmability.

We are following the Dataflow work closely, especially languages. We believe that the first application of Dataflow will be at relatively coarse grain size suitable for execution on conventional multiprocessors.

7 . TRANSFER OF TECHNOLOGY FOR MILITARY APPLICATIONS

We believe Encore personnel have demonstrated far more capability of transferring research results in laboratories into cost-effect products than any other company. For example, these transfers include: the first commercial timesharing system (DECsystem 10 from CTSS and DECsystem 20 from Tenex), LISP, early DEC graphics, computer networking (DECnet from ARPAnet), various editors and languages including APL, BLISS, TECO, etc. Encore is committed to this tradition of NOT reinventing concepts, but rather making them available to the computing world in a most expeditious fashion.

Encore's product line is directed toward the high performance, real time market place found in scientific laboratories. Initial applications will be general purpose in nature and evolve to both the technical and commercial markets such as office processing.

Encore is actively negotiation with several companies regarding licensing military versions of all products. Ruggedized and militarized licenses will be available concurrent with first prototype operation. In this fashion both conventional commercial and fully militarized versions of Encore equipment will be available.

<u>Kenneth G. Fisher; Chairman, President, CEO, Founder</u>

Mr. Fisher is computer industry executive with 25 years experience, including General Electric and Honeywell, as Vice President of Central Operations, where he had responsibility for one-third of field operations.

In July 1975 he became President and CEO of Prime when it had 150 employees with net sales of $7M per year. Prime's first computer was predicated on Multics, but at 1/10 the price. When he left Prime in 1981, Prime had grown at 88% per year to have over 4000 employees and sales of $350M per year.

<u>C. Gordon Bell; Chief Technical Officer, Founder</u>

Mr. Bell has been responsible for supplying DARPA's computing for the last 20 years in his position as head of computer design (1960-66) and Vice President of Engineering at Digital Equipment Corporation (1972-1983).

He led the PDP-6 (the forerunner of DECsystem 10/20) development, the first, computer designed explicitly for interactive timesharing. The PDP-6/10 was explicitly designed for executing LISP, and is still the LISP benchmark computer. The PDP-6 was designed and used as multiprocessor.

During 1966-1972 as professor at Carnegie-Mellon University, he researched and wrote books, including Computer Structures with Allen Newell. While at CMU he consulted on the design of the PDP-11; the Unibus and General Registers concepts came from the research on computer structures. In 1971 he proposed a 16 processor, computer, C.ai, for AI applications; this was the basis of Stanford's S-1. C.ai was also the basis for CMU's C.mmp, a 16 processor computer, built in 1972, the first large scale experimental multiprocessor. In 1974, Cm*, a 50 processor computer was started with Siewiorek and Fuller; it became operational in 1976 and still continues to be used as one of the world's few, operational large scale multiprocessors.

In 1975 he lead the VAX architectural development, which was introduced in 1978. In 1978 he architected the VAX strategy which interconnected computers in various ways including Ethernet for distributed computing, high speed LANs for multicomputing and multiprocessors. At Digital, he sponsored and contributed to four multiprocessor projects ranging from 4 to 64 processor computers.

At Encore, he and Burkhardt are responsible for the overall Encore architecture and product strategy. Encore is predicated on developing the Multi, ie. multi(ple) microprocessor computer and parallel processing. Encore's products include workstations using LAN based intercommunication.

Mr. Bell has written books and papers on computer structures, has various awards and is a Fellow of the IEEE and a member of the NAE.

<u>Henry Burkhardt, III, Vice President, and founder</u>
Mr. Burkhardt has a broad range of skills ranging from legal issues to manufacturing, finance and system and software

design.

Mr. Burkhardt co-founded Data General in 1968, resigning in 1976 and remained on the board until 1982. At DG he was the principle architect of the NOVA and head of software engineering. He also managed the development of innovative software including the first PL/1 for the minicomputer. He was the firm's Chief Financial Officer and directed administration. In 1974 he became head of Manufacturing and developed an organization and system for high efficiency and throughput, while at the same time increasing customer satisfaction.

After leaving Data General he became active in startup medical and communications firms as a consultant, investor and director.

Mr. Burkhardt is co-ordinating the creation of the Encore Computing Environment, and is especially interested in the areas of secure, distributed computing and parallel processing.

Fisher, Bell and Burkhart founded Encore in July 1983.

<u>Professor Daniel P. Siewiorek, Technical Director of Ultra and Principle Investigator, DARPA Project</u>
Professor Siewiorek is half-time at Encore and a member of the Carnegie-Mellon University Computer Science and Electrical Engineering Faculty. His specialties include performance analysis, reliability / availability anaysis, Digital Computer and Digital Systems Design including CAD of VLSI circuits, and parallel processsing.

At CMU he led the Cm* effort for the last 8 years resulting in papers, reports and a book (in press) which gives the experience gained about parallel processing. This book is the only report to examine parallel processing from an experimental view. Siewiorek was also responsible for the design of C.vmp, a triplicated computer also built in the CMU environment.

Dr. Siewiorek is an author of numerous books and papers on reliablity and computing structures, including being the principle author in 1981 of an updated version of Computing Structures with Bell and Newell. He is a consultant to numerous corporations including AT&T, Bendix, Digital, and United Technology. He is also a Fellow of the IEEE.

Julius L. Marcus, Vice President, Business and Product Management

Mr. Marcus is a general manager with broad experience in the computer industry including product marketing, divisional management and engineering managment and design. He is a member of the board of directors of Ultra.

Prior to joining Encore, Marcus was a Senior Vice President with Digital Equipment Corporationh for 15 years holding numerous positions in engineering, product and business management. Most recently, Marcus was responsible for the Office Products Division Products. His first assignment with Digital was as Marketing Manager for the PDP-11.

Robert W. Puffer III, Vice President, Operations

Mr. Puffer's professional background includes a wide range of managment positions in engineering and manufacturing. He is a member of the board of directors of Ultra. He is has operational responsibility for various Encore groups.

Prior to joining Encore, Puffer was Vice President of Storage Systems where he was responsible for manufacturing all disk and tape products. These facilities encompassed approximately 1/3 of all Digital manufacturing. Mr. Puffer's earlier efforts included responsiblity for Digital's first peripheral engineering and Manufacturing Engineering.

Ivor Durham, Software Engineering Leader, Ultra Laboratory

Andrew Wilson, Hardware Engineering Leader, Ultra Laboratory

Mark Reich, Program Manager, Ultra Laboratory

David Schanin, President and Chief Technical Officer, Hydra Computer Corporation

Steve Frank, Analyst and Consulting Engineer, Hydra

IA. CLAIMS (9/27/84)

1. The design of a single, integrated mix-and-match architecture to support three types of processors for: multifunction, symbolic and signal (and special) processing in a unifed physical and programming environment.

2. A modular hardware design which scales linearly, and efficently over a four level hierarchy to form a single, large multiprocessor computer with over 1000 microprocessors, in a single 32-bit memory address-space and include: processor-cache (substrate); processors (card); Hydra Multi(processor) Computer (medium scale box); Ultra Multi(processor) Computer (close area cluster computer). This gives 1000 Mips in 1988.

The programming environment includes a fifth level, the Local Area Network which is used for: interconnecting computers, gateways to other computers, concentrators for terminals and PCs, network connected host-based workstations and host-compatible workstations.

One common package (box) and about ten card types provide: the medium and large scale Multi's in a single, scaleable performance, availability and applications (multifunction, symbolic, signals) range architecture.

3. Deployment now for parallelism research applications using the medium scale Hydra Multiprocessor Computer including: robotics at CMU and Harvard, Productions Systems at CMU, and parallel Lisp (breadboard) at Stanford; two simulation activites within Computer Aided Design at CMU and Encore; and next generation Systolic Signal Processing with Kung. Deployment of the large scale Ultra Multi can begin in '87.

4. Reliability and maintainability can be optimized anytime by redundant components to give an order of magnitude improvement in MTTF and downtime over uniprocessors. Security of the environment will be DOD Level B.

5. Monitoring hardware for measuring performance and diagnosing system faults. Analytic tools and models for hierarchical Multi's, with multiple level caches and filter memories will be provided.

6. The 64-bit architecture is standards based and oriented to high performance, including caching, instruction lookahead (for symbolic processing), and signal processing. Performance scales gracefully both by utilizing a hierarchy and by microprocessor evolution.

Encore would assist a DARPA initiative to change complex instruction sets of microprocessors to a simple load/store format ala Cray, MIPS and RISC. Near-term microprocessor performance increases can be greatly accelerated using advanced DARPA technology.

July 28, 1982

Professor Barry Richmond
Dartmouth College
Hanover, New Hampshire

Dear Barry:

I'm really grateful for the incredible job you did in "modeling" DEC as the basis for management training in Engineering. Although I regret I couldn't attend this session, I do want to play the game. The real endorsement came from the enthusiasm of the managers who attended the course and gained the insight.

It is really important that we refine the model and make it suitable to operate across Digital because it looks like the best of all training mechanism. The part about servicing looks especially good and I believe that Customer Services would also benefit by using it. Your course should also be the ideal second course in the cross organizational series. I also see it as a vehicle to explore effects of changes in organizational structure.

Prompted by your course, I'm writing a brief note to Science or Electronics regarding the effect of "overfunding" in basic research. What I "conjecture" is the basic loop: ARPA and NSF are discovering the basic ideas for computer science and are publishing them widely; there's no mechanism or funding (we can't afford to do the refining) to move the ideas into the corporations; the Japanese are now organizing, selecting and developing the ideas which result in products; the result is inadequate funds back into the goverment sector and hence deficits; finally, there's no market for engineers and scientists as the industries are aimed at distribution rather than development/manufacturing. For example, the Japanese Fifth Generation Program is a collaborative, advanced development program based on world basic research in AI that's been done over the last 20 years.

I'd like to encourage you to proceed to build a model of the Japanese industrial sector and mode of operation that could be played by various MBA's-to-be, corporate and government managers so they can see the problem and ultimately deleterious effects in competing with Japanese corporations.

Again, thank you for the extraordinary effort in the model and in leading the course. I look forward to a continued interaction.

Sincerely,

Gordon Bell
Vice President, Engineering

Professor George R. Stibitz
Department of Physiology
Dartmouth Medical School
Hanover, New Hampshire 03755

Dear Professor Stibitz,

Digital Equipment Corporation is in the process of developing a Digital Computer Museum. Last fall, we had an opening of the exhibits of pre-computer calculating devices, parts of Whirlwind, MIT's TX-O, and DEC machines representing each of the subsequent generations of computer technology. Professor Maurice Wilkes presented our inaugural lecture. I would like to ask you to give the second Digital Computer Museum lecture on Thursday, May 8th.

We would like you to talk about your pioneering contributions on binary and floating-point arithmetic, memory indexing, operation from a remote console, and program-controlled computations and the environment in which these were made. The lecture will be attended by engineers at Digital Equipment Corporation, and invited computer scientists from the Boston community. We will have about 100-200 people in attendance at a 4:30 lecture followed by a pre-view of the museum exhibits and reception. The lecture will be video-taped for the museum archives.

I am able to offer you an honorarium of $500 plus any expenses incurred. I certainly hope that you will be able to do this as I am sure that the computing community, especially our engineers will greatly benefit from understanding more of the history and tradition to which they belong. If you have any questions please feel free to call me at 617-493-2236. I am looking forward to hearing from you.

Cordially,

Gordon Bell
Vice President,
Engineering

Bill McBride
David Skyrme

Date: 15 OCT 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

I can't understand how the Geaghan, Skyrme Data Tablet Business Plan makes any sense whatsover because:

1. It fails every test of what has been proposed to be a rational make vs buy policy! (see attached)

2. I believe it's significantly understated in terms of development cost ($75K for this is too optimistic based on what other

tablets cost to design!--see their P/L statements)

3. I believe the price is unrealistically high based on the Summagraphics Product.

4. There was no ROI calculation!

5. There are at least two good buyouts...maybe more!

6. The same $100K+ applied to software will move to get a critical mass which will easily generate more than $1M in extra sales for current products (WITH software)!

7. Let's buy out or better yet, structure so our customers can.

SUBJECT: GOING TO ARPA FOR SUPPORTING THE DATAFLOW WORK

Since ARPA has a supercomputer effort, I'd like to start going
to them with work we have unique skills in and can make a contribution. Also, I want to go outside for our funding for work such as DATAFLOW where the payoff is either very long or very high risk.

I talked to Arvind (MIT) and he'd really like to see us go out to ARPA to get this production level complier for dataflow
and have it available widely. He believes that it requires a significant engineering effort (as well as some research possibly). In the past, ARPA has funded companies to do work of this type when it requires significant engineering (eg. the ARPANET, various large stores, Illiac IV, etc.). Also, much of the CMU work should have been bought out because it was engineering, and didn't get done well or on a timely basis.

Can we get together and approach ARPA to build the compiler?

This is simply another reason why I believe engineering work should be done in a group who has the expertise to do the job.

SUBJECT: DOING DATAFLOW RESEARCH

Although I can understand Alain's viewpoint it makes me sick.

As a someone who is interested in Dataflow as a way to describe
algorithms and makbe as a way of building machines, I have to
ask at times, does anyone look at this work? does anyone care?
what's the priority of the work? when do we expect the payoff?
why should we be doing any work at all besides tracking this?

Ivan has been doing this for several years, and we are missing
him in the routing work, and I'd like to get him back into
helping in technology scaling using AI techniques, perhaps.
Now, Ivan has a second person working in applications of
Dataflow machines, and I for one am pretty sure that there
aren't going to be Dataflow machines... at least in the next 5
years. My belief and reason for support is that it will drive
parallel processors ala PPA.

Ivan asked me to fund another person to make a compiler, and
I agree such a compiler is really essential for the myriad

of Dataflow work being done in the outside research community.

Since none of you in Hudson have any particular experience in dataflow compilers, I really do want the work (if we are going to do it), run by the languages group. Steve Hobbs uses the Dataflow approach in his compilers, and it's fairly natural to have the Technical Languages group do this work Also, the techniques they develop any should find their way back into the other languages. I believe it is very hard for a specialist operating in a different environment to remain very good simply because there's no one to talk with about questions of writing such a compiler.

There seems to be several questions:

1. Should we spend so much on dataflow?
2. Why is the dataflow work connected to semiconductors?
3. Why isn't the extra person that Ivan got working on the critical compiler instead of more applications?
4. Does anyone review the goals and objectives and the progress and timetable for this work? eg. RAD?

SUBJECT: WHY NOT FUND TECH LANGUAGES TO DO SAL?

I do not want to get involved in cross group projects. When I don't control the developers then the job can't be depended upon. If I agree to run a project I want the people under my direction and control. I don't want to be responsible when they screw up or if their management changes direction if they aren't under my control.
I have a track record for finishing and delivering on commitments I make. This may seem a bit selfish, but I have been burned too many times here at DEC. I believe that any other way to operate is untenable and too risky. There is no way we can run a joint project with the languages A/D people unless the developer is right here and we review his work regularly. Also trying to exercise the software will be hard enough with some of it in Manchester, we don't need another long-distance connection with Spit Brook. We're the ones who have the Dataflow technology and needs here.

I have no problem if Technical Languages wants to assign a person to work here and then the person gets to rejoin their
group, but we must direct and control the person to assure success for our project goals and assure that our time is well
spent. Also, we need to specify when the person is done. I don't

want the person walking off when the job is incomplete or not debugged fully, because either time is up or his boss wants him
to work on other things. After a year, I want the option to let
that activity continue and fund it myself a little longer, if
dataflow will benefit. I want to protect Dobes and his
co-developers from any unnecessary outside distractions so they
can complete their major tasks successfully.

That is my position on the subject.

Alain

This year our software has gotten worse, it seems! Can
you have someone get some understanding, statistically
and intuitively.

1. How do we compare overall with other vendors?

2. What's the overall rating correlated with? (I.e., how does quality vary with documentation? ease of use? vendor support?)

3. How does this compare with previous years? (E.g., why has 11M gotten worse, RT better?

4. Anything else that can be gleaned?

Come to Marketing Committee after we have some insight to explain things.

How can we get better.

Dear Jim,

Enjoyed your Update on Intel, Vol III, 8.04. Do you have a better, more detailed breakdown of the Microcomputer Systems Division? This would include several cuts by level of integration (boards, boxes, development systems, and software), and also by family. It would include some comment as to how much there is a family, and some way of looking at a distribution of their customers in the categories. Also, I would like to have a more complete list of their facilities and what they do there, eg. do they make PC Boards in Puerto Rico?

If you have these readily available or if you can refer me to some other source, I would certainly appreciate the information.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

Victoria, British Columbia V8W2Y2

Dear Dave,

This is a note to confirm that I would like to hire you as a consultant to Encore Computer Corporation on Saturday, June 23 for a critical review of an operating system project. The review will be held at Hydra Computer Systems, 15 Mercer Street, Natick, Mass.

I have discussed the review with Dave Schanin, the President of Hydra and told him of your suggestion for attending your course on Software Engineering the week of June 18. We both think this is an excellent idea, and are trying now to figure out who (including Dave and I) should / could attend your course.

I understand the fee will be at your normal consulting rate and no other comparable company receives a lower rate.

The information we provide for the review will be treated in a confidential manner, and we'll ask you to sign a standard agreement regarding this information.

Sincerely,

Gordon Bell
Chief Technical Officer

CC:
David Schanin
Henry Burkhardt, Encore
Steve Emmerich, Encore

The Business Manager reports to the Director.

The main function of the Business Manager is to free the Director, Exhibit
Coordinator, Programs Coordinator, and Office Manager from bookkeeping and other money related chores.

From the Business Manager's viewpoint the Museum is divided into four areas: Director's Office, Exhibit Center and Archives, Program Center, and the Resource Center.

The Business Manager performs the following tasks areas and they relate to the four larger areas of the Museum mentioned above: payroll, insurance, bank accounts, bookkeeping and accounting, budget, taxes, state and federal reporting, store management, bill paying, invoicing, money handling, preparing for audit, relations with vendors, petty cash, and keeping track of fundraising. Also photography, report editing, and tasks for special events.

Payroll. Shawmut Automated Payroll Service -- Contact is Thomas Chatelier, 292-2197. In Payroll File see sample forms for: New Employee Setup for both salaried and hourly employees; Employee Revision Form for any change e.g. salary change, tax status; Employee Prelist (comes from Bank each payday, to be filled in with hourly employees' hours listed. Time cards are collected every 2 weeks. Employee Prelist Total is stapled to Prelist and must be into Bank by 2 p.m. on Monday following the end of pay period. Pay period is Sunday through Friday, biweekly. Checks are processed on Tuesday and can be picked up at the bank on Wednesday a.m. Bus. Mgr. has key to the bank pouch. (More bank forms can be obtained from the bank when needed.)

All employees must fill out a W4 Form for Federal withholding tax and a M4 Form for State withholding tax. These forms may be obtained from the IRS Center in Holyoke.

Other forms: Employee Reference Card from bank will verify pay status of a new employee or that revisions have been made to the pay status of an existing employee.

Insurance. Two areas--Museum Insurance and Health Insurance.

Museum Insurance includes: 3 polices with Johnson & Higgins, 3 Center Plaza, Boston -- Joan Goldberg 742-5300

Director's and Officers' Liability

Underwritten by Chubb; includes areas of Embezzlement, Limits on Personal Liability, and others.

Blanket Excess Liability Policy

Underwritten by Fireman's Fund: includes areas of Bodily Injury, Automobile Liability, Workman's Compensation, and others.

Commercial Insurance Program (biggest area)

Underwritten by Federal Insurance Co. (Chubb): includes areas of Property and Building Losses, Bodily Injury (visitors, accidents), Employee Dishonesty, Personal Property.

Health Insurance Group # (or Employer #) is 26232. Plan Administrator is MSP (Multiple Security Program); Claim Office is John Hancock Mutual Life Insurance Co, St. Louis Group Claim Office, 13523 Barrett Parkway Drive, Building #2, Suite 250, Ballwin, MO 630ll, Telephone # 314/821/3002.

Health Insurance or more correctly called Small Group

Insurance Plan includes: accident, hospital, dental, mental, surgical, $10,000 Term Life, long term disability, $10,000 accidental death and dismemberment.

Claim forms include: Statement of Claim (to Dr. or hospital)
Dental Claim Form
Group Hospital Insurance Form (to hospital)
plus Claims Filing Instructions.

Contact at MSP (Plan Administrator) is Vivien A. Benning, Contracts Service Coordinator at MSP Insurance Trust, P.O. Box 786, Boston, MA 02117, Tel. No. 421-5000.

To enroll new employee in plan two forms must be filled out and mailed to Vivien Benning: John Hancock/ MSP Group Insurance Enrollment Card and John Hancock/MSP Statement of Health.

Bank Accounts. The Business Manager maintains 3 accounts, writing checks, keeping registers , and reconciling bank statements for each.

All are at the Shawmut Community Bank, Marlboro West Branch; Manager, Susan Smith 485-6697.

l. A deposit account for VISA and Mastercharge sales. Account #294-4146.

2. A membership account (checking) formally called Non-DEC Contributions;
an interest bearing account; the general operting fund (the largest acct.)
Account # 275-959-4

3. Store and Events (checking) account; deposits from store, play, etc.
Account # 275-960-8. Out of this account comes money for store inventory, food for special events, expenses for any money-making event.

For Investment Information the contact is Gail Chadwick at the Framingham Office, 620-1100 X362--info on IRAs, CDs, etc.

Bookkeeping and Accounting. For each of four areas of museum there are income and expense records in file folders.

Budget. On Floppy kept in Gwen's Executive Committee Notebook, in pocket in back. Monthly Budget Report shows Projected, Year to Date, For Current Month, Total, Deviation. Income and Expenditures for all 4 areas.

Fiscal Year runs July 1 through June 30.

Taxes. Federal ID # is 042-747-017 (also called Employer ID # and Tax ID #.)

The most important filing is Tax Exempt Filings for Federal Form 990 and Schedule A; and for State Form PC. These are filed after close of Fiscal Year and a period of 5 months is allowed for filing. (The due date for the Museum would be November 15.)

Quarterly Sales Tax Form ST9Q (State form)

Withholding Taxes: Federal Form 941E--Quarterly Return of Withheld Federal Income Tax. (Museum has not yet filed with State in regard to withholding income taxes.)

We are in an Advanced Ruling Period with the IRS until June 1984. The IRS

will give permanent tax exempt status to the Museum at that time if in the
probationary period it maintains a 2-l ratio (For every $2 that is contributed by corporations, there is $1 from the public).

Store--info from Carole.

Bill Paying. Invoices come in and are 1. grouped by when they are to be paid, 2. o.k.'d by person initiating the expense securing as much info about it as possible, and 3. paid out of correct account.

Invoicing. Use invoice form. Mostly for dinners done for groups. Copy goes in Receivables folder. When paid goes in account folders.

Petty Cash. Taken out of membership account when needed. See Petty Cash file folder. Usually an expense voucher is filled out and must be ok'd.

Audit. Coopers and Lybrand do the auditing (gratis) after the FY is over. The Business Manager supplies the raw data from the income and expense files. Contacts at C&L are Scott Eston and Ed Gillis, 1 Post Office Square, Boston (574-5000). All information should be given to C&L in September so that tax forms will be ready by the November deadline for filing.

Relations with Vendors. The policy of the Museum is to pay bills promptly when due. They may be potential members of the museum or possible contributors of money or goods for special events.

Keep track of fundraising. Important to watch the income and to go slow on outgo, keep expenses down, and process deposits quickly when income is less.

The Business Manager is for the present the official photographer for the museum. Equipment is kept in the Twilight Zone and in the file cabinet in the Bus. Mgr.'s office. Equipment includes:

Cameras Nikon F body Serial #6972015
Nikon F Viewfinder Serial #497271

Lenses Nikkor-UD Auto 1:3.5 f=20mm Serial #434267
Micro-Nikkor-P Auto 1:3.5 f=55mm Ser #648625
Nikkor-P Auto 1:2.5 f=105mm Serial # 428755
Nikkor-Q Auto 1:4 f=20cm Serial # 198738

Accessories Nikon M2 (extender?)
Nikon HS-4 lens shde for 105mm
Nikon K1, K2, K3, K4, K5 (filter holders)
Aetna Close Up Lens #1 52mm
Aetna Close Up Lens #2 52mm
Nikon hot shoe

Davis and Sanford Model B Floating Action tripod
Panrite Universal tripod head
Mole-Richardson light stand
Larson Soff - Box flash diffuser
Larson Reflectasol Clamp

Studio FlashNorman 800 Flash Power Supply & Power Cords

(3) Norman Lh 2000 Flash heads
Norman aluminum light stand
Background stands
PC Synch cord

Good contact for photo advice is Steve Spellman, Brownstone Group, Brookline. He is a professional photographer and also a Founder member of the Museum.

The Bus. Mgr. has done some report editing and performed tasks for special events (such as stage mgr. for play).

Floppies are stored in "Software" file folder and are as follows:

Budget Monthly budgets.

TWIT Archives expense voucher, purchase order forms, invoice forms, list processing, etc.

DHB 001 Notes to financial reports (taxes), other tax information, receipt form, information about Report.

File Folders contain procedures for payroll, preparing taxes according to printed instructions, accounting system. There are no printed instructions for most procedures but easily learned by a newcomer.

Legal Advice: Jim Davis at Bingham, Dana, and Gould, 100 Federal Street, Boston, specializing in legal affairs for non-profit organizations. (Expensive) Clerk of our Board of Directors.

Sends copies of any legal or tax filings to
Davis for locating potential problems.

Darman Wing, DEC Legal Department, Secretary to Executive Committee; also gives general advice

Legal information is filed in bottom drawer of file cabinet.

From DHB: Procedures for Processing Museum Store Sales, Procedure for Handling Money Given to Museum, Museum Store Purchasing of Inventory & Supplies, Procedure for Handling Money Given to Museum, Procedure for Handling Accounting for Functions. MB will go over these procedures when time permits.

Dear Donald:

I would be pleased to give the "Silver Jubilee Lecture, 1984" to The British Computer Society and its guests on Wednesday 14 March, 1984. (I am unavailable on 28 February.)

Please let me know when you need the title, abstract, and biographical information. I would like to use the talk as the draft for a written paper, and trust this is acceptable.

I look forward to giving the talk.

Sincerely yours,

MEMORANDUM

SUBJECT: Digital's competitive position vis-a-vis our market segment.

TO: Gordon Bell, Vice President, Engineering

COPY TO: Ted Johnson, Vice President, Marketing: ML10-1/A55
Bill Avery, Engineering Manager, Terminals and Work Stations:

ML12-2/E71
Dick Loveland, Program Manager, DECmate: ML1-2/T29

FROM: Gerald Davis, TEAG

I came to Maynard as a user-requirements consultant. I have been advising a client who now uses DEC systems, but was considering turning away from DEC, and starting to buy small and portable systems from some other supplier. I wanted to know if DEC's product development (including products not yet announced) would be adequate to meet this client's needs.

Jointly with our clients, we have recently assessed the leading computer manufacturers vis-a-vis both their present product lines and their likely directions for product development to about a 5-year horizon. We rated suppliers against three main factors:

A. For work done on mid-range and larger systems. Digital was seen as the prefered vendor.

B. Suitability for use by professionals and managers, etc. Digital was seen as the preferred vendor, but because of its stalled product development, the competition is catching up to DEC, and sometimes passing it.

C. For work requiring small systems at a wide range of locations. We doubted whether Digital would be an effective competitor, since it was falling behind in hardware, software and price, and had no portable unit in sight. We therefore were considering going to a second vendor for systems for this application.

Following my meetings at Digital today, I feel that I have enough information to be able to rate Digital as best against all three factors; subject, however, to;
- the emergence within the next six to nine months of the product development and up/down compatibility in word- and small-systems that was discussed today; and,
- availability of units discussed today, that are small and rugged enough to be portable or easily transportable.

Our ratings are summarized on the attached pages.

Gerald Davis

SUMMARY OF OUR RATINGS OF DIGITAL AGAINST THESE THREE FACTORS.

A. FOR WORK DONE ON MID-RANGE AND LARGER SYSTEMS.

Digital was seen as the prefered vendor.

- Compatibility with existing key users in our field, and with relevant data bases. Digital is seen as the leader. For instance, PDP-11's are used at most of the universities where research in building science is conducted.
- Computer professionals and scientists are familiar with the operating systems and software requirements. Digital was preferred.
- Hardware and basic operating systems are effective, reliable and sufficiently mature. RSX-11M is widely known, and is used at key sites. RSTS-E is less common in our environments and VAX-VMS is relatively new. These systems are seen as reliable and programmer-friendly. Hardware reliability is seen as competitive, and field service in the Ottawa area has improved markedly.

B. SUITABILITY FOR USE BY PROFESSIONALS AND MANAGERS, ETC.

Digital was seen as the preferred vendor, but because of its stalled product development, the competition is catching up to DEC, and sometimes passing it.

- Operating systems are user-friendly, and suitable for professionals and middle-managers. We considered the basic approach of DECword, its use of menus, user protection, and other features, to be the best in the field for this type of product.
- Operating systems are convenient for the occasional user with no prior computer experience, and no knowledge of programming. We considered DEC's systems to be excellent, but sometimes "muscle-bound", and requiring much more work and many more menus than the competition to perform some frequently required functions, such as: sort a list of records each of which is only one line long; or, edit in one or another of two columns of text which must be side-by-side, and so on.

C. FOR WORK REQUIRING SMALL SYSTEMS AT A WIDE RANGE OF LOCATIONS.

We doubted whether Digital would be an effective competitor, since it was falling behind in hardware, software and price, and had no portable unit in sight.

- Compatibility between small systems and the family of mid-range and large systems. Digital is seen as poor, but not worse than IBM. Media (diskettes and disk-paks) cannot be hand-carried between DEC's small systems and DEC's PDP-11's. Until recently, documents/files could only be communicated to DEC's mid-range and larger systems with CX, i.e. formatting codes were stripped out; DEC recently corrected this with the release of a DX software product for PDP-11's.
- Commitment to small-product development. The PDP-8 has been declared a "mature" product. We are told that the WS-200 is a dead-end product, with no further software development planned. Software development for the WS-78 family had been stalled for several years. We questioned whether DEC had sufficient commitment to office systems.
- Cost-effectiveness. DEC's small-system products were seen as cost-effective for only a few specialized situations. New suppliers, such as Toshiba, are entering the market with cut prices and products that look to the buyer very much like market leaders.
- Portability. It had appeared to us that Digital was not in this market. After our meetings today, I infer that within nine months Digital is likely to have first production of a small system that is "transportable", and that Digital may have a product that is portable, i.e. that will fit under an airplane seat, and is not too heavy.

January 25, 1982

Gerald Davis
TEAG
P.O. Box 1088, Station "B"
Ottowa, Ontario

Dear Gerald:

Gwen and I enjoyed the visit and dinner with you and Francoise. Thanks again.

The report and discussion with our product designers was enormously helpful.

I'm sorry that you couldn't use our next system, but ask that Dick Loveland test it with you.

As usual, please feel free to comment on our products to me or directly to our development people.

Again, thanks for dinner and the comments.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

February 15, 1980

Mrs. Gwen K. Bell
Page Farm Road
Lincoln, MA 01773

Dear Gwen:

It is my pleasure to appoint you Assistant Keeper of the Digital Equipment Corporation's Digital Computer Museum at the Tower Building at One Iron Way, Marlboro, Massachusetts. We look for you to set up and manage all phases of this exciting project that will trace the evolution of computing.

As such, you will design and lay out the exhibits and displays, schedule lectures, handle museum publications and, in general, do everything that is required to establish an interesting and representative display of computing history.

Digital's resources are available to assist you in your ambitious schedule, to open the museum at Digital's Board meeting, September 22, 1980. The resources include our purchasing functions so as to be able to obtain equipment and supplies.

More specifically, the original term of this appointment is the calendar year 1980 and, while such appointment neither designates you as an agent or an employee of Digital Equipment Corporation, you are to be granted the honorarium of one dollar ($1.00) per year. Of course, you shall be reimbursed all of your expenses in this activity in accordance with our existing policies.

Let me extend my personal appreciation for this most gracious contribution of your time to this undertaking of such importance to Digital. Please feel free to call upon me if I can be of help.

Very truly yours,

Shel Davis
Vice President, Personnel

Am glad we've decided to continue this and find out by finally building and evaluating DAWN.

I understand it's being funded by Lou Klotz group and that we are considering moving it to him.

Given that Lou is new to SW management, has a number of people to hire, and is not in the systems programing development business, I'd like to insist that it be managed either within CRG or SWE. It could go to Ollie Stone or Bob Daley. Can we please make this happen?

Subject: **What's the Conflict Between DCG and T/SS Engineering? We want to help now!**

To: Dick Clayton, ML12-2/E71
Bruce Delagi, MR2-1/M64

CC: John Meyer, ML12-1/A11
Stan Olsen, MK1-2/C36
Bob Puffer, ML12-2/E38

Date: 1/28/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

<u>Stan and I have agreed to meet with you in two weeks</u> in order to get an understanding of the above problem. Hopefully by the time we get together the problem can be well formulated so that we can begin to resolve it. From all that I can see and hear, there is a real problem here and we must act quickly to resolve it.

Some of the symptoms:

- Engineers leaving the T/SS group (and Company) count this as a reason
- There is no joint planning or communications among what is apparently the same charter space
- Central engineers who develop products aren't coupled into market requirements, sales meetings, given credit, etc.
- Pressure on LSI group is so high to do products that can't be done (i.e. Tiny, that we do no product rather than a 2 chip

processor)
- A duplicative product, the TOBY, is posited rather than build on a DCG product
- Requirements for DCG products for 11 compatibility aren't the same as those developed within T/SS, creating heat
- Architectural planning, advanced development, control is unclear
- Development priorities are yanked around even within T/SS in response to latest market ideas (e.g., low cost portable terminal)
- Unclear responsibility of product support for DCG/T/SS-designed products (eg BSR)
- Long time to market for DCG-designed PDT's due to unclear Product Manager drive alignment with DCG
- Multiplicative products for End user, TOEM and DCG (hopefully solved now)

There are probably more symptoms, but I doubt if this is the best way to attack the problem definition. In fact, I don't know how to approach it...all that is clear is that we must focus on defining and solving this quick. Let's not lose or waste engineering resources in this fashion.

Stan and I are committed to help. Please get us going. What can we do?

Digital **Interoffice Memo**

Subject: DCG Engineering Plan Discussion

To: Andy Knowles
Roy Moffa

Date: 9 DEC 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

CC: Ed Corell, Dick Clayton
Henry Lemaire, Bob Peyton
Larry Portner, Bob Puffer
Steve Teicher

Thanks for updating me today on your direction. I look forward to a full meeting with the group who receives this memo to work out some issues.

I believe you are building a strong engineering function within DCG and will generate products which are necessary to your markeplace and to the other product lines. It feels like you are under control (since you're adding people before you take on work) and are providing products more cheaply than we are, hence, I believe incremental growth should be within your area. We must support you in this effort. I believe your charter should be extended to include both products that we are not aggressively pursuing or are critical products which could benefit by a competitive, alternative approach.

The issues we discussed:

1. T-11 - how do we drive to get it? Who builds it?

2. Low cost logic peripherals for LSI-11 must get addressed.

3. Interim LA120 versus LA120 to get LA00 quicker. Seems like a reasonable idea.

4. Low cost peripherals aren't being done in central engineering.

5. VT78 board might be used vs 8080 based RX36, especially in lieu of our commitment to field support an 8080 programming system.

Other issues that should be dealt with:

6. Could DCG be 8080 systems manager?

7. How can we help beef up programming in DCG?

Long Form of the Issues

The five areas we discussed should be discussed with the larger OOD group on an open, hassle-free basis.

1. T-11. While Steve is driving to get a proposed design from Bill Roberts, I worry about its timeliness - hence we have to be open about getting the detailed design and fabrication outside. A T-11 with 8080 bus within the next 18 months would be a red-hot product...too much longer might be non-viable. Roy is the driver of this now in terms of strategy. I don't see that much design activity here.

2. Low cost peripherals for LSI-11 based on industry chips would wreck 11 program compatability. I have no hangup on rewriting handlers for RSX and RT as long as the hardware development project pays for it. A customer is clearly going to win with this approach. Roy should drive to get a low cost system, and then get the handlers rewritten on a prototype basis. We must investigate costs via a prototype before getting uptight or rejecting the idea. Now, it seems, our hardware's too costly.

3. LA120 versus LA00 - My gut feel is that we should finish the LA120 prototype and then get an ECO phase-in program to get functions (volatility and electronics enhancements, 11 wire matrix, plotting) and cost reduction (1 board, LSI, knock down) on the existing LA180. This would generate 3 functional models (basic, high quality, plus plotting). Our effort should go to a low cost unit...and possibly Bickoff should investigate an alternative, up to prototype stage.

4. Low cost peripherals - The paper tape deal, 3M cassettes, TU60 repackage, other low cost media are all possibilities. If the group doing paper tape and their design could be acquired, it would be worthwhile increasing our electromechanical design capability. Also I support a design for a hand-held console based on calculator technology. This, if cheap enough, would feedback into our peripheral and cpu as a common

console/control panel.

5. VT78 board versus RX36 - This would get us to a DEC supported cpu product versus building an 8080 system which would be field supported. If we ship the 8080 and provide 8080 systems software (loader, ODT, device handlers, associated diagnostics) it should be a corporate decision. Right now I would oppose an 8080 product that is not entirely ROM based! (Andy points out: he and I have totally switched positions on the 8080 this last year!) I would like to move to CMOS-8, as the Corp. microprocessor if it's available!

There are two other issues which should also be addressed:

6. 8080 support/standards - I've gotten nowhere in getting Lorrin to lead this. It includes all aspects of programming convention and support, physical and logical architecture, testor design, etc. Since DCG is the 8080's biggest user, this would be a natural home for 8080 systems architecture and standards. We're doing many 8080 based products and there's costly anarchy that will hurt in reliability, support, etc.

7. Getting a strong applications programming staff for DCG - The amount of programming will increase rapidly over the next few years, and we have to help provide this. (Larry, could you please talk with Roy and Andy?)

We all have too many commitments to products to get involved in hassle. I want us to come away from a meeting with fairly clear charters.

SUBJECT: CFM: COST. PERF., PERT., PPA, TITAN

GB4.S1.29

Cycles for the Masses is beginning to look up. The following table indicates we have some very interesting possibilities for competitive machines everywhere. Note the following table.

	Time	Price($M)	Perf.	mflops	flops/$	# Users
Microvax W/S	85	0.01	0.9	0.45	45.0	1.0
Scorpio	85	.04	0.9	.45	11.0	5-500
780	78	0.4	1.0	0.5	1.25	5-500
790	6/84	0.5	5.0	2.5	5.0	5-500
Nautilus	4/85	0.25/.4	4./8	2/4	8/10	5-500
dual proc.		0.4	8.0			
PPA ?	6/85	0.25	40.0	20.0	80.0	5-500
Titan	12/83(prato)	0.1	10.0	5.0	50.0	1- ?
KL	74	0.75	1.33	0.66	0.9	10-500
Jupiter	+30 mos	0.75	6.0	3.0	4.0	10-500
Cray 1	76	10.0	40-100	20-200	2-10	50-1000
with vectors						
Cray 2/XMP	85	10.0	120-300	60-600	6-30	
with vectors						

Notice there are several ways to get a performance:

1. Supercomputers (eg. Cray) operated in batch mode. At LLNL, a large user gets a maximum of 1 hr/day. Therefore, if one of our systems can deliver only 1/8 to 1/24 the performance, the price performance is likely to be better with a Supermini depending on the problem. In a real environment, most users would

rather have
something else.

2. Supermini, operated as a personal or with a small number of users.

3. The new, powerful microprocessor based Personal Computer with
750-780 performance. This gives a user the most power.

4. The shared, supermicro such as Scorpio - These computers have the
best cost/user, but will the added sharing be worth it.

5. Specialized facilities such as PPA, FPS, XYCAD for high
performance batch. Quite interesting.

Performance/price depends on the fraction of a system that can be dedicated to a user. With MicroVAX PC - the price may be in the don't care range 10K-20K (or 10% of a professional's salary) but the performance is at 780 level. Therefore, work will migrate both from supers and superminis.

We have some incredible opportunities. It would seem desireable that we consider Titan and PPA as purely computational processors, although Titan would eventually be a PC when it has software. They would be

operated as servers running say Fortran, to off-load a KL on VAXen
a CI.

This VLSI generation is going to generate many more kinds of computers
than ever. Supers, mainframes, and superminis are all going to feel
the impact.

June 14, 1983

Prof. J. F. Traub
Computer Science Department
Computer Science Building
Columbia University
New York, New York 10027

Dear Joe:

Would prefer to speak on Monday, and will probably come down for the weekend. Since I'd like to interact with your folks designing machines, I hope there'll be time.

I just spent 3 weeks at Stanford, and am reforming opinions about building machines for AI and other special purposes at universities. In particular, given the current state of understanding of AI programs, it's a significant waste of resources to be designing a computer for AI. These machines will require a large effort to build (i.e. probably an order of magnitude greater than C.mmp or Cm*), and I don't see the experimental and analytical underpinnings, experience and reasons to proceed especially since there is such a limited supply of talent. It also became clear to me that Carnegie is 10 years ahead in understanding parallelism because it had built and used those machines.

Am looking forward to a lively conference, and chance to formulate and expose some ideas. Regards to Pam.

Sincerely yours,

Gordon Bell
Vice President,
Engineering
10/15/83 Sat

Dear Fellow Friends of JVA:

Please let us join you in honoring this great computing pioneer on his 80th birthday.

His ideas we take for granted about using binary arithmetic, storing information by regeneration which he called jogging and is the basis of today's random access semiconductor memory, processing information serially and fast division are almost 50 years old, and have been right.

From the moment we heard about the ABC at the Computer Museum in November 1980, we believed that others should know the story too. Over the last few years John and Alice have worked at writing about the invention of the first electronic digital calculator and we look forward to finally seeing it in print. We also applaud the movie as another way to tell the story.

We regret not being present on this occasion, but look forward to viewing and preserving the movie.

Sincerely,

Gordon Bell

Mr. Jack Worlton
Los Alamos National Laboratory
International Technology Division
P.O. Box 503
Los Alamos, New Mexico 87544

Dear Jack:

Thanks for the invitation to the conference, and I regret that I can't attend because I'm recovering from a by-pass operation, and am trying to limit my commitments, especially those requiring travel. I would have liked to hear about the Cray, Dennelcor and CDC machines. Bill Strecker's attending from Digital, so I feel we're represented.

If it's not too late, let me urge you to reconsider the speakers from academia and invite someone who has produced results. None of the speakers, besides Kuck have ever built anything. The folks at Carnegie and Manchester are about 10 years ahead of their colleagues in understanding parallelism and how to build systems. The attendees should understand that parallelism does exist and can be exploited to varying degrees using dataFlow and multiprocessors.

Sincerely yours,

Gordon Bell
Vice President,

Engineering

GB:
When I was at Carnegie, I looked at the jobs. The dean's jobs were the hardest. Turf everywhere to fight for and protect, with finite budgets, more programs than money, and everyone with ideas to spend more money, and no action on programs you consider vital by an obsolescing or otherwise inert faculty.

Several of us were called in to a university a couple of years ago to sort out CS... where did it belong? It grew up as programming in the math department which was part of the school of science, the EE's did their thing, and the provost asked for a blue ribbon committee. Several of us, all engineers who do a lot of computing, unanimously recommended that it be part of Engineering. At last look, a new school was established for computing. I thought how dumb... but maybe something good will come out of it. It agrees with my model about the importance of computing. Maybe you'll try it. I'll argue this later, but not very hard.

I remember Herb Toor aging about 10 years in 2 years, as CMU's dean, followed by a heart attack. In february, my heart stopped for awhile, and shortly thereafter had a bypass operation.

I can relate to this, I have many groups that do various kinds of engineering that result in either products, components or processes to make components. In a sense, it's a lot like being a dean.

Why am I here?
The usual rationale. My stacks of books to read on engineering education has grown to where I couldn't see over them. If I have to give a talk, I'll learn the subject matter... just like the reason to teach a course... why else would one ever teach a course except to learn it?

Also, I wanted to take my mind off my problems, and turn them to yours for diversion. As you can see, as a typical engineer, I'm a problem formulator, and occasionally a solver.

What do I see as the issues in engineering education today, and do I have anything useful to add?

As an activist, I feel I must make some comments NOW that I have you that I hope are relevant. Not that I can speak to everything that's relevant. The issues can come from a single problem statement:

HOW TO SUPPLY THE DEMAND FOR QUALTIY, HIGHLY TRAINED ENGINEERS, IN THE FACE OF TECHNOLOGY CHANGE BOTH HERE AND FROM ABROAD (JAPAN) NOW.

THE USUAL WORRY IS WHETHER THE DEMAND IS REAL AND SUSTAINED WITHIN THE TIME SCALE OF UNIVERSITY DECISION MAKING,

THIS REQUIRES MORE TEACHERS: THE BUDGETS ARE FIXED AND THE LOADS GO UP MAKING ACADEME LESS ATTRACTIVE

QUALITY HAS TO GO WITH LARGER COURSES.

TECHNOLOGY IS CHANGING, BUT HOW DO YOU MOVE THE PROFESSORS?

TECHNOLOGY IS CHANGING, BUT HOW DO YOU TRAIN THE AGING ENGINEERS?

THIS REQUIRES $ AND COMPUTING (MY INTEREST) FOR BOTH TEACHING AND RESEARCH!

I HAPPEN TO BELIEVE THAT COMPUTING IS DRIVING A SUBSTANTIAL AMOUNT OF THIS CHANGE, AND I DON'T SEE THE BROAD CHANGE THAT'S REQUIRED ACROSS ENGINEERING. THIS MEANS THAT MORE EXPOSURE TO COMPUTING IS NEEDED!

FINALLY, THE JAPANESE ARE BEATING US IN THE WORLD MARKETS, INCLUDING COMPUTING.

NOW, TO TOP IT OFF, THEY'VE ANNOUNCED THE 5TH GENERATION OF COMPUTING IN WHICH THEY OPENLY CLAIM THAT THEY'LL OWN COMPUTING BY 1990!

THERE YOU HAVE IT: ENGINEERING DEMAND UP, TEACHER DEMAND, FALLING QUALITY, CHANGES IN KNOWLEDGE IN THE FIELD CAUSING AN OBSOLESCENCE BOTH IN THE FACULTY AND IN INDUSTRY, LACK OF RESOURCES... ESPECIALLY SINCE COMPUTING IS AT THE HEART OF THE CHANGES, JAPANESE COMPETITION, AND THE FUTURE! NEARLY ALL THE PROBLEMS YOU... LET'S SAY WE FACE!

HOW TO SUPPLY THE DEMAND FOR QUALTIY, HIGHLY TRAINED ENGINEERS, IN THE FACE OF TECHNOLOGY CHANGE BOTH HERE AND FROM ABROAD (JAPAN) NOW.
The report, by the NAE in 1981 Academe/Industry/Government Interaction in Eng. Educ exlored the overall issue. George Lowe's opening address was especially insightful.

concern- reward teaching. I've asked several of our groups, and they say you're doing a good job! Let me congratulate you.

Since I'm more remote, I have some concerns: I asked where's the best school? San Luis Obispo. Why? They don't do research, they teach! Their teachers do and teach engineering.

I think the supply is diminished by driving them out with publishing requirements that may be difficult to meet in experimental fields.

I've seen this in virtually every school, especially those who work in building systems, as a sure road to non-tenure. Illinois vs CMU; Northeastern, U Mass drove one of our best engineering managers to us by a non-tenure decision. The students stopped building and we don't get as many students from there anymore. In other cases, they're driven out into high paying jobs and start ups where they become millionaires.

THE USUAL WORRY IS WHETHER THE DEMAND IS REAL AND SUSTAINED WITHIN THE TIME SCALE OF UNIVERSITY DECISION MAKING, Computing has been on an uncontrolled growth since its beginning, and many faculties simply cannot accept the fact that information processing is as fundamental as mathematics, or mechanisms. It took 15 years ater the computer and profession was established, BEFORE a department of Computer Science could be formed in the first university. I know if the computer to were to vanish tomorrow, it would be at least 15 years to get rid of it.

We're also losing them to MBA school, which I regard as a waste of time. You could give a short course and give honorary MBA's. There's even a book.

THIS REQUIRES MORE TEACHERS: THE BUDGETS ARE FIXED AND THE LOADS GO UP MAKING ACADEME LESS ATTRACTIVE
believe that people in industry could help (I'm on the academic board of the Wang Institute of Graduate Education... requirements teach very well, be a great engineer, can do research and knows several particualar fields, yet can teach all the courses. It turned out that the quiz they gave every applicant was a graduate seminar... and they all flunked! no wonder. Unless you've spent enough time, you can't speak the language. Having gone from industry to academe, I had to learn, but people were willing to gamble. Probably couldn't make it into CMU today.

It's important to figure out how to communicate with industry. Dean Louis Padulo of BU suggested a Dean of the Month program, where we communicate between our engineers, the dean, and various department heads. We have a similar program with researchers, where we describe our problems.

QUALITY HAS TO GO WITH LARGER COURSES.
I don't understand why much of the increased load can't be handled by TVI?

I think maybe the pendulum has swung too far to specialization, especially in EE where Computing can occupy a large fraction of a person's curriculum. 10 years ago I was on a series of Computers in COSINE... computers in ee. to get some changes to the curriculum and the courses. about 6 courses.

Now, I think we have to go back into some fundamentals where discrete and continuous mathementics are taught. I noted that YOU folks are taking these courses right here at these conferences.. Digital signal processing, or how to get those functions into a form the computer likes.

TECHNOLOGY IS CHANGING, BUT HOW DO YOU MOVE THE PROFESSORS?
MIT's Centennial Celebration focussed on Continuing Education. They have an excellent report. I urge you to NOT have another task force, report, etc. and simply adopt

theirs. My fear is that nothing will happen, the report took so much work.

Who can blame them? The faculty already is overworked: they can't spend all the money that's been foist on them by ARPA and IBM, the loads are high, and they haven't any time for any more teaching.
consulting, co-operative courses,

TECHNOLOGY IS CHANGING, BUT HOW DO YOU TRAIN THE AGING ENGINEERS?
we badly need continguing education programs
we have to have your help
This is an excellent way to start and improve the necessary relation that must exist between university and academia.

THIS REQUIRES $ (AND COMPUTERS) FOR BOTH TEACHING AND RESEARCH!

COMPUTERS IN TEACHING
lots of reports, and occasionallys some money. I think you'll find that this problem will go away shortly. The $25 slide rule that engineering students used to buy would now cost $150, or about the price of what is becoming a useful computer.

COMPUTERS IN RESEARCH
Let me recommend the recent report by the NSF, U-I Research Relationships: Myths, Realities and Potentials

Here, we have quite a lot of positive experience, and the recent posture of various funding agencies is hopeful, by virtually demanding that we work together. It isn't easy because of the conflicts about owning knowledge, and deadlines that we insist on.

One of the healthiest relationships has been between DEC and CMU to build experimental machines. The only problem in retrospect, is that we should have done more to make it work. Starting in 1970 CMU built about 3 parallel machines.   As a result CMU knows more about parallelism than any other university. I'm sadened by the proposals I read to do research in this area that will yield results that were known 10 years ago.

Several of us with Jerome Feldman put together a successful plea to get computers for CS research. Even more successful than the grant was the idea that companies would get extra benefit for computing equipment. This became a law, and equipment's starting to flow.

Focussed Research Institutes are GREAT: Robotics, Semiconductors at CIT, then Berkely and Stanford, Magnetics at San Diego and possibly CMU, Some fundamentals in optics, ceramic material... we ain't making it folks.

Then there's manufacturing engineerng.

I HAPPEN TO BELIEVE THAT COMPUTING IS DRIVING A SUBSTANTIAL AMOUNT OF THIS CHANGE, AND I DON'T SEE THE BROAD CHANGE THAT'S REQUIRED ACROSS ENGINEERING. THIS MEANS THAT MORE EXPOSURE TO COMPUTING IS NEEDED!

GIVE THE PAGE OF STATISTICS OF COURSES AT THIS CONFERENCE

cs should be difused 4 years ago I wrote an appeal to the CS&ERB to revamp the thinking about computing so that the other disciplines start doing their share. The problem is that computing people won't let them.

Computers are things to be taught not to fear and to be ordered around view (MBA school... where you know enough to order up some programmers, tools (analyzers, displays, drawers), simulators, and
then they become components of the systems you build.

I'd like to see ALL of this, but I'm greedy, I want more. I'd like to see engineering faculties become entrepreneurs by encoding their knowledge in programs. It already happens; in vlsi Stanford and Berkely have been doing in for years. Cogo and Stress were done years ago. NYIT builds some of the world's best graphics systems, which by the way it sells extensively. It is the only university I know that's also an OEM. After all, what's wrong with packaging this knowledge in a program and getting a royalty? Professors have been doing that for years.

Now there's more work to be done in the form of expert systems.

What are they, what are some examples: interpretation, prediction, diagnosis, design, planning, monitoring debugging, repair, instruction, control.

Let me talk about the system, XCON... XSEL...

Here, I may be reminded of the doctor, lawyer and engineer that were to be guillotined. The first two were spared because they rope ws binding. The engineer just had to redesign it so that it worked.

FINALLY, THE JAPANESE ARE BEATING US IN THE WORLD MARKETS, INCLUDING COMPUTING.

5 years ago was my first visit, last summer my second. I consider them to be the world's greatest engineers.
The threat's described in Feigenbaum's book: The 5th Generation

The issue is the building of computers that can behave as experts, say like engineers or engineering professors, or engineering managers. I've already started one to be me.

The expert system is built by a combination of knowledge engineer and and expert. The design problems enclude knowledge reprsentation, and then getting sufficient knowledge to be able to solve problems.

NOW, TO TOP IT OFF, THEY'VE ANNOUNCED THE 5TH GENERATION OF COMPUTING IN WHICH THEY OPENLY CLAIM THAT THEY'LL OWN COMPUTING BY 1990!
knowledge information processing systems
knowledge engineering

To me this means certainly everyone has thereown machine like I described. This is being done right here at RIT, Clarkson's doing it, and CMU has an institute dedicated to it. Other institutions are moving forward including Standford and MIT that I know of.

Every student will have one. YOU HAVE NO CHOICE, THEY'LL BRING THEM IN WITHIN A FEW YEARS.

It can comunicate with all the others in a community. YOU HAVE A PROBLEM: CAMPUSES MUST BE REWIRED TO SUPPORT THIS. Like our engineering net. We have over 1K computers in the net.

The machines are doing more than communication, but are teaching, allowing people to design by positing, analyzing, simulating.

Expert systems should play a major role in this future by allowing knowledge to be encoded and used, versus being static like in books.
April 23, 1984

Mr. John Opel
Chief Executive Officer
International Business Machines
Armonk, New York

Dear Mr. Opel:

I am writing to you because Fred Brooks said you were an intelligent man. I am asking you and IBM to support The Computer Museum.

IBM did not ask The Computer Museum to be born, but it is alive and number one, especially in its collection. Now we need IBM's support so it can reach its full potential. Having reached a critical mass with a strong, attainable vision of what is a unique, technological museum, we (myself, the staff, the board and members) are now even more determined to succeed. This means it will be the mecca for all professionals in information processing with a wide variety of activities ranging from supporting other museums (including The Smithsonian) to being visited by a large audience.

Let me attempt to summarize in one place, why The Computer Museum needs IBM's support and why it is in IBM's interest to give support.

IBM's cooperation is needed to efficiently preserve, interpret and exhibit the entire story of information processing. For example, there are more IBM artifacts in the collection than any other manufacturer. IBM has preservation activities, yet we also will have to collect and display in overlapping areas in order to portray a complete picture. Worse yet, I am concerned that our historical quality may suffer when we are forced to take a "black body" view of IBM, rather than to interact and determine the best presentation of a subject.

The October opening includes a number of IBM computers: SAGE, a 1401 insurance office recreation, a few PC's, and many events on the 1950-1973 timeline, starting where the original Eames Wall stopped. In January 1985, the exhibit on the Computer and The Image, other artifacts will be required from IBM. We need a few artifacts, some background material and a few photographs. But mostly we need an interface with IBM.

While the Museum was founded under Digital Equipment Corporation's support using a Digital building, it has been a non-profit organization for two years and is now located in Boston (with The Children's Museum, near the site of the new Boscom Computer Mart). While Digital continues to give even greater financial support, it is essential to have wide international and corporate support. The risk phase sponsored by Digital is over. By supporting the Museum now, IBM can lead and get significant recognition.

Given IBM's reputation and image of supporting culture, such as ballet, the Olympics and a television show on Leonardo, the Museum should be at the top of the list in terms of cultural support. What is more significant culturally than the history of information processing? (The amount requested recently was probably less than it took to make the recent temporary exhibit on computing at 590 Madison Avenue.)

IBM people have made suggestions and expressed concerns about our interface with The Smithsonian to which we have responded.

- One of Roger Kennedy's associate directors for technology is being nominated as a board member.
- We remain dedicated to supporting the Smithsonian both now and in the future in every possible way, including sharing of artifacts and exhibits, and even ultimate acquisition of The Computer Museum if this is best. Our activities may have stimulated the Smithsonian to begin thinking about a new computer exhibit. Like any important project, having a backup insures that the work will get done sooner and at a higher quality. More interaction will give us both ideas and motivation. The result may be TWO, high quality exhibitions in two major cities. This is surely desireable.

The Museum focusses ONLY on information processing. As such, the Museum doesn't have to make tradeoffs between displaying Archie Bunker's chair, a steam engine, or computers.

The Museum's charter as a scholarly, international museum versus a national institution means that we are likely to have a significant role forever. We will not get caught up in national puffery when many ideas started in the U.K. and are now coming from Japan.

The Computer Museum has demonstrated competence by reaching public, non-profit status -- all for about a million dollars incremental expenditure. Perhaps it should have first come to IBM with a proposal for a museum, but now one can view real results instead of promises. Since the past is the best predictor of the future, it is very low risk to support known winners. This next level of activity will cost about ten million dollars in over five years. The next one, which we hope to attain by the early 90's will cost about 100 million. Today, the Museum has:

- key artifacts and archives - For example over 300 machines and 200 films are preserved. It also includes books, manuals, and photographs. These are available to authors, the media, companies, and universities to aid in the understanding of information processing.

- a staff of 15 involved in artifacts, exhibits, historical research - No museum has this level of activity in computing. The curator from Britain's Science Museum is preparing one of the major galleries.
- a building that is centrally located, operational and able to be used during this consolidation phase
- a dedicated board of computer industry leaders (including Erich Bloch and Jean Sammet from IBM)
- dedicated members and supporters ranging from Amdahl and Atanasoff to Zuse. Every IBM person who has visited the Museum believes it is significant and worthwhile; many ask about IBM support. A large number of IBM employees are founders.
- support from other technical people at IBM, including: Lewis Branscomb, Fred Brooks, Bob Evans, Jerrier Haddad, and Ralph Gomory

Lewis Branscomb commented that if the Museum never opened, it would be really significant in terms of its collection function. At first glance, this may be true, but the Museum needs to be open and very active because:

- Exhibits and a place to visit are required in order to get public and individual member support, including new artifacts.
- Exhibits force the deadlines to organize our thoughts, taxonomies, and displays without which the Museum would just be a collection of uninterpreted artifacts.
- Exhibits start with an initial wish list for the collection, but as collecting is carried out, the final result is often quite different. This is just like research in science.
- These "firsts", being routinely thrown out every day, need to be saved now. An avalanche occurs when we start the process.

At a personal level, I believe my own work in computing has benefited IBM. The Museum will be no exception. This work includes:

. Training of various IBM scientists and engineers at Carnegie-Mellon in computer systems because of the experimental engineering nature. Carnegie-Mellon was first in this area and continues to lead the big three universities.

. Writing texts for scientists and engineers. My 1971 book with Allen Newell just made "classic" status in terms of citations.

.Collaborating with Erich Bloch in selling the Semiconductor Research Consortium to SIA and work in defining the program. IBM will benefit most.

. Establishing by way of example, a model for co-operation between industry and academe at Carnegie-Mellon. DEC pioneered this and now IBM is benefiting by taking over DEC's 1970-1982 role.

. Engineering exemplarity, first systems (archetypes) that are the mainstay of IBM's products including timesharing, the minicomputer, Local Area Network and LAN clusters. The later two are not yet mature.

. Using the Museum's collections to understand and interpret the computer industry. As a result of Museum work, two papers are being published within the next three months: one on Standards (Keynote talk at IEEE's Compcon) and the others on how the microprocessor is restructuring the industry.

While I can't guarantee that IBM will benefit as much from the Museum as from the above work, I believe it will benefit. I am asking for you to trust me. In this regard, can I apply to be an IBM Fellow for historical work?

I would like to urge IBM to support the Museum at the two million dollar level for five years as requested when IBM visited on January 25, 1984. If this is not acceptable or IBM is concerned about some aspect of our relationship, then let me urge an initial grant for two years at $800,000 followed by annual reviews.

If there are any questions regarding any aspect of the Museum, I or any member of the Museum's staff or board are available to answer questions and visit you. The Museum is open for review and inspection.

To reiterate and close, The Computer Museum needs and wants IBM's support.

Sincerely,

Gordon Bell
Member of the Board, and Curator ex officio

CC: Erich Bloch
    Lewis Branscomb

GB13.14

The Secretary reports to the Office Manager.

A major portion of the secretary's job is replying to requests for information, tours, literature and taking messages for the Staff.

Other duties include:

updating the calendar daily for the whereabouts of the staff and to keep track of museum happenings (e.g. tours and lectures)

processing all outgoing correspondence

processing new memberships

scheduling tours and

assisting with bulk mailings.

An "Office Procedures" manual is located in the secretary's office which supplies most of the information needed to perform the secretary's duties. It contains the following information:

A. New Member Procedures including an example of the form used for Matching Gift Program for DEC employees and

Membership Card and Receipt.

B. How to Section including How to Run Labels, How to Run Rolodex Cards, How to Pull a Founder List, How to Do a Member List, and Procedures for Correspondence File Headings.

C. Disk Indices including the following floppies:

SUESYS -- DECMATE System disk

DEBBIE

SYSMBR -- System disk for memberships

MBR001 -- Membership List

C001 -- Chronological correspondence

C002 -- same
C003 -- same

D. Miscellaneous information regarding: the calendar, letters, mail, and filing.

Forms used frequently are: Tour Information Sheet, Tour Information Summary, Museum Tour/Office Calendar. (Add any others.)

SUBJECT: RE: THE 10/20 BUSINESS

Jupiter was born right here in the River City Engineering Department! It should have been a relatively straight-forward machine to engineer, but it is a big project, and much bigger than what was thought, simply because the guys doing it didn't have the knowledge of the 10, didn't understand the magnitude of the project, and hadn't managed anything this complex. The first version (2x KL at lower cost) is what I'd expect from going to 100K. Getting a 5x KL at only slightly more money was the proverbial "free lunch".

The 10 is now more complex and difficult to build than VAX in terms of data types, because of recent extensions, particularly to deal with extended addressing. I didn't understand the complexity of the machine at the time, nor what they were doing because the whole project was done in what I call the "one head" model. Since the original machine, the 6 was so simple (I did the whole machine, except the arithmetic control (Kotok did it) plus lots of the I/O and memory), I thought it was pretty easy for a small, dedicated team and a few designers. The 2020 was done with a few people and that reinforced my belief that the 10 was

simple enough. Jupiter is complex and didn't have the external
reviews and tests that are needed when there's not "one head".
The project added people but without the discipline and
management. The stupidity is that virtually all the problems of
VENUS were on Jupiter (project organization, management, quality
design versus build and try it, simulation, modelling). The
problems were masked because they were debugging a powered on
machine... little did I know that they were still designing it...
otherwise, I would have pulled the plug on the proto 18 months
ago!

My concern about the 10 is exactly that of the 8 ... both
machines will bleed us dry if we have to add programs to them. I
have enormous respect for the machines in their time, and I hate
to see them being forced into situations where they are not
suited. Mostly I hate to see these classics become non-profit
institutions and be eaten up in the marketplace. For example, it
costs about $200 to add an instruction to any PDP-8 program
simply because the memory is full. No way can one build
competitive software on the 8 today, except by using an
existing, well-debugged, high level language such as Dibol.

It's still unclear that these programs would be competitive.

To make the 10 competitive requires a full re-write of every compiler and other programs to handle the large address. Once the re-write, the machine will slow down enormously because of the extra indirect references, and today there's no way to make a 10 competitive with VAX due to the equal complexity and lack of software. Our customers have been creative about using multiple processes (forks) to get a bigger address, but this is enormously expensive in programmer time. What concerns me is the fact that we are in for a very large software bill.

The 10/20 is a cult, and we have to have machines to support these customers. It's important to realize that Honeywell's Multics users, Univac's 1100 series (a super/super kludge based on the 1103/1107/1108/11xx evolution to get address bits and for function), and Burroughs machines (the Barton Stack machines) are somewhat cultish too because the buyers bucked IBM. I hate to even think of these machines in the same sentence as the 10, because the interaction isn't there... except Multics.

The thing that these machines have in common with the 10/20 is the continued support requirements of the customer base. This is historically what's killed all the mainframers. The simply haven't provided for the transition or the evolution of competitive machines. Thus, when I say we're like BUNCH, I believe we have the same problem in being enveloped in past support, and like them, we too will go down the tubes holding on to the base. VAX did a great job in dealing with the base ... mostly because the minis were more dedicated and there wasn't the apparent, large investment. In reality the software investment and base is much larger; it's just not concentrated in a few sites. RSTS was moved to VAX using software tools and VAX provided a direct execution environment for RSX-11/M.

I don't see a way out of this dilema where we can ever make the last 10 (or last 8). Common I/O is a way to reduce the engineering bill a bit, plus things like common compilers (we tried one on APL). Never have I felt so stressed: there are lot of great things we should be doing, but because we've screwed up schedules (Jupiter, J, Venus,...) and have no resources, we're committed to the past. I want to get on with MicroVAX based products for example, and VAX is a much, much better base to build on now.

It really bothers me now to see a strong marketing group unhook VAX sales and get us further committed. I believe the upsurge in 10/20 sales are simply substitutions of what would have been VAX, since we are selling resource/marketing constrained here.

It would be nice to see some aggressive marketing in the cluster domain with VAX or with VAX and AI, but I certainly don't believe the 10 group could do it... it's religious as your memo descibes.

We're getting a strong AI group in order to go after this business. The 10 is now very overpriced here, the 2080 is likely to perform poorly with LISP, and it will be a real

poor performer when the extended addressing is put into LISP, if
and when it is. The point on the AI is that we have one set of
resources... we should go after the AI maarket with VAX, while
holding anything we can with the 20. The AI market wants LISP in
a 30K workstation... and Xerox is offering it. Again, like
the multi-Pc's, the enemy is outside, NOT inside.

These examples typify the problem: We can never sell/market
outside while stopping the development inside, when a product
should be a cash cow! The PDP-8 should have been an all time
cash winner. Instead, in it's last days, like India where cows
of all kinds roam the streets and buildings, we have to build
hospitals for life support.

Bottom line
Am strongly committed to honoring our growing commitments and
getting this follow-on to the KL. At some point, someone is
going to have to work on the solution for Digital for life after
the 2080... a problem I wish we now had.

Subject: **DEC, A Shrinking Ecological Nitch**

To: Gordon Bell

Date: June 6, 1979
From: Dan Siewiorek
Dept: CMU

I was having a discussion with Lloyd Dickman this afternoon that stimulated this memo. I observe DEC from afar, and occasionally from close up, I see several disturbing signs. These signs seem to indicate that one of my most favorite biological organisms, DEC, may cease to exist the way we know it today.

I am sure you are familiar with many of these signs, but let me ennumerate them.

1. Increased time to market. Even though DEC is growing in personnel at a high rate, it is taking longer for a design to reach market. Even simple reworks of an existing design takes 18 months.

2.Technology is rapidly changing. Part of the increased time to market is due to introducing a new technology into DEC and learning all about it. There is almost a different technolgy for each major project (i.e. Dolphin was using ECL gate arrays, COMET bipolar gate arrays, NEBULA TTL, Fonz NMOS, etc.) This technology learning process delays the timely introduction of the new technolgies into the DEC marketplace.

3.Processors ain't all that different. Ed Snow's study of the PDP-11 implementations illustrated their high degree of similiarity. A recent comparison in Datamation of the IBM S/370-168 and 3033 also indicated a high degree of similiarity. Certainly in this day and age processor design is well enough understood that we do not have to start from ground zero each time.

4.Decreasing number of new processors. There are essentially no new PDP-8's under development. The only PDP-11's are the model 44 and the JAWS-11. DEC has seemed content to hold PDP-11 top of the line performance at the 11/70 level. Does that mean the JAWS-11, or perhaps a follow on project with an 11/70 on a single chip, will be the last PDP-11? Then there will probably be three or four VAX's: small, medium, and large.

5. Lack of design aids. Since there are so many diverse technologies to support, a do-all design aid system is too complex to build. Thus as design complexity increases, so does design time (at a greater than linear function).

6. No new value added. The semiconductor houses will beat DEC at the K-bit MOS processor game and shortly at the 32-bit game. They are already talking significant RAMP features, something DEC has failed to treat in a uniform manner. DEC is not developing other non-MOS technologies that could be a value added feature. There are fiber optics, integrated optics, and Josephson's Devices that IBM and Bell Labs have been investigating, just to name a few.

At some point, DEC may be reduced to a software house with others mass producing DEC's hardware (e.g. I would guess that already today half of the gate count in a typical system running DEC software is due to non-DEC vendors). At that point DEC would stop growing its user base. Existence on a fixed size use base will limit growth and challenges. The limiting of challenges will lead to an exodus of creative talent leaving behind a hollow shell.

I think that two major actions, backed by corporate wide commitments, are necessary.

1. Technology. Standardize on a single (or at most two) technology, as IBM has done on gate arrays. By constraining designer choices, a set of design aids and a mechanized production facility can be developed. The technology may be suboptimal compared to hard packing designs, but the cost savings and reduced design/manufacturing time should more than pay for it. DEC's designers have too much freedom today, almost akin to unrestricted use of Goto's in FORTRAN I.

2. Technology research. DEC should be doing active research in new technologies both for logic and for peripherals. DEC can no longer afford to borrow the technology of others.

SUBJECT: VISITING (OVERSEAS) OFFICES -- FOLLOW-UP 10/31

GB0005/9/EMS

Subject: **Visiting (Overseas) Offices, Plants, Engineering Facilities at the Right Time of Year: Are There Any Guidelines?**

Having just come back from a four day business trip (accompanied by Gwen) to Rio and Sao Paulo here are some observations and questions based on this and other trips:

Appreciated -

1. Book on economy of country (e.g. Brazil) as homework.
2. Japan in August (manager later fired) because itinerary well (jointly) planned and extremely intense and effective customer, office and vendors. Intense sightseeing on weekends. More accomplished than in the U.S.
3. Written background, briefing information (possibly this could be a voice on a cassettee - with no written copy). As a non-verbal communicator, I process written information much better, however. A collection of articles or references or internal memos would suffice.
4. DEC purchased flowers and fruit in hotel, could have been omitted.
5. Evening affairs with office, their family and/or customers.
6. Dinner at homes (and always reciprocate).
7. Wife-Wife diplomacy, but clearly well

outside of responsibility.

8. Mostly talk about computers, Digital, or general business including time when wives are present.

Am concerned about -

1. DEC employees at swimming pool with novels during working hours.
2. Planned sightseeing during working days.
3. Maynardians in an office for inspection/fact-finding when there's no formal review mechanism scheduled.
4. Maynardians or customer inspection tour with no pre-planned itinerary.
5. Whether we have too many Maynardians on the road.

In general, one should expect to accomplish more on a visit than at home, because of travelling overhead and the limited time we have on these trips, independent of whether travelling with members of ones' family.

SUBJECT: 2080 SLIP CAN'T MEAN NI AND PLUTO WILL SLIP!

Now that the 2080 has slipped a bit, there may be a tendency to want to slip the software and possibly slip Pluto. We can't do this.

The irony is that the 10/20 group spent so much time worrying about Pluto and backing it up, that they screwed up their own work. This is a classic DEC disease and that is especially prevalent in LSG Engineering.

The main point is, putting Ethernet on the 2080 cold turkey is
just plain idiocy anyway. We have a new machine, a new operating
system, and a new way of doing things with NI and CI. The right
way is to test the product on a 10 or 20 which has an NI on it!
We should have seen this and not accepted the plan based on simultaneous testing of all the unknowns.

By the next 2080 review, could you make sure that our Pluto and
NI integration plans are not slipped, but are based on using current hardware for testing?

I hope that we can deliver a Pluto to VAX at the same time in March, so we can begin the checkout of the NI distributed architecture there too.

Having given a presentation of the wonders of Ethernet with Xerox
and Intel last week, I'm really sold on our need for it.

We must have one operating in MR on a production basis by no later than July 1, and it must operate for testing when Pluto arrives there!

Subject: DECAIR'S Kamikazee Flights That Shouldn't Be Scheduled

To: Mary Jane Forbes, ML12-1/A51
Jeff Randall, HN

CC: Al Bertocchi, PK3-2/A56
Ed Finn, MS/B87
Ken Olsen, ML10-2/A50
Bob Puffer, ML12-2/E38

Date: 6/2/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Every now and then I have short lapses of sanity at which time I find myself in a situation, sometimes not totally of my own making, that is patently dumb. Several of these lapses revolve around flying on DECair. Namely, DECair should have never provided the service in the first place because it is not cost effective, and then given the situation, it ought to back out of the deal quickly.

Flying to Stratton Mountain is one of the places in the world that should be off limits to DECair. It takes slightly over 2 hours by car and when all the smoke has cleared, about 1.5 hours by plane if everything goes well. Unfortunately, the probability is low that one can get in to the Red Fox (Sly Fox) airport. When this happens, going to Springfield airport takes an added hour by car, or a Vermonter's 1/2 hour because the clocks only go half as fast in that part of the world. Thus, the actual time can go to easily twice as long as driving in the first place when all the waiting and messing around is considered...certainly the expected (in a probablistic sense) time is longer by air than by car. Thus, I submit you should under no circumstances offer the service.

Having been involved in just a few other trips of this kind and having been involved in the potential for several in which I was smart enough to not be involved, I would like to put some responsiblity in your hands to say no and to not offer such dumb sevices. Even though I may not be very bright as I get older, it seems to me there are people who are no brighter than I that end up in the same situation and we need your help.

D I G I T A L INTEROFFICE MEMORANDUM

DIST:

Mary Jane Forbes	ML12-1/A51	Jeff Randall	HN
Al Bertocchi	PK3-2/A56	Ed Finn	MS/B87
Ken Olsen	ML10-2/A50	Bob Puffer	ML12-2/E38

8 December 1984

Mr. Edson DeCastro, President
Data General Corporation
4400 Computer Drive
Westboro, Massachusetts 01580

Dear Ed:

I was glad you could come to dinner on Thursday and view the Museum first hand. I hope you like what we've done with Data General's generous funding and its equipment.

The physical realization has turned out to be much more exciting than our plans showed. The staff made a very large "stretch" to open a range of galleries. The reviews have been positive and it is easy to spend a half day in productive learning. Knowledgeable teenagers are spending their days at the Museum. The most flattering comment to date has been that it is the first American technology museum to be at European standards. Dr. Oliver Strimpel, who did the Museum's Image Gallery has just become the Associative Director and Curator. Oliver was formerly the Curator of the Mathematics Section of The Science Museum, London. The long collecting period and five year breadboard at Digital really paid off in collecting artifacts, building exhibits, doing lectures (ranging from Amdahl to Zuse) and gaining widescale support from computer people and companies.

I want to see this phase aimed at:

- putting a formal educational program in place,
- continued collecting of artifacts (whether letters, films, manuals or machines) in order to record the significant, information processing events, and
- getting broad public support from computer-knowledgeable people who want to learn more about the past and future history of computing.

Henry recently gave a thousand shares of Data General stock to the Capital Campaign, and I've given about 1/2 of my salaried earnings the last two years. I would like to convince you to become a major financial supporter now, and a board member within the next few years. The board is a four-year appointment.

Sincerely,

Gordon Bell

TO: A. M. BERTOCCHI DATE: THU 3 JUL 1980 1:36 AM EDT
|AL BERTOCCI FROM: GORDON BELL
cc: OPERATIONS COMMITTEE: DEPT: OOD
EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: PLEASE HELP ME EXPLAIN OUR DECISION AND DECSION MAKING TO ALAN

Al
d you look over this draft and help me explain to one of our 3 Senior Consulting Engineers (who's product designs have helped bring in something over a couple of a billion $) just what he should do on the teleconferencing?

Feel free to use any business talk (he has a fresh MBA), is a lot brighter than either of us, is mature (over 40), and has about 25 years of experience dealing with all forms of computers, telephony (he helped design the DEC phone system with ma bell), and understands video, etc.

I don't think he is going to be sweetalked into your business type sounds "included in the FY 81 Capital Budget - prioritized list _ for Corporate decsion-making on what to exclude".
He might want to know what the criteria are for priority, who has the list, who is the Corporate, when, where, etc.

Above all he might want to know why the hell you have sat on this for 6 months and spent more money studying the god damn thing than simply doing it?

I think we would all be happy with the simple answer I intend to give him, if we can't agree on the text of this draft it is:
No- go back and work on products, it's too much of a hassle and not workth trying to make any change of any kind in the domain of trying to save time? Furthermore, I'm going to suggest he minimize the interaction with you communications people whose job this is and who have spent more damn money and got us nothing.

In short with don't patronize, collude with or go near city hall. Get back in the back room and work with me.

TO: ALAN KOTOK

DATE: WED 2 JUL 1980
FROM: GORDON BELL
DEPT: OOD
EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: TELECONFERENCING- I DOUBT IF A DECISION WILL BE MADE

Alan,
Al and we met with Larry finally when Al could do it.

Al sent a memo to me stating what he thought we agreed to,

which
was not the same as we thought we agreed to. In essence it was:
1. He supported the proposal
2. It has to be done as part of the Capital Budgeting as part of the FY 81 to be part of someting called the priotitized list as to what to include... as part of the corporate decision making.
3. We would be willing to reduce the Engineering budget over the next two years to directly fund it.

We thought it was only items 1 and 3. We propoposed 3 simply to show that it is possible to tradeoff expenses for capital when one has a good plan. His memo after the meeting was a blow which I will never recover from.

The offer was to reduce complexity and to show how one can trade-off expenses for capital in a simple way got shoved under the table.

Al, Win and Ken are running the company from building 10. All decisions about Space, Who gets what equipment, and what the capital equipment budget is are made there in what appears to be closed, unclear processes in a top-down arbitrary way. The fact that I thought I could approve a plan, or comit to a product plan based on an expense budget (where capital or computers or space is implied in the numbers) seems to be a farce, given that these other variables are controlled somewhere else in an arbitrary, capricious way. Somehow, I feel responsible for results (including getting us better facilities) and that there is no way to perform against these plans, is tying me in a

knot,
and I don't want to be a party to wasting any more time on this...
either yours or mine. Therefore the answer is:

We should not bother to engage in anything having to do with teleconferencing between ML and MK due to the problem of getting
any way to do the planning or approval of capital equipment. It
is a hell of a frustrating way to do anything. This, like computer equipment and space is another issue that I, nor my peers can not discuss in any kind of rational fashion, let alone
straighten out.. Furthermore, I can not even read a memo or listen to what is generally a content free discussion on any of
these subjects because it is such a waste of time and so frustrating.
Order processing is an example of another such process but we in engineering have been spared this. I have been been only mildly harassed as a bystander, but have had to listen to the vacuous arguments.

My reasons why it is not worthwhile persisting any longer are based on a whole set of things:
1. None of these 3 areas have any formal processes, objectives
or responsible persons assigned to them, nor is there anyway of judging one proposal against another.
2. If there is any need to cut the budget, I believe it will be
this 400K, even though we will pay for it in 1 or 2 years (a
hell of a lot highert than some of the squirrely projects or capital that it would compete with. The cut is obvious because it
is a clear, line item. I recall us spending 30 minutses cutting
the library budget back to a flat budget (requiring layoff) severl
years ago, while allowing several fat, incompetent groups to

grow
at a 20% rate, simply because "libraries can get out of control"...
despite my cries to the fact that our output in the library and
cost per unit output (books, information delivered) has been declining. At the same time we built a brand new library in a
building far away from here that spent more than the library budget.

The issue was that this part of a 20M$ expenditure where there
was no visibility as to the 50, 400K line items that formed it.

This year, I expect another 1 or 2 helicopters and airplanes to
be approved simply due to the linear growth way we do planning.
We've all liked these since our childhoods and will support getting
more due to the hassle we get into at airports and the fact that
we can't plan what to do if we have to drive or spend the time.
Never mind the fact that just this afternoon 10 people met
with Larry, BJ, and I this afternoon for 2 hours, with 2 hours
of driving to discuss the WPS Product development . (Here
we spent only about 10M, lost revenue of maybe 100M, and lost
some of the market share and customers that we need. All of the concerned parti
parties who fouled it up will suffer probably with only 10%
raises and only average stock options granted worth about 5
times what a very good, unique individual contributor will
get for developing a product that will bring in 1-2 billion
in revenue.

3. We have gotten so big in some sort of sick way that the old
Do the right thing rule is absolute bullshit in light of

mediocre
bureaucrats and people who only exist now to check on anyone who comes forward with a proposition. I think we will get to a situation soon where there won't be anyone coming forward. Cutler is extremely concern, and I have to go off and work with Jack Shields to find out why Jack requires 50 signatures before a product can be released to the field. Presumebly these 50 add something, but NONE are categorically capable, in some real sense of tcarrying Dave's listings. Here, I don't
want Dave to leave, so this fight is not optional. If the 50 would leave, I think I would personally sponsor the going away
party, it's clearly not company policy to allow any rewards like parties for jobs well done, except in the sales department.
(Maybe we could get milk from this sacred cow because teleconferencing obviously could be used to minimize these needs. ... but don't hold your breath.)

4. We have to also support not only the checkers in 3, but also
the studiers in tgroups like telecommunications who are asking
when we should build such a system. I have tried to tell Al that when he goes to play golf with all the other large corporate executives who play with the real golf players that he
could really one up em by telling them about our teleconferencing.
My guess is that we have spent more than 400K on studying teleconferencing in Al's department alone to get paper.

This would get him pioints and even a golf game, but he's worried
about how he's going to make this big 4ooK decision in light of
a 400M request... and I'm glad he's worried. I'd be petrified
given our state of decision making, ability to discuss, to have
any clear criteria, etc. Therefore, again, I can't blame Al,

he's OK, it's just that the company did him in. Therefore he has to say no to someone, and it had best be to you instead of the 21M$ board shop in Phoenix.

5. We have to spend money doing dumb things like sandblasting your conference rooms rather than putting insulation up which would save money because there was a rule someplace apparently
and the space people are afraid to change anything that is working becuase space has such high level concern about what it is. This has resulted in more expensive buildings becaue
no one wants to make a mistake here. At a recent meeting a number of us were present who had earned our golden plummer's helper and golden shovel awards (I only have the plummer award,
but an honorary golden crowbar award... for taking care of the
Mill for a few years and for making a bunch of changes including
the sandblasting which apparently no one can undo now, just as
I had a bitch of a time doing the first one) You get the shovel
if you put up a building. We all agreed that it was the worst
experience that we had. We get all the bad things: relatively
expensive buildings and questionable results. The capital budgeting favors open offices and I am now ready to wquestion this wisdom given the noise, etc. But it appears to be cheap and you can write the furniture off in a few years.
Again, notice that we budget (control) the input, not the results.

6. Our capital is really stetched because of inordinately high
inventories. This comes about for a few simple reasons including
the way (where) we build (a design problem in manufacturing and
engineering), forecast (strictly bottom up by clerks with no

concept of what people buy) , and flow (through every god damn
plant in the country and Far East) prodcucsts. This is a disaster of vast proportions.
There's conservatively about 150M in i
inventory carring charges and waste work in flowing products in this morass as a conservative estimate.

7. We can and do hire, creating expenses of vastly more than the 400K. A helicopter pilot creates a lifetime expense of something like several million doollars, vastly more than this experiment. There is no process to validate hiring requests
versus capital equipment which we can get rid of through depreciation. People are a much greater drain. The good ones
get trained, tired and turned off (and leave). The slow ones just say no or ask others to do things. (One of the joys of work to me now is the museum and its because we all do work including putting on lectures, building exhibits, archiving, writing papers, understanding)... however, when I interface to
a large group to get a piece of equipment, or information or make a slide or a poster or generally do anything it is so depressing because there are intermediaries who manage and generally only screw things up. Again no concept of quality and
output, only input. For the 100K we spend, we do more work than
just the cost of the interface people alone. Now I begin to understand all those books nd papers on big bureucries and groups. I don't think DEC is especially worse, it's even better
than most, it's just the size and so we might as well all go back to our desks and cancel something. (There are some bad people though, one of the "management" in MR thought he was entitled to some of the building's plants, so he took them because he had the right as a part of his status and power.)

Well, Alan I am not going to help you anymore on this one. You have to decide whether you want to keep pushing. I still feel that it is very important process, but I have no idea

what the so called prioritezed list - for Corporate desion -making on wh
what to exclude list is that Al told me about. Based on my past experience on space, buildings, getting computer equipment, getting EMS slots, ... etc. I can't begin to tell you when or how or where or who to talk with (Ken likes t make sure things like this are presold when the9 come before the Operations Committee, but make damn sure you do it carefully, because we all hate politics.) Buy I doubt if the Operations Committee will get involved in this one because it's only 400K, unless there's a good chance to say no and let us show the world what hard headed, tough minded, results oriented, down tto earth, futuristic (Ted just went to the Aspen Institute), solid (we eat lots of carbos) business men we are. If you want to bring it before us, I'll gladly stand behind you (especially if you have presold it), and if it looks like it can't go through, then I'll probably be a hell of a long way behind you.

As to bringing in a competent person. If they are a friend and has to work in the middle of this dreary bunch, I say no because I think you should valuable your friendship more. If the person can work in anothe group where he can really feel good and get something accomplished, then why not get them there? On the other handthere are days I worry about getting things done i
too.   Which reminds me: I think it is time we got to work on the array processor in earnest. .. assuming we can somehow get the machine to use for this.

Let's really concentrate on projects that will produce results... my tendency is to forget the whole damn thing.

Let's get together and figure out the possibilities, there's never been a better time to do engineering.

SUBJECT: VIDEO CONFERENCING DECISION

I have not heard whether you, Larry and Al Bertocci discussed the proposed system, and whether or not we have a go-ahead. This thing has dragged on so long, that my patience is almost expired. I now gather that the thing is somewhere in some budgeting cycle, looking for money. If it was worth doing last year, it ought to be worth doing this year.

Although I realize we cannot make decisions based on hiring a particular person, I really believe we have a first rate guy lined up to do this project, who can only be hired if we have a project. He presently has an outstanding offer from another firm, and can only wait until Tuesday.

It seems as if nobody can make any decisions in this company anymore. Is that the price of giant size? It may be too big a price to pay.

SUBJECT: DECMAIL SCHEDULE SANITY CHECK USING EMS AND WPS PROGRAMS

I was impressed with the aggressive schedule that the DECmail folks talked about last week. It seems like we've had many other schedules before and others might have trouble believing us. Why don't we test whether the schedule is reasonable by looking at how we've performed on EMS, whose listing I am sending to you and on our other WPS programs? Also, I've asked Bruce to gather data on productivity on WPS. This shouldn't take more than an hour to get a back-of-the-envelope estimate.

I'd like each of you to estimate the time to get DECmail, which we have promised, and is to be roughly EMS, but with a better interface and a better file system. However, it should answer, and be verified against past performance. Also, I would be skeptical if it violated the Brooks hypothesis about programmer productivity (a neat article in March Datamation computes the output for various sized groups). In our case, I think we ought to include as part of the team: writers, program managers, product managers, and architects because they take time for interaction too. For example, I spent a day with several of the non-programmer group, but I'm not sure whether this decreased productivity or increased it cause the 2 or 3 designers didn't have anyone to talk with that day. What is your assumption about the output of the group? How many lines/day/group can be written?

So, given we have an EMS, in MUMPS, let's make assumption about productivity in the given language (now it might be PL/1 cause it's only for VMS), also considering differences in what it takes to get the file system and the screen manager, and assuming the editor is already there. How many Mumps lines per line of the language of choice? What are the times you assume about when we can start writing the programs that don't exist now? What are the other delay times for test, etc. that get added into the Pert chart?

I'll coordinate the collection of envelopes as you get the listing. Bob or Bruce should send us an organization chart and since Tom is the acting product manager, he can send us a list of the open issues (which we can estimate the time to resolve). The only ones I know that are pending are: the file system and how messages are mapped to files, how communciations protocols to other systems are handled, distributing directories, user interface, terminals supported (I asked them to reconsider because there were only 2: 9600 baud dumb terminals and everything else which was considered like a Teletype... I didn't like being in this category), the commands, etc. DECmail is part of the undefined OFIS program and I assume it relies heavily on CATS, which is incomprehensable to everyone by Rich Kalin and Product Managers. The editor is pinned down though and

that's
the part that programmers always complain about, and since every
part of the design is table driven, the semantics of the operations are nearly defined, it is simply up to some hypothetical user to figure out how to map screen images to commands. Bob and Tom, could you send this data around so we can
get our estimates started?

MESSAGE ID: 5186755549

SUBJECT: WHY BOTHER WITH DECMAIL?

GB4.S1.10

DECmail is not preferred by the field organization for various reasons:

1. All-in-one requires support and brings in revenue

2. DECmail is written in Mumps (whatever that means)

3. DECmail is a large system requiring central support and sold to
central people. Our forte is distributed systems for departments

4. All-in-One is adequate, given the state of the user base (where
Digital was four years ago).

I think we should formally (or quietly) withdraw DECmail and go for it with only All-in-One in an evolutionary fashion. We'll evolve All-in-One to do all the functions and to operate both in a central and a distributed environment.

Why have the extra development experience and the field support if it's not going to be sold? Could we have a formal proposal?

SUBJECT: DECMAIL: AM ANXIOUS TO SEE GOALS, CONSTRAINTS AND
PLAN

We have not cancelled DECmail. As you may now, I am
concerned
about our ability to produce a product here. The external
views seem reasonable, although there are lots of rough
parts,
indicating a poor knowledge of EMS as we know it today.

Mostly, I'm worried about what the structure looks like
internally (architecture) such that there is any credibility
that this product can be built in anything resembling a
reasonable
time and with any flexibility to be extended to all the other
functions that this facility will ultimately require.

I support our taking EMS/VMS to market in a controlled
fashion
in order to get reactions from other organizations with other
types of users. Also, I want to take the pressure off this
project until we have some better understanding of it.

I understand we are to review DECmail goals and constraints
within the next week and then review the plan within two
weeks.
I await this, in hopes of getting some better understanding
of
how to better proceed about how to best fill this important
product area.

If there are any concerns you have about my concerns (eg. interface, architecture, product structure, or sheer proof of being able to produce the product in a timely fashion with a given set of resources) please ask for clarification.

SUBJECT: RE: DECMATE I & II VS. THE WANGWRITER

WANG IS STILL KILLING US

Although we all agree about Wangwriters and DECmates, note the paradox:

1. DEC completely dominates Wang in distributed processing.
2. DECmate completely dominates Wangwriter!
3. DEC is losing in Word Processing.
4. Wang is winning with good, shared word processing. (Because Wang also has distributed processing.)

LET'S STOP WANG!

The key is to use our full set of strengths (in a large organization):

1. DECmate for lowest per terminal cost.

2. For shared, word and distributed processing user: 11/23... 11/70.
3. If you want heavier duty word processing use DECmates for terminals.
4. For real, open ended heavy duty work, mail, data and distributed processing use VAX's and DECmates.

DECmate also has a very good and fast BASIC that some users would like.

VT125 emulation would give a capability such that virtually few, rational buyers of the VT100 or VT125 would buy DECmate II's instead.

I don't understand why we can't offer and push DECmate as an alternate terminal across all P/L's?

Above all, we've got to market OFIS products.

SUBJECT: DECSET: A VERY NICE BASE... BUT A TIME TO FOCUS

The designers and developers are to be congratulated for a really fine, general purpose language and data base for storing and processing text. Also, the text processing editor looks very fine. I was especially impressed with the incredible productivity in terms of program size. It should be the base for us and our customers to build some really useful typesetting systems.

The review did raise some concerns:
1. Presentation/architecture- I felt a need for better understanding
the structure and function. This didn't come out of the presentation
or the brochure or any of the previous documents I've read. A model
based on layered machines seems best for showing languages... which
this is. The model should identify the parts, how they connect
(database, process, mailboxes), and which ones are variable as program
or tables. I really think I could understand this, given the right
documentation.

2. Product Cost looks way out of line for what is basically a word
processing editor, albeit a nice (hopefully great) one. As a more
"Wang style" editor, I doubt if it outperforms a Wang, and at 10K
terminal cost plus 1/16 of a $256K VAX giving a cost per terminal of
$25K, it feels high. This is why you have to stay out of the word
processing market ... where they know what's going on. Also, many of
the nice features such as spelling and grammar checking needed there
are in WP's and in VAX, but inaccessible to DECset.

3. Systemness/completeness, whatever be the market. Since I don't
understand or relate to the typographer market, I won't comment except
to say, poor devils. As a typesetting system for the office, it looks
like a long time. For direct authors, as yours told you, it had
potential. This means: indexing, table of contents, control

of pages,
figures, word processing conversion BOTH ways (not just getting a
wps file into a VAX file), spelling and grammar, proof reading at all
stages etc. (Note Bob Ulichney has any font at any scale you need to
do dot matrix printing.) I believe this is the requirements for simple
office tasks like brochures, manuals and books.

4. Compatiblity with WPS. This may not be needed in the Typographer
market. I trust they don't know any better, nor do they care. They
have typesetters, unions and a vested interest in preserving the
status quo. These are the people who have helped stretch our
production cycles for printing to the absurd.

5. Overhead- I heard that there were 18 programmers who did the work.
The amount of people inputting to them and which their product has to
support was frightening. It was amazing that they built anything.
It's clear that the incredible input did produce an incredibly general
product that is potentially good for any typesetting task. The
question is: Can anyone define any market segment, or any class of
users and then set about using it? Which leads to---

6. Market segmentation for finally defining the product, targetting
the customers, selling them, and supporting them. Here, it feels like
there are several classes of users (and customers):
. in house publishers, who are staffed by typographers and whose
standards are linotype machines. Any electronics or

editing is
great to them. This is basically our traditional high cost, high
support, lots of training, highly specialized market that is
Graphics Arts. (Bedford, Northboro folks within DEC)

. OEMs who can take the product and install it in various
organizations say smaller than Moody's to handle the plethora of
applications. This would be a way of getting at the volume.

. the modern office where users have word processors and who want
quality typesetting of all kinds of documents. The trick here is
to identify the classes of documents to be handled and then to go
like hell in a methodical way to get them done. (Would be run as
a layered product on VAX and used by authors at our software
facilities within DEC... and this isn't possible!)

Frankly, I don't think it is a product for the modern office, or if it
is, it should be integrated with the office products strategy. If we
mix the users/markets, it will result in getting nothing!

Recommendation:

0. Focus and stop muddling. Make it profitable.

1. Market the product to the Traaditional Graphics Arts business we
know and love. It's a tiny market, but we can dominate it and command
high prices! Above all, be profitable. Given that we've built such a
good product base, then let's get the reward (profit) that should come
from the work.

2. Have a Product Manager within the Office Program define the
requirements for the typesetting part of the Office. UNDER NO
CIRCUMSTANCES SHOULD THIS PRODUCT DEFINITION BE PART OF THE EXISTING
GRAPHICS ARTS PRODUCT LINE.

3. Investigate DECset, Scribe, and other typesetting systems for
possible use in this market. If feasible on DECset then set about the
enhancement of DECset if necessary, along with the programming of
DECset, to accomplish this task. Then sell it through all possible
DEC channels as part of our office offering in a layerec, high volume
fashion.

4. Actively sell and support other externally developed typesetting
systems that run on our hardware and systems. Our VAX and office
users do need something, and 3 looks like a couple of years away.
This is what EDU is doing, and I hope the Engineering P/L
will do. Inside engineering, we should consider field testing
their products.

5. Focus and sell. Stop trying to do it all.

Again, Congratulations on building a fine language and database
on which some very nice typesetting systems can be built.

SUBJECT: DECSIM: MAKE VS BUY AND SELLING IT

DOD is going out for bid of a hierarchical simulator covering
logic to machine description ala ISPS. It would seem we
might
have the answer already in DECSIM. At least we ought to get
the
requirements and look at the feasibility if it isn't too
late.
Whether we want to or should bid on this is a question.

I'm certainly all torn up on the issue as a question of make
versus buy. I visited TEGAS and they are selling and
supporting
VAX's like crazy. They are extending TEGAS to be
hierarchical
and we ought to look at this as an alternative to doing our
own,
as I can't see how we can afford to be in this business.
They

are also building a hardware TEGAS that runs at Cray 1 speed. (It's very much like the issue of PWB layout.)

DECSIM's specs are most impressive and we are making progress against the specs. However, having our own, means a continuing investment of several million dollars a year to maintain and enhance, and we could clearly make a lot of money with a great product. How much would we be cutting our throat by competing with our software suppliers? and by providing a state of the art simulator to competitors or potential competitors (eg. Sony)?
Note, TEGAS is widely available in Japan at every site and as it gets better, the question of our lead is mute.

I'd sure like to get a look at this after we find out about the DOD contract and after we've got a better assessment of where TEGAS and others are and are headed.

After we know the state of the art and its direction, then shouldn't we address the long term?
What you folks think?

I agree. Program generation and distribution is the key to our future. It's especially frightening since TI and HP are providing a way for their users to write programs and get payment (royalty)...the basis of encouraging use and programs. We must revamp DECUS beyond the social club it is so that the users are encouraged to submit high quality programs and fix the bugs. We'll take a cut for the catalog and possibly QC.

Unfortunately, now that DECUS is in the sales budget, the only behavior will be to ask for more % of NOR...not make it a business or really have a goal direction. This will be a further drain, and push status quo.

Could someone make a proposal here to get DECUS to be something other than a big blast and boon-doggle?

Bob Peyton, Oleh, what are the alternatives for low cost distribution media and devices?

follow up 11/9/78

The Marketing Committee is trying to get the number of attendees down by a factor of two.

I would like to review each of your lists briefly at OOD on Thursday. Please make a note beside each attendee as to the number of papers, number of panels, number of panels leading, and number of sessions that each person is planning to attend.

Unless a person is presenting a paper or chairing a panel, I'd like to suggest they not attend.

Please bring, in a memo by each person and/or their boss, their purpose of attending if they do not satisfy the presentation criteria.

Subject: **DECUS Attendance Quotas and Control**

To: Ed Kramer, MR2-2/A67
Bill Picott, MR2-3/E55

CC: OOD, Marketing Committee

Date: 11 DEC 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

We need attendance guidelines set now while we still have time before papers are due at spring DECUS in New Orleans. I've tentatively set attendance within engineering at no more than Fall DECUS in San Francisco. Can you get me a list of who finally went?

Our guidelines:

1. Presenting a paper.
2. On at least two panels.

Can I suggest you have a form which has some sort of signatory authority (VP-level in engineering) which has:

1. Talks (titles)
2. Panels (titles)
3. Hospitality suite (hrs.)
4. Planned customer conferences (list)
5. Equipment booth duty (hrs)
6. Other
7. Customer visits enroute

Overall, I hope we can have continuing DECUS participation at at least the current level. Even though it's expensive, it gives:

1. the needed customer interaction;
2. incentive to finish and describe products;
3. exposure/composure for presentation;
4. feedback on current products.

I was proud to be part of engineering, having seen and heard professional presentations and talk with customers. I hope more of our managers go.

John Edwards
Chariman, DECUS Australia
La Trobe University
Bundoora, Victoria
Australia 3083

Dear John:

Thanks for the kind offer to attend the 1979 DECUS Australia Symposium in New Zealand. As you may know I spent last August visiting customers in Australia, Japan, and within the United States. The unfortunate effect of this was that it created an impetus to make some changes in our basic engineering direction. As a result, I am committed to make these changes and find that I have virtually no time right now, and doubt if the situation will change for the next year.

As you point out, there is a large concentration of VAX users, and it would certainly be good to meet with them. I would like to. However, in the interest of providing better computing to you in the future, I must decline.

The point of interest on human engineering is an important one, and it will be possible for us to provide a speaker. I am asking Dick Clayton, Vice President for our Terminals and Small Systems Engineering, to look into providing such a speaker and presentation in the event that you want to go ahead.

I will also be presumptuous and recommend someone who could attend the Symposium in my place. You should have this name within a few weeks.

Sorry I can't come to New Zealand, but offer it to me another time.

Sincerely,

Gordon Bell
Vice President,
Engineering

Subject: **Meeting With DECUS Library Group**

To: Peter Conklin, TW/A08   Date: 3/13/79
Chuck Conley, MR2-3/E55   From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

CC: Bill Picott, OOD

Thanks for the discussion with the DECUS Library Board. It seems like we covered the following:

1. Technology isn't going to help that much for now. Video tape and disks should be watched and we'll know a lot more here in the next year. Both these approaches are interesting because they would allow complete libraries to be distributed with documentation, cheaply.

2. Semiconductor memories aren't appropriate now for the job, because they are aimed at small sizes and rarely is this what we have.

3. The group rebels at working the economic issue. This is at variance with my beliefs. I'd like to see the thing operate at break even and with much subcontracting to internal groups for program distribution, library maintenance.

4. One of the most likely technologies is DECnet links and communications line query. Here, a user would query catalogs and have tapes etc. sent out on a demand basis. If a user had a DECnet link then it could be sent out, using a single dial out WATS line at the library to the appropriate, prearranged number.

In this later regard, we should try an experiment and the board suggested that one of the most likely groups to benefit would be DEC Engineering. Therefore, I'd like to see how we could do this on one of the VAX systems because the interest is so high and because various M,S, IAS, and D users are interested in the upgraded possibilities. Peter Conklin discussed this too, apparently, so I'd like to ask: What is the cost to set it up? (We might also look at it for the 10/20.) It seems to me that if the library has any knowledge of real costs, then DECnet is the only way to do it.

SUBJECT: ARE ANY DECWEST IDEAS APPLICABLE HERE? SOMEWHERE ELSE? GB5.57

Visiting DECwest and talking with Dave, on their organization of 24:

Dave-(writing microcode, worked on O/S, etc., manages group)

Secretary for the group

Bob Friedman- facilities, procurement, also for California,

Reid Brown + Ron Parson in ZK for Product Management

Roger Heinen + 5 programmers for the O/S and SEApascal

3 technical writers for hardware and software (2 for hardware)

all of which have a Xerox STAR for manual production

Larry Coppenrath-interface with manufacturing and service

Peter Schnorr-head of the hardware design and designer

Bob Short and Bruce Butz, engineers

Ken Abramson-simulation and microverify, on board diagnostics

Diagnostics person (hardware and software)

1 technician, 1 technician from Burlington for checkout

1 representative from CSSE

1 Mfg. person

They get help from personnel with what amounts to about 1/4 time, and they're getting their boards layed out in Colorado Springs. Also, Burlington Manufacturing is taking on much responsibility.

SOME OBSERVATIONS:

0. All the effort is directed to their products. Both of which look great! The group size doesn't require meetings and travel for resolution. There are almost no surrogates and "process/staff" folks.

1. Only 5 people, two of which are non-engineering, don't work on the product... for a staggering 79% efficiency! Note, that in a hierarchy with a span of control, s, and number of layers, l, where only the bottom layer works, the loss due to management overhead is

roughly 1/s! The main loss of direct, product output is through the large number of "process" workers: CAD, testing, publishing, etc. versus direct product workers. Within DEC, as one of the overhead, I estimate we lose at least 25% in "management" overhead, that is, only 1/4 have to work because they aren't managing. I'd also estimate we have only 10-20% directly working on products. (This would mean about 600-1200 for all of engineering, of which 19 are in Seattle.)

2. By taking on more responsibility as individuals, and by buying out Process tools, and a chip they're able to DOUBLE what amounts to productivity by NOT having a CAD group! For example, the CAD groups for Venus, Nautilus and Scorpio are at least as large as the group doing the work on the product, immediately halving the group output. (Presumably this is corrected for by inordinately higher productivity of the designers.) I should point out, however, that the Nautilus CAD group of 70, is doing a trivial amount of work compared with the Trilogy CAD group. Also, Nautilus appears to have 2-3 times the designers that Trilogy has for a machine that has about 1/10 the number of gates. (I also think Nautilus is one of our best projects.) We also ought to buy out more of our CAD tools now that startup companies are doing so much in this area!

3. By using STAR workstations to do publishing, the whole manual editing and publishing group is unnecessary. This may give a factor of 3 improvement. The writers always see the page layouts, do all the work, eliminating the publisher (where 1/2 the people are) and this interface time (negotiation, surrogates for both sides).

4. Diagnostics are done mostly by the design team. Here again, there's a large number of people who are often not accounted for in

the project costs, but cost at least as much as the design.

5. Special VLSI is being bought out, reducing the number required, and the associated management requirements.

6. By living small across the board, an extra management layer is eliminated, thus cutting out a whole set of meetings where turf is described, discussed and divied.

7. Note there's only one secretary. We managers require many secretaries to sustain the paper blizzard.

8. There are no draftspersons. This is a major breakthrough, and the way I remember doing engineering, because the documents are the only things that engineers produce.

9. The team had a product and used vision and built it. (We're spending many times that of DECwest on VT chips, and there's only a fuzzy future product vision, and no way to attain it. The effort to produce the UNA at 1/2 the performance twice the cost and 2 years after it had been done outside is legend; and probably the biggest single reason that Ethernet won't come into significant use.)

10. Cray's laboratory has always been about 30 people for supers. In going on to Colorado, I was similarly impressed, and would be curious to see a comparison.

The revelation was that we ought to look at the whole notion of quality and individual responsibility in a different light so that as Dave says- we must drastically raise our expectations as to what can be accomplished by an individual... because they can. In doing this, the quality of the product would get very, very high (never mind the fact that engineering could produce 5 x what it does today). We probably should be trying 5 x as many ideas as we do now, some of which might fail because they're too daring. Those settlers in the west seem to have only one care- getting a product; not their careers, training, processes, tools, interfaces, etc. which we spend our lives worrying about here in New England.

I doubt that we can change the bureaucracy we've created, but I think it's imperative that we try and create at least one more group of the same size and quality because we need more high quality products so that the empire (and the mediocre products) can be sustained.

Any candidates for another remote group?

SUBJECT: RE: PEOPLE FOR DEC-WEST

May be haggling over details. Key is who is going and what their interface and credibilities are with the existing group.

Am delighted about the commitment to growing the group out there, versus only the pressure to take people in the long run who may want to move. Felt that in the initial blast, there should (must) be one person from the area just to start to tie the group there, versus having the people who tie the group here.

You, Roger and Kawell represent an incredibly powerful team. Want to get the new growth started there too.

What is the way to get the connection with that community too when you first move out? One person could be highly useful and very symbollic to the community, especially the computer science group at Washington and Boeing who we know.

Dear Mr. Delehar:

Enclosed is the check from Gordon Bell for 460#'s to cover his purchase.

Please package so he can carry it on the plane. I'm not sure what information or forms he will need to get through customs but will check on this. If you already are aware of what is needed and have it available I'd appreciate your putting it with the package.

Gordon will pick up the package at our DEC office. If you would deliver it by September 3 to the following address, it would be much appreciated:

Janet Partridge
Data Center Manager
Digital Equipment Company Ltd.
James Watt House
279 Tottenham Court Road
London, W1P9AA

Tel: 6375200

Thank you for your assistance.

Sincerely,

Mary Jane Forbes
Secretary to Gordon Bell

September 20, 1983

Dr. Burton Smith
Denelcor Corporation
PO Box 31500
Aurora, Colorado 80041

Dear Burton:

I'm delighted to hear that several of your machines are in use and that you're working on the next machine.

Could you please send me information on the machines and any results on applications that exploit parallelism?

Sincerely,

Gordon Bell
Chief Technical Officer

August 18, 1977

Professor Michael L. Dertouzos
Director, Laboratory for Computer Science
Massachusetts Institute of Technology
NE43-105
Cambridge, MA 02139

Dear Mike:

We thoroughly enjoyed the chance to talk with you, about machine ideas. From our viewpoint this discussion has been fruitful by providing us with a challenge about cost, performance, and functionality. I hope we can engage in a closer liaison. It seems there is already progress within the Electrical Engineering Department on being able to use our semiconductor facility. I hope that Multics people will also participate in this because using such a system is also a computer applications problem.

It seems that while we've been working on machines we aren't yet able to provide a personal computer with 0.25 to 1 megawords (PDP-10) of primary memory and 20-30 megawords of secondary memory for $30K by 1980. You outlined five areas we must examine.

1. Is it worth (useful) to microcode machines for LISP? You asserted that it probably wasn't worthwhile. I am attaching the draft of a paper for the special issue of the CACM on Computer Architecture in which I talk about MIT (mainly McCarthy's influence on the PDP 10 for LISP). I think you might have some impact since we might make modifications using microcode.

2. The memory is supposedly 0.25 to 1 megaword. The question is how large as this drastically effects price? Also, I believe we must use a memory hierarchy with CCD's. This relates to issue 4.

3. Should there be a central disk system or should each machine have its own disks which are 20 to 30 megawords (40 to 120 megabytes)? (I favor standalone systems.)

4. Should there be a memory hierarchy? I claim that we have not found a case where the notion of memory hierarchies do not work (i.e., memory locality exists). Your insistence that memory hierarchies do not work for your problems means that we can not reach the cost goals for 2 to 3 years before they could be met in another environment.

5. What should the flow of money be?

We would like to establish a much better relationship with MIT and MULTICS...in fact we would like to approach the relationships we have with Carnegie-Mellon, Cal. Tech., and U. of Pittsburgh. While we didn't go into this, I believe we must begin to understand the benefit to us more clearly if we are to work closer with MULTICS. MIT's unique operating systems on 10's and 11's have insured that there is no software that can be transferred to us or other users of our equipment. Aside from DDT and TECO, I don't know of any other programs that are used outside the MIT environment. (LISP was rewritten by Stanford to run under the 10 operating systems.)

While Multics is concerned with what it can get from DEC, I'd like to re-iterate why I believe we should be interested in each other:

1. I have the impression that you're working on programs that use large memories. Since memory prices are declining rapidly, we should be interested. Here, MACSYMA is the best example. Are there any others that do useful work?

2. Your desires for computer capacity leads others.

3. We listen to your needs and concerns about equipment.

I believe we have a way (factory) whereby your ideas about computation can be utilized quickly and made available to a large community.

4. We simply want to supply the right computers to you and the R and D community.

5. The students who enter MIT are bright and they are exposed to a bright faculty with good computation facilities. We enjoy working with (and trying to hire) these people.

I and Ron Bingham promised to get you a model of component prices so that we could jointly develop (configure) systems that would meet the $30K goal. For now, please extrapolate the data in the attached figures (from a paper on the 10 by me for the CACM) taking the fact that a CCD memory is about 1/3 the cost per bit as a random access memory. (Let me know if you'd like a copy of the paper as it was submitted.) You might also take into account the factor that you buy machines at some discount and the 30K should reflect this. (Maybe a factor of 2 is reasonable here.) While I'm not happy with this model, it can get you going now. I'll try to get you a refined component model soon that's more oriented to high-volume minicomputers.

I'd very much like to get a copy of the text you're putting together on computing in the future.

Again, we enjoyed the interaction. We need to hear about/understand something as to these large memory applications.

Sincerely,

Gordon Bell
Vice President,
Engineering

MESSAGE ID: 5166445007

SUBJECT: TRAINING FOR NAUTILUS BY DOING REAL DESIGNS

The loading on TW drafting is light I understand now before Nautilus builds up. Ulf has observed that it's important to do designs even if they are not going to be used simply to train the cad folks. We pay them anyway, and the issue is that they have to learn.

I believe we ought to have a backlog of cost-reducible designs that our drafting groups could work on to fill in time. Right now, it is critical that these folks start to do gate array designs and get the process debugged!

In Venus, we learned that every part of the process has to be characterized and debugged before real use and there is a real, learning curve on the order of 20% (each time you double the experience of the number of parts processed, you get a 20% reduction in time to do the work).

I'd like to see us run the various parts of the Nautilus design system including simulation and the links with TI (especially!). We should also get parts back and go through the testing and debugging of boards.

The second thing we learned on Venus is that someone has to be responsible for every step of the process (schematics, simulation, gate arrays, interface to vendors, testing, the whole board process including stuffing and testing). TW doesn't look very good here because it doesn't do that many designs and the designs are all different designs styles. Therefore, we need to characterize the process even more.

Let's use this vehicle to get the process running.

Bill,
Who is responsible for the whole process?
Can we try this to get ready for the Nautilus in a real, meaningful way?
What youse think? good/bad idea?

SUBJECT: MECHANICAL DESIGN ELEGANCE AS THE FAST TRACK TO Q&P

At the OC Woods, Ken asked us to emphasize our mechanical design,
especially packaging. We all know the incredible effort it takes
to design something that is very simple in concept, manufacture
and appearance. Our designs leave a lot of room for improvement.
They are hard to build (some requiring >2 armed robots), heavy to
carry and the customer can't really deal with them in his environment.

It's clear to us all that the new products we are building
have to be mechanically elegant and customer integrateable.
Virtually all 16-bit systems in the early 80's are going to be
modular and buildable by the customer (including Aztec based
ones). Furthermore, a customer should be able to put together a
full blown communications network using NI and Mercurys.   We
should target as much as possible to have modular, Type III
systems whenever possible. (Recall type III is desk, or table
based whose modules should all be independently portable by 1
PERSON, with the ability to be merged by the customer.)

Mechanical elegance must permeate all our designs from the chip up to all options and all systems. I don't know precisely how we start, but it's a clear topic that will come up again and will be looked at very much in the April Woods.

If we go for Quality and Productivity as our work theme these next 2 years, one of the fastest roads to quality is through elegant (simple, few, correctly placed parts) mechanical designs. The product just looks better (and higher quality). Mostly having fewer parts gets us a triple whammy: quality image, lower cost, and higher reliablity.

Any ideas how we really go for this?

SUBJECT: QUALITY DESIGN METHODOLOGY FOR YOUR GROUPS NOW

GB4.S1.12

The attached describes what has to be implemented across engineering starting now -- especially in light of the

ECO's in DECMate and the Pro.

The problems (hell) we've gone through in the VLSI, large and mid-range systems due to complexity is similar to the one I see on your projects given the long gestation time (and ECO's). I can only conclude that we aren't being careful enough and are not well enough trained . . . strictly the Old Digital. (I've seen nothing but primitive design aids.)

While we must bring in all available resources to thoroughly analyze and review these designs, it is only a palliative to get them done.

In parallel, I'd like you to introduce the design walk-through
and simulation steps now as a further palliative. John Manzo and others on BJ's staff can describe the design processes.

We have to get to the point where a one board design requires a few months of design and simply works WITHOUT ERRORS.
Let's start today.

SUBJECT: SCORPIO: ORGANIZATION REVIEW AND INSTALLING TND/EQDM

At the recent Scorpio Design Review, several issues came up:
.Who's in charge of the system architecture and various
modules?
.Do you specify and characterize the components and
processes?
.What is the design methodology? Who's in charge of it
.Will you use quality walk-throughs? how much simulation?
.How are you doing the training? since engineers will run
programs
.Do you have the machine resources?
.How do you manage across all the sites?

While I don't think you are near VENUS/Jupiter disease
because I see
much more involved and knowledgeable top managment, I would
like to

see how the detailed design is organized, managed and what the
designers know regarding handling a design of this complexity. Also,
we simply can not afford any slips in Scorpio or the BI options... and
I would like to accelerate them, as well as get more modules for the
same effort. Note that quality design increases productivity.

PROPOSAL: LET'S USE THE QUALITIY DESIGN METHODOLOGY...

While this has not been flushed out very well, I'd like to use Scorpio
to define and use it. John Manzo and Sharon Keilor would come in and
help in the definition, and then go on to work on training.

The following slides were given at the State of the Corporation last
week, and what I think we need to have in order to get the job done.

THE NEW DIGITAL (TND): ENGINEERING

THE EDGE IS THE ENGINEERING ENVIRONMENT

where we use our Fifth Generation products based on a homogeneous VAX environment, to learn, bootstrap and build the Sixth Generation

WHERE ENGINEERS, ENGINEER!

products, tools and processes to build products, and components for building products in ALL parts of the World

AND USE THE QUALITY DESIGN METHODOLGY

to drive and exploit engineering learning curves so that as engineers, we do lots of designs in our lifetime!

(The ROI on designs that have a shorter gestation time will be very high because the designs will be much more competitive...)

A PROJECT EXPERIENCE (in the old Digital)

Specify the scehdule: 9...27 months to FCS
Establish a program office to co-ordinate and trade-off:
  Service, Manufacturing, Marketing, Design Processes, Scheduling,etc.
Establish a design group and leave them alone to oranize, argue and
  try to write some sketchy specifications about the product
Occasionally review but concentrate on the periphery, not the product
Predicate design on QUICK DESIGN, BUILD, SEE IF IT WORKS METHODOLOGY
  where a poor, half-done breadboard is somehow built to learn from,
  followed by a redesign (or two) that will be manufactured,
Avoid: understanding, conflict that comes from design trade-offs,
  timing analysis, formal (computer checkable) interfaces,
  verification, design inspections, simulation, etc.
Manufacture and wait for the ECOs

VENUS EXPERIENCE

(an example, of the Quality Design Methodology)

Copy and install the ideas from complex VLSI design and software:

Organize in a hierarchy of chief designer, project leader and box projects (each with chief designer and project leader)... in a team!

Establish clear goals: eg. quality, shipment, performance and cost

Characterize the processes and components (eg. gate arrays, modules)

Be able to understand the "state of the design" automatically

Predicate the design based on the QUALITY DESIGN METHODOLOGY:
  where at each step, there are no errors...
  design it correctly, verify and model it, inspect it, test it via simulation, and then build it (and expect it to operate at power on)

Use the physical hierarchy as a "friend" to segment the design and establish formal contractual boundries among the team

Use the logical hierarchy as a "friend" to segment the design in time and make sure that there is always a "running" (simulated) design!

Repeat on the next design!

TND: ENGINEERING FOR THE FIFTH AND SIXTH GENERATIONS

Highly trained, engineers and managers who understand the competition
by being with customers, at school and technical seminars,
competing with the Japanese, IBM, AT&T (et al), and start-ups

Install and use much improved design tools based on our own
Fifth Generation...the VAX, homogeneous computing environment
(with direct links to all engineering and manufacturing sites)

Tools for technology scaling to allow re-use of designs at least once,
and learned from. Also, tools for automatic, low level design which
will allow creative, higher performance and higher reliable designs

Underlying semiconductor and interconnect technology for designing (by
compiling) all kinds of computers and computer based systems

The Sixth Generation, based on known and evolving ideas about better
communication with humans, thereby creating more use

25 November 1984

Mr. Arnaud De Vitry
41 rue de l'Universite, 75007
Paris, France

Dear Arnaud:

Thank you for the gift to the Capital Campaign and the moral support that helped open the Museum on November 12. I hope it will be one of Digital's greatest achievements.

The physical realization has turned out to be much more exciting than any plan could have communicated. The staff made a very large "stretch" to open a range of galleries. The reviews have been positive and it is easy to spend a half day in productive learning. Knowledgable teenagers are spending their days at the Museum. The most flattering comment to date has been that it is the first American technology museum to be at European standards. Dr. Oliver Strimpel, who did the Museum's Image Gallery has just become the Associative Director and Curator. Oliver was formerly the Curator of the Mathematics Section of The Science Museum, London. The long collecting period and five year breadboard at Digital really paid off in collecting artifacts, building exhibits, doing lectures (ranging from Amdahl to Zuse) and gaining widescale support from computer people and companies.

I want to see this phase aimed at:

- putting a formal educational program in place,
- continued collecting of artifacts (whether letters, films, manuals or machines) in order to record the significant, information processing events, and
- getting broad public support from computer-knowledgeable people who want to learn more about the past and future history of computing.

Again, thanks for the support. I hope you can visit it soon.

Sincerely,

Gordon Bell

SUBJECT: OUR VAX STRATEGY (AND THE NEXT DG MACHINES)

All future Dg 32-bitters are TTL or TTL/AS with a very few gate
arrays.

Nebula - size	(2 board)	end '82
780 X 1.5	Comet Pricer	early '83
780 X 3.0	780 Price	Mid '83

We must re-think our product strategy and our product implementations
to live within our basic up-front project planning, technology,
tools,
design discipline and methodology and project management skills
instead of making every machine a research project in one or more of
these dimensions (Venus breaks them all).

Even living within these constraints doesn't insure a timely product
because we may change our mind when the machine is built (eg. Nebula).
Our management record is really poor! I'd like to get the Operations
Committee to review our thinking and our readiness to build and
effectively produce Nautilus, Gemini and Scorpio.

Our design philosophy must also change for VAX. We must look

at basic
design alternatives that trade off chips for regularity. Our old
style design temperament to minimize manufacturing cost is not
relevant for VAX because minimizing cost may increase complexity in
the structure and in microcodes. Also, this style design increases
time to market, manufacturing testing and perhaps field service costs.

Here we need some new ideas.

Operations Committtee: please start by scheduling a review of
Nautilus.

Diary of My Visit to Japan

Gordon Bell — Summer of t

th

July 1 — Arrive Tokyo

My seat mate from Honolulu, Anthony Geber, Director of Economic Policy, Bureau of East Asian Affairs (State Dept., 202—632—9690) elicited some argument from me. (He opened.) We exchanged business cards (I'm practicing for Japan) as it's the only time I've carried cards. (This, according to Reischauer, is the thing to do.) At any rate, his concern is simply that Americans are too lazy to compete. Also it's too hard for us to go after their small markets. Mine is more fundamental —— Japan's growth versus return on investment; the availability of capital; Japan's trade barriers and language/cultural barriers; and the way the Japanese focus on winning in trade —— all serve to scare the hell out of me. Throw in our waste, vis a vis energy, too. I also attribute our regard for science over engineering and engineering over manufacturing as key. The fact that we no longer build, but use tape recorders (especially videotape), radios, TV, high quality cameras (we only built a few — Kodak 35), small cars, is cause for concern.

July 11 — DEC Office + Keio University

Here we lie, watching the news (in English) after a day of running around like mad. Our host, Yu Hata, picked us up at 9:00 AM, took us to the DEC office, gave us a one hour briefing on computers in Japan (a brief history), and then I gave a two hour seminar on DEC products and engineering organization. There was an hour of questions on everything from 50 hertz 100 volt power to multiprocessors. It's clear we have inadequate planning of products for this market. Engineering makes its plans clear. Who's got the responsibility? (GIA-Janzen, CSS-Holman/Martin/Watanabe, the VT100 product here — Halio, or DEC Japan or some P/L for character sets?) This is a mess! For starters, I say GIA had better drive this issue!

We went to a nearby hotel and had to have an international style lunch (versus Japanese) because the Japanese part was full. I intend to assimilate everything —— just like the Japanese, so the food is paramount.

We left at 1:00 PM for a ride to Keio University (CHU affiliate) where I gave a talk onminicomputer architecture, which prompted lots of questions. We left at 5:00 after interaction and a view of their predominantly batch 11/06. Professor Toroko is an assistant professor in hardware. We were shown around by Professor Nori Doi. They would very much like to visit DEC. There was interest in architecture, as they wanted to build a large multiprocessor. Funding is tight as they're a private university with no NSF, ARPA or real industrial support. The main professor wasn't there.

Toroko gave me some papers which I'm sending internally, and Doi gave me a paper on the Fortran they built for the 11/08 patterned after Waterloo's WATFIV. On the return, Hata finished his lesson on the Japanese computer industry vis a vis the 3 pair of groups (Fujitsu — Hitachi, who make 370 compatible), (NEC — Toshika, who're looking for

a mini in Honeywell and used to be with GE) and (Mitsubishi — Oki). Univac (Nippon) is a dominant supplier somehow, based on Mitsui's earlier impetus! (Sept. 76 Datamation explains this quicker and better. The article is attached.)

We were dropped off at the Okura Hotel, I wandered around checking out the baths, water, etc. and finally settled on a swim indoors with a sauna. This let me shed a kilogram quick plus earn dinner. We went to a nearby restaurant Hata recommended and got a reasonable meal for only $30 each. It was quite good, not great, but we muddled through as I almost drank the tempura sauce versus wait for food to dip it in. We returned at about 8:30 and I called Don Frost about our visit tomorrow to NEC. I'm set to see the Director plus the technical management. Since I have a strategy to get a large share of the market, I wanted to check it out. Don said I, objective technocrat, should try it out with them! Basically the theme is: Buy any or all of DEC hardware/software; use it as a standard (just as Fujitsu—Hitachi do with the 370); sell in any/all Japanese/world markets and build a huge 11—based computer business! The Ministry of Trade/Industry (MITI), who controls all, should absolutely love it. The only trick is to get them to invent the idea!

July th - NEC

We had enjoyable talks/visits with NEC. The main purpose was to assure them we'd support them in their effort with the distributed system for the IRS (NTAA) using our machines (DECnet, 11/70, lAS). This was needed because they may view us as a source of technology (DECnet, minicomputers, interactive systems). Actually, technologically they're quite advanced, but probably in the wrong direction as their machines are ECL—based. The high ends are a takeoff of the Honeywell ceramic modules. They've been affiliated with Honeywell for 10 years, and next year the affiliation will be reviewed again. (Honeywell doesn't offer them anything.) The high—end is 635 based; the mid is on some earlier (2000?); and the low is on their earlier machines. Their office machines (100—series) are based on their versiOn of the 8080 —— note it's an upward—compatible (one-way) version!

Their factories (computer and TV) were immaculate. People seem to move around fastei' than in ours, with more to do. The designs and quality of workmanship were quite beautiful. They commented on our reputation for quality and reliability —— which I think we have

but we have to get these better. It's the one sure way to sell in Japan. They like quality/reliability (probably our other customers do too).

I had visited a TV factory; it's like I expected. They make 1,500/day

— 300K/year. They have to make subassemblies because of U.S. import quotas. Their 5 Japanese competitors for U.S. market now have U.S. factories, which means the issue of Japanese products (TV) is solely a capital, manufacturing and design issue — not high labor, for example. Again, I remember buying and giving away a large Zenith portable color and replacing it with a Sony color! (The Zenith

replaced an old GE B/W which was never particularly good.) So in essence, I believe our ability to compete with the Japanese is:

1. A product design: quality/functionality (they adore knobby gadgets just like we do)/reliability.

2. Ability to manufacture it cheaply (and in volume).

As long as we don't forget this, we have a market. When we do forget, we'll be a distributor, just like GE and Zenith! (Incidentally, I recall that as engineers we felt sorry for the 100 TV engineers on Zenith's research group.. .why didn't they design better products? Why not a tape recorder? No American company produces a VTR (yet it was a U.S. invention). This gets back to emphasis of research (science) vs engineering vs manufacturing. I hope we're doing the right thing by pushing more on engineering and manufacturing (to a lesser degree) versus research at DEC.

In the afternoon I met with a number of their people from Central Research. They're largely American trained, where the cost is lower and training is supported by U.S. government. One was trained on MIT Multics. We had no trouble in communicating! My earlier frustration that they wouldn't talk wasn't true. I did have to control the flow, otherwise they'd clean me out of information! The affiliation with CMU turns out to be good, because I can merely quote work there and stay out of DEC's work. The central (non—product specific) R&D is 100 people versus 50 for us.. .or they have)4 x the R&D per NOR since they have roughly 750M in sales!

They're building a very high speed COBOL engine, multiprocessor (just as we're fascinated by them for production reasons), and doing a mass store subsystem. It's hard to compare us because they're more into batch. They build bigger machines, but they'll soon learn, as they build Honeywell's Level 6 mini under license. I sense they have a fairly muddy strategy, building product—by—product as ideas seem to be good. (With our high end VAX/10/2O machine, I think will be a long way to having a clearer product strategy —— although we'll have more products!) A person from R&D was amazed at VAX, and what it had, what it cost.. .he said all those ideas came from large machines. Surprise! I said this in a paper in 1971 on minis!

Speaking of ideas. The Japanese (and we) have about the same regard for ideas.. .they're useless until applied. Once applied, fair game to be modified, taken, etc., within the limits of the law and morality (e.g. patents). I think we need to state as a policy that we do want patent protection on ideas whenever possible, and that we'll take ideas from any source subject to moral/legal constraints! Here's what struck me:

1. The semi—automatic wiring machine that Stocky designed wasn't

patented. We gave it away to be manufactured locally. It was manufactured here as a copy by a Japanese firm. (1 suspect.

they've improved it and maybe we should look into purchasing them

here.)

2. Their low cost Teleprinter was adapted from Extel.

3. Their high speed laser printer was mainly IBM based using some Honeywell ideas.

4. The CML logic on ceramic modules came from Honeywell — although they made them manufacturable.

5. They use Gardner—Denver wirewrap machines and Universal inserters.

6. Manufacturing tools seem to be adapted from Macrodata, Universal, Teradyne (the wirewrap/backplane tester).

7. Their printer came from Versetec, though in a different package!

8. Their Fax machines probably have similar origins!

9. Their new Spinwriter is an adaptation of Interdata's carousel — I have some printout samples. The quality may not be high enough

for word processing use. They're stressing reliability, speed (to c/s) and quality!

10. Cables/connectors come from the U.S. (maybe under license).

11. There are copies of the Tektronix scopes.

On the other hand, aside from our development and dedication to interactive and real time computing, many ideas of our products came from someplace outside (e.g., DECtape, 3M tape, cassette tape, the RKOS, the

DECwriters, the CRT's, the cache) various CPU implementation organizations, APL, BASIC, COBOL, FORTRAN, wirewrap, various LSI and manufacturing tools). We did contribute to computer structures more. In many ways we resemble them.

In the evening we had dinner at a posh, continental style restaurant with Dr. Ishii and Mr. Kitamura of NEC. I reaffirmed our support to them to make the NTAA (IRS) project a success.. .without this MITI will clobber us and our name will be mud. This is merely a reaffirmation of the Operations Committee decision requested by Marcus, GIA, and DEC-Japan.

Ishii was relatively speechless when I laid out the proposition that they standardize on li's and drop the manufacture of the Honeywell Level 6. This gets them a mini right now, without continued investment, and they can backward integrate as they see fit. This theme for the GIA nationalistic companies is the right way to approach the marketplace. Somehow, we have to convince them that we're sincere and believe it to be the way to get into computers. This "sales approach" isn't widely understood/used. We need to formalize it. Japan would be the ideal place to start.

In the afternoon we went to the NEC computer factory and I talked with a number of very bright people from their central research lab. Fortunately they don't understand minis .... or they put on a good act

(they had xerox copies of our VAX documents). Research has 100 people for a company half our size (i4 x the effort). We saw a TV factory complete with multi—height rack burn-in (which we should use for disks).

July th — Fujitsu

We visited the central lab of Fujitsu at Kawosaki (Mr. Kurosaki and Mr. Sato), and then went to Numazau near Mt. Fuji where the computers were built. Fujitsu is the most computer oriented of all the companies because their founder, who died a few years ago, built one of the first relay computers. They ran the relay machine for me at Numazau while it calculated several common functions. They're not especially profitable, but they make beautiful computers and have the necessary technology. We saw their newly announced M200 (1.3 — 1.5 x 3033) multiprocessor using a dual cross—point for reliability. It appears superior to both Amclahl VT and IBM (neither of which believe in multiprocessors (on M200).

Yu Hata and I could have easily had an argument on the relationship between Amdahl and Fujitsu. My view is simple: at IBM, Amdahl had developed a significant set of ideas on how to build 360's/370's. He left there and further enhanced the ideas in the circuits, design aids, packaging, small components assembly and testing areas. He got into financing trouble and Fujitsu bought a significant amount in return for the technology. Fujitsu put up the capital for the factory and made the assembly line work — no trivial feat because there's so much small assembly work. Fujitsu's first machine was not better than Amdahl's, but they took a longer term view (they are not that profit oriented) and produced better design aids and semiconductors, etc., so that their circuit M200 will probably beat Amdahl's V7.

The workmanship and detailed engineering is really fantastic. They have a very good master—slice (gate arrays) and fast (8 nsec) RAMs. In the terminal work, they have an anechoic chamber to get noise level down. They have some color CRT's and a floppy based intelligent terminal and are working on high level forms languages to make them easier tc use. Of course, their disks are reverse engineered copies of IBM's.

Overall, Fujitsu seems the most frightening because of their dedication to quality, and winning. They have the strongest engineering and so far haven't been interested in mini's (PANA FACOM is their brand — a joint venture of PANASONIC (Mitsubishi) and Fujitsu). Also, given their disinterest in profit, they'll be doubly hard to beat.

Probably more important, Amdahl understands IBM mentality and how they strategize. This clearly influences Fujitsu and MITI. In fact, I believe Amdahl influenced MITI, at least indirectly, to build the plug compatible systems!

In visiting the Fujitsu factory, we saw one of the floors of the factory was devoted to programming. They had set up something that

was very much like an assembly line for programmers. I would love to have our programmers look at this kind of environment because, in effect, there was really a sea of programmers. Probably the most impressive part was that they had a great number of line printers all backed up to a conveyor; and as each line printer finished its output, it was cut and stacked. It was cut into the appropriate pile; the pile was put on the conveyor; and the conveyor ran it off. The whole thing appeared on a carousel so that in fact all the programming listings were delivered stacked automatically. Of course, there were no individual offices for the programmers, only a sea of desks.

I guess the other thing that was impressive about the Fujitsu factory was the very clean atmosphere. The custom of removing shoes is very helpful; this is done on entry to computer rooms, temples and tea rooms. It was the cleanest of all the computer companies that we saw. This really pays off when dealing with the large number of contacts, the small coaxial cable, and the way the multi—terminal integrated circuits are sorted at that point under the board.

The Fujitsu M190 and M200 computers also used color CRT's for controlling the computers. KIVIAT graphs are displayed on the consoles so that one can get an idea of what's happening to the various resources. They are used in real time display in the Fujitsu computers.

th

July Q - Electro Technical Lab and University of Tokyo

We visited Dr. Nishino and Dr. Mo of the Electro Technical Lab, which is run by MITI. This is a Central Research group responsible for computer research (the nearest equivalent of ARPA). The lab in a sense looked like many government labs — a series of dusty old equipment with experiments, which can be put into service for visiting dignitaries; some good and some bad work; and a bunch of reasonably intense Ph.D's. I gave a talk on the VAX design and it illicited a number of interesting questions. They're doing a large number of computer structures related work, several projects on multiprocessors and on microprogramming, and various things on language translation. On Dr. Nishino's desk was a well worn copy of the Quantam Sciences forecast on office automation. I asked to see stuff on Word Processing but the stuff I saw was not particularly useful or impressive.

The ETL does have one interesting virtue in that it does very little hardware building. In fact, its main function is to fund various industry groups to do design for a lot of the Japanese minicomputers. Anyway the one that is the equivalent to the DG mini looked exactly like the DG framework, except the workmanship on the console was much better than Data General's.

We went to the Tokyo Hilton and fortunately had Tempura, which is sort of batter fried fish, shrimp, and vegetables (probably the easiest thing for Westerners to accept and digest). It was about our second Japanese meal, because all the other meals were given to us assuming that we could not eat Japansese food. We had sandwiches (with bread

crusts removed, delicately made and presented) at the various companies and had continental food when we went out (especially the elegant NEC meal which was heavily influenced by French cooking).

In the afternoon we went over to the University of Tokyo where I gave a lecture on minicomputer architecture in a very formally decorated room (held about thirty). They apologized for the small crowd because it was vacation. I was with Professor Ashida and Professor Inose, both of whom had spent a great deal of time at BTL. Inose is the father of the time sort algorithms for ESS No. 1 time division multiplex switching, which he did about twenty years ago. The talk was supposed to take one and a half hours with a half hour of questions, but ended up taking about one hour with roughly forty-five minutes of questions. We went to Professor Inose's office, were formally received, and discussed various types of things. The two professors had to leave because they had a dinner meeting of some sort.

We were then shown around the large Hitachi machines by one of the students. It was the Hitachi 8800 and he lamented the fact that Hitachi now was making IBM compatible computers, which he considered inferior to the ones they had currently made. Their other line is almost IBM compatible, derived from the Spectre 70 unit, but has special supervisory call instructions which makes them incompatible. We looked around the computer, which is really a monstrous machine because it was made out of MECL 10K, I believe; but the machine was water cooled.

There was a four processor system, three fast processors and a slower processor. The load was not very heavy. We went over to look at the system resources and I ran a BASIC and FORTRAN program. The BASIC null program really bombed out so I have a feeling the null program took a good deal of time showing that they had some kind of interpretive compiler. The FORTRAN produced good quality code and ran very rapidly.

We left there about 6:00 PM for dinner with Yu Hata, his wife and Don Frost at Yu Hata's son's apartment. We spent a thoroughly enjoyable evening looking at his airplanes. Because he is an avid photographer, he got into building model airplanes for aerial reconnaissance photos. He also built some helicopters. All of this was indeed incredibly impressive. The airplanes are very detailed and take something in the area of six months to one year to build.

July st - Sony

We were picked up early at the hotel, checked out, and went to the Sony Corporation Central Research Lab where we were given a brief introduction to what Sony is working on. Other than that I was able to get no information from the Central Research Lab group. I asked about what was going on in the Systems Research Group, but the only thing we saw was a Sony TV tube (used for Graphics) for which .1 have the specifications.

They also demonstrated with characters but the interlace problem created incredible flickers. I asked about buying monitors but they said I would have to see Mr. Iwama. Having gotten no information from the Central Research Lab, we then went to Sony’s Atsugi plant, where we saw the video tape recorder being made. In contrast to the NEC TV plant, the Sony plant did not do any burn in of parts but in fact used testing to ensure that the product worked when they were all put together.

A large number of the parts were done outside this plant and subassemblies were brought back for fabrication. In all the plants that we saw only about half of the work is done inside. The rest is done by subassembly or contract labor. In the factory only 40% of the 1,100 people were workers. Of course, this was reasonably high considering that in that factory about 250 out of the 1,100 were in the engineering group. This is where they made so many semis.

The semiconductor part used three micron channel width for NMOS. They were the first in Japan to use the Bell Lab license of the transistor, and Mr. Iwama, the President and technical person at the top, insisted that a large number of engineers be hired to do semiconductors and, in fact, he backed Dr. Esaki.

Sony has an electron beam mask maker, which they got from Japan Electric Corporation, which is a copy of the American electron beam mask maker. We saw one of the AM 2900 ion implanters. It was just the fourth or fifth installed there. They pride themselves in owning a great number of the key semiconductor patents and, in fact, have a 10,000 volt transistor patent which is very key to making all solid state TV sets.

We left the factory in time to have lunch with Mr. Iwama, who of course took us to a hotel where we had a western meal; but before this, we looked at three very interesting video recorder projects all of which we have become interested in.

The MAVICARD recorder, which I have brief information on and a carousel version that allows up to five other cards to be loaded automatically, is a scanned device and the card holds up to one hundred images. There was a small video disk which held ten seconds of video on a frame by frame basis, and could be used in freeze frame applications. That system will be introduced this year for sports teaching. I am asking Yu Hata to go ahead and get information on these products. The third device was a small tape recorder, a tiny video disk about three inches in diameter that can store only a few frames of video.

All these products I find extremely intriguing, and all we have to do is figure out how to couple them to DIGITAL recording. Iwama talked about the various forms of pulse code formulation for audio and video (they have got to get into it). We would automatically end up with tape and disks that will allow us to use the video technology in computers.

They make it a point in their advertising of trying to stay away from anything that other people are doing. One can see by their various products and images, just what their approach to life is. Their motto is, “research makes the day”

After lunch with Mr. Iwama, we drove to the train station where we got on the bullet train for Kyoto arriving in Osaka at about 7:15 PM. We were met by the software specialist and were taken to the Osaka Hotel where DEC Japan, Osaka Branch, were having their end-of-the-year party. There were about 75 people there. Don Frost gave a good speech calling for plenty of openness and then I followed up by saying how glad I was to be in Japan, about how impressed I was with the Japanese, and our need for quality.

We finally got back to Kyoto and the Tawaraya, an old-style Japanese Inn, at 11:00 or so. I was glad to lay on a mattress that was flat on the floor and very comfortable, after having lay too soft in Tokyo.

July nd a rd — Sightseeing at Kyoto and Nara

We had breakfast, Japanese style, in our room at about 8:30 AM and then Gen. Narui and Miss Tomioka came for us to go sight—seeing. In Tokyo we had home—made coffee and fruit in the room to gain time, decrease interaction, write, and it's awfully cheap.

In the morning we went to the summer detached palace of the Emperor Shugakuin outside of Kyoto, which included many temples, houses and rice paddies in an extremely beautiful setting. We were very fortunate to get there, and because I was a visiting "dignitary", we were allowed to go. I was glad that neither Yu Hata nor Gen Narui had seen the palace so it was a treat for all of us. Miss Tomioko was in a traditional, elaborate, beautiful Kimono and kept being stopped by U.S. photographers at each site.

We took off on a tour, which was about a two mile walk in reasonably warm climate, up and down the hill in an almost Greek-like setting. Then we left for Araàhi—Tei, a restaurant I think attached to a hotel that overlooked the Hozu River. We had a typical Japanese, probably nine course, luncheon starting off with beer because we were so thirsty after the walk. After lunch we went up the Hozu River and rode the boat down for about 10 miles back to the landing of the restaurant.

Off we went to visit the Nijo—Jo castle in the center of Kyoto. This was a castle of the Shogun, built to impress the Emperor to put him in business. However, neither of them spent that much time in Kyoto because they both lived in Tokyo. The castle was, of course, extremely impressive with moats all made of wood and bambоO.

We came back to the Tawaraya, cleaned up a bit, and went out to dinner at a very nice restaurant. It is hard to remember which is the most memorable part of it, given that there were so many courses. After dinner we went down the main street of Kyoto looking for various souvenirs.

I spent most of my time looking for a knife, having been intrigued with the possibility of slicing vegetables very thin which is one of the specialties of the Japanese salads. I found one, got a few other odds and ends as presents, some more ideas for presents, and returned to the Hotel about 9:00 or so, quite ready to konk out so I could go the next day.

On Sunday morning we were trying to sleep late, given that we were going to take off at 9:30, but our maid/attendant unfortunately decided that we should get up about the same time as the day before and we were out by about 8:30. We met Gen and Miss Tomioka at the railway station and caught the 10:00 o'clock express train to Nara. The train is run by a private company and was extremely comfortable and cool, as are all the Japanese trains. We all got to the Todaiji Temple at about 10:30.

We went on to visit the Taishi Shrine at the same location, walked around, and had a fairly heavy nine—course lunch at an old inn called Tonochaya. We were off by 2:00 and went to visit both the Toshodaiji Temple and the Yakushaji Temple. These were high points of our trip. We were met by a lady who is on the staff there. Miss Tomioka knows her very well and we had an incredible walk through the various temples. The latter temple was probably most impressive because a fire had destroyed the west temple and they are building a new one. We were able to talk to the engineer who is in charge of the new construction. He showed us around and we ended up going into the construction of the temple. It is made of wood with no metal and is about 30 — 40 meters tall. We also went to the site where the wood was being prefabricated. This is being done by a bunch of scholars and an old carpenter. The whole temple is, of course, designed to last 1,000 years and, with the care they are taking, should easily accomplish this. There are about twenty carpenters working on the building. It is thought it will take about three years, or about sixty man years of work, to complete this temple.

The superstructure of the building is built around a wood pole and the temporary structure is made of steel and is quite permanent. After we got through climbing around, we were taken up in another temple that houses some of the Buddhas. All these temples, of course, house Buddhas of various sizes and shapes. The first one houses the world's largest Buddha made of 12th century bronze.

We were presented with various photographs, gifts, good luck charms, and goods to help us on our way. We had tea and cakes with one of the monks at the temple before we left at about 5:15. We got the 5:30 from the station near the temple, transferred to the express at Nara, were back to Kyoto by six, and had dinner at seven.

The five of us had dinner at the Tawaraya - eleven courses. It was a magnificent dinner starting with raw fish, vegetables, and soup. Along about the eighth course we were served with a very heavy tempura as batter—fried shrimp, vegetables, potatoes, and fish. I was hoping things would be over, but in came the next course, which featured the hibachi. Everybody had steak and various vegetables. Somehow I

managed to get through that course, but skipped the next two because it is probably thought bad luck to have an even number of courses. We were all presented with small hibachis. We finished dinner at about quarter of nine which is not necessarily typical, because for some reason, even though food is very lovely and things are in small servings, the Japanese eat very fast. While I am here I am trying to eat slower than normal, otherwise we would finish the meal in probably an hour. I do enjoy the food and the time spent very sociably.

July th - Talks at Kyoto, Osaka, and Kyoto Sanyo University

I gave lectures at Kyoto and Osaka Universities and had dinner with people from Kyoto Sanyo University. (The tape is apparently lost in the Sydney secretarial pools).

July th - NEC

We visited NEC in Kyushu, which is on the island of Okinawa, a place where NEC makes almost 80% of its semiconductors. It is there because of the labor force and because of the supply of water. They make about 5 million pieces a month, 60 million per year (at 80%, this would give the total NEC IC's at 75 million per year). If each is selling for maybe $3.00, because they have a large amount of LSI, NEC's total sales would be at about a quarter billion dollars (which is what we think they are).

Mr. Iwao, Chief Engineer, took us around. He is actually the operator of the plant and is interested in high volume manufacturing. The brochure I took badk has all of this annotated. They started there in September 1969, with only 1400 million yen capital, or at today's prices, about $2,000,000. They employ about 1,750 people there —— 1,250 are direct laborers. They operate two shifts —— 5:30 AM to 1;145 PM, and then the second up to 10:30.

Their history there is one of starting out to do semiconductors for NEC's NTT telephone business, so they have a fundamental interest in quality. Subsequently when they got into the NMOS PMOS calculator, cash register, and computer business, they changed the emphasis to volume, which they have now. In doing this, they never left their concern for quality.

All products are burned in. The NTT products are sometimes burned in for as much as a week, and some products are only burned in half a day. Eight percent of NEC's total sales go outside. It is building

as much as 15 to 20% of these sales for export. Probably a larger

amount is to the United States, although we don't know. They are

making all PMOS 14 calculators and cash registers, and NNOS computer memories, including the 4K plus 16K RAM. They are doing a lot of GMOS for watches, calculators and radio equipment. In addition this NEC plant makes the BIPOLAR CML logic for the high speed computers based on the Honeywell CML logic.

We initially had concern whether we could visit there and they reluctantly agreed to let us. The person who took us around was not

that keen on having us, but was certainly cordial after we arrived. They try to keep their labor force flat. They have taken all of their plating and marking equipment for the two in—line packs to local shops outside. They start with silicon wafers, go through test, then ship. They have a very nice process chart. In fact, virtually like every Japanese company, we were handed a brochure that clearly described their whole process. In this case there are 15 steps. The 16th is shipment, which is by air in specialized containers. From a semiconductor standpoint, they used the 4" wafer on one line in a large two—story building (240 x 40 meters) —— they have about 4 lines and at the one end is the new 4 inch line.

In a small building they have the bipolar line which is low volume for all of the processing areas. The second floor is the pellitization through testing processes, exlcuding the part that is done outside.

Mr. Iwao wanted to know how this compared to TI and to INTEL. I could not tell him (probably because I don't understand semiconductors that well). Frankly I was quite impressed simply because of the incredible cleanliness and the well designed layout they have.

Again, the pressure of the Japanese custom of taking shoes off (leaving them at the door) to enter a building is really helpful to a semiconductor processor, because it means that you don't carry a lot of dirt around. All of' the areas that were part of the factory were marked in terms of class. The workers and the back of the equipment was class F and then everything else was in class C. They had class B and class A rooms. They end up with a failure rate of 1% at burn in, so that they have a very high overall volume rate at customer acceptance.

They own mask making equipment in Tokyo, which is an EB machine. All of the work done by the design and manufacturing production equipment design is done in Tokyo.

NEC has processed SOS wafers, but is not interested in it because of the low volume, low yield, high cost nature of it. They are also looking at and made (it is not clear how) JIL parts apparently for the NTT. (NTT wants it.) Unlike many of the other semiconductor companies, especially Sony, NEC believes that it must bring all of the

manufacturing equipment along. It has formed a wholly owned

subsidiary tester company called ANDO. Of course, being very

patriotic to Japan and themselves, they use the NEC M4 minicomputer, which is a conversion of the Varian machines. The manufacturing complaint, about the difficulty of maintenance of the tester, is traditional with every manufacturing group I have heard.

The ii inch line is one area that we weren't allowed to see. In fact, he studiously avoided us looking at their wafer lines although there were windows into all of the other lines. In the case of the new)4NC wafer line, there were no windows and no hint as to what was inside. He did say, however, they use automatic aligners, and •that through the process up to diffusion, everything was handled as a continuous process. I would guess they have as highly an automated function as

TI's we saw several years ago. Diffusion, and some of the other processes, are batch in production. He longs to have the whole thing be a continuous process.

I was incredibly impressed with the fact that there were graphs of everything everywhere and I suspect even some graphs on semi—log paper somewhere. The graphs were used to plot everything against everything else, so that they really knew what their process was doing and the output. In the case of the secret prooess I asked about, he said that it had considerable computer control and he main reason for doing this was to know what the various steps of the process were doing and what the productivity was. As a manager, since he is not given that much control over his own destiny, he is very concerned about productivity. He does move some of the simple parts outside, but also is concerned with automating as much as possible, and keeping the cost of all the labor force flat while maintaining the various steep increases in volume. He did not say when the 65K/RAM would be built but they are being produced now in Tokyo.

follow up 1/2/79

Given that we're launching off on significant applications in Dibol for the store, it's essential to have a clear definition of compatibility among Dibols.

Can we get this definition?

Shouldn't the testing of software be done on all Dibol machines?

SUBJECT: DIBS III AND FIXED/PARAMETERIZED/ALGORITHMIC APPLIC

In discussing the so called parameterized applications with Bill Turner and Cliff Neer, I think we came upon a strategy which could enable us to make a really significant contribution
to Applications programs... and get a really great jump on the
market.

Cliff defines 4 levels of variability:
0. Fixed programs
1. Providing variable constants (put in at installation time)
2. Ability to change report titles and headings
3. Processing option selection (alternative algorithms)

4. Computational algorithms (without loops)
(5). General program extensions to existing programs

Based on my understanding of the DIBS packages, we have somewhere
around level 2 amount of variability.

The strategy for doing applications would then be:
0. Enhance Dibol to support the various levels
1. Select field proven applications packages
2. Document, enhance, test, and market the given fixed applications
3. Given, the market use of a package, find out what needs to be variables, parameters and variable algorithms; enhance the package accordingly and rewriting if necessary to meet the market needs. Maintain compatibility with the original documentation
and user interface, and preferrably the file system so as to preserve trainin, documents, and user base, etc.

Note, this takes the risk out of the program and is along the lines of what we do best: evolution based on tried and true ideas.
Also, this is exactly the path that nearly all languages and applications languages follow---they build like crazy on the past!

THE DIGITAL COMPUTER MUSEUM

from The Director's Office

Dateline 1990

After more than a decade of operation, the Digital Computer Museum's collections encompass the entire information processing family. It has evolved to be similar to a well-developed natural history museum, where collections are classified to show entire branches of the plant and animal kingdom and whole societies. The collection of the Digital Computer Museum tells the story of the "natural" history of information processing with exhibits. Because information processing is such a large field, the Museum, like the great Museums of the late-nineteenth century, virtually requires an ark to house all its specimens. In cooperation with the archival projects of the Charles Babbage Institute, the Museum serves the scholar in researching topics in the history of computing.

This monumental achievement can be credited to a well thought out plan and policy articulated in early 1982. The clear identification of the audience, selection of a permanent location and building site, and conceptualization of an interpretive program for the collections provided the necessary direction for communicating the goals and ideas for the future.

Dateline 11/30/81

PROJECTED AUDIENCE

The audience is comprised of three parts. One group is the serious connoisseur of computing history. Exhibits, library facilities, seminars, lectures, and a visiting scholar program are geared to their needs. While their numbers are not large, their participation is absolutely essential to maintaining preeminence in the field. A visiting scholar program provides one way for some of the pioneers of computing, computer historians, and computer artists and musicians to be in residence and add to the richness of the environment.

Another group includes all people who want some understanding of the evolution of computing. Most computer scientists, programmers, engineers and professionals employed in, or being trained for the computer industry belong to this group. Special seminars, lectures, half-day and one-day programs provide overviews of the historic evolution of computing. Members of the IEEE, AFIPS, and other professional organizations, and retirees from the computer field are attracted to exhibits, the library, and the Museum's special programs and facilities.

The third group consists of families of the first two groups, museum goers, and others who are curious about the museum. Experience has shown that these people come and learn from quality exhibits. The Museum's exhibits are designed to communicate the history of computing and not to engage visitors in amusements.

LOCATION

Comparison of four different locations within Greater Boston suggest varying opportunities for the Museum.

Marlboro, in the building in which the Museum started: A pattern of visitors that evolved was never disrupted by moving the Museums location. The location on Route 495, close to the Massachusetts Turnpike, and within an hour of Boston, is isolated from other cultural or educational facilities. The site itself is outside of town and accessible only by automobile. Thus, the facilities must be developed to attract the visitor who will make a special trip and invest a half day in the trip.

Maynard, the home base of Digital Equipment Corporation and the "mini computer" capital of the world: The town is not on any main route, but within 45 minutes of most of the "computer engineering" community of Boston. All sites would be in a "downtown" with some bus transportation.

Route 128, the "high tech" nucleus of the sixties: 128 is the center of the computer community within Boston, and accessible to the interstate highway system. A number of building sites would be possible in the vicinity.

Boston or Cambridge, the center for the cultural institutions. While most students and tourists are confined to these settings with a large number of competiting cultural institutions.

Each location has its inherent attractions and difficulties. The critical decision point is the availability of a building with appropriate financing to make the Museum happen.

MUSEUM BUILDING

A Museum building has very special needs:

At least 120,000 square feet

60,000 square feet of exhibit halls with controlled lighting, temperature and humidity control, divided into at least ten different units ranging in size from 3,000 to 10,000 square feet, and including a theater for about 300 people, small meeting rooms and theaters for 12-100; space for a library,

store; restaurant; workshops for exhibit development; and facilities to allow for a flow of the public.

Parking for cars and buses.

Issues regarding MR-2 (using the present building)

<u>Legal/financial.</u> Two alternatives were considered. 1) Immediate acceptance of the entire building as a gift that would require raising a matching one-third from others for its renovation/endowment (as required by IRS regulations for public foundations). The Museum would lease back portions of the building to Digital or DECUS with their gradual withdrawal by 1989. 2) The separation of the building into three condominiums, each of two floors, to be given to the Museum in three stages: 1983; 1986 and 1989 at which time the Museum owned the entire building. At the time of the acquisition of each portion of the property one-third matching donations of $1.2, $1.5, and $2 million were attracted and divided equally between exhibit renovation and endowment.

<u>Space.</u> The configuration of the building and its associated property into a Museum poses the following issues:

Cost-effectiveness: if the expense to transform it into a Museum would be greater than building anew or looking for another site.

Appropriate timing of major spaces during the 10 year development period.

Establishment of free visitor flow throughout the space to encourage viewing many exhibitions, while maintaining use of part of the building for the other tenants.

Integration and use of computers and technology for interpretation and control of the Museum itself.

<u>INTERPRETIVE PROGRAM</u>

The draft catalog (attached) lists all the artifacts according to one taxonomy. Other classification concepts are useful in building exhibits. The two in conjunction are designed to provide a rich interpretive experience. For example, the first major exhibit, the Pioneer Computer Timeline, is actually based on one of the major chapters of the catalog and features two of the more significant artifacts of the collection: the Whirlwind and the Atanasoff-Berry Computer. The ideas for further exhibitions are listed below.

Interactive computing: The TX-0, PDP-1, PDP-11/45 and other machines capable of running and demonstrating interactive programs.

Super computers: Texas Instruments's ASC, Control Data's 6600, IBM's Stretch, University of Illinois's ILLIAC IV, etc. -- standing as sculpture with associated films, photos and other interpretive materials.

Personal computing: From the LINC, LGP-30, to Altos, ATARIS, etc. with the potential for user interaction.

Evolution of card programmed processing from a working Jacquard loom to a 1950's card room and inclusive of other examples.

Robotics from deVaucauson's automata through the evolution of industrial robots with demonstrations.

Memory devices, tracing the read-only and write-only memory devices through such use as player pianos to current read/write devices.

Computer ancestors in the craft generation, between 1600 and 1800, providing a feeling for the whole technological context of the era.

Computing in the transistor generation during the sixties.

Computer graphics, arts, and music exhibits with permanent listening galleries, halls for changing exhibitions and laboratory demonstrations.

Computing in space -- on-board computers and what they do.

Mechanical calculating -- from the Pascaline to Lehmer's number sieves, with opportunities to operate the calculators.

Games and gambling -- playing with numbers in simple early games, the totalisator machines of the 30s, classic chess programs and other games of skill and chance.

Developing appropriate levels of interpretation through signage and/or a/v materials, and communicating a direction and flow to the exhibit space without a personal tour guide is critical in the development of the exhibition program. The standardized text panels and catalog entries provide scholarly documentation that needs to be supplemented with interpretive story lines. Video equipment and comfortable seating is needed to allow the use of the films

that are being developed.
DRAFT FROM 7/81

THE DIGITAL COMPUTER MUSEUM

date: 1990

from: The Director's Office

After more than a decade of operation, the Digital Computer Museum encompasses the entire information processing family tree with a complementary program, document, photograph and film library. (see fig. 1) Housed in a 120,000 square foot building, historic artifacts of computing, video- and audio- presentations by the engineers and programmers working on historic machines, examples of benchmark computer applications, and a library of relevant books, manuals, photographs, and programs are on display and available for reseach purposes. Classrooms, viewing rooms, and a computer data-base system provides resources for resident scholars, short-term seminars, and lecture series.

The collections have been built up from gifts from industry, universities, government agencies, and individuals. All materials more than 15 years old are considered for the collection. This formula is also The Annals of Computing History to verify collectable materials. The artifact collection started in 1973, grew to more than 500 pieces in 1981, is currently at 5,000 and continues to grow. The film and photo library was inaugerated in 1981 and is now the pre-eminent historic resource collection. The book and program library were opened in full scale on moving to the present site in 1987, although collections began in 1981. The site has sufficient space to expand to double or triple its 120,000 square foot facility.

The Digital Computer Museum is unique. It cannot be likened to Science Museums that emphasize visitor numbers by attraction exhibits, for example the live Muppet show was the outstanding draw of the last decade at Science Museums that then hope the public will also look at serious exhibits. Nor can it be likened to industry-related museums that allow specific companies to outfit exhibits that fundamentally become self-advertisements. Nor can it be likened to experiential museums that attract children and parents to find out and experiment for themselves. The Digital Computer Museum is most like a well-developed natural history museum, where collections are classified to show entire branches of the plant and animal kingdom and whole societies. The collection of the Digital Computer Museum tells the story of the "natural" history of information processing, pieces are added to the story not for their intrinsic value but because they have a place in that history. Because this is such a large field, the Museum like the great Museums of the late-nineteenth century virtually requires an ark to hold its population.

AUDIENCE: The audience is drawn from three levels.

The primary audience is the serious connoiseur of computing history. Exhibits, library facilities, serminars, lectures, and a visiting scholar program are geared to their needs. While their numbers are not large, their participation is absolutely essential to maintaining predominance in the field. A visiting scholar program provides one way for some of the pioneers of computing, computer historians, and computer artists and musicians to be in residence and add to the richness of the environment.

The secondary audience includes all people who want or need some understanding of the evolution of computing. This includes most computer scientists, programmers, and engineers as well as other professionals employed in, or being trained for the computer industry. Special seminaras, lectures, half-day and one-day programs provide over-views of the historic evolution of computing. Members of the IEEE, AFIPS, and other professional organizations, customers of Digital and other computer companies, and retirees from the computer field are attracted to exhibits, the library, and the Museum's special programs and facilities.

The tertiary audience is made up of families of the first two
groups, museum goers, and others who want to find out what the museum is all about. No attempt is made to amuse or attract this audience via low-level fun and games. But,

experience shows that these people come and learn from quality exhibits.

SELECTION OF A PERMANENT SITE

Because Digital Equipment Corporation had the foresight to fund the establishment of the Museum, in 1981 they had the unique opportunity to benefit from planning a site for its long-term home.

A Museum building, itself, has very special needs: large exhibit halls with controlled lighting, theater type areas, and facilities for the public are important considerations.

Considering audience factors, four different sites were evaluated: Marlboro, Maynard, the Bedford/128 area, and central Boston/Cambridge.
From the point of view of what was known in 1981, the best sites seemed to be Maynard or near the Bedford 128 location. The wild card affecting these sites is clearly the availability of a building.

Figure 2 shows the weighting of the site selection criteria, and some scenarios affecting location.

FIG. 2 SITE SELECTION CRITERIA

	Relative Weight		Marlboro	Maynard	Bedford	Boston	Other
AUDIENCE							
DIGITAL							
Primary	5	15	20	10	5	__	
Secondary	4	12	12	16	4	__	
Tertiary	2	4	8	6	2	__	
NON-DIGITAL							
Primary	5	5	10	15	20	__	

Secondary	2	2	4	6	8	__
Tertiary	1	1	2	3	4	__
SUMS			37	56	56	43

FOUR SCENARIOS

Marlboro: Although it was known that the audience would have to be attracted to the site, the Marlboro campus facility of Digital was selected. A special museum building was erected on the site, tied into corporate displays in MR-2 and the use of public spaces in MR-1 and 3, especially after hours. With guest facilities for resident scholars and with on-site classes given by WPI and Northeastern, Marlboro became a center for computer history.

Maynard: , the Marlboro campus facility of Digital was selected. A special museum building was erected on the site, tied into corporate displays in MR-2 and the use of public spaces in MR-1 and 3, especially after hours. With guest facilities for resident scholars and with on-site classes given by WPI and Northeastern, Marlboro became a center for computer history.

Maynard: Two scenarios seemed appropriated: (1) The "Mill" centralized Digital's continued interest/support of the independent Museum, housing it adajcent to Corporate Headquarters, and Engineering. (2) A proper Museum was built in down-town Maynard providing life to the town and its redeveloped center and mall.

Bedford: Site and facility are independent. A site was developed (1) adjacent to Digital's Educational Services facility, (2) near the National Historic Park, (3) on Route 128, based on the following kind of facility, (1) an old shopping center, (2) new building, (3) reclaiming Lincoln Labs, or (4) something else. It became a center of activities for the large number of computer people within a half-hour of the Museum.

Boston: Much to everyone's surprise, the Digital

Computer Museum was given a building in Boston. The following two choices seem to represent the polar possibilities: (1) The site is a well-kept secret, about like the glass flowers, and it is a peaceful oasis for computer buffs. (2) Along with the Aquarium the Museum has become one of the chief attractions in the downtown area although we have not comprimised any historic standards.

December 20, 1980 - OPERATIONS COMMITTEE APPROVED THE

CHARTER OF THE DIGITAL COMPUTER MUSEUM

Preserve artifacts relating to the history of computing;

Carry on a lecture and educational program;

Loan artifacts and consult on exhibits;

Prepare exhibitions and arrange tours;

Provide a resource on computer history;

Develop and sell museum-related products;

Make the Museum a center of interest and activity; and

Investigate non-profit status.

August 18, 1981 - OPERATIONS COMMITTEE MINUTES

The Operations committee approved the proposal to establish the museum as a public non-profit corporation.
Our intent is to support the museum on a continuing, stable basis and to treat it the same way as other important programs of the Corporation.

****

Presented: "Why can the Digital Computer Museum be Number One?"

Today: We are number one in quantity and quality of computer exhibits.

PIONEER COMPUTER EXHIBITS IN MUSUEMS AROUND THE WORLD

Museum	Date & Machine
Science Museum, London replica Smithsonian piece, Boston Museum of Science	1840s Babbage Analytical Engine (partial)
prototype & teletype, DCM	**1939 Bell Labs Relay Calculator**

POLICIES

* Preserve the history of computing.

"You must feel like the Director of the Museum of Natural History when he started to collect bones."

Jan Adkins, National Geographic

* Expand "oral" history via lectures and seminars by computer pioneers:

"There is no history, only biography."

Andy Knowles

* Make the machines themselves focal points:

"Well-engineered machines speak eloquently of their own elegance. Museum designers can't equal them."

Frank Oppenheimer, Director
The Exploratorium, San Francisco

* Interpret exhibits for the computer community:

"Hey, this Museum is for us big kids."

George Michael
Lawrence Livermore Laboratories

* Involve the primary audience:

"The Museum does not have to convince the computer community to support the museum because its artists are worthy; they <u>are</u> the artists."

Harold Cohen
Creator of the Museum's murals

STRATEGIES

1979 Built first exhibits; Held first lecture.

1980 Formed collections and exhibit policies;
Opened for viewing by appointment.

1981 Organized the public non-profit foundation.

1982 Open to the public from 1-6 Sunday through Friday.

Raise $125,000 from the "public."

Establish archives.

Start a research program.

1983 Obtain accreditation from American Association of Museums.

Plan an endowment program.

SUBJECT: DIGITAL MORALE

GB0005/6/EMS

Have just enjoyed a visit to Brazilian offices at Rio and Sao Paulo.

Overall, everywhere it seems we have bright, hard-working people. Bruce Ryan, a former IBMer, who heads the Brazil, Mexico, Caribbean, and Japan offices, points out:

1. We are in an incredible position

overall with the computer industry because of:

a. People in all functions
b. Products and product family

2. We apologize too much.

3. We always mention IBM in our talks and offices apologetically - we should never do this. (I'll try this for the next six months.)

4. We spend too much time focused internally.

5. We don't blow our own horn enough.

SUBJECT: LOOKING AT COMPUTER ENGINEERING ROYALTIES IN RETROSPECT

Given that Craig feels he has been screwed out of what he thinks he should have gotton on computer engineering, I think we have to first understand this. As head of Digital Press, Marcia, can get us some data. Craig's mental model is 10K.

Under no circumstances would we ask DP to pay royalties after the fact, however, we can ask what they would do, given the policies for DEC authors now and what they remember in regard to Computer Engineering. There are several ways to compute it:
1/3 splits, on page counts pro rating all the authors including

the ones who had previously written articles, on the basis of time spent outside of DEC allotted time (eg. all my time was outside of work and all of McNamara's was inside of work and Craig's was mixed.) Marcia can you give us some help here in what is a delicate situation as we want to keep Craig here, happy and productive?

Thanks,
g

SUBJ: **Stern Manuscript**

About 20 pages of comments will follow, but the bottom line:

The book is a factor of 2 too long, takes too much work to read, has all types of errors, draws and presents false conclusions, and delivers far too little insight to any reader I know. We can not publish it unless the issues are attended to.

It should come about R&S in quality and even try to attain Lavington quality, even though it will take another year. The beauty of publishing history is that it's virtually timeless; we have to control to quality, not schedule.

I still think it is an important story that needs telling. We have to set the standards and suggest the approach. Nancy's got most of the facts, let's help her make a great book!

GENERAL COMMENTS

1. Think a penultimate copy should be complete with table of contents and preface. Don't you require this as the publishers?

2. The book lacks any hard illustrative material that I can dig into: not one time line, table, chart, circuit diagram, flow chart, photograph, patent figure, etc. Both previous books in the series had such materials. Isn't it the publishers job to keep and maintain the standard of the series? These are not secret requirements, but things that have been constantly important.

3. The first chapter is lacking the standard review of the literature. Don't you require authors to say, who else wrote what in order to clearly delineate their own unique contribution? On this point she is fuzzy. Chapter one states that she will assess the judgment of the Sperry Rand Court Case (p. 1-8). Then in the conclusion (p. 9-37) she says "the controversial issues relating to Atanasoff's contribution to Mauchly's works...have all been addressed by Goldstine and others who have written on the history of computing." She backs out of doing one of the things that she says she

will do. As editors you must be responsible that an author delivers what is promised---many people can say they will prove or even assess something, if so it must be done.

4. If the case is to be "assessed" and this is a purpose, then either all sides need to be re-interviewed and the transcript of the case analyzed, or no sides interviewed and only the materials from the transcript reviewed. Her interviews are highly weighted toward Eckert and Mauchly. From reading, the language she uses is highly colored creating sympathy for these two poor lonely men fighting the "establishment."

5. In fact, I find that the manuscript that is produced might properly be categorized as a historical novel...she often imputes how people thought or felt. Her statement is accurate that it is "a case study ...on two men who made very significant technical contributions to the field and on the institution, technological, scientific, and economic problems they faced along the way." At the very least one would expect her to exactly count, categorize, list, the significant technical contributions exactly. I could not find such a statement that did not have a qualifier, i.e., "in part". She should be the expert on Eckert and Mauchly and should be able to reliably tell us just what they did do. But she doesn't and she wanders around and that is why I call it a novel.

6. If the following comments are attended to, then there might be a publishable book. But I really thought that you folks and other reviewers would take care of the details. The subject is worthwhile and could make a decent history of these folks and times.

Chapter 1

1-1 The first sentence is written in such a way that one is led to think the four points are the major achievements and not the four computers. I would like to see a table that lists:

- name of computer
- date of start
- date of completion
- use
- bench mark statistics (speed, size)
- funding agency
- number made
- period of use
- major achievements

If such a table were made then I think that the first paragraph would write itself much more clearly and would also be more interesting.

1-2, p 2. What other aspects make them ideally suited for an indepth historical analysis? These need to be summarized here or the paragraph deleted. It would also be useful to have a chronology of Eckert and Mauchley. A photo of each-- or the nice profile of the two of them together and a page noting the major benchmarks in their lives. An appendix could describe the other folks too.

The list of interviewees in the appendix should contain their position at the time on which they were questioned and perhaps their present status.

1-2, last para. If RCA and Bell were the main corporations from which employees reviewed the progress of the Moore School then this should be a declarative statement. The paragraph goes from a vast unnecessary generalization, "during the war, organizations like the Bell Telephone Laboratories and RCA were actively engaged in government work," true but unnecessary to the story to a specific, "employees from these organizations were frequently called upon to assess the computational work at the Moore School and in some instances to provide assistance." The story would be better told if the sweeping general statements were left out and things just told as they happened. The work would then become clean.

1-3, para 2. It is the amount of funding, the kind of funding, and whether people are producing as agreed upon that sustains a project. What was the amount of money and the agreement? What are the facts?

1-3, para 3. What is the insight? Recent American history is replete with examples of individuals making new high-technology companies. What should we learn? Are Eckert and Mauchly bad businessmen? -- did they have inappropriate technology? -- what is the critical issue? -- or did the bogie man get them? This is old news -- don't rub it in -- just state the facts and don't preach. All ex-cathedra statements need to be eliminated.

1-3, last para. lst sentence. Wrong. Ferranti Ltd was already in the computer business, ERA was working on computers and IBM cannot just be swept away. (See the chart, History of Computers, Science Museum 1975) 2nd sentence. Don't see that this is done. What does "so late" mean? Could it have been earlier? Forrester has made the point that the development of computers was hindered because there were no users -- one had to have computers to be able to use them. Perhaps IBM realized the commercial "potential" quite early, but knew that they had to wait before there were users in order to realize it. Using an early computer was not as simple as going from a typewriter to a word processor.
I would like to see a list of all the purposes of the book (say in the preface), then the research that was undertaken to accomplish these, and finally the results.

1-4, para 2. The words science and technology are not clearly and consistently used throughout the manuscript. Line 6, "the sciences" is a broad use probably encompassing engineering and gunnery and even accounting. On the other hand, the thesis that science and the scientist is different from engineering and the technologist and both are needed is the major point that is being made. (Also, there's our relative, the mathematician.....) If it is, then the use of the word science needs to be appropriately restricted and is again improper in line 10 "scientific problems" for "ballistic calculations." The whole manuscript needs to be combed through and exact issues written in place of the general statement.

1-5, para 2. Is it certain that "Von Neumann's scientific orientation came into direct conflict with the engineering and commercial orientation of Eckert and Mauchly. This led to a bifurcation in computer technology, with some machines being developed exclusively for commercial use and others for scientific use." If this is the major cause of this dichotomy then please prove it. Or is it simply typical of what was happening in the embryonic computer industry? How do you accomplish what you say you will accomplish in the last sentence?

1-5, para 3. Sentence 1 only rubs salt into wounds. Just tell the story...don't whip up the "controversy", it's old news. The whole paragraph can be omitted.

1-6, line 8. Like IBM, and who else?

1-6, last line, 1-7, first line. Atanasoff is a physicist. What do you mean "originally a mathematician".

1-7, para 2-3. Make it clear that you will investigate three issues brought up at the trial. These would be better rewritten so that one can see the whole picture at once--sentence 3, para 2, p 8 really belongs with para 2 page 7. etc.

1-8, para 2. Discussed in the opening remarks.

1-8, para 3. How can you explore "the relationship between John Mauchly and John Vincent Atanasoff" without also talking to Atanasoff?

1-8, last para. The summary statement is really wishy-washy and could be left out. The previous paragraph interwoven with the court issues could be much stronger.

Other comments on the introduction. It is often helpful to indicate what will not be done, what others have done, and how you are going to accomplish your purpose. Try to excise the word "insight" from the manuscript. Provide the insight directly and don't just hold out a promise.

Chapter 2.

2-1, sentence 4. Think of what engineering and science were in the 30s. The whole field was intertwined. Why don't you have a table here of all the computer pioneers and what disciplines they represented. One additional example doesn't make a case. Don't interrupt the story of Mauchley with this example from Von Neumann. The last half of the para fits better much later in the book.

2-2, line 19. leave out the comments about money. They are noise in the history and really don't have anything to do with ideas. Every operation that I've know about has the same claims, oh if there were only more money. But that's not really the case and it just clutters the story, let's show his ideas. The next sentence really tells the story without his "wry comment".

2-3, line 8. should read "digital calculator." The previous page said that he had a digital counting device, but it does not say that he had a memory or a way to store it. Atanasoff put the counter together with a electrostatic memory and used binary arithmetic. In the manuscript it is important to use computer to mean a processor with a memory. Make an appendix of exact definitions that you stick to.

2-3, para 2, line 5. Redundant to qualify "the institution where the ENIAC and later the EDVAC were developed." delete.

2-3, para 3, How many director's of research were there? Might be a good idea to give an idea of the size and scope of the Moore School at the time.

2-4, para 1. How many integrators did the MIT DA have? 6

as noted in footnote 7, or 9 as stated in the text? Why does the reader care if there is tension between the Moore School and MIT? What does this mean? Isn't there always competition?

2-4, para 2. In 1940 was Brainerd an Assistant Professor or Director of Research as stated on the previous page. If he made the change then note this. Perhaps just delete "then an assistant professor".

2-5, line 10. Real estate is hardly an "applied area." Perhaps it is better to say far more interested in "business" or else directly quote Eckert. I'd say this background caused Eckert to be an entrepreneur.

2-7, para 2, last line. If true, then you must prove it. The English might say that code breaking was the single most important impetur to technological development. The generalization is too vast. Try impetus "to the development of the ENIAC."

2-8, para 2, line 1. Unnecessary. Also excise "shed light on" as well as the word "insight." Just give the facts.

2-8, para 2, sentence 2. When stumped with a problem, governments, industry, families, anyone will try anything -- fund anything, and build in lots of redundancy hoping that something will work. This is nothing new. Build up the case steadily and then draw some conclusions. One now might argue retrospectively that there wasn't enough effort.

2-10, last para, Redundant.

2-16. Your use of the conversation is really out of context. The BTL machine was proven and reliably calculating. Another $17K was very little to ask for and your unstated allusion is to contrast such a request with one from the Moore School. It is a kind of specious argument. There had to be shortcuts during the war to get the kind of work done that had to be done. This quote might be interesting, but I don't think it's very useful.

2-26. Para 2. Can't you find a quote from one of the people about the morale of the ENIAC team and then cite that this was also true at Whirlwind. What was the morale at ENIAC? Were they young and bitter? Young and enthusiastic with a high morale? I've observed this around really all groups who build things.

2-27. Sorry all that you have found is that the old men are conservative because they know all the ways that things can go wrong and the young men don't know yet and hence are innovative. The scientific elite had power because it was part of the bureaucracy. Goldstine represented a younger newer part of the bureaucracy that had problems to face and believed in a different solution. You did not really discover a paradox.

Chapter 3

3-2, para 2, last sent. A conclusion. Should be saved until later.

3-2, para 3, 1st sentence is redundant. 2nd sentence unnecessary.

3-5, para 2, More appropriate early in the document.

3-6. para 4, 1st sent. Similar to an IBM plugboard that existed at the time?

3-6, last para. Don't bring up controversies in the generic. Be specific. There is no need to say "Although there has been a good deal of controversy over priority claims", just state the facts. Either go into or don't go into it. This paragraph can be boiled down to a sentence lead in to the quote.

3-10, last para. 5th line from bottom. It should read "they were designed to operate".

3-11, para 2, 2nd sentence. Redundant.

3-11, para 2, 3rd sentence. How can you prove that. Did it proceed faster than Whirlwind? TX-0? Z-4? Wilkes really moved fast; the Manchester MK 1 beat everyone else.

3-11, para 3. A table of times on the ballistic benchmark test -- the standard of the day -- would be appropriate here.

3-12, para 2, line 5. Although there are quotes there is no source and we don't think it was ever called the "ABC computer" but the "ABC" or Atanasoff-Berry Computer.

3-12, para 3, line 1. Ditto.

3-12, para 3. These are only words, nothing is added from before. You need to point out the similarities. Note for example that everyone was wrong on having separate accumulators-- a hold over from the ideas they took from the differential analyzers. It should also be noted that everyone went to direct binary arithmetic eventually, NOT decimal as EM did. Look at or show the circuit diagrams. The circuit diagrams for direct digital computation had been worked out by Atanasoff and were absorbed into the Moore School. Have you ever wondered why Atanasoff didn't bring suit to UNIVAC? Do you really think the whole affair was moral? Considering what Zuse was doing and what Turing was thinking the "idea" was in the air....society is a much greater benefactor because the case was thrown out, but is it the purpose of the book to judge right and wrong? That really could have set computing back.

3-14, end of para 2. At this point the visit of M to Iowa is brought up. You should enunciate what he saw, how long he talked and what he had access to. You have my earlier note on JVA here. You have not treated the issue of JVA fairly! He wasn't even interviewed by you. Don't stand behind Goldstine's report on page 3-15. The ruling of the judge looks right to me too. I make direct digital computation with electronics a key invention. Everything I read says he did it first, damn it. Where is your counter evidence? JVA also invented the regenerative delay line and serial computation. All early computers used this, even though ENIAC erroneously didn't. EM get clear credit for the Mercury delay line. I would challenge this too as it being a mere adaptation of the radar delay lines using the regenerative idea from JVA's electrostatic drum. All physicists built counters and experimented with neon bulbs for storage in the late 30s, and I'm sure Mauchly did too. What bothers me is the lack of actual references from notebooks, or would you have me believe that Mauchly was a really sloppy scientist that didn't keep a notebook?

3-16 last para. The Schumpeter definition of "entrepreneur" seems irrelevant in this context since the common notion generally relates to the business as well as innovative dimensions. Perhaps it fits better when you have EM going into business.

3-17 2nd para. If you claim this, enumerate Eckert's inventions as distinct from Mauchly.

3-19. Previously you made the point that Mauchly took after his father and was a scientist. The popular myth is that scientists are not concerned with costs....now it seems that in fact he has a practical bent. On other accounts, it seemed that E did engineering, M was a scientist that turned more into the conceptualizer and possibly administrator. M also drove the programming it seemed?

3-20, para 5. Did JVA fail? He didn't continue, but he was right. On what grounds can you judge him a failure? Why not ask him?

3-20, para 5, last sentence. Be precise. What do you mean "later years"?

3-21, para 1. In arguing for supporting the ENIAC patent on the grounds that it made important contributions by incremental innovation really weakens your whole argument that it was truly significant. What I mean to say is that it looks like you first discredit JVA en passant, and then do a turn about and say, that even if EM weren't major inventors, what they did as engineers and evolvers was still worthwhile and therefore the patent should be upheld.

Occasionally "right" lines up with the law. You seem to think that EM were right, therefore their patent should hold. I know it is illegal to claim someone else's previous work as an invention. EM claim too much, and as such their patent was and should have been invalidated! It would have been trivial to make a valid ENIAC patent had they not have been so greedy. This continues to come through in all I can read on this case. Three independent groups were out after EM. JVA for not recognizing the direct digital computation, JvN for what is probably erroneously called the stored program computer (which I think EM can probably claim although I could understand how JvN would claim it or think he invented it), and Burks et al who were rightfully inventors of the various parts (try re-reading what seems to me is a careful account of this by Burks).

In short, to the novice you might strike a sympathetic chord, but at this point, you have succeeded in discrediting EM in my mind, although I do have a great deal of respect for them. In particular, without the engineering skill of Eckert, the machine might never have worked and this would have put off the development of the computer several years. I have no trouble in believing that it would have evolved about the same way because of the independent efforts in Germany, the UK (read Lavington), and even at the other universities.

(There's a whole issue surrounding the ERA part of UNIVAC that you haven't dealt with yet. If I had to "judge", I would put it that Sperry's contributions came out of this school, not the EM school. I hope to read about that in a later chapter.)

3-23, para 2. Yes. But should these men then be cited in the patent? Were they sought to be wronged by EM who would reap economic gains from the patent (if they had won) and not shared them? From a moral standpoint, I have lots of trouble with the whole idea of patents when the work is paid for by someone else whether it be the government or a company. I feel patents in this case could belong to either the Government or Penn.

3-24, para 2. Arthur Burks has been introduced, the phrase is redundant.

3-25, quote. What date was Frankel speaking of? For a long time the technology was just not to make that possible. Sounds like a fool's dream or that of a science fiction writer. Hardly seems appropriate for the book.

Chapter 4.

4-1, last sentence. "could" turn their thoughts or "turned" their thoughts... They were still under contract to the army and employed at the university. You imply by the use of the word "could" that it was completely appropriate for them to do so. Other computer pioneers didn't ... they "could" also turn their thoughts to developing the "science" of computing, or other things. The point is that they didn't. Why don't you delete the para, all the points are repeated in the 2nd para of page 4-2.
4-2, lst para. Redundant.

4-2, para 3. Why don't you start the chapter here.

4-16. How can you characterize Mauchly as so amiable when your evidence showed that people wanted to "cut him out." Was he too threatening, too dull, malacious, too-faced, or what?

4-18. What is your evidence that "Eckert depended and relied upon (M" in an inexplicable way." Explain. You have said it and said it. Does Eckert say so.

4-19. para 2 is redundant ... has been said at least 2 times before.

Final comment. If EDVAC were eliminated from that chapter it might become cleaner and tighter. A portrait of ENIAC on inauguration day would be nice.

Chapter 5

5-1. 2nd sentence. Self-serving and unnecessary. Last sentence repeated and questioned at the first time it was written. Suggest the first para be deleted.

5-2-4. This treatment of VonNeumann's life is longer than the treatment of either Eckert or Mauchly. But it is essentially a regurgitation of what others have said. One would like about two or three pages on each E and M to get some insight about them .. that is where the book has potential and where it falls down. Although the expectation was of oral history, very little of the feeling of a Nancy Stern interview and unique approach comes through. The author stands behinds others words too often and seems to parrot phrases over and over.

5-2, para 2. Most interesting because this is Stern's conclusions but the writing is very muddy. Sentence l has two ideas.. the fact "he willingly accepted" the dual roles ... should be stated cleanly. Stern's conclusion, "a dual role was particularly suited to his personality" is more conjectural...the reader has been provided with no study of "his personality". Sentence 2 implies that he was "always right". Sentence 3 states that he had "entrepreneurial attributes" which are distinct from being "enterprising" -- isn't this redundant? The example of being "enterprising" then is that he emphasized the need for written reports. In general this is not an example used for some who is enterprising, but for a good scientist who understands the need for documentation. Then in sentence 4 "delegating authority" is used almost synonomously with "collaboratively" while they are two different administrative styles. If he combined them then the author should show how. Often people who know how to collaborate don't know how to delegate and if he could and did do both, then a good example is needed. Sentence 5 is parenthetical. The antecedent to "such attributes" are the topics of sentences 2, 3, and 5. This is what I call muddy writing and unfortunately happens over and over. Experience tells me that muddy writing is the result of unclear thinking and cannot be cleaned up by a copy writer but most be reasoned through.

5-4, last para. Again muddy thinking. The quote by Fry does not subtantiate the authors allegation that "pure mathematics was at that time usually VIEWED AS TOO ABSTRACT for practical applications." I would delete sentence two and three.

5-5, 2nd para. Only "in an ideological sense"?

5-5, last para. "In short" is not accurate, a new point is being made.

5-7, last para. 1st sentence has been stated before. Delete.

5-14, 1st para, last sentence. Stated before. In addition, who cares that von Neumann is Goldstine's idol -- that should be an aside. How do you prove this? I should have thought in the interviews you would have determined how both E & M felt about von Neumann; what their appraisal was of the meetings with JvN; the book is supposedly about E & M and yet they still remain almost shadow characters in the background whereas JvN is coming alive and even Goldstine is starting to emerge as a real person and in the fifth chapter there is yet no good grasp over the reactions of E & M or any plunge into their interactions and reactions.

5-14, last para. essentially a repetition. Delete.

5-15, Paras 2 and 3 are confusing. Straighten out the chronology, the afterwards and befores. Does it go --

teamwork during the war, followed by a honeymoon with JvN, followed by conflict and individual self interest?

5-31, para 1, sentence 2. Be precise. It is not JvN's attention to "publication" in this case, but his making sure that the work was "written". He did not submit the draft report for "publication", but was providing a record. By omissions in this manuscript, E & M come off as very sloppy project administrators; they should have had notes and reports that could have been circulated as WW did. You cannot impute this as a difference between "engineers" and "scientists". It is the difference between a thorough job and a more sloppy one.

All one should state as a rule: engineers produce things, and usually do not publish externally; scientists produce knowledge, as such publication is essential. Both engineers and scientists perform experiments, keep records and build operational theories.

5-31, para l, sentence 4. must read "Eckert and Mauchly built the first, U.S., full-scale, operational electronic digital computer"; plugboard or general-purpose could be added. Each declarative statement on this subject must be evaluated for precise use of terminology. Also there should be an appendix where precise definitions are given (eg. calculator, computer, integrator, da, dda).

By this same token, JVA invented and built the first, electronic digital computer using direct operation, serial, binary arithmetic and the first serial, regenerative memory.

5-32, para 1, last line. Repeat of a statement that has been challenged. Yes, it represents a bifurcation but not of "computer development." How do you then explain WW, IBM, Z4, the St. Paul group, etc.? This is a non-supported ex-cathedra generalization with no data.

5-32, last para, lst sentence. Not substantiated by the reference. This is a sort of "oh wow" statement that is just not needed.

5-33. lst para. The allegation is that JvN almost blackmailed IAS. You must present your source for this.

5-35. last para. Don't understand? What was JvN's impropriety? It seems much less than E & M who were collecting a salary on the project while they were applying for their own patent and planning to "market" for their own personal wealth what they had done. Academic propriety is pretty clear about not collecting a salary for one thing while one is really working for something else. The whole approach of JvN to cooperate with industry -- with the scholar getting his reward (tenure, acclaim by peers, etc.) and industry getting theirs (economic gain) is something understood by many academic administrators and fosters the best kind of symbiotic relationship allowing the complementary forces of science and industry to grow. And on not citing others work surely E & M, especially M for not citing JvA, should be very harshly criticized. JvA was an academic and not out to get his own fortune on the invention of the computer and should always have been cited by M when describing ENIAC. Apparently there was a period when M talked about an Atanasoff-type machine. Do you have any records of this?

5-39. I read the differences as real. The operative sentence in the quote from Eckert is "get a lot of commercial money behind it." (And we know he meant behind E & M with their patent personally.) JvN had RCA as a one-third partner and maintained his independence -- thus he could write things up that would be widely available.

Chapter summary. List von Neumann's contributions in direct sentences. The first sentence says nothing. The last paragraph is superfluous.

In general this chapter could be tightened -- little detail is needed on the IAS machine. It more or less detracts from the story. What is needed is a very good time line; month by month showing when EDVAC was proposed; when the IAS machine was proposed; when the various memories were incorporated (known about); where JvN was; when Penn released the patent, etc. The narrative (the way it is organized) moves around too much in time and the reader needs a roadmap (I think the author does as well.)

Chapter 6

6-1, para 1, last line redundant. omit

6-2, para 2, last sentence. Overstatement. "The departures served to disperse THE existing expertise in the computing field..." maybe alot of the, but not all of it.

6-4, line 5. "disclosure" is a word often used for revealing information that should be kept secret. It is loading the dice against JvN. Tone your writing down. Alernatively you may be reontract with to have an NBS source for this.

6-13, first full sentence. E&M may have wanted to protect their patents and not talk, but almost everyone else seemed very willing to publish and talk. Your second reason, the lack of vehicles for publication probably has much more weight. Who else beside E&M didn't speak because they were protecting patents?

6-18, The Ravetz quote and preceding paragraph just add noise to the story. Delete.

6-19. Last para and on to 6-20. A preachy statement. Delete.

6-21. 2nd para, last line. What's the antecedent for "several years before" --- is that point relevant -- or would it be more to the point to say that NPL was the base for development of one line of early British computers.

6-21, 3rd para. Irrelevant. Delete.

6-21, 4th para. could also be deleted.

6-22-26, This section could be reduced to about a paragraph... the concluding sentence reads like a novel. Just be precise and give the facts.

6-27, line 11. Why not tell the facts. The Census Bureau had a competition for the design of a tabulating machine and Hollerith won. He was then funded. (But get the exact story.)

6-30, para 2, 2nd sentence. Delete. Irrelevant. Government had a "need" and were funding E & M.

6-30, para 2, 3rd sentence. Too sweeping a generalization. They supported E&M to do a job that they needed to have done.

6-35, summary para and quote. Not needed. No reason to put down Goldstine; nothing new added.

6-45, line 10. Need you repeat "the young and less prestigious Moore School group" over and over.... Delete.

6-45, last sentence of lst para, Delete "In addition" and use it to start the next para.

6-45, last sentence. Reference needed.

6-46, lst sentence. Leave out all extra verbiage like "of course".

6-46, lst para, last sentence. unnecessary and conjectural.

6-46, para 2, 3rd sentence. Introduce computer pioneer's once. I believe Aiken has been introduced, then stop identifying them.

6-47, para 2. The conclusion is that the Census bureau had a real need -- something that you have never addressed. A need that was as all-consuming as a war-effort and had to have a machine. The committee did not point out an alternative way. They had hope with EM, and no hope going the way of the committee.

Chapter 7

7-1, lst para unnecessary

Not "THE STATE OF THE ART IN 1947" You don't talk about the technology, separate the groups working on true lst generation computers from the electro-mechanical machines. The heading is really who is working in the field of computing.

7-2, line 4. Not, "like Harvard." Their machines were not relay computers, but really mechanical.

7-2, line 6. Is 5 numerous? Be precise.

7-2, line 7. IBM's 603 was on the market.

7-3, 3rd para. In England, Collossus had been built and in operation for cryptography and was classified. The ACE proposal had been written by Turing, and the NPL, Manchester, and Cambridge machines were being built and were not classified.
Read Lavington. Actually the Manchester MK l was the first operational stored program computer, not EDSAC. This needs to be changed when it is referred 19. Last to later.

7-3. 3rd para. Last two sentences, delete. Don't keep making such conclusions. Let the reader judge a few things for himself...just try giving the facts.

7-3-4, last para and to top of next page. Repeated from previous chapter. In fact all the material to page 7-5, "THE BINAC" is essentially redundant and can be omitted from the chapter.

7-5, last para. Delete. Start the section with the date on which E&M signed the ch Northrup. If EM had gotten, 2nd para. last sentence is very awkward. Try writing simple sentences with few parenthetical phrases that break up the main thought.

7-6. * This footnote can be a footnote and does not have to interrupt the story. (It is actually wrong.)

7-7. last sentence unnecessary

7-8, photo and diagram of BINAC would be nice.

7-9. last para. Sophomoric writing. Line two, rewrite to "an encoded magnetic tape." Delete "with magnetized spots representing characters." Next sentence: Output was produced either on a "modified" electric typewriter or on tape. What kind of typewriter was it? Are you sure that it was not a teletype of some kind? Be precise.

7-9, last para. delete 3rd sentence.

7-10, lst full sentence. Who made the tapes? Where did they get them? Why didn't EM hold these as a proprietary patentable idea? When did the Raytheon and WW tapes come for example? Where did EM get their ideas for using tapes in the first place.

In general it would be very good to have a complete listing with dates of all the contributions of EM. Maybe show the ones in contention.

7-10, line 8 need to change to "converted to binary for processing."

7-10, 3rd para. Explain specifically. What sorting algorithm was it? Why did you signal this? There had to be many things that were done first by EM, this is rather trivial one. Is it referred to in the literature? Did someone else claim it? Unless you understand what you are talking about don't write about it.

7-12, last para. If you are going to make a comparison, do it thoroughly. See Lavington p. 125. A table like this would be useful. The comparison should be with MK 1. The Lavington book is really good, clean and clear.

7-13, 2nd para. Delete.

7-22, 2nd para. A repeat. delete.

Chapter 8

8-1, para 1 - delete, a repeat.

8-2, Delete from first full sentence to the last para.

8-18. Why didn't you interview General Doriot? He generally has very good insight about why he funds and does not fund projects. It was ten years later that he funded Digital, and hardly relevant to this story.

8-19. Footnote 51 is missing.

8-23. last sentence. An implication is made that is not necessary. Suggest deletion.

8-24. Please, please have a table showing the characteristics of the ENIAC, EDVAC and UNIVAC for comparison. There are too many words and too much imprecision in your descriptions.

8-24, para 2. UNIVAC had 18,000 germanium diodes. Did ENIAC have any diodes? When did the diode first exist? Were the tubes in the ENIAC and UNIVAC the same? Was the density of the tubes for UNIVAC higher? What are the comparative specs?

8-24. 2nd para, last sentence. My references say UNIVAC had 5400 tubes.

8-24. A picture of a UNIVAC would be good.

8-24, para 3. By 1951, the mercury-delay-line memory had also been successfully utilized on Pilot ACE and Whirlwind. (Also on SEAC?)

8-25,line 8, rewrite to: The 2.25 megahertz pulse rate of the UNIVAC...

8-25, para 2, Sentences 5 and 6 are redundant. Delete.

8-25, para3 could be eliminated if you had a table. That is hard to read and not very interesting. But for the interested it is good material to have in a table.

8-29, line 5. You don't literally mean purchase from "Eckert and Mauchly" -- were they selling these on the side?

8-31. para 3. UNIVAC is not an "invention". It happened at a breaking point -- about 1950 was a revolution throughout the industry, but UNIVAC was not central to this. From 1940 to l950 one has the gestation period of the computer industry with many seeds planted. UNIVAC was the first computer oriented to commercial data processing and in this domain alone it was revolutionary.

8-31, para 3, line 4. two years before the 701 (did it have tape? and was it used for commerical purposes?) or four years before the 702 which clearly was competitive.

8-35, para 3. I'm convinced at this point that Henry Halladay's statement is right, and not one bit ironic. I don't see how you come to the conclusion that you do.

8-36, sentence 2. What about ERA? NCR? IBM? Burroughs? Leo? Elliott Brothers? Ferranti? British Tab Machines?

8-36, last sentence. True. But you have said this before.

CHAPTER 9

9-1, 2nd para. l idea. write as one sentence.

9-1, 3rd para. Don't understand lst sentence. What is antecedent of "such devices."

Delete from 9-1 to 9-5. Mix up accusations about corporations and government. No new facts.

9-5. If you are going into this area then read von Hipple at MIT. His work feels a lot better than the ones you use.

9-7. lst full sentence. If you really want to be technical, the date is 1906 (the deForrest triode -- which was theory and implementation of a valve), 1919 the date of the flip-flop was only a circuit diagram -- no real theory (science). You neglect Turing and all the formal representation of algorithms that were really necessary for the computer. These were after 1919.

You need a glossary of working definitions that you use for this book, otherwise you can't use the words that you do all the time. How do you use science, technology, calculator, computer, etc. etc.?

Actually for publication by DEC Press in its special history series that last chapter should be deleted. It is clearly a reptrospective cross cutting the facts from an historians perspective. It looks at various historic theories. But our readership is not interested in this. In moving from a dissertation to a book it is important to leave out such chapters which could have great meaning for achieving a degree, but are not appropriate for commercial publishing, especially within the dimensions of our series.

If this is left out and the other sections omitted as suggested the book will also get down to a better size. I want computer hardware and software engineers to read the history series. For this reason, I expect that the editors at Digital Press will insist that all the books have tables, charts, or photographs. Only if, all these suggestions are made, then we might have a publishable work.

         Message ID: EMS   26-MAR-79 19:31:48 100 1

I think that the first three chapters are part of the basic meat of the book.
The Seven Views, Technology Progress, and State of the Art Line discussions
are a major contribution to the literature and a good reason to buy the book.
I'm opposed to any reprinting at this time. 1980-1981 is too close and may
adversely impact sales just as we should be hitting our peak.

Dear Richard,

Thanks for the information on the PDP8 serial no. 2. The Museum now has a table top 8 on display and has no money. However, 8's are in demand as museum pieces -- we've supplied one to the British and Canadian science museums. I suggest that you store it -- don't throw it out -- since I believe there are going to be more and more requests for these in museums. If you want to ship it to the US, then we can store it here.

I'm enclosing a copy of our latest newsletter and brochure. Do hope that you get the chance to see the Digital Computer Museum.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

SUBJECT: MY UNDERSTANDING OF THE DIRECTION AND NEED FOR BI

We (MSD,CSD and DCG engineering an Product Management) met today to relook at where we are in the interconnect implementation versus the strategy put forward last May.

It is clear that the design has gone upward in either a real or perceived sense because there has been no involvement by DCG or CSD in the spec or understanding the implementation of BI. Also, it is clear that everyone believes the NI is the hope for the future in nearly every dimension. It is clear to me, and I am asking that we disavow the NI as being the answer to

all the problems faced in building current and future systems...therefore,
I assume we are going to have to build systems as we currently know them
and love them, at least until such time as we can show that NI does indeed
allow us to build systems at no cost or performance penalty, with no software
and with hi fi+ ease of interconnectablility, etc. Therefore, the bottom
line is: WE HAVE TO MAKE BI WORK AND BE SUITABLE FOR BUILDING DCG-TYPE
PRODUCTS, AND TO HAVE THEM BE COMPETITIVE WITH THE MULTIBUS APPROACH OF
INTEL. This means that CSD/DCG take over the responsibility for the BI
spec to insure its applicability and do it based on knowledge, by implementing
options and systems now. MSD would then adapt designs (Comet BI adapter,
Hg options and CPU, and Nebula) to the revised (if any specs).

NI can easily get into the same fix. In order to avoid this, someone(s)
from CSD/DCG must be part of the spec team and also concurrently implemenat
a breadboard for theQbus.

The way I look at this is then:
1. We are still proceeding with the original interconnect strategy, however
we are directing the BI to meet the goals (actually constraints) imposed by
CSD/DCG instead of being allowed to drift up into a higher performance place
that I don't knw who (including Venus) wants.

2. Q bus is really evolved to have 22 bits.

3. BI is really the follow on to the Unibus, but with the cost of the Q bus

so that it can be the successor to both busses.

4. NI is really the follow on way to build lower cost systems, and we have to
make it happen...even though it isn't essential to building a system. It is
essential to building a distributed processing network however.

5. BI will be used by our TOEMS eventually as incremental expansion, and
to do multiprocessing if and only if the need really develops this way.

6. BI as being redirected will be equally useful for a memory and I/O
interconnect. The initial use will be as I/O interconnect in both MSD and LSG. Mercury will use it as its memory/I/O bus (really a test case for bus and for multicomputer use). CSD/DCG
require BI for a high performance version of Jaws as Q22 is too
slow, a multiple set of Q's too kludgy, and another bus inevitable to realize Jaws' performance potential. CSD/DCG also
require BI as a bus for VLSI VAX.

I hope this captures the meeting direction and output. I assume there
will be full minutes.

SUBJECT: SOME DIRECTIONS TO TEWKSBURY RE GRAPHICS

The folks at Tewksbury are working like crazy to build a bit map in time to demo at Stratton. It will run a display and a Canon Printer. The next phase is to do the processor so that it will be breadboard by June. There are a few problems How can there be a better interface with the A/D and products development parts of LE and Terminals? Should they move to the mill?

There are major communications required vis a vis compatibility with the Regis architecture.

Who will ultimately do the product? (It's going to be somewhat expensive to start, especially if it is hi res color. (One version is this way.) The candidates are:
You
MSD
CSS

I vote for later, just because they have people in the mfg. and eng. space already...and could have this charter.

Could you convene us on just when and where we are going if the graphics area?

Subject: DISK AND CRT AREA

To: John Kevill
Bob Puffer

CC: Ed Corell

Date: 3 MAY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

When Bob Puffer had his office on the third floor of one there was a ritual that the area was cleaned up every Friday afternoon; now with him on 12-2, this apparently doesn't happen.

Ken reported that he was up on 1-3 some time around lunch hour and the area was very depressed looking and half empty. Maybe this is just because we are going to Colorado, but he was concerned that in fact we had become a little bit sloppy.

His proposal right now is that at one of the next Board meetings we show them through engineering.

F/U 9/28

I was recently asked:

How can I get the resources, such that we can build good, low cost, disk controllers? It was postulated that the disk people are only interested in the drive, and not the logic.

It doesn't seem like a matter of $, but of capability. I'd like to get a critique from people inside and outside if necessary to solve this problem by having others look at design alternatives. Also, should we still reconsider moving the controller design back to the CPU groups?

Note the floppy system is not only ridiculously expensive, but it doesn't work...to be in the low end, these designs are critical!

Bob, can you please see if we indeed do have a competitive (cost) problem here, and indicate the size of it by getting someone to measure (e.g., count chips) and compare us with competitors for various features?

EMS 27-NOV-78

21:53:51 370 1
To: John Kevill
CC: Bob Puffer, Larry Portner

From: Gordon Bell
Date: MON 27-NOV-78 21:53:51 EDT
Subject: My priorities in understanding the disk crisis

Larry reported that I wasn't concerned about the high end and mid range disk
problem that is coming on us very fast. Nothing could be further from the
truth. It is somewhere there with my concern about hydra as 1 or 2 on my
priority list.

John, I think you should come forward quickly with any requirements for
more $ or resources just as soon as you've laid out the alternatives to save
our ass in this area. I think it is the # 1 compteititve problem in the
next 6 months and we really need a protptye such that we ould announce if
necessary at that time.

I think you should give a pitch to the marketing committee by mid December
on the problem and what the alternatives are.

Command:

EMS 23-JAN-79
15:35:14 010 1
To: John Kevill
CC: Grant Saviers
From: Gordon Bell
Date: TUE 23-JAN-79 15:35:14 EDT
Subject: disk priorities

I would like to meet with you and Grant on friday after your meetings in
order to get an idea of what we are going to do in the mid range systems
where it is becoming increasingly clear we will have a major competitive

problem.

I see us as having the 11/24, 11/44, Minnow, Nebula, and Comet all sitting
the there with a need for more than an RL02 due to the fact that the system
software is big! Furthermore, all our competitors are coming out with
reasonably large disks of the 50-60 mbyte level and the pres are the same as
what we offer for the RL and RK products.

To me, this is probably among our highest priority, as it represents such a
large systems base (eg. targetted by IBM via the Series 1, System 38 and 8100,
all of which have the above disk). Now, with the RP07 and 08 being feasible
and reasonably cost-effective and holding the line in our 11/70, 2020,
adVAX/780 systems, it is time to worry about the heartland. With the risks in
the r80, it seems like the path you suggest is reasonable: 1. Make uda have
first the 9762 interface and use the CDC 63MByte unit we hav on the Massbus
be used there. This also gets us access to 9762 interfaced drives. The cost
is right versus the rm02 and rk07 2. Get the r80 on uda 3. Get the r80 on
Massbus 4. Get HSC50 eventually, eventhough we don't need it except for
Dolphin and Hydra. These can wait since Dolphin can stand the price of
massbussesa and the delay. Hydra can't use it at fcs due to the added work we
aren't read

to do yet anyway.

Let's get the settled and going.

Subject: **Alternative Disks for Medium Systems**

To: Bill Demmer, TW/D19
Bernie Lacroute, TW/A08

CC: John Kevill, ML3-6/E94

Date: 3/16/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up 3/30/79

Is there a way you could breadboard (try) the CDC 9762 interface to the Unibus (CSS has one, I believe) and explore using the plethora of external and internal disks interfaced this way as an alternative to the current disks? This would probably give us a much better system's price, get rid of many of the configurations, etc. It might apply to 11/44, Nebula, and Comet.

The CDC disk used as part of RM03, is already in-house and might be considered because it would save on spares, incoming inspection, etc. The RM80 has this interface (as used with the Massbus) and CDC has a storage module 60 Mbytes (fixed), evolving to 120 Mbytes. Other vendor disks use this interface, including a 600 Mbyte disk from CDC to come.

Subject: **High-End Mid-Range Disk Strategy and Architecture**

To: Bill Demmer, TW/D19
Ulf Fagerquist, MR1-2/E78
Bill Johnson, ML21-3/E87
John Kevill, ML1-3/E58

Date: 31 OCT 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

I'm feeling very uncomfortable now with the disk effort vis a vis the high end, the impending products of IBM using the Winchester technology in fixed disk systems, and the underlying architecture of the NDS. Somehow they all seem coupled, and if one could be fixed, maybe all of them could be.

It seems that the RP07 would have been all right if it had been on time and if it had an RP08 follow-on. Given that these conditions have changed, then it seems like we need to rethink our direction. We're on the threshold of getting creamed in the high end systems businesses (2020's, 11/70's and 780's).

The Massbus price continues to be a big source of problems in cost and pricing. We have to get off it, and if we bite the bullet now and planned for no new products as of now, we might be better off. The de facto plan is to have a new disk interface, but yet that takes incredible changes in our software to support it, and I worry about when we can get there. Also, with this interface, like the Massbus, the systems group is captive to our internal supply. A way around this is perhaps to get multiple suppliers on board with disks immediately, so we can buy disks as commodities. In this regard, I think it is time for the base hardware groups to start worrying about disks, because that's where the cost problem is. John, your threat to Bill that there would be trouble with building a Unibus interface to the new disk interface worries me. Since there's so much diagnostics built into the disk, I fail to understand the concern. In short, we need more parallelism in the design. Other groups have to help.

NDS has always been a concern and I have been ineffective in communicating the exact nature. Now, I'll try again. I see all these systems coming down in price and I see the price of NDS as significant in all but the 780 and 2040 and above class machines. I don't see it as being applicable to Hydra because it is most likely too expensive and it introduces another system component type in the system and this adds to the unreliability, and makes the architecture unclean and inhomogeneous. (I realize that it may be necessary for the functionality, but I still don't like it). Therefore, the product has a limited market, and with such memory design resource limits, I wonder if we should be going to a system that will take more resources in what I think will turn out to be an unbounded fashion. This is also my concern about the migration of software to the Colorado Operating System. If the architecture were more in line with current operating systems, there would be a natural migration to a special system; or, said more simply, if the disk traffic gets really high, then one or more of the standard system component in Hydra would be dedicated to Memory/File/Record/Database work, rather than having a special system components that only deals with physical records and that is somehow extended to the other levels on an ad hoc basis. In short, I do not like the architecture of the system and I feel uncomfortable with it. Only immediately after I talk with the NDS group do I ever feel very good but that passes with time. In this instance, I must ask the architecture group for alternative structures, because there must be better alternatives.

The issue of caching is bad too. I wanted to build the Massbus cache to get some experience which I think we badly need and in doing what I think will be the only reasonable way to cache disks. Let me relate the story on the 11/45.

> I tried to get a cache in the 45, but the complexity was too great for the project. Fortunately, a fast bipolar option was put in and a few users bought it. We ultimately offered an all bipolar version in the 55. The real winner is the 70 with the cache, because users need not worry about what is cached and what is not. In doing the 70 the alternatives were to do software caching in the bipolar memory, but this is impossible even though the software people and hardware people said we could do it in software.

Right now, every system has a disk cache in software. A major part of TRAX and its complexity is disk caching. Again, this whole effort is largely nonsense. The memory group could have solved the problems by a disk cache. Now, NDS is the only way we can have a disk cache, and it is only for the high end. Again, it is software, but in the NDS. I believe there needs to be some provision for caching simply at the disk interface so that it can enhance all systems.

The bottom line: we have some nice opportunities for consolidation and we need to look at our systems architecture quite quickly as we pour money into what may turn out to be the biggest White Elephant around.

Let's get together for a way to segment the problems and proceed.

We seem to have the potential to need many displays very soon as the competition will get more aggressive. Somehow, our R and D ought to be aimed at getting us in a position so we can make the greatest number of products with the smallest development and manufacturing changes. This would let us key off of the production base. This is a technique that we have used in our computers and that the TV industry uses.

I don't know what the basic modules are, but the parts that we have already identified include the package, power supply and module frame. Could we identify an approach so that we can evolve:

1. current screen to higher resolution for a full page of text (here, I believe that the 66 lines are important so as to see the page

2. current screen to higher resolution graphics to 1000 line graphics

3. black and white graphics to color

What are the right evolutions and components?

SUBJECT: DISTRIBUTED SYSTEMS HARDWARE DEVELOPMENT IN NEW HAMPSHIRE

I have committed to Bernie Lacroute and Bob Savell that they can

continue to keep a hardware development group in Merrimack,
occupying the 20K ft space they now occupy, and staffing as they
desire within the limits of that space as long as there is
any significant amount of development activity of any kind
taking place in Merrimack.

Should the development activities currently located in Merrimack
be moved to another New Hampshire location, the same commitment
applies.

Larry and I are particularly sensitive to the need for stability
of people's work location and are committed to improving that
stability.

In this particular situation it was very clear that a formal,
irrevocable commitment be made.

SUBJECT: JOB DESCRIPTION - FOLLOW UP: 2/1/80

JOB DESCRIPTION

DOCK MERGE/CUSTOMER MERGE/PROGRAM MANAGER

To "work with/manage" across engineering and manufacturing and then to sell the changes and benefits to P/L's. This person will define and accelerate dock and customer merge of systems along the lines needed by the current programs (e.g. Comet, Nebula). The program must get and maintain high visibility. The current hi volume system (Nebula, Comet) have moved a significant distance, but much work is required to co-ordinate and to get the details worked out which are at a stand still. We must get the right partitioning of system components (e.g. cabinet mounted RL's) to the high volume plants. Also, the critical communications options are not dock mergeable. We must have a continuous monitoring of where we are and what's left to do.

Folks, we ain't making it although there's lots of progress. There's nothing here that's very hard, but there's lots to do. I think a person, reporting to Larry and I is needed even though I'm not anxious to take on any more. The payoff, one less FAT plant is so high, that I think we need to do it. What do you think?

follow up 1/23/79

Just got a glimpse of costs and time to market of these alternatives. Can only think of three more alternatives before we propose the direction.

1. An MCA version, based on Comet to get product cost down. Venus seems too expensive. Also do Dolphin 32/36.

2. Dolphin 36 and both Venus for 780 and multi-Venuses connected to Dolphin bus for performance.

3. Do #2 except use the lower cost COMET-based MCA processor of #1 as the Dolphin components.

Am worried about understanding ECL as it relates to KL and MCA. We must have high availability.

The development costs for the alternatives seem low. Here, can we get total costs of KL and 780 including software support of special hardware and the options, etc. that these programs have triggered (e.g., 2040 ~ 2060, MA780, DR32)? Let's get at what planting a base system seed cost in terms of software support, hardware branches, options. Also, we should get some handle on demonstrators, software development machines, manufacturing, services and sales fixed and variable costs as a function of volume. Namely, it looks so cheap to do all machines, yet I know about all these other resources (I'd guess $25M+/machine within engineering alone). That's why understanding KL and 780 is critical to projecting the future.

In terms of comparing cost and performance let's use system configurations and system performance (in terms of the number of users) to plot the cost-performance "plates" (areas) that the System Analysis Group has started using.

EMS 10-MAR-79 12:47:46
130 1
To: Ulf Fagerquist
From: Gordon Bell
Date: SAT 10-MAR-79 12:47:46 EDT
Subject: Dolphin Dilema

Want to move quickly, agree with you. Maybe it would help at this time to
posit alternatives...this will ease anxiety.

Follow-on 10/20's--- Minnow, KL cost reduction and MCA izing for cost and
performance, while building on the support structure already existing.
What about MCA'd kind of minnow that would use ICCS and only be a processor
and memory with no channels or not have peripherals. ICCS would provide all
of these. This would get the system more in line with the homogeneous network
and would have to be a part of it. In this way we would mix 10's and VAX's
and have thm share the same files, etc. Would we make Donphin differently if
it were just an ICCS inteface, a Processor and Memory, and no multiprocessor,
except fortje HYDRA-type strucuture. Actually several processors on the bus
might not be bad (or hard), but it does raise a bunch of problems that might
otherwise be not worth solving. A structure like this could be really cheap,
I would guess.

I'm enamoured with the CMU proposal and this would let us focus onthe
homogeneous network strucutre by getting a breadboard environment that
includes 10's, vAX's (the migration problem), plus interfaces to other
machines. Jorgenson's analogy to Israel makes sense here. If we didi it, I
would believe that you should manage the interface with a project and put
some people there and here to really push this. That would be a major
program focus!

Disks and controllers are nneded and I see that in here somehow, a although
the disk group says no vehmently

Command:

EMS 28-JAN-79
17:50:05 370 1
To: Ulf Fagerquist
From: Gordon Bell
Date: SUN 28-JAN-79 17:50:05 EDT
Subject: Priorities

I can see that you have the same problem I have...namely there is a very long
list of things to do.   The systems insight seems to be coming along fine,
but can't you get Flynn and Shanzer to do the work and insighting under your
direction? This one looks like a good one to get down on the list. The
highest priority just has to be the settling, if we can, of the Dolphin and
Venus...or the notion that we will wait for more information. In this way,
everyone can go ahead, but in a very unsettling way.   I talked to Win on this
and his goal is: 10/20 customers don't feel mad at us. We don't lose any of
the 10/20 group...and of course we make money. He doesn't care about where
the machine is positioned in the 250-500K space. I mostly care that we do all
this really fast to avoid the wear and tear on the people. Can you get a list
of the stuff youa'e into, and then drop some for now so as to just

concentrate? I will help here. I think the key in the product positioning is
what the software will look like and just who we are supporting. From a
corporate profit viewpoint, given that we are now growing at less than 41 %
(Namely 26%), and that we are really expanding into the low end (a la store,
micros, etc.) , it seems like the implication that all grops will compete for
NOR (production) resource s   such that the net effect will be much oorer
performance which we may be seeing now. Namely, we have too many product
families in now this faster market. The solution would be to start a
phaseover now. What do you think? (The strategy posited by Bernie and Per
for doing both seemed wrong in light of constrained market need, and
especially that the 10/20 wasn't positioned to go after new business... and
George agrees too.) Let's talk on the phone.

Command:

October 25, 1976

Mr. Don McCoy
Manager, Advanced Systems Development
U. S. Steel Corporation
Pittsburgh Service Center
1509 Muriel Street
Pittsburgh, PA 15203

Dear Don:

It was nice talking with you and Ron Richards again on

Wednesday, and to greet Mr. Beeken. I believe it would be worthwhile to visit Maynard and to pose some of the problems you feel will limit our continuing (start-up?) relationship. I agree with Joe Monihan that DEC can most likely provide you with computers and an applications software base (i.e., tools); but, the interface of what services (help) is available, its price, and how much DEC is going to invest initially has to be decided. Getting your applications to work successfully is probably the first order of business.

Your assistance to us about interfacing to U.S.S., and to larger customers, in general, would hopefully be welcome. I believe we learn rapidly and can change unnatural policies...provided we know what's wanted. Could you write down some of those problems (e.g., the $35 syndrome)? I'll try to fix the problem you had with our software distribution center.

The reputation among U.S.S. and other users you know that "DEC has very good products, but is hard to deal with" is a frightening concept to me. While I tended to agree, as a customer, the alternative suppliers appeared to be about the same. Could I enlist your support in parameterizing this interface, and then ranking the companies? (Just a gut feel on the back of envolope in 10 min...no big survey although it would be worth seeing if its a universal feeling at U.S.S.)

Although I believe there are significant gains to be made through using computers in control, I'm quite concerned about several aspects that may be troublesome:

1. Having come from a fundamentally batch orientation, there may not be enough understanding of resource constraints. With batch, a program is written, executed, and then machines are ordered depending on the needs. A real time or transaction processing application only exists if it can meet resource constraints. Somehow we have to work better to understand how to define the problem a priori. We also have to learn how to help our users define and solve these problems.

2. Working without a structure for specifying the problem in successive details versus using the solution (i.e., the program) will not yield predictable (manageable) results. (I think we do software engineering here versus art now, and it might be worth discussing this with you and some of your colleagues when you visit.)

3. The Factory Data Collection will help significantly, but it won't be a panacea, and the problem experienced on the application giving poor response time will still be possible unless there is a deep understanding of the problem.

4. I really wonder whether we know how to support you in the manner which IBM may have made you accustomed? (I'm sure we can provide better products at lower prices, but you may not feel so good). Also, I suspect we can probably work effectively with a more engineering oriented group. Quite possibly our Commercial Group would be a better interface? This really prompts me to be skeptical of any of our marketing plans to the larger IBM (especially batch) oriented customer. While you suggest that the interlude was profitable for Burroughs, it seems like you still went back to IBM. Do you have any thoughts on this conclusion?

It was good to discuss some computing with you again. I believe if we can get to the point of being a reliable supplier it will be worthwhile.

Sincerely,

Gordon Bell

Attachment
November 25, 1984

Mr. Doug Drane
Drane Associates
231 Boston Post road
Wayland, MA

Dear Doug and Sandra:

Thank you for the gift to The Capital Campaign and moral support that helped open the Museum on November 12.

The physical realization has turned out to be much more exciting than any plan could have communicated. The staff made a very large "stretch" to open a range of galleries. The reviews have been positive and it is easy to spend a half day in productive learning. Knowledgable teenagers are spending their days at the Museum. The most flattering comment to date has been that it is the first American technology museum to be at European standards. Dr. Oliver Strimpel, who did the Museum's Image Gallery has just become the Associative Director and Curator. Oliver was formerly the Curator of the Mathematics Section of The Science Museum, London. The long collecting period and five year breadboard at Digital really paid off in collecting artifacts, building exhibits, doing lectures (ranging from Amdahl to Zuse) and gaining widescale support from computer people and companies.

I want to see this phase aimed at:

- putting a formal educational program in place,
- continued collecting of artifacts (whether letters, films, manuals or machines) in order to record the significant, information processing events, and
- getting broad public support from computer-knowledgeable people who want to learn more about the past and future history of computing.

I hope we can have another assault on Rochester, but based on the attempts to call there, I can understand your frustration. Kodak has a number of artifacts that I'd like to see collected, so we somehow have to establish a connection with them.

Again, thanks for the support. Please let us know when you can come for a personal tour and dinner.

Sincerely,

Gordon Bell
January 20, 1981

Prof. Francis Lee
Massachusetts Institute of Technology
Electrical Eng. & Computer Science
36-576
Cambridge, MA 02169

Dear Francis:

I've just described your book project to Jack MacKeen and he's quite enthusiastic to support you.

Rather than being a "switcher" in this project, I think it's best to go ahead and meet with Jack directly. At that time you can sign a non-disclosure agreement and then proceed to learn about our future products, including our one-chip processor. Also I'd hope you can influence our product direction based on your experience. If you haven't visited our Hudson Semiconductor Facility, then you might also plan to do this when visiting Jack at Marlboro.

Jack's expecting your call and is ready to proceed. If there's anymore I can do, please call me.

Sincerely yours,

Gordon Bell

SUBJECT: DP-MICROPROCESSORS LSI-11 BOOK BY FRANCIS LEE (MIT)

Francis asked me for advice on whether he should devote some energy into writing a book on microprocessors for real time control. The LSI-11 is used as his laboratory and a pedagogical carrier.

His approach is top-down design, starting with problem statements written in PASCAL. He uses the first problem that can be solved this way. Then he progresses to add the real time primitives, descend into selective use of Macrocode, then to microcode, and finally the addition of hardware in order to handle the real time problems of speed control of a motor.

He believes in the 11, RT11, and Pascal as the right way to solve these problems. His demos in class use an 11. His lab, which we helped him build, is very impressive.

I strongly encouraged him, and asked what he needed:

.Some occasional guidance from RT11 group on some of the subtleties.

.Disclosure of future products so he can write in our products, and also test them. He has questions too from time to time.

He also
would like to influence them because he is buying some of his parts
(clocks, A/D) from the independent market. He doesn't consult with
anyone else...maybe we should get him to consult with us in the
micros area too? (He'd sign a non-disclosure.)

.He'd like to get his RT license extended from 1 to 9.

I also encouraged him to think of Digital Press, but he thought it was
premature. If we have a WPS, maybe we ought to contact him and
encourage him. Marcy, you might have your acquisitions person contact
him.

Jack, can I have your support and suggest he come visit you to get at
the nitty gritty? (I said I'd call him back.)

Follow-Up: 11/9/79

Bill Demmer is going to go to the board on November 26 to discuss Distributed Processing and our strategy to it. A major issue that prompted this was the fact that Ken (and I when I found out) wants a brochure or brochures that describes this. It has been promised. Let's make damn sure that a draft with pictures, writing, etc. is available by that time. I don't want us to continue to be nailed for these basics.

George, please let me preview when ready.

SUBJECT: SOME QUICK (AND OTHER) QUALITY ACQUISTIONS

Having thought some more about the dilema of how to make a
few
fast, good bucks:

Cheap calendars are also bad because your order processing
will
eat you alive. You are set up to ship 20$ items, the
calendar

would kill you. Don't know what it is, but look for 50$ items.
Do you understand whether you are selling to individuals or to
institutions?

Why not reproduce the 45 Computer Art Murals that we will be exhibiting in September as part of the ASTC (Amer. Science and
Tech Center) road show? This could be a packet of posters or a
coffee table type, quality book. Note, there is no book here and
the exhibit travels to other museums and you might have a market
per se. There is a person who put the show together who could be
the one who got the book together. It could be quick and quality.

What ever happened to getting the Computer Encylopedia of Ralson's? Anyone want to sell it to us?

I thought we had agreed to immediately go out and get the Eames
book from Harvard University Press that is out of print. Could
you please do it? The book is now beginning to be appreciated
and it would also fulfil the quick, quality rule. Also, it will
be a massive service to the field. The reproduction should be
bigger though so that the pictures stand out and the print is larger. PLEASE, PLEASE, TODAY!

The Ten Pioneer Computers book is soon, now targetted for shipment to you on 2/82. This is made up of the DCM lectures by:
Wilkes, Stibitz, Forrester/ Atanasoff, Zuse, Wilkinson (for ACE),
Eckert/ Bigelow (IAS), Hopper-Salton-Brooks? (Mark I),

Kilburn
(Manchester)... finishing in 12/81. Given that you have seen the
lectures, what do you recommend as the format? Substantive suggestions are needed now (ie. photos of people, machines, footnoted, extra reprints of original, thick, thin, big etc.).

Please put Generating Computer Generations in your pipeline with
an unclear delivery to you. It will be built on a bottom-up basis for sometime in order to get the ideas together, based on a
series of essays and lectures. Given that you have all read it,
feedback is necessary. Who should it be written for? How would
you sell it if is merely a filled out version with lots of examples (photos, cartoons, diagrams, etc.). How long? Easy
reading or scholarly (lots of references that are drudged up)?

SUBJECT: INTRODUCTION TO OFFICE AUTOMATION

Really don't have time to do a proper review. Suggest you get
Jack Gilmore to do one and also someone from Al Crawford's shop. Try Ken Mayers or Claire Messier (who's writing a long

range plan for OA) and also we have someone there who has written a good questionaire about what should be in systems over time.

From reading it hurriedly, 1/2 hr., and while attending a meeting in parallel I found I didn't learn much of anything except some random facts about there being an unreasonably large number of microfiche standards... hence no standard at all. I learned what they are. I didn't get at the point of why microfiche system haven't been useful and what it taks to make them so and where they might be useful.

It is an easy book to dislike or not get very attached to. I feel there may be more there and with the tables and pictures it might be a reasonable book for someone who wants an overview
of the possibilities. It ain't for the academicians! Possibly
for dp or office manager types. It is very detailed (eg. micro-
fiche), yet very superficial. I think it could be be made to be useful as a handbook, something along the lines of Christy's
book on Dist. Data Proc. Note you have my notion of levels of
architecture about how these systems are structured internally
as a comparison, but it isn't the type of thing to give to an office manager. Also, it doesn't get into the subtelties of WPS that mean that people are actually programming, albeit called by something like list processing or math or sort. This
should be delt with, also it would be nice to get into some of
the ergonomics and anthropometrics so that people know what they are trading off when they look for various systems. Some
of the stuff in Martin's book would be appropriate here, plus there are others.

Specifically, it starts with a bunch of terms it never proceeds

to define on page 6, like office automation- what now exists is possible and practical... This is enough to make anyone hate
the book! the defs, p12 are poor and sloppy. The communications
primer could be simplified and the jump rope removed and even the whole thing put in an appendix. (data, text, information,
tables, words, messages, etc. all must have precise definitions
that weren't in the non existent glossary... but they should be
defined in passing too. He ain't knowledgeable about bandwidth
(eg. tv channel is about 4.5 mhz, not 300 mhz!) In many cases
he could simply give some tables of pros and cons, not bury it
in text. Overall, things seem to text-bullety, not crisp tables
with explanatory text.

Overall, I would pass it to several people like Claire and some
of our marketing folks in Buzz's group for review to see if the
world could get anything from it. Somehow I think they know a
lot of what's in it. On the other side, the Office Automamtion
conference by the ACM which Morgan from Penn presented along with other academicians, was extremely thin. It isn't clear that there is any depth on the whole issue that can be discussed
other than details of implementation and features. (It doesnt
say how to buy a machine or run a benchmark or measure it or introduce it or write a procedure or how to get a system installed
or....

Frankly, I would say dont publish unless there is support for

a readership (I don't know them or who they would be or claim that they don't exist). If you do publish it, it will take major
revisions and at that point, please get a clear readership along
with what the pople are expected to know, and then I would review
it in the context of a rewrite.

If you want Mary Jane to review it, I would run it by her, cause
she really is good at knowing what's available and what various
users know and need. (note there is a lot of crap from consultants
that looks about like this) nancy seabold got raves in MK, so
you also might try her.

Let me know if I can be of further help,
Sorry I couldn't be of any more use.
gordon

GB1.S6.50
The following three slides are needed for Dist. Processing
talk in albequerque:

The Central Facility

Large, shared data base
Archiving for personal or organizational computing
Program facility for a few, distributed users
Quality printing (typesetting) and special facilities
Very High Performance Processing
General facility for casual users

Group Level Facilites

Shared, project data base
Specialized facilities (eg. microprocessor debug)
Programs run in common for group
Intra-group communications
Communications with Central and Personal Computers
High Performance Processing
Personal computing for many of the group

Personal Level Facilities

Personal data base (usually transient)
Communication with one or two, link to home, link
to higher level machine
Fast response, high quality terminal
Program environment for entering new programs
Processing sufficient for an individual, and
compatible with every other level

SUBJECT: COMMENTS ON STRATEGY AND MINI SERIES

Haven't had a lot of time to look at this. On the first reading,
I got these impressions. Probably we ought to discuss this as
this would force me to read it more carefully. Would like
lots more numbers, review of charter (in appendix, etc.)

The Strategy
First off: going from an expense relief of 400K to 527K in FY82
is ridiculous! I think DP ought to be closed down if it can't
get to a position of making money. It sounds like that the more
we sell, the more we lose... this is a hell of a way to run a
business. It is inconceivable to me that Jack Shields would want
you to operate this way! I don't.

There are classical solutions to the losing money problem. Why
not raise prices by say 20% along the same rates that other
publishers have raised their prices over the last few years?
Could you sell more? Why not get your various author
organizations to put up front money? The royalties sound awfully
high, given you are losing money and given that several authors
get nothing. What's the story? Alternatively, what about a
paring of the staff to get to a breakeven point? There is a 1
week summer course for DEC Managers that you might attend at
Cornell on running a business.

I would think you ought to plan on what is fundamentally an
opportunistic approach for several books, like Knuth. However,
instead of losing money, there has to be a way of getting support
and up front money. Univac should have paid for Stern, Mitre for
Redmond and Smith. British Computers was worked into a deal,
since MU printed it. Did it make money?

As far as the strategy document is concerned, I didn't get a very
good feel of where DP is, or where it came from. I really wanted

to see it's whole history financially, and what the prospects are
for the future. It seems like only enough was given to get through the FY82 budget cycle; if you slide by this time, it would be a bad thing. Again, I don't see investing our money in this area. My goal for DP has always been a press that supports our beliefs in computing and that makes money.

I'd like to see a graph that shows the investment for each book
and when the breakeven point is. You have to get someone to help
you with this financial work! (What is engneering as an expense
line? what is inventory as it relates to a P&L?) BURP would let
you get at this, for example, or you could use one of the myriad
of Visicalcs to get the work done. You must get to a business
understanding of publishing and whether it can operate within DEC!

Some Specifics
Why do you care if there is more than 1 DEC book per year?
(assuming they are good and make money)
I'd put profitablity first on the criteria.

The Mini Series
It would seem that you ought to give up on this, given the difficulty of doing it, until some person materializes who wants
to do it. We aren't especially together in the marketing or product area now, so I can't see it as essential there. Also,
the needs will probably be more based on a PPG approach when it
comes, thus you can't make money on it. The series would also be
riddled with problems: existing publishers, lots of freebie articles appearing all the time, no mailing list or way of

selling the books, a different set of readers, etc. You might
contact some of the internal folks: Si Lyle, Avram Miller, Peter
Conklin, Mike Weinstein, Ollie Stone (Applications), Glen Reyer
and Jack Gilmore (office). It would seem like a better strategy
would be to get really good (classical) books in these areas,
such as that by John McNamara, even though the areas are changing
rapidly. Also, note that we have been successful as a company
selling to the more sophisticated users.

25th Anniversary Book
There was a discussion at Operations Committee as to whether we
would allocate $30 per book for the 25th anniversary. We voted
not to, but would wait until a book was written that could be
reviewed. Gwen is meeting with the 25th folks tomorrow and may
get a better idea. You might call her on this. Fundamentally,
the book makes me a bit ill. I want to get a writer FIRST, let
him propose and work on it, then let's decide what to do with it.
In general, I think I'd rather see something that has more
general utility, appeal, quality. I really think this book
should be the ANNUAL REPORT of 82! These sort of books make me a
bit ill, but not quite as ill as the history of GM by Sloan, or
the history of P&G in 3 volumes. It would seem that the best
place to stay is far away, except to help out in the publication
and be a channel for sales of the book (if anyone would want to
buy one)... I reserve comment until I see the text.

NCC
Did we get any sales there in the booth? or at Univac? or at the
history meeting? What was the interest? Any new authors there?

Factor of the Future Book
Don't know it. It feels like a new topic. Let's publish it if
it has the quality and/or potential sales.

Stern Book
Perused the Edvac report and like the look of the pictures.
Hope the text is better too. Need a copy to JV Atanasoff.

LARRY PORTNER EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: CONGRATULATIONS, GOOD LUCK, AAND YOU HAVE OUR SUPPORT

Again, let me offer our combined congratulations on this job. I also
look forward to you contributing to the engineering staff.
Communications and networks are about our hardest challenge now.
Seeing what you've written down, it already feels better. Although
it's too much to expect getting the act together before April, it is a
nice target. Certainly we should aim to have the issues outlined by

then, showing what is really firm, and what needs to be worked out.

It feels like we should be using gateways NOW as the way to get at x25 and sna and also perhaps some of the terminal emulators. Instead of making the module be outboard to a system and attached to a Unibus, I can not understand why we don't use one of the Micros products and have it be a totally self contained piece of hardware that is either in a box or rack mountable. Micros is working on a Tiny with memory on a dual, and this with maybe only 1 or two other duals is all that is required in such a system. If we took this approach, then we could get the gateways started before we have to get into the complexity of NI.

NI for now should just be aimed at getting a decent interface to our various large systems, and at the same time getting the concentrator built. We have yet to have a concentrator. For now, it would seem we should declare victory and use the existing one we have that has been used for years on the 10/20, but modified to do the virtual terminal work via DECnet. Here, Scott Davis is near making the experiment in VMS that indicates how much processing is required when the terminal handler is moved to another system. We must have this data before we can get very far. I've been waiting patiently.

Kotok has been working with Stan as a consultant across the

board. I
hope he'll continue to work here, albeit at an accelerated rate.
Savell and McNamara have done some first rate analysis that should
form the basis of a competitive hardware strategy. We have recently
lost Telephone business because of our comm. products.

You have notes and thoughts from me on European Engineering... ie. do
it like Colorado, evolve as the competence develops. Don't Honeywell
it, moving the product and charter to Tulsa only to find the
developers are still in NE. Fortunately for us, we were able to offer
them jobs and start a mass storage group.

Am also worried about the hardware vis a vis using competitive micros.
The boards, with intelligence, sure look expensive, impossible to
program and kludgy. My guess is that the 16 (actually 22 bit) micros
are the answer here by using substantial amounts of VLSI for cost and
easier programming. Also, I feel we should be using higher level
languages, possibly decision tabel-type languages to specify the
protocols. Again, we need some experiments.

Am certainly concerned about the transition from conventional comm, to
the point where all comm is on the NI. My fear is that we are
planning the transition too soon, and have not worked out the numbers.

Metrics are the key to knowing where we are in this space. Right now,
I don't understand it as a whole, nor do I think anyone else

does. We
need the type of treatment Riggle and Sills have given Mass
storage.
The cost metrics should be clear for the hardware, and then
we get
into what is essentially cost when we trade-off cost of the
interface
for performance in the host. For example, I suggest that
the comm
interface harware should be no more than 10% of the system
cost.
Here, you must add the percentage of the cpu that you use for
it. A
terminal costing 1500, should spend no more than 150 for the
comm part
including the modem. At the other end, take another 150
because of
symmetry. Here, if the cpu of a 250K VAX is required 0.1%
per line
before the characters get to the job, then the cost is
another 250$.

Thus, soon, we had better get metrics (including modems, line
costs,
switching like Gandalf or ma bell) to know where we are.
Then we
ought to get the competive data.

Again,
comm and networks are clearly about the most important
product set we
are doing. The needs are voracious. Only clear thinking and
hard
work are going to pull us through.

I'm available and would like to meet with you and your staff
within
the next month. I have the highest regard for your staff and
the
people doing the work are really competent, having given us
some
really strong products in the form of DECnet, together with a

strong
base using Ethernet. All I think we need is product targets, stability, leadership and all our support.

You have mine,
Gordon

SUBJECT: MORE ON THE DEINITION OF DP

DP matches computer system s to needs on a geographical or organizational basis, AND interconnects individual computers into a single network

The objectives of dp are:
1. to allow effective matching of resources to needs

2. to allow both local and autonomy and central control of the various distributed parts
3 to provide an evolving , openen ended system so that development of ditributed parts can proceed at their own, pace in a quasi independent fashion
4 to allow purchase and installation of computers in a most timely cost-effective wasy, taking advantabte of reduced (with time) hardware costs
5 to build on and communicate with existing , more central systems, fully dispersed systems, and emerging personal computers
6 to provide computing , control and storage of information nearest the need.

(sorry about the spelling/wording but the ems editor ant this ti terminal are not up to coping with my typing.)

SUBJECT: THE STERN BOOK: HOLD THE PRESS ...

About 20 pages of comments will follow, but the bottom line:

The book is a factor of 2 too long, takes too much work to read,
has all types of errors, draws and presents false conclusions,
and delivers far too little insight to any reader I know. We can
not publish it unless the issues are attended to.

It should come about R&S in quality and even try to attain
Lavington quality, even though it will take another year. The
beauty of publishing history is that it's virtually timeless; we
have to control to quality, not schedule.

I still think it is an important story that needs telling.
We have to set the standards and suggest the approach.
Nancy's got most of the facts, let's help her make a great book!

GB2.S4.15
July 10, 1984

Dr. Irwin Dorros

Executive Vice President
Technical Services
Bell Communications & Research
290 West Mount Pleasant Avenue
Livingston, NJ 07039

Dear Irwin:

The Computer Museum is opening in downtown Boston on November 14 after operating successfully for five years within a Digital Equipment Corporation building, the last two as a non-profit, public Museum. The Museum wants AT&T to become a major supporter!

A first-rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the Computer and the Image. Predictions are that we should have attendance of over 200,000. This world-class, international Museum should be a major attraction and asset for the computing community. The enclosed brochure describes the Capital Campaign, and several reports give an idea of the Museum's activities.

The Museum has started communicating with the AT&T Foundation. Bob Everett asked Robert Lucky to help, who in turn sent the request to Ms. Esther Novack, Vice President of Cultural Programs. In talking to Ms. Novack, the Museum fits within the Foundation's frame of reference, but she needs to understand how The Computer Museum would benefit AT&T. Now I want to enlist your support to:

1. work with us to prepare an appropriate proposal to the Foundation. As AT&T becomes a significant computer supplier, it will increasingly benefit from The Computer Museum. George Stibitz was one of our first speakers and would like to contribute in a major way, but never reaped many rewards from his contributions to computing and as he said in his last letter, is facing one or two lingering illnesses. He has given many of

his papers, made the Museum a model of his first relay adder, and when he can, he comes to Museum functions on the bus from Dartmouth. We show the first transistor and need to incorporate software more prominently in our exhibits.

AT&T might want to name a lecture series recording its contributions which have benefitted computing including: programming, UNIX, C, speech and music, graphics, semiconductor technology, communications etc. We also want critical artifacts for the collection and the possiblity of assigning this important function to us. We continue to need an unlimited supply of working computers for various exhibits.

We are looking for a complete, AT&T sponsored package that would amount to $400,000 or $100,000 per year. DEC gives $600,000 per year!

2. become a personal "core" contributor ($4K over 4 years) or foundership, ($250); (The founding period is just closing.)

3. contribute your own important artifacts; (The Museum will act as a repository for things that would otherwise be forced to be scrapped.)

I will call you to discuss these activites and how we can be responsive to AT&T's needs. Even though it's not open, I'd be honored to give you a tour and a meal.

Sincerely,

Gordon Bell

follow up 1/23/79

Just got a glimpse of costs and time to market of these alternatives. Can only think of three more alternatives before we propose the direction.

1. An MCA version, based on Comet to get product cost down. Venus seems too expensive. Also do Dolphin 32/36.

2. Dolphin 36 and both Venus for 780 and multi-Venuses connected to Dolphin bus for performance.

3. Do #2 except use the lower cost COMET-based MCA processor of #1 as the Dolphin components.

Am worried about understanding ECL as it relates to KL and MCA. We must have high availability.

The development costs for the alternatives seem low. Here, can we get total costs of KL and 780 including software support of special hardware and the options, etc. that these programs have triggered (e.g., 2040 ~ 2060, MA780, DR32)? Let's get at what planting a base system seed cost in terms of software support, hardware branches, options. Also, we should get some handle on demonstrators, software development machines, manufacturing, services and sales fixed and variable costs as a function of volume. Namely, it looks so cheap to do all machines, yet I know about all these other resources (I'd guess $25M+/machine within engineering alone). That's why understanding KL and 780 is critical to projecting the future.

In terms of comparing cost and performance let's use system configurations and system performance (in terms of the number of users) to plot the cost-performance "plates" (areas) that the System Analysis Group has started using.

To: Ulf Fagerquist
From: Gordon Bell
Date: SAT 18-NOV-78 14:29:38 EDT
Subject: Dolphin vs Minnow
----
pnother reason I didn't list waas that if the rumours of the
impending H series
in a 1 or 2 ~ear time frame running at 20 mips is true, then we
are going to be
in trouble...particularly if the price is 1.8 million.
dolphin/vax/10/20 will
be about the highest priority projects around.   A hot, lower
cost 360/370
would re-establish the comp centers, and discourage the buyers
from gettin
their own minis (ie VAXs and 10/20's t that off load the 370.

EMS 10-MAR-79 12:47:46
130 1
To: Ulf Fagerquist
From: Gordon Bell
Date: SAT 10-MAR-79 12:47:46 EDT
Subject: Dolphin Dilema

Want to move quickly, agree with you. Maybe it would help at this time to
posit alternatives...this will ease anxiety.

Follow-on 10/20's--- Minnow, KL cost reduction and MCA izing for cost and
performance, while building on the support structure already existing.
What about MCA'd kind of minnow that would use ICCS and only be a processor
and memory with no channels or not have peripherals. ICCS would provide all
of these. This would get the system more in line with the homogeneous network
and would have to be a part of it. In this way we would mix 10's and VAX's
and have thm share the same files, etc. Would we make Donphin differently if
it were just an ICCS inteface, a Processor and Memory, and no multiprocessor,
except fortje HYDRA-type strucuture. Actually several processors on the bus
might not be bad (or hard), but it does raise a bunch of problems that might
otherwise be not worth solving. A structure like this could be really cheap,
I would guess.

I'm enamoured with the CMU proposal and this would let us focus onthe
homogeneous network strucutre by getting a breadboard environment that
includes 10's, vAX's (the migration problem), plus interfaces to other
machines. Jorgenson's analogy to Israel makes sense here. If we didi it, I
would believe that you should manage the interface with a project and put
some people there and here to really push this. That would be a major
program focus!

Disks and controllers are nneded and I see that in here somehow, a although
the disk group says no vehmently

EMS 28-JAN-79
17:50:05 370 1
To: Ulf Fagerquist
From: Gordon Bell
Date: SUN 28-JAN-79 17:50:05 EDT
Subject: Priorities

I can see that you have the same problem I have...namely there is a very long
list of things to do. The systems insight seems to be coming along fine,
but can't you get Flynn and Shanzer to do the work and insighting under your
direction? This one looks like a good one to get down on the list. The
highest priority just has to be the settling, if we can, of the Dolphin and
Venus...or the notion that we will wait for more information. In this way,
everyone can go ahead, but in a very unsettling way. I talked to Win on this
and his goal is: 10/20 customers don't feel mad at us. We don't lose any of
the 10/20 group...and of course we make money. He doesn't care about where
the machine is positioned in the 250-500K space. I mostly care that we do all
this really fast to avoid the wear and tear on the people. Can you get a list
of the stuff youa'e into, and then drop some for now so as to just

concentrate? I will help here. I think the key in the product positioning is
what the software will look like and just who we are supporting. From a
corporate profit viewpoint, given that we are now growing at less than 41 %
(Namely 26%), and that we are really expanding into the low end (a la store,
micros, etc.) , it seems like the implication that all grops will compete for
NOR (production) resource s   such that the net effect will be much oorer
performance which we may be seeing now. Namely, we have too many product
families in now this faster market. The solution would be to start a
phaseover now. What do you think? (The strategy posited by Bernie and Per
for doing both seemed wrong in light of constrained market need, and
especially that the 10/20 wasn't positioned to go after new business... and
George agrees too.) Let's talk on the phone.

Command:

October 25, 1976

Mr. Don McCoy
Manager, Advanced Systems Development
U. S. Steel Corporation
Pittsburgh Service Center
1509 Muriel Street
Pittsburgh, PA 15203

Dear Don:

It was nice talking with you and Ron Richards again on

Wednesday, and to greet Mr. Beeken. I believe it would be worthwhile to visit Maynard and to pose some of the problems you feel will limit our continuing (start-up?) relationship. I agree with Joe Monihan that DEC can most likely provide you with computers and an applications software base (i.e., tools); but, the interface of what services (help) is available, its price, and how much DEC is going to invest initially has to be decided. Getting your applications to work successfully is probably the first order of business.

Your assistance to us about interfacing to U.S.S., and to larger customers, in general, would hopefully be welcome. I believe we learn rapidly and can change unnatural policies...provided we know what's wanted. Could you write down some of those problems (e.g., the $35 syndrome)? I'll try to fix the problem you had with our software distribution center.

The reputation among U.S.S. and other users you know that "DEC has very good products, but is hard to deal with" is a frightening concept to me. While I tended to agree, as a customer, the alternative suppliers appeared to be about the same. Could I enlist your support in parameterizing this interface, and then ranking the companies? (Just a gut feel on the back of envolope in 10 min...no big survey although it would be worth seeing if its a universal feeling at U.S.S.)

Although I believe there are significant gains to be made through using computers in control, I'm quite concerned about several aspects that may be troublesome:

1. Having come from a fundamentally batch orientation, there may not be enough understanding of resource constraints. With batch, a program is written, executed, and then machines are ordered depending on the needs. A real time or transaction processing application only exists if it can meet resource constraints. Somehow we have to work better to understand how to define the problem a priori. We also have to learn how to help our users define and solve these problems.

2. Working without a structure for specifying the problem in successive details versus using the solution (i.e., the program) will not yield predictable (manageable) results. (I think we do software engineering here versus art now, and it might be worth discussing this with you and some of your colleagues when you visit.)

3. The Factory Data Collection will help significantly, but it won't be a panacea, and the problem experienced on the application giving poor response time will still be possible unless there is a deep understanding of the problem.

4. I really wonder whether we know how to support you in the manner which IBM may have made you accustomed? (I'm sure we can provide better products at lower prices, but you may not feel so good). Also, I suspect we can probably work effectively with a more engineering oriented group. Quite possibly our Commercial Group would be a better interface? This really prompts me to be skeptical of any of our marketing plans to the larger IBM (especially batch) oriented customer. While you suggest that the interlude was profitable for Burroughs, it seems like you still went back to IBM. Do you have any thoughts on this conclusion?

It was good to discuss some computing with you again. I believe if we can get to the point of being a reliable supplier it will be worthwhile.

Sincerely,

Gordon Bell

Attachment
November 25, 1984

Mr. Doug Drane
Drane Associates
231 Boston Post road
Wayland, MA

Dear Doug and Sandra:

Thank you for the gift to The Capital Campaign and moral support that helped open the Museum on November 12.

The physical realization has turned out to be much more exciting than any plan could have communicated. The staff made a very large "stretch" to open a range of galleries. The reviews have been positive and it is easy to spend a half day in productive learning. Knowledgable teenagers are spending their days at the Museum. The most flattering comment to date has been that it is the first American technology museum to be at European standards. Dr. Oliver Strimpel, who did the Museum's Image Gallery has just become the Associative Director and Curator. Oliver was formerly the Curator of the Mathematics Section of The Science Museum, London. The long collecting period and five year breadboard at Digital really paid off in collecting artifacts, building exhibits, doing lectures (ranging from Amdahl to Zuse) and gaining widescale support from computer people and companies.

I want to see this phase aimed at:

- putting a formal educational program in place,
- continued collecting of artifacts (whether letters, films, manuals or machines) in order to record the significant, information processing events, and
- getting broad public support from computer-knowledgeable people who want to learn more about the past and future history of computing.

I hope we can have another assault on Rochester, but based on the attempts to call there, I can understand your frustration. Kodak has a number of artifacts that I'd like to see collected, so we somehow have to establish a connection with them.

Again, thanks for the support. Please let us know when you can come for a personal tour and dinner.

Sincerely,

Gordon Bell
January 20, 1981

Prof. Francis Lee
Massachusetts Institute of Technology
Electrical Eng. & Computer Science
36-576
Cambridge, MA 02169

Dear Francis:

I've just described your book project to Jack MacKeen and he's quite enthusiastic to support you.

Rather than being a "switcher" in this project, I think it's best to go ahead and meet with Jack directly. At that time you can sign a non-disclosure agreement and then proceed to learn about our future products, including our one-chip processor. Also I'd hope you can influence our product direction based on your experience. If you haven't visited our Hudson Semiconductor Facility, then you might also plan to do this when visiting Jack at Marlboro.

Jack's expecting your call and is ready to proceed. If there's anymore I can do, please call me.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

SUBJECT: DP-MICROPROCESSORS LSI-11 BOOK BY FRANCIS LEE (MIT)

Francis asked me for advice on whether he should devote some energy into writing a book on microprocessors for real time control. The LSI-11 is used as his laboratory and a pedagogical carrier.

His approach is top-down design, starting with problem statements written in PASCAL. He uses the first problem that can be solved this way. Then he progresses to add the real time primitives, descend into selective use of Macrocode, then to microcode, and finally the addition of hardware in order to handle the real time problems of speed control of a motor.

He believes in the 11, RT11, and Pascal as the right way to solve these problems. His demos in class use an 11. His lab, which we helped him build, is very impressive.

I strongly encouraged him, and asked what he needed:

.Some occasional guidance from RT11 group on some of the subtleties.

.Disclosure of future products so he can write in our products, and also test them. He has questions too from time to time.

He also
would like to influence them because he is buying some of his parts
(clocks, A/D) from the independent market. He doesn't consult with
anyone else...maybe we should get him to consult with us in the
micros area too? (He'd sign a non-disclosure.)

.He'd like to get his RT license extended from 1 to 9.

I also encouraged him to think of Digital Press, but he thought it was
premature. If we have a WPS, maybe we ought to contact him and
encourage him. Marcy, you might have your acquisitions person contact
him.

Jack, can I have your support and suggest he come visit you to get at
the nitty gritty? (I said I'd call him back.)

SUBJECT: SOME QUICK (AND OTHER) QUALITY ACQUISTIONS

Having thought some more about the dilema of how to make a
few
fast, good bucks:

Cheap calendars are also bad because your order processing
will
eat you alive. You are set up to ship 20$ items, the
calendar

would kill you. Don't know what it is, but look for 50$ items.
Do you understand whether you are selling to individuals or to institutions?

Why not reproduce the 45 Computer Art Murals that we will be exhibiting in September as part of the ASTC (Amer. Science and Tech Center) road show? This could be a packet of posters or a coffee table type, quality book. Note, there is no book here and the exhibit travels to other museums and you might have a market per se. There is a person who put the show together who could be the one who got the book together. It could be quick and quality.

What ever happened to getting the Computer Encyclopedia of Ralson's? Anyone want to sell it to us?

I thought we had agreed to immediately go out and get the Eames book from Harvard University Press that is out of print. Could you please do it? The book is now beginning to be appreciated and it would also fulfil the quick, quality rule. Also, it will be a massive service to the field. The reproduction should be bigger though so that the pictures stand out and the print is larger. PLEASE, PLEASE, TODAY!

The Ten Pioneer Computers book is soon, now targetted for shipment to you on 2/82. This is made up of the DCM lectures by:
Wilkes, Stibitz, Forrester/ Atanasoff, Zuse, Wilkinson (for ACE),
Eckert/ Bigelow (IAS), Hopper-Salton-Brooks? (Mark I),

Kilburn
(Manchester)... finishing in 12/81. Given that you have seen the
lectures, what do you recommend as the format? Substantive suggestions are needed now (ie. photos of people, machines, footnoted, extra reprints of original, thick, thin, big etc.).

Please put Generating Computer Generations in your pipeline with
an unclear delivery to you. It will be built on a bottom-up basis for sometime in order to get the ideas together, based on a
series of essays and lectures. Given that you have all read it,
feedback is necessary. Who should it be written for? How would
you sell it if is merely a filled out version with lots of examples (photos, cartoons, diagrams, etc.). How long? Easy
reading or scholarly (lots of references that are drudged up)?

LOC/MAIL STOP: ML12-1/A51

SUBJECT: INTRODUCTION TO OFFICE AUTOMATION

Really don't have time to do a proper review. Suggest you get
Jack Gilmore to do one and also someone from Al Crawford's shop. Try Ken Mayers or Claire Messier (who's writing a long

range plan for OA) and also we have someone there who has written a good questionaire about what should be in systems over time.

From reading it hurriedly, 1/2 hr., and while attending a meeting in parallel I found I didn't learn much of anything except some random facts about there being an unreasonably large number of microfiche standards... hence no standard at all. I learned what they are. I didn't get at the point of why microfiche system haven't been useful and what it taks to make them so and where they might be useful.

It is an easy book to dislike or not get very attached to. I feel there may be more there and with the tables and pictures it might be a reasonable book for someone who wants an overview
of the possibilities. It ain't for the academicians! Possibly
for dp or office manager types. It is very detailed (eg. micro-
fiche), yet very superficial. I think it could be be made to be useful as a handbook, something along the lines of Christy's
book on Dist. Data Proc. Note you have my notion of levels of
architecture about how these systems are structured internally
as a comparison, but it isn't the type of thing to give to an office manager. Also, it doesn't get into the subtelties of WPS that mean that people are actually programming, albeit called by something like list processing or math or sort. This
should be delt with, also it would be nice to get into some of
the ergonomics and anthropometrics so that people know what they are trading off when they look for various systems. Some
of the stuff in Martin's book would be appropriate here, plus there are others.

Specifically, it starts with a bunch of terms it never proceeds

to define on page 6, like office automation- what now exists is possible and practical... This is enough to make anyone hate
the book! the defs, p12 are poor and sloppy. The communications
primer could be simplified and the jump rope removed and even the whole thing put in an appendix. (data, text, information,
tables, words, messages, etc. all must have precise definitions
that weren't in the non existent glossary... but they should be
defined in passing too. He ain't knowledgeable about bandwidth
(eg. tv channel is about 4.5 mhz, not 300 mhz!) In many cases
he could simply give some tables of pros and cons, not bury it
in text. Overall, things seem to text-bullety, not crisp tables
with explanatory text.

Overall, I would pass it to several people like Claire and some
of our marketing folks in Buzz's group for review to see if the
world could get anything from it. Somehow I think they know a
lot of what's in it. On the other side, the Office Automamtion
conference by the ACM which Morgan from Penn presented along with other academicians, was extremely thin. It isn't clear that there is any depth on the whole issue that can be discussed
other than details of implementation and features. (It doesnt
say how to buy a machine or run a benchmark or measure it or introduce it or write a procedure or how to get a system installed
or....

Frankly, I would say dont publish unless there is support for

a readership (I don't know them or who they would be or claim
that they don't exist). If you do publish it, it will take
major
revisions and at that point, please get a clear readership
along
with what the pople are expected to know, and then I would
review
it in the context of a rewrite.

If you want Mary Jane to review it, I would run it by her,
cause
she really is good at knowing what's available and what
various
users know and need. (note there is a lot of crap from
consultants
that looks about like this) nancy seabold got raves in MK,
so
you also might try her.

Let me know if I can be of further help,
Sorry I couldn't be of any more use.
gordon

talk in albequerque:

The Central Facility

Large, shared data base
Archiving for personal or organizational computing
Program facility for a few, distributed users
Quality printing (typesetting) and special facilities
Very High Performance Processing
General facility for casual users

Group Level Facilites

Shared, project data base
Specialized facilities (eg. microprocessor debug)
Programs run in common for group
Intra-group communications
Communications with Central and Personal Computers
High Performance Processing
Personal computing for many of the group

Personal Level Facilities

Personal data base (usually transient)
Communication with one or two, link to home, link
   to higher level machine
Fast response, high quality terminal
Program environment for entering new programs
Processing sufficient for an individual, and
   compatible with every other level

SUBJECT: COMMENTS ON STRATEGY AND MINI SERIES

Haven't had a lot of time to look at this. On the first
reading,
I got these impressions. Probably we ought to discuss this
as
this would force me to read it more carefully. Would like
lots more numbers, review of charter (in appendix, etc.)

The Strategy
First off: going from an expense relief of 400K to 527K in FY82 is ridiculous! I think DP ought to be closed down if it can't get to a position of making money. It sounds like that the more we sell, the more we lose... this is a hell of a way to run a business. It is inconceivable to me that Jack Shields would want you to operate this way! I don't.

There are classical solutions to the losing money problem. Why not raise prices by say 20% along the same rates that other publishers have raised their prices over the last few years? Could you sell more? Why not get your various author organizations to put up front money? The royalties sound awfully high, given you are losing money and given that several authors get nothing. What's the story? Alternatively, what about a paring of the staff to get to a breakeven point? There is a 1 week summer course for DEC Managers that you might attend at Cornell on running a business.

I would think you ought to plan on what is fundamentally an opportunistic approach for several books, like Knuth. However, instead of losing money, there has to be a way of getting support and up front money. Univac should have paid for Stern, Mitre for Redmond and Smith. British Computers was worked into a deal, since MU printed it. Did it make money?

As far as the strategy document is concerned, I didn't get a very good feel of where DP is, or where it came from. I really wanted

to see it's whole history financially, and what the prospects are
for the future. It seems like only enough was given to get through the FY82 budget cycle; if you slide by this time, it would be a bad thing. Again, I don't see investing our money in this area. My goal for DP has always been a press that supports our beliefs in computing and that makes money.

I'd like to see a graph that shows the investment for each book
and when the breakeven point is. You have to get someone to help
you with this financial work! (What is engneering as an expense
line? what is inventory as it relates to a P&L?) BURP would let
you get at this, for example, or you could use one of the myriad
of Visicalcs to get the work done. You must get to a business
understanding of publishing and whether it can operate within DEC!

Some Specifics
Why do you care if there is more than 1 DEC book per year?
(assuming they are good and make money)
I'd put profitablity first on the criteria.

The Mini Series
It would seem that you ought to give up on this, given the difficulty of doing it, until some person materializes who wants
to do it. We aren't especially together in the marketing or product area now, so I can't see it as essential there. Also,
the needs will probably be more based on a PPG approach when it
comes, thus you can't make money on it. The series would also be
riddled with problems: existing publishers, lots of freebie articles appearing all the time, no mailing list or way of

selling the books, a different set of readers, etc. You might
contact some of the internal folks: Si Lyle, Avram Miller, Peter
Conklin, Mike Weinstein, Ollie Stone (Applications), Glen Reyer
and Jack Gilmore (office). It would seem like a better strategy
would be to get really good (classical) books in these areas,
such as that by John McNamara, even though the areas are changing
rapidly. Also, note that we have been successful as a company
selling to the more sophisticated users.

25th Anniversary Book
There was a discussion at Operations Committee as to whether we
would allocate $30 per book for the 25th anniversary. We voted
not to, but would wait until a book was written that could be
reviewed. Gwen is meeting with the 25th folks tomorrow and may
get a better idea. You might call her on this. Fundamentally,
the book makes me a bit ill. I want to get a writer FIRST, let
him propose and work on it, then let's decide what to do with it.
In general, I think I'd rather see something that has more
general utility, appeal, quality. I really think this book
should be the ANNUAL REPORT of 82! These sort of books make me a
bit ill, but not quite as ill as the history of GM by Sloan, or
the history of P&G in 3 volumes. It would seem that the best
place to stay is far away, except to help out in the publication
and be a channel for sales of the book (if anyone would want to
buy one)... I reserve comment until I see the text.

NCC
Did we get any sales there in the booth? or at Univac? or at the
history meeting? What was the interest? Any new authors there?

Factor of the Future Book
Don't know it. It feels like a new topic. Let's publish it if
it has the quality and/or potential sales.

Stern Book
Perused the Edvac report and like the look of the pictures.
Hope the text is better too. Need a copy to JV Atanasoff.

LARRY PORTNER EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: CONGRATULATIONS, GOOD LUCK, AAND YOU HAVE OUR SUPPORT

Again, let me offer our combined congratulations on this job. I also
look forward to you contributing to the engineering staff.
Communications and networks are about our hardest challenge now.
Seeing what you've written down, it already feels better. Although
it's too much to expect getting the act together before April, it is a
nice target. Certainly we should aim to have the issues outlined by

then, showing what is really firm, and what needs to be worked out.

It feels like we should be using gateways NOW as the way to get at x25
and sna and also perhaps some of the terminal emulators. Instead of
making the module be outboard to a system and attached to a Unibus, I
can not understand why we don't use one of the Micros products and
have it be a totally self contained piece of hardware that is either
in a box or rack mountable. Micros is working on a Tiny with memory
on a dual, and this with maybe only 1 or two other duals is all that
is required in such a system. If we took this approach, then we could
get the gateways started before we have to get into the complexity of
NI.

NI for now should just be aimed at getting a decent interface to our
various large systems, and at the same time getting the concentrator
built. We have yet to have a concentrator. For now, it would seem we
should declare victory and use the existing one we have that has been
used for years on the 10/20, but modified to do the virtual terminal
work via DECnet. Here, Scott Davis is near making the experiment in
VMS that indicates how much processing is required when the terminal
handler is moved to another system. We must have this data before we
can get very far. I've been waiting patiently.

Kotok has been working with Stan as a consultant across the

board. I
hope he'll continue to work here, albeit at an accelerated rate.
Savell and McNamara have done some first rate analysis that should
form the basis of a competitive hardware strategy. We have recently
lost Telephone business because of our comm. products.

You have notes and thoughts from me on European Engineering... ie. do
it like Colorado, evolve as the competence develops. Don't Honeywell
it, moving the product and charter to Tulsa only to find the
developers are still in NE. Fortunately for us, we were able to offer
them jobs and start a mass storage group.

Am also worried about the hardware vis a vis using competitive micros.
The boards, with intelligence, sure look expensive, impossible to
program and kludgy. My guess is that the 16 (actually 22 bit) micros
are the answer here by using substantial amounts of VLSI for cost and
easier programming. Also, I feel we should be using higher level
languages, possibly decision tabel-type languages to specify the
protocols. Again, we need some experiments.

Am certainly concerned about the transition from conventional comm, to
the point where all comm is on the NI. My fear is that we are
planning the transition too soon, and have not worked out the numbers.

Metrics are the key to knowing where we are in this space. Right now,
I don't understand it as a whole, nor do I think anyone else

does. We
need the type of treatment Riggle and Sills have given Mass storage.
The cost metrics should be clear for the hardware, and then we get
into what is essentially cost when we trade-off cost of the interface
for performance in the host. For example, I suggest that the comm
interface harware should be no more than 10% of the system cost.
Here, you must add the percentage of the cpu that you use for it. A
terminal costing 1500, should spend no more than 150 for the comm part
including the modem. At the other end, take another 150 because of
symmetry. Here, if the cpu of a 250K VAX is required 0.1% per line
before the characters get to the job, then the cost is another 250$.

Thus, soon, we had better get metrics (including modems, line costs,
switching like Gandalf or ma bell) to know where we are. Then we
ought to get the competive data.

Again,
comm and networks are clearly about the most important product set we
are doing. The needs are voracious. Only clear thinking and hard
work are going to pull us through.

I'm available and would like to meet with you and your staff within
the next month. I have the highest regard for your staff and the
people doing the work are really competent, having given us some
really strong products in the form of DECnet, together with a

strong
base using Ethernet. All I think we need is product targets, stability, leadership and all our support.

You have mine,
Gordon

SUBJECT: MORE ON THE DEINITION OF DP

DP matches computer system s to needs on a geographical or organizational basis, AND interconnects individual computers into a single network

The objectives of dp are:
1. to allow effective matching of resources to needs

2. to allow both local and autonomy and central control of the various distributed parts
3 to provide an evolving , openen ended system so that development of ditributed parts can proceed at their own, pace in a quasi independent fashion
4 to allow purchase and installation of computers in a most timely cost-effective wasy, taking advantabte of reduced (with time) hardware costs
5 to build on and communicate with existing , more central systems, fully dispersed systems, and emerging personal computers
6 to provide computing , control and storage of information nearest the need.

(sorry about the spelling/wording but the ems editor ant this ti terminal are not up to coping with my typing.)

SUBJECT: THE STERN BOOK: HOLD THE PRESS ...

About 20 pages of comments will follow, but the bottom line:

The book is a factor of 2 too long, takes too much work to read, has all types of errors, draws and presents false conclusions, and delivers far too little insight to any reader I know. We can not publish it unless the issues are attended to.

It should come about R&S in quality and even try to attain Lavington quality, even though it will take another year. The beauty of publishing history is that it's virtually timeless; we have to control to quality, not schedule.

I still think it is an important story that needs telling.
We have to set the standards and suggest the approach.
Nancy's got most of the facts, let's help her make a great book!

GB2.S4.15
July 10, 1984

Dr. Irwin Dorros

Executive Vice President
Technical Services
Bell Communications & Research
290 West Mount Pleasant Avenue
Livingston, NJ 07039

Dear Irwin:

The Computer Museum is opening in downtown Boston on November 14 after operating successfully for five years within a Digital Equipment Corporation building, the last two as a non-profit, public Museum. The Museum wants AT&T to become a major supporter!

A first-rate team is designing the exhibits, including Dr. Oliver Strimpel, curator of the Science Museum in London and Dr. Paul Ceruzzi, a young history of computing scholar. In addition to the exhibits with historical artifacts, two major interactive galleries are being built for PC's and on the Computer and the Image. Predictions are that we should have attendance of over 200,000. This world-class, international Museum should be a major attraction and asset for the computing community. The enclosed brochure describes the Capital Campaign, and several reports give an idea of the Museum's activities.

The Museum has started communicating with the AT&T Foundation. Bob Everett asked Robert Lucky to help, who in turn sent the request to Ms. Esther Novack, Vice President of Cultural Programs. In talking to Ms. Novack, the Museum fits within the Foundation's frame of reference, but she needs to understand how The Computer Museum would benefit AT&T. Now I want to enlist your support to:

1. work with us to prepare an appropriate proposal to the Foundation. As AT&T becomes a significant computer supplier, it will increasingly benefit from The Computer Museum.   George Stibitz was one of our first speakers and would like to contribute in a major way, but never reaped many rewards from his contributions to computing and as he said in his last letter, is facing one or two lingering illnesses. He has given many of

his papers, made the Museum a model of his first relay adder, and when he can, he comes to Museum functions on the bus from Dartmouth. We show the first transistor and need to incorporate software more prominently in our exhibits.

AT&T might want to name a lecture series recording its contributions which have benefitted computing including: programming, UNIX, C, speech and music, graphics, semiconductor technology, communications etc. We also want critical artifacts for the collection and the possiblity of assigning this important function to us. We continue to need an unlimited supply of working computers for various exhibits.

We are looking for a complete, AT&T sponsored package that would amount to $400,000 or $100,000 per year. DEC gives $600,000 per year!

2. become a personal "core" contributor ($4K over 4 years) or foundership, ($250); (The founding period is just closing.)

3. contribute your own important artifacts; (The Museum will act as a repository for things that would otherwise be forced to be scrapped.)

I will call you to discuss these activites and how we can be responsive to AT&T's needs. Even though it's not open, I'd be honored to give you a tour and a meal.

Sincerely,

Gordon Bell

4231 W. 16th Ave.
Denver, Colorado 80204

Dear Drs. Thurman and Elliot:

The trip back to Massachusetts was uneventful and rapid. I find it's good to be home despite the fine care at St. Anthony's.

Having been home now for two weeks, and recovering on schedule, I continue to be thankful for the operation and care under your direction at St. Anthony's.

For the last week, I've spent several hours a day reading and looking at interesting work-related projects, and have visited with colleagues at home 1-2 hours each day. My hand exercises are now centered around a word processor, and terminal for electronic mail. I've also gotten a classic Atari video game to educate me and to help improve manual dexterity, but find that it's easy to generate a high pulse rate unless great care is taken.

Again, thank you.

INTRODUCING

SYSTEMBUS 80

BENEFITS

- Spans system family from $10K - up

- Common bus between 16 and 32 bit architectures.

- Preserves the UNIBUS and QBUS software and hardware investments.

- Optimizes new hardware and software investments thru the eighties.

FEATURES

- 32 bit I/O addressing.
- Support of large memory on both 16 bit and 32 bit
- Peripheral interchangeability between 16 and 32 bit
- Greater range of peripherals at low end
- Greater reliability and serviceability (e.g. parity)

FEATURES (CONTINUED)

o OEM

- Ease of interface
- Multi-processor interrupt structure
- Variable transfer lengths
- Assignable priorities
- Economical form factor

Date: 3/6/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

CC: Ebod, OOD

The data this first go around was superb...especially at this early stage in the process. I almost feel like we have cuts that we could live with for several years.

Dave Quimby's last minute slides cut by activity and size really gave me (and I hope others) a great deal of insight. However, the next go around I would like to change the cuts to make them price factors of 2.5 so that we can have bands that should be viable over a long time period. There is also a notion that we should only have a single product in a price band, but the product would be extensible, by options, over the band. At first glance, it appears that the bands are pretty much determined by the availability of a particular kind of mass storage device. Note that in the case of IBM and the 360 (only because I know it best) had factors of 2 separation in price and factors of 3 separation in performance (note not Grosch's law). In this case 3 bands would give us a factor of 15.625 versus 16 if we used a factor of 2 for 4 bands to cover the same range.

These price bands would be:

mid Micro	160	400	Boards and small terminals
high Micro	400	1K	
small Small	1K	2.5	Current Terminals
mid Small	2.5	6.25	Beginning pre-programmed terminals and intelligent terminals, minimal memory
hi Small	6.25	16K	Low end systems- bounded by floppies; desk based
small Medium	16K	40	Medium systems: traditional DEC; cabinet based
mid Medium	40	100	
hi Medium	100	250K	
small Large	250K	625K	Hi end systems
mid Large	625K	1.6K	

Note, that the number of numbers we would deal with in a given context using this approach would be 3 and then 4 someday as we get to Micros. As we descend in detail, we pick up only 3 more categories per range of 16, for a total of 9 (actually 10 above, only 7+ of which are really active).

I'd like the three systems areas to also plot their systems using the same graph sizes (but not the same scales) in the space of System price versus Mass Memory size with either separate plots for the product available at various times including FY 82, or if it isn't too cluttered put the systems on one page and note the introduction date. (Do we have too many introductions?) The scale should be agreed to by the system size groups, but the plots are basically those shown in the MSD section. Note, the specific applications oriented terminals like the 162 and the recently announced (by AT and T) bubble memory editing terminal would show up in the small to mid Small areas. The object of a design will be to evolve to the next lower band.

GOSPEL

Next, given that we have these system plots, I want to generate: GOSPEL-the Good, One Sheet Product/Environment Log, as shown in the attached sketchy first one I tried the night before to EBOD. Most generally this is just a plot of system size with correlated "sections" for each level of integration: base system, mass storage, and software. It would be extended as needed to other software and other levels including chips. It would also be the base for other activities such as R and D, tools, standards, etc.

It has the 4 decades of system price corresponding to the above against which base hardware systems prices, complete storage subsystems, and the base operating systems are plotted.

1. In the base hardware part of it, there are segments for the 8, 11, VAX-11, 10/20, LA and VT. Each system is plotted as a price line, or point if

there are no options (e.g., LA34).

2. There is a corresponding part for mass storage cost, where we can see the very rough correlation (be careful, it ain't written in the stars, but is only a "rule of thumb") between cost and system price. This is ratio of a 4x markup and the fact that the mass store is about 40% of the system cost, hence the total systems price is roughly 10 x the cost of the mass storage subsystem (ie. both the disk and tape or at the low end just the removeable, backupable media). This would be plotted in parts corresponding to the hardware systems, or by device classes (RX, RP/TU,etc.) or preferably memory size starting with bubbles at roughly 10K bytes, in factors of 10 going up to 1 gigabyte. Note only legal subsystems would be plotted (ie. a fixed disk with no backup or distribution media would not appear unless we figure out a way to have the network doing memory backup and program distribution).

3. There are lines for each of the operating systems which correlate with the hardware ranges showing which operating systems run on which base hardware systems. The separated lines would include: OS8, RT11, RSX11S-M-D-IAS, SCS, TRAX, RSTS, VMS, T10, T20. Possibly this should be intermingled with base hardware to show complete hardware/software systems for each.

4. I suspect we need a corresponding set of charts showing the interconnections which are now tending to be >10% of the system cost.

5. Finally, we need a way of showing the development that is for particular market areas so that we can better make policy decisions without getting to a project basis. This is really the outer most levels of integration. Thus, product lines could show their systems lined up against this and then select which lines they're going with. Here, there would be lines both showing:

Systems for each of the product groups and product lines

There could be other plots against the system size, which would show the distribution of NOR and development expenses in each of these ranges at various units of time. These fixed price bands would then be the methods of measuring the allocation of resources and the NOR. Here we would make investment decisions based on the expected revenue, product needs to get us to competitive or more profitable, etc. Dave Quimby's plot on activity vs price (a section of GOSPEL) would show where we are spending.

Summary

Overall, let's get to a highly structured approach to planning so that we can easily fill out the plans without having to continually reinvent ranges, collect data in different way, etc. This would get us history and understanding. Also it would provide healthy targets and containment. But basically, I hope you agree that I am not proposing anything radical, but merely saying:

1. There is a set of fixed price bands for products which is the dominant measure. I want to try these this round. Also, let's have a set of standard plots for each systems area. Let's use the MSD log-log systems price versus mass storage size. Also, we should get the common "plates" plots of number of users versus system price.

2. Mostly we are positioning products in

these bands, and there will be sections corresponding to the levels of integration from mass storage, communications options, base systems, base software, group and market level products.

3. We will look at revenue and spending in these two dimensions, but mainly in the price one.

4. We will look at revenue and spending in the market dimensions and eventually be able to pin point just how much is base, group and particular product line. Otherwise, we'll continue to spend it all on base systems.

THE ENCORE PRODUCT/COMPANY ARRAY (GB View on 21 Jan. 84)

CHIP, BOARD WITH BASIC SOFTWARE

MIPS CO. (with VC's) Stanford MIPS chip doubles cost/performance

BASIC SYSTEM COMPANIES

TERWSCO -CHARLE' RUPP's CO. for terminals evolving to workstations

Silicon Graphics (Buyout to get high end and workstation software)

Symmetric Computer Systems - 25% to 100% ownership

HYDRA- for all OEMs and Technical End Users, responsible for integrating PC and Terminals with appropriate buyouts

LAMP- for high performance and building a TP system

SOFTWARE

FOUNDATION - Ally, Commercial Systems, Office Products (3 div) perhaps doing a Transaction Processing type systems on lamP

ECE: Encore Computing Environment, our network company

APPLICATION PRODUCT COMPANY

Takes any of the above products and outside software to address very specific markets such as CAD/CAM, Typesetting, AI, etc.

Perphaps this is multiple companies or multiple divisions.

ECE: THE ENCORE COMPUTING ENVIRONMENT COMPANY
(IE. THE NETWORK COMPANY)

WE <u>MUST</u> HAVE A SEPERATE COMPANY TO ADDRESS THE INTEGRATION OF THE BASIC PRODUCTS BEING BUILT AND TO BUYOUT SOFTWARE WHICH WILL TIE ECE to other environments. This company could also have responsiblity for buying out the terminals and PCs. Ideally it would provide concentrators, gateways and servers for printing and specifying addresses (Name Server). The range includes LANs, Wide Area Nets, SNA, x.25, PC-net etc. The group would buyout a very large portion of hardware and software. ECE should provide product during FY84!

Some alternatives:

1. Julius Marcus would start this up
2. A group from Gould is now available to startup or join

3. Other engineers who have approached me
4. Try to buy a fraction of a very competent local group who
   build DECNet and SNA gateways
5. Network Research Corp. gateways to XNS and TCP/IP
6. Existing company such as Interlan
7. Other startup if we can find one

NETWORK COMPANIES WE MIGHT INVEST IN OR BUY PRODUCTS FROM

PLEXUSNETCO
Bob Marsh proposed that we form a network company that would sell and continue to develop the PLEXUS-developed distributed software. This software is an excellent starting point for our LAN-based cluster oriented systems. It would compete with TNC (The Newcastle Connection) and other clusters such as the LA based company of Gerald Popeck.

The company would start with the key engineers from Plexus. Perhaps we would take on the software marketing role with the emphasis on makin this a standard. We would put money into this along with VC funding.

Even though it would appear that Plexus would be giving up technology, I think this is a clear case of "either make the standard or follow the standard". In this case there's not a standard yet except the networking software inside of Berkeley 4.2, which could be considered to be the breadboard for this type of software. In fact, the position of Plexus and Gould, for example is to use System V architecture and add ideas from 4.2 where they don't violate the architecture. (System V is AT&T blessed and the version V.2 still doesn't have virtual memory. Berkeley 4.2 has significantly better file performance, virtual memory and nice networking primitives.)

Our interest would be: making money, getting a standard sooner, getting somehting to sell now in order to engage in the market.
However it would: cost money and time and might not become a standard. We could also buy it if it's right.

Plexus interest would be: making money and getting their standard to be the standard.
Plexus would: give up some people and a proprietary product.

We need to get back to Bob next week.

NETWORK RESEARCH CORPORATION
Steve Emmerich introduced me to a super group of networking software engineers. They want someone to handle their field support and marketing so they can concentrate on product. They want to increase their investment in order to accelerate some product introductions. They have products that we could market now and get a jump on our 85 revenue. Steve is preparing a bigger writeup.

STU WECKER'S COMPANY IN SUDBURY
Stu has a very competent group of 25 engineers who do the following:

teach courses twice a year
simple consulting
engineering large, systems
building standard products (They now have DECnet gateways on UNIX
and are building SNA gateways. We could market these now.)

GOULD DISTRIBUTED PROCESSING AND NE GROUPS
Greg Hopgood said the Nashua New Hampshire group is being cut because the new VP of engineering doesn't like engineering outside of his single site. This group of 11 has a few UNIX folks, but is oriented to making SEL products into Workstations by buying the Raster Tech product (which he says is excellent).

Things are still chaotic in the UNIX/Distributed Processing Group. Joe Haney is in charge. Their divisional VP and Sales person quit. The UNIX sales are really booming and may overtake the old, promising to be 20M. Greg believes that all the cost cutting is aimed at getting Gould or SEL in a position to sell.

PORTABLE SOFTWARE INC

This group is selling The Newcastle Connection which permits distributed processing clusters to be formed on UNIX systems.

THE ENCORE CONTINUUM: A MULTI-BASED COMPUTING ENVIORMENT

C. Gordon Bell[1], Henry B. Burkhardt III[1], Steve Chapin[2], Steve Emmerich[1], Russell Moore[2], Isaac Nassi[3], Charle' Rupp[3], David Schanin[2]

1. Encore Computer Corporation, Wellesley Hills, Mass. 02181
2. Hydra Computer, an Encore Company responsible for Multimax, Natick Mass.
3. Resolution Systems Inc., an Encore Company, Marlboro, Mass.

SUMMARY

The Encore Continuum is a complete, UNIX compatible, computing environment designed to provide a range of computing styles covering distributed workstations and central, host computers in the minicomputer price class, and all interconnected via a Local Area Network. Encore's Multimax is a new, computer structure formed from multiple, microprocessors sharing a common memory. The "Multi" offers a new level of performance, price/performance, and reliability. Furthermore, a single Multi can be used to cover a complete price and performance range. While the "Multi" will be used for traditional multiprogramming, we believe it will soon lead to parallel processing.

ENCORE CONTINUUM OVERVIEW

Figure 1 shows the Encore Continuum, composed of the following elements:

- Multimax, multiple, microprocessor computers. Multimax spans a processing performance range of 1.5 to 15 Mips in expandable increments of 1.5 million instructions per second (Mips). Input/Ouput throughput can be expanded in increments of 1.5 Mbytes/sec. to 15 Mbytes/sec. Memory can be expanded in increments of 4 Megabytes to 32 Megabytes.

  Multimaxes can be interconnected whereby all processors, input/output channels and primary memory to form a single multi.

- Annex concentrator and gateway computers - for Ancillary Network EXchange computers. All terminals and Personal

Computers attach through Annex concentrator computers. Annex gateway computers enable communication with public networks (x.25) and IBM SNA facilities.

. Resolution R100 Host Stations and R500 Workstations. The R100 is a high resolution, large screen, multiple window, multiple host access station designed for host-based computer access. The R500 is a compatible Workstation with local processing and mass storage.

. Interconnection with other computer vendors which support the TCP/IP LAN protocols.

. Local Area Network (LAN). Ethernet (IEEE 802.3) LAN is used to interconnect all computing elements and provide computer to computer intercommunication, common gateways to other computers and public communications networks, and common access to terminals and Personal Computers.

. UMAX 4.2 and UMAX V. Two, software environments are provided which are derived from the University of California/ Berkeley BSD 4.2 and AT&T Unix. These are for technical and commercial applications use, respectively.

GOALS AND CONSTRAINTS OF THE ENCORE CONTINUUM
The principle design goal of Continuum is to provide a continuous and very wide range of computing, utilizing Local Area Networks for:

. choice of where and how to compute ranging from terminals and Personal Computers accessing shared, Multimax host computers to compatible, fully distributed Resolution Computing Stations

. choice along these five, computing resource dimensions:

  . processor performance for traditional multiprogramming and revolutionary parallel processing ranging from a single processor to multiple processors

  . memory size for arbitrarily large virtual memories, large file caching and input/output buffering

  . input/output performance with multiple computers and disk channels for high data rate input/output (eg. video)

  .human interface through Resolution Host and Workstations

  . arbitrary communication via the LAN and ANNEX concentrator and gateway access computers for terminal and Personal Computer access and other computers and communications networks

. choice of system availability through redundancy and use of a small set of components to provide the range

The principle constraint of the Encore Continuum is compatibility based on Industry standards to provide:

. compatible products that all work together, permitting the location of function to occur both statically (at purchase and configuration time) and dynamically (while programs are running) based on cost, performance, reliability, security and physical needs

. compatibility with other vendors, enabling communication with existing programs and migration of existing programs to Continuum

. compatible products that work with all other UNIX products and facilitate the use of UNIX and traditional software applications

Hardware independence utilizing industry standard LAN's, microprocessors, data formats (eg. IEEE floating point), languages, and operating systems must be supported. The transportable C programming language is used as the lowest programming interface, and no assembly language programming will be used or provided externally.

Users benefit from standardization in several ways:

. competition and alternative source of hardware

. reliance on a single hardware vendor in a "locked in" fashion

. longevity of stable, system interfaces

. a very large flow of compatible, competitive software from many sources. By having a single, standard interface (principally the C language), applications software can be written that runs on all hardware rather than just a single vendor.

CONTINUUM HARDWARE

Multimax

Multimax's power is derived from the Nanobus™ used to interconnect the Multimax options within a backplane card holder for 20 cards which is about 12" long, and corresponds to a transmission time of approximately one nanosecond (see Figure 2). Every 80 nanoseconds a 32-bit address (corresponding to an ability to access up to 4

Billion bytes of memory) and a 64-bit data word can be transmitted from card to card plugged in along the bus; thus Nanobus has a data carrying capacity of 100 Million 8-bit bytes per second. (By comparison, standard and emerging busses for Multi's are one-tenth to one-fourth as fast.)

At least one of each type of the following four card-type options is required:

- Dual Processor Card (DPC100) - two, National 32032 processors have a common 32 Kilobyte cache. A high performance floating point option utilizing special VLSI chips is provided for arithmetic intensive applications. Encore rates this processor at 0.75 Million instructions per second. With 10 DPC100's, a single Multimax can process up to 15 Million instructions per second.
- Ethernet/Mass Storage Card (EMC100) - interfaces to Ethernet and to disks. This card contains a 32032 for managing input/output transfers and diagnostics. It has sufficient capability to operate as a LAN-based file service computer. Up to 11 DPC100 or EMC100 cards can be placed in one system.
- Shared Memory Card (SMC100) - 4 Megabytes of memory, organized in two independent banks with error detection and correction codes and utilizing 256Kbit memory chips. Eight SMC100 cards can be placed in a single system, providing up to 32 Megabytes of memory. A local computer allows the card to be completely checked and diagnosed on an offline or standalone basis.
- System Control Card (SCC100) - continually monitors, provides diagnosis, and communicates with an operator and a remote console.

<u>Reliability and Maintainability</u>
All of the above cards have microprocessors which can operate standalone and carry out a complete, self-diagnosis of the card.
.... more to follow....

<u>Peripheral Options.</u> In addition, Multimax offers: battery backup; fixed and removable disks of 520 and 300 Megabytes respectively; and 1600/6250 bpi magnetic tape options.

<u>Longevity.</u> The Nanobus provides the key to product longevity by being able to accept new, higher speed processors that will be evolve with CMOS VLSI. Real time data can be processed at up to full bus bandwidth (100 Mbytes per second) using all known methods

of interfacing including: interrupts (? events per second), direct program control (? events per second) and direct memory access (DMA).

The Local Area Network

Encore currently uses the most accepted Local Area Network standard, IEEE Standard 802.3 (Ethernet), to interconnect its computing nodes at a rate of 10 million bits per second. Other standards will be adopted in response to market requirements. The function of the LAN in the Ensemble is for:

- computer to computer communication for distributed processing, file transmission, and virtual terminal access among computers,
- common access to other networks i.e. a gateway,
- common access from terminals and PC's i.e. a terminals concentrator,
- formation of a fully distributed computing environment using Encore's powerful, single user workstations.
- connection to existing personal computers, minicomputers and mainframes

A LAN is not required for system operation.

ANNEX Terminal and Personal Computer Access (Concentrator) Computer

Each ANNEX Concentrator Computer attaches up to 16 terminals and printers along the LAN in a fully distributed fashion, permitting up to several thousand terminals to access all computers within a single LAN. Five ANNEX's can be connected to a single LAN port, or it can be directly connected to a Multimax if there is no LAN. ANNEX roughly doubles the processing power in the Ensemble since roughly one is used per additional Multimax processor. Wiring is simplified by distributing the physical connections to the LAN with the terminals and Personal Computers that require access, unlike past connections which require all terminal lines to be connected to a particular computer. A terminal can access all computers since the LAN is used for switching.

ANNEX is a compatible, distributed computer utilizing a National 32016 microprocessor with 128 Kilobytes of memory. ANNEX is programmed to reduce host work and allow orderly migration of time-consuming functions such as character echoing and screen updating which require no host or central database interaction.

ANNEX has options for both asynchronous and synchronous communications and direct and modem connections. Standard terminals and Encore Host Stations communicate with hosts at up to 38.4 Kilobaud transmission rate per terminal.

Hard copy options include a 200 character per second matrix printer and 800, 1200 and 1800 lines per minute printers.

ANNEX Gateway Computer

The ANNEX Gateway to the LAN and provides gateway access to various communications and industry networks using protocol conversion hardware and software. The protocols include: IBM SNA, IBM Block Mode Terminals (3270), IBM PC, and X.25.

RESOLUTION COMPUTING STATIONS

The Resolution Stations use a 19" screen size to give an unscaled, ledger sized 11" x 14" page at high resolution using 1056 x 864 pixels. A ledger sheet of 176 columns and 86 rows can be displayed. Keyboard and pointing device (e.g. mouse) input are provided. The Stations (without keyboard) occupy a desk space of 16-1/2" square.

Text and graphics protocols are provided which allow existing and future software to be run without modification, including: VT100, ANSI 3.64, Tektronix 4010/4014, Regis, and VDI for GKS.

The stations are designed to address a variety of applications including: the station of choice for the professional programmer; text and typographic input; engineering; business and accounting where computational power and large screens are required; and special functions such as translation where side-by-side text is required.

Resolution Host Station - R100

The R100 is a single, but universal Host Station because it can communicate with as many as three computers through separate windows. For example, the R100 can simultaneously access Hydra, a traditional host (eg. IBM 370 or VAX-11), and a PC AT for personal computer software. All the functions of the R100 are carried out under the program control of a National 32016 microprocessor. The R100 is also designed to be used as a remote, slave station to conventional workstations (i.e. a user can have a workstation at home or a second office).

The R100 can be upgraded and become an R500.

Resolution Workstation - R500
The R500 is self-contained computer system with a primary memory of two megabytes and disk memory of 20 Megabytes. The processor, a National 32016, is completely compatible with other computers in the Encore Continuum. Thus, software can be run either within the Workstation, among Workstations, or among Host Stations and Multimaxen(s?) in a completely flexible and transparent fashion.

THE UMAX 4.2 AND V DISTRIBUTED SOFTWARE ENVIRONMENT

CONCLUSIONS

APPENDIX 1. THE MULTI, A NEW COMPUTER CLASS

THE MULTI - A NEW COMPUTER CLASS

The Multi (for multiple, microprocessor) is an emerging computer class made possible by recent, powerful micros that have the speed and functionality of mid-range super minicomputers. A Multi is scalable, permitting a single computer to be built which spans a performance range, in contrast to computer families implemented from a range of technologies. The Multi is a significant alternative to conventional micros, minis, and mainframes.

Multis can be used today - without redesigning or reprogramming of applications - because computer systems operate on many independent processes. With Multis, it is possible to operate on many of these processes in a parallel fashion, each on an independent processor, transparent to the user. Most importantly, the Multi is likely to be the path to the Fifth Generation based on parallel processing.

This Preface briefly summarizes the generic Multi - what it is, why it has come to be, and how it is applied - to better prepare those unfamiliar with this new concept for the Multimax design discussions which follow.

THE MULTI - ITS HISTORICAL AND TECHNOLOGICAL BASIS

Computer systems with multiple processors have existed since the second generation (the Burroughs B5000, a dual symmetrical processor, was introduced in 1961). Most mainframe vendors and some minicomputer suppliers currently offer systems with two to four processors. However, these structures have been expensive to build - due to the high cost of typical processors - and hence have found application mostly for high-availability computing (e.g., communications, banking, airline reservations).

The modern 32-bit microprocessor's function, performance, size, and negligible cost are creating a new potential for multiprocessors. With 32-bit addressing, hardware support for paged, virtual memory, and complete instruction sets with integer, floating, decimal, and character operations, these chips offer performance levels comparable to mid-range superminis such as the VAX™-11/750.

The Multi is a multiprocessor structure designed to use these new micros to advantage. It employs an extended UNIBUS™-type interconnect, whereby all arithmetic and input/output processor modules can access common memory modules. Cache memories attached to each processor handle approximately 95% of its requests, limiting traffic on the common bus. With these local caches, an order of magnitude more processors can be attached before saturating the common bus.

With proper attention to design of critical elements (e.g., the common bus), large multis using current-technology micros can outstrip high-end superminis, and even some mainframes, in total performance. This advantage should continue to grow. The performance of MOS and CMOS microprocessors has improved (and is expected to continue to improve) at a 40% per year rate, while the TTL and ECL bipolar technologies (on which most traditional minis are based) have shown roughly a 15% per annum improvement.

When compared to traditional uniprocessor designs, the Multi delivers improved performance, price, and price/performance.

- **Configurability Range** - through modular design, the Multi allows the user to "construct" the correct level of performance or price, without having to choose among a limited number of computer family members.

- **Availability** - the Multi has inherent reliability through redundancy because it is built from a small number of module types (typically, four). With appropriate software support, faulty modules which are replicated can be taken out of service - allowing continued operation with minimum downtime.

- **Designability and Manufacturability** - because the Multi is comprised of multiple copies of a small number of modules, instead of the large number of unique boards in a typical minicomputer, it is faster and less expensive to design. Individual module types are produced in larger volumes, producing improvements of 30% in manufacturing costs due to a learning curve over conventional uniprocessors.

APPLYING THE MULTI

Multis will be widely used for many applications because they can provide the most cost-effective computation unless the power of a single, large processor is required today on a single, sequential program. Because of the rapid rate of microprocessor evolution, the percentage of applications requiring single-stream performance in excess of that delivered by each of the Multi's processors is already quite small and will continue to shrink. On the other hand, we believe the emergence of the Multi will lead to parallel processing.

We can better understand where Multis may be applied by classifying the degrees of parallelism achievable. Grain size is the period between synchronization events for multiple processors or processing elements. Synchronization is necessary in parallel processing to initialize a task, parcel out work, and merge results. The Multi exploits the Coarse- and Medium- grain parallelism within an application, not the Fine-Grain, which is the focus of vector, pipelined computers (e.g. Cray 1) on wide word microprogrammed array processors. Groups of Multis and conventional Workstations can interact over networks to implement Very Coarse granularity.

Grain Size	Construct for Parallelism	Synchronization Interval (instructions)	Encore Computer Structures to Support Grain
Fine	Parallelism inherent in single instruction or data stream	1	Specialized Processors (e.g., Systolic or Array) added to Multimax
Medium	Parallel processing or multi-tasking within a single process	20-200	Multimax
Coarse	Multiprocessing of concurrent processes in a multi-programming environment	200-2000	Multimax
Very Coarse	Distributed processing across network nodes to form single computing environment	2000-1M	Multiple Multimaxes, Encore workstations, and other machines, on Ethernet

As all modern operating systems are multiprogrammed, whereby each job in the system is at least a single process, and many support multi-tasking or sub-processes, most current applications are already designed to take advantage of the Multi at the Coarse-Grain level. Also, when used in a timesharing or batch environment, each processor of a Multi can be assigned to a separate job to exploit the parallelism inherent in the work load. The UNIX™ pipe mechanism allows multiple processes to be used concurrently on behalf of a single user or job to achieve parallelism in reading a file, computing and output to one or more files. Transaction Processing is inherently a pipeline of independent processes.

The Multi can be a more efficient multiprogramming computer than the traditional uniprocessor, because the number of context switches (and hence lost time) is dramatically reduced. Additional parallelism is in the operating system itself. Execution of operating system code often accounts for 25% or more of available processing time, when file, database, and communications subsystems are included. By restructuring the operating system internals, multiple, independent system functions can be executed on independent processors.

When reprogramming of subsections of the application is possible, Multis permit additional parallelism to be realized, at the Medium-Grain level (i.e., parallel processing), by segmenting a problem's data for parallel manipulation by independent processors. This has been shown to be quite effective on simulation, scientific modeling, and analysis problems (such as matrix operations, linear programming, partial differential equation solution, etc.) which permit data elements to be processed in segments.

Finer granularity of parallelism is achievable in the framework of the Multi through specialized processors installed into its common bus. This is most effective when the algorithms are known a priori, such as in certain signal processing applications.

We believe multiprocessors, augmented by both programmable pipeline, i.e., systolic, and specialized processors for Fine-Grain parallelism, will cover the widest range of problems of any computing structure.

. Evolutionary Technology Upscaling with appropriate design, Multis allow long-term performance upscaling through evolution. As key components of the processor and memory cards improve over time, the computer can be upgraded without replacement in an evolutionary fashion. In addition, increased cache sizes through denser parts and improved cache management disciplines will permit substantially greater numbers of processors to be installed without saturating the common bus (provided the bus design has allowed for this performance growth).

All of this will permit graceful and cost-effective evolution in processor performance, input/output throughout and memory size over a range of one to two orders of magnitude over a ten-year period.

ENGLAND

Dear Ian:

Enclosed is a copy of the book that came out of some of the lectures. Thanks for the material. I'm not doing any writing for awhile.

Sincerely,

Gordon Bell
Vice President,
Engineering

GB:swh
GB0004/18
Enclosure: book - Computer Engineering
On Sunday, the Globe noted that no one wants to buy concepts, only products. Have talked to several potential investors and then looked at the PPM again, it looks like we are selling a risky concept: parallelism. On the other hand, we don't sell our real strenths.
Given that we are going for direct private funding, bypassing the normal venture capital cycle, we have an incredibly difficult sell. It is only a concept, but the important parts aren't there. Somehow, we have to strengthen the story for our salesman because the PPM just looks like a way to get them in trouble.

The focus is on parallel processing, which comes out in the first paragraph ... which doesn't exist and is hard. For example, my investment advisor, Tony Pell said he wanted to know much more about this. This is crazy because Tony doesn't even know what processing is. (This is like a marketing guy that used to sell the fact that we had a Syntax Directed Compiler, but didn't know what a compiler was.) All that's known about parallelism is that it isn't done now and hence is risky. With the Trilogy slip (expect another 9 months), people will be leary of anything that has a risk. We almost need a card that says we are doing NO parallel processing, we are using multiprocessing for independent tasks, because NO ONE knows how to do parallel processing to any degree. If we get this round, the next one is going to be harder because DEC will have a 64 processor out by then. (They delivered a 4 processor system for early breadboarding of software to Livermore as scheduled.) They will also have a system that will compete with Hydra in terms of performance and probably price. Our pitch is going to be harder with competitors out there.

AN OPERATING VENTURE COMPANY OR A MULTICOMPANY STARTUP
Conceptually, we need a name to market. Since Venture Capital funds are still selling, then we might better position ourselves as the ultimate of a VC company, except that:

- we know the business
- we can help the companies
- the product companies are focussed
- we have economy of scale in distribution
- our products are complementary, not competitive
- we have a full product line, not just a single product

A FULL PRODUCT LINE, NOT A ONE PRODUCT COMPANY HAS TO BE THE REAL SELL
We are NOT a one product company as the PPM seems to imply, but a full product line of EIGHT, independent companies to spread risk, amortize software over in a compatible fashion and get economy of scale in field. This should provide exponential growth of 8 times a single company. The full line includes:

- HYDRA- mini-class supermicro, but wider range of products (a Sequent, or megaframe division of CT)
- lamP- basis for high performance and TP products (a Synapse, but without risk associated of building high availability)
- Terwsco- a company that will compete with SUN, et al in transitioning to the fully distributed processing generation, if people believe that minis are dead. (A SUN or one of 123 Workstation companies.)
- NETco- tying all the systems together and to other companies. This also distributes and interconnects PC's and Terminals. (Interlan, etc.)
- Tabletop systems for distributing processing (NCR Tower)

- Commercial Software Products and Computing Environment-- probably this includes the integration of Office Automation software
- Technical Computing Environment (integration of external software)

- MIPSco- chip... probably only worth hinting about

OTHER THINGS TO SELL

What we are selling:

- Proven ECC helpers who can go in and solve virtually any marketing, engineering or manufacturing problem in a product company. It has critical industry links to influence direction. This is already in operation. This can't be done by a VC or board structure.
- A proven field organization that can grow at arbitrarily high rates to absorb products. (In visiting 10 companies in January, 3 had superb product, but will probably not get off the ground to any degree due to sales.)
- A structure that is attractive to product producers because the expected reward reflects the fact they are able to win by just designing and building great products. They don't have to risk the field/distribution problem. The maximum reward is less than by standing alone, but when you look back at minis where only 2 won by themselves, the best they can hope for is a successful merger down the road. Thus, for starters, multiply the business plan by say 5%-10% to get the <u>expected</u> reward. We should have a story, with numbers that shows just how people are going to make out when you add in the bonus! (Then we have to educate them that money is just as good as equity.)
- Redundancy in our product companies. We intend to have enough so that any one or two can hiccup and we still make the plan. This also helps the product company sale because there are others to help.
- Anti-sell to make having the incompatible hodge podge that will result from buying out from all the burgeoning CT-like companies and merging with the old line a loss.

Somehow the message of what we offer didn't get through too well in written form from what I can tell. This puts all the pressure on personal selling. Given our inherent selling capability within ECC and by two banks, is it possible to train more than two people to sell?

I hope this worry by me and my friends is ill-founded and not just another case of error in my gut feel or being poorly informed about how the investment community behaves. Since there are plenty of experts, I hope you'll indulge in teaching.

THE ENCORE COMPUTING ENVIRONMENT

PROVIDE A COMPLETE, BROAD, COMPATIBLE PRODUCT LINE

WITH A CHOICE OF <u>WHERE</u> AND <u>HOW</u> TO COMPUTE:

.ULTRA-PERFORMANCE, MULTI-PROCESSOR
.ULTRA-RELIABLE, MULTI-COMPUTER OR MULTI-PROCESSOR
(MAINFRAME PRICE AND SYTLE MANAGEMENT)

.LARGE, APPLIED, MULTI-PROCESSOR
(MINICOMPUTER WITH VERY LARGE PRICE RANGE: $40K TO >$400K
USING A SINGLE BASIC COMPUTER)

.SERVERS FOR TERMINALS, NETWORKS AND PC'S

.TERMINALS, EVOLVING INTO FULLY DISTRIBUTED, CLUSTED WORKSTATIONS
(PERSONAL COMPUTING)

.LOCAL AREA NETWORK AS THE BASIS FOR A COMPLETE INTERCONNECTION

.FRAMEWORK FOR A VARIETY OF PRODUCTS AND COMPANIES.

MAIN GOALS AND CONSTRAINTS FOR ENCORE PRODUCTS

ACKNOWLEDGE AND ADHERE TO PRODUCT-SEGMENTED, STRATIFIED BY LEVEL-OF-INTEGRATION INDUSTRY
(STANDARDS DETERMINE THE STRATA)

STRICT ADHERENCE TO INDUSTRY STANDARDS VERSUS VANITY INTERFACES

TIME TO MARKET (CONCENTRATE ON PRODUCT UNIQUENESS, NOT COST)

BROADEST POSSIBLE PRODUCT LINE OF FULLY-COMPATIBLE PRODUCTS

MAXIMIZE ABILITY TO COMMUNICATE WITH OTHER SYSTEMS (EG. IBM, DEC)

PERFORMANCE/COST (INCLUDING COST OF OWNERSHIP AND USE)

FUNCTIONALITY AND IMPROVED HUMAN INTERFACE

PERFORMANCE

MAINTAINABLITY (ASSUMES WE HAVE NO SPECIAL HARDWARE MAINTAINENCE)

MANUFACTURABILITY

THE ENCORE COMPUTING ENVIRONMENT AND ITS PRODUCTS

PROVIDE A COMPLETE, BROAD, COMPATIBLE, STANDARD-BASED PRODUCT LINE

WITH A CHOICE OF <u>WHERE</u> AND <u>HOW</u> TO COMPUTE:

.LARGE, APPLIED, MULTI-PROCESSOR - HYDRA

(MINICOMPUTER WITH VERY LARGE PRICE RANGE: $40K TO >$400K

USING A SINGLE BASIC COMPUTER)

.SERVERS FOR TERMINALS, NETWORKS AND PC'S

.TERMINALS, EVOLVING INTO FULLY DISTRIBUTED, CLUSTED WORKSTATIONS

(PERSONAL COMPUTING FOR PROFESSIONALS)

.LOCAL AREA NETWORK IS THE BASIS FOR A COMPLETE INTERCONNECTION

.ULTRA-PERFORMANCE, MULTI-PROCESSOR EXTENDING HYDRA

.ULTRA-RELIABLE, MULTI-COMPUTER OR MULTI-PROCESSOR

(MAINFRAME PRICE AND SYTLE)

.FRAMEWORK FOR A VARIETY OF PRODUCTS AND COMPANIES.

GOALS OF THE ENCORE COMPUTING ENVIRONMENT

AND ENCORE PRODUCTS

0. ALL PRODUCTS MUST PROVIDE THE MOST COST-EFFECTIVE COMPUTATION

1. MASTER "MULTI" TECHNOLOGY:

TIMESHARING AND TRANSACTION PROCESSING -> PARALLEL PROCESSSING

EVOLUTION TO FAULT-TOLERANT COMPUTING

EVOLUTION TO SPECIAL, HIGH PERFORMANCE PROCESSING

2. BE INDUSTRY STANDARD FOR COMPATIBILITY AND MAKE-BUY FLEXIBILITY.

(EXPLICIT DECISIONS ABOUT VANITY STANDARDS)

PORTABILITY ACROSS CHIP AND OPERATING SYSTEM FOR FLEXIBILITY

GOALS OF THE ENCORE COMPUTING ENVIRONMENT AND ITS PRODUCTS continiued

3. PROVIDE PRODUCT COMPATIBILITY TO OPTIMIZE LOCATION OF COMPUTATION

A USER'S PROCESS CAN BE LOCATED OR MIGRATED AMONG

TERMINAL, WORKSTATION, FRONT-END, AND MAIN COMPUTERS

4. MASTER LAN TECHNOLOGY:

SEPARATIONS OF HUMAN INTERFACE AND COMPUTE SERVER

DISTRIBUTED PROCESSING

SEPARATION OF COMPUTATION AND COMMUNICATION VIA THE LAN TO AVOID

COMBINATORIALS OF PROTOCOLS AND PHYSICAL INTERCONNECTIONS

PROVIDE FOR FUNCTIONAL DECOMPOSITION ALONG THE LAN VERSUS TIME

5. INTERCONNECTION WITH:

UNIXES (LIKE SYSTEMS)

ESTABLISHED VENDORS: IBM, DEC, ...

COMMUNCATIONS SUPPLIERS: X.25, PABX

PC'S

WHY ENCORE CAN WIN

ENCORE IS PREDICATED ON ENTREPRENURIAL ENERGY DRIVEN INDUSTRY WHICH IS

.STRATIFIED BY LEVEL-OF-INTEGRATION (BASED ON STANDARDS)

.SEGMENTED BY PRODUCT

INDIVIDUAL PRODUCT EXCELLENCE AND VERY LARGE PRODUCT RANGE

MASTERY OF "MULTI'S" WITH EVOLUTION TO PARALLELISM

MAXIMUM INTEGRATION OF PRODUCTS FOR SYNERGY AMONG PRODUCTS

MASTERY OF LAN'S FOR DISTRIBUTED PROCESSING

COMMODITY SILICON FOR LOWER INVESTMENT AND ARCHITECTURE INDEPENDENCE

STANDARDS TO

.LEVERAGE OUTSIDE DEVELOPMENT AND REDUCE TIME-TO-MARKET, AND

.GET ACCESS TO A BROAD CUSTOMER BASE

CAPITALIZE ON ENTREPRENURIAL ENERGY DRIVEN INDUSTRY WITH

SMALL COMPANIES, DIRECT REWARD

CAPITALIZE ON ONLY ECONOMY-OF-SCALE: COMMON FIELD-SALES COMPANY

Eckert-Mauchly Award

Gordon Bell is given the Eckert-Mauchly Award for his contributions to designing and understanding computer systems. He blends both the academic and commercial world, and is hereby cited:

For the contributions in the formation of the minicomputer as embodied in the PDP-5 and PDP-8. The PDP-8 demonstrated that minimal computers could be created and applied to a wide variety of tasks including: control of real time and laboratory equipment, personal computing and timesharing.

For the architecture and implementation of the first commercial, interactive timesharing computer, the PDP-6, the forerunner of the DECsystem 10/20 computers.

For his architecture and PMS structure contributions to two of the most widely used computer families, the PDP-11 and VAX.

For pioneering work in the field of hardware description languages. PMS and ISP have had a major impact on our ability to express and understand computers.

For being a co-author of classic reference books on computer architecture and computer engineering.

For being a founder and curator of the Digital Computer Museum, which seeks to further understanding the evolution of computing.

Professor Doug Jensen
Carnegie-Mellon University
Department of Computer Science
Pittsburgh PA. 15213

Professor Jack Lipovski
University of Texas
Department of Electrical Engineering
Austin, Texas 78712

Dear Doug and Jack,

Enclosed is information that Jack asked me for in regard to the Eckert-Mauchly Award. In the event that I do not receive the award, I would like the right to withdraw my name from further consideration. In any case, I would like not to have my name in your files more than another year.

I or someone from my immediate family would be available to accept the award.

The award process could be revised. The notion of applying for this is disconcerting, and you will not get the quality nominations that I would hope should exist. For example, Cray would be at the top of my list, yet I can't conceive of him nominating himself. Let me suggest that for starters the Collusus team, Wilkes (and possibly other members there), Kilburn (and possibly other members), the team of Amdahl, Blauuw and Brooks, and Cray should be given awards. Certainly Cray and the Manchester Groups have the clearest, longest record of achievement.

Sincerely,

C. Gordon Bell
Vice President, Engineering

Berkely, CA   94720

Dear Dave:

Thanks for the very nice introduction for the Eckert-Mauchly Award.

I enjoyed your paper and follow RISC. When you get an operational system, I'd like to really understand it because I think you're just operating on a different point on the space/time curve and this may "cost" time or space somewhere else... whether this is important or not is strictly an engineering question at the time. There's also the issue of data-types when a machine is built for gp use.

Right now I'd like to understand the use of a constant "C" compiler in performing the evaluation since we went to extremes to make sure nearly all statements in scientific and commercial languages computed into one instruction. Such a

compiler may reduce all machines to a common subset. Clearly the procedure call (and resulting time) is a major factor which RISC seems to address. The good use of a cache might have a similar effect. The registers may have an effect somewhere else - I know not where now. For example, a stack machine encodes certain problems efficiently. I've erroneously evaluated stack performance independent of implementation. In particular, a stack machine with only a top can easily take three (or more?) memory references. Having helped on George, an interpreter which is the first stack machine that English Electric built as the KDF9, I designed one which is approximately the HP3000. The PDP-6 was a reaction to it and I remember when Nico Habermann's Algol 60 on the 10 outperformed the
B5000 - for about the same technology and memory size. Hence my inherent distrust of all stack machines and the difference between architecture and implementation.

What might be interesting is a recompilation on our new C compiler which is reported to run several times faster and targets VAX. Could you see how it compares and then do a "hand" recompilation using it for RISC?

Sincerely yours,

Gordon Bell

January 5, 1981

Prof. Harold S. Stone
University of Massachusetts
ECE Dept.
Amherst, MA 01003

Dear Harold:

I'm writing to nominate Wesley A. Clark for the Eckert-Mauchly Award. Wes has made many direct and indirect contributions to architecture via DEC and other persons and organizations, including sponsorships and consultation.

Direct Contributions

.Design of the MIT Lincoln Laboratory TX-0 (first transistorized computer) designed to test large memory, the first transistor circuits, for the TX-2, and had built-in 10" x 10^{-1} scope.

.TX-2 architecture, (Clark, 1957) a large scale computer used for interactive computing research including Sutherland's sketchpad, Roberts' graphics research, and the first computer network research that led to ARPAnet. The TX-2 had an important set of ideas, the most important were addressable tape (which IBM ultimately adopted in the mid 70s) and the multiple sequence mechanism. The multiple sequence mechanism provided the basis for multiprogramming by permitting 32 separate program counters, thus giving 32 independent computers. Honeywell used this idea in the 800 and we used it in the PDP-1 in 1960. It is also the basis for the multiprogrammed PCPs of the CDC 6600.

.LINC - the Laboratory Instrument Computer (Clark and Molnar, 1964) was the first truly personal computer (12-bit word) for the scientist. It had 2 scopes, a personal file system using addressable tape (with 256 Kbytes), and ability to directly interface to laboratory experiments and equipment via analog/digital channels.

.L-1 (circa 1960) a very small 9-bit word length really minimal computer for data gathering and data communication application. An extremely innovative design that was truly, a "minimal" computer.

.Macromodules (Clark 1967) were a method of building digital systems of virtually unlimited size based on a modulo 12-bit word length. In designing this basic scheme, the team at Washington University discovered and solved the timing problem inherent in building modular systems by using asynchronous logic. This early work was the basis of the asynchronous logic work.

.Basic understanding about Integrated Circuits (Clark 1980)

Indirect Contributions via DEC

His designs are extremely clean, clear, noteworthy and examplary. He and his designs have influenced me, others at DEC, and our computers directly.

.PDP-1 was an 18-bit computer growing out of the TX-0 work. The PDP-1 Sequence Break System was an improvement on the TX-2 Multisequence mechanism.

.PDP-5...PDP-8 used concepts in LINC and the CDC 160. (LINC also used concepts from the 160.)

.The notion of minimality for the PDP-5 was derived from the L-1 design.

.LINC, LINC-8, and PDP-12 were implementations of the basic LINC architecture.

.DECtape was an adaptation of the basic LINCtape.

.Register Transfer Modules (PDP-16) came out of the Macromodules. While neither RTM nor Macromodules were directly influential, Fairchild did build a version of PDP-16s as IC's. Later bit and byte slice IC's did build on and use the fundamental primitives they introduced.

Sponsorship, and Consultation (that I know of)

.Lincoln Laboratory FX-1, designed to test 50mhz circuits and high speed circuit techniques (James Forgie)

.Lincoln Laboratory theses surrounding the TX-2. See above.

.Lincoln Laboratory was established for designing the SAGE computer. As such, it affected IBM's designs.

.Washington University, Programmed Console for ECG analysis via phone line control (Dr. Jerome Cox). Note that under his sponsorship the glitch phenomenon (Charles Molnar) was validated (Clark, 1980).

.ARPAnet Architecture and Interface - I believe there was significant involvement in the early conceptualization of the design. (Dr. Larry Roberts)

.BBN's, IMP, and TIP and other communications processor designs. Frank Hart, Vice President of BBN can describe the extent of this involvement. Wes has been a consultant to BBN on these and other systems.

.University of Vermont PROMIS System (Dr. Larry Weed)

.CALTECH Visiting Fairchild Fellow (Profs. Carver Mead and Ivan Sutherland)

.Burroughs Corp. (Robert Barton)

.Xerox Corp. (George Pake, Chief Scientist)

Wes has contributed much to computer architecture. It is time we recognize him.

Sincerely yours,

Gordon Bell

Subject: **Getting the Poop on ECL for Venus**

To: Don Busiek, PK3-2/S17
George Hoff, MR1-2/E47

Date: 4/11/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

CC: Brian Croxon, TW/C04
Bill Demmer, TW/D19
Ulf Fagerquist, MR1-2/E78
Andy Knowles, ML10-2/A52
Dave Rodgers, TW/C04

follow up 4/30/79

The thought of building a high volume machine in Venus and having it behave like the KL10 in terms of RAMP is quite frightening. There seems to be a superstition associated with ECL stemming from several product failures. Most recently, the 303x series has suffered from some bad design. However, the early ECL 10K had very poor margins in terms of power and temperature. On the other hand, the 158 and 168 are reliable, and the Amdahl and Fujitsu machines are very good...quite possibly because they are so beautifully cooled. Burroughs is supposedly giving up CML for TTL, but I would expect poor performance because they are the sole source of their own technology, and hence may not have the learning experience to get the reliability.

I'd like to get some real data on our experience with the failures in the KL10 processor and compare it with a TTL/S machine such as the 11/70. It seems that we can get this data with only a couple of phone calls and a large back of the envelope. This simply entails calling the repair centers. Since we know the population and the number of modules per machine, we can get the failure rate per module and per dip. These should then be compared with the theoretical rates when we make the final decision. I would certainly be biassed toward any chip designs which have accumulated failure rate data so that we know just what we are getting into. Selecting Siemens or one of the Japanese arrays would be an advantage because of this data.

Could you carry this little analysis out and have it part of the selection criteria for Venus technology?

follow up 12/11/78

The Cray 1 power supply is fairly unique in that it is a three stage affair with a 150 KW MG-set to get power to 400 cycles, followed by a solid state AC-DC converter and in the machine there are final voltage regulators. Since ECL is a constant load, only inductors are used. There are no capacitors. What kind of supply are we looking at for the Dolphin? Are we looking at buyouts?

Alan Kotok MR1-2/E47 Henk Schalke TW GB0003/36

The Loire Valley represents one of the greatest system balancing problems known to man for in a combined distance of only X Km. There are a combination of y-restaurants with a combined value of z-Michelin rated rosettes (see figure 1). Bicycle touring, is the ideal solution to burning calories, and meeting aerobic requirements while seeing the countryside, and its chateaus as the conveyance among the restaurants. Although one would ideally like to have maximum flexibility to accommodate the weather, terrain, spontaneous menus, and ones muscles it is necessary to plan ahead. This particular tour took only 10 days, covered y Km, z restaurants (with r rosettes), sightseeing in chateaus in t towns at an average star-rating of 2.1 and staying in h hotels.

Planning consisted of defining the itinerary in an eco-gastronomical fashion to burn-off 4000 calories/day by covering an average of 30 Km/day and then making the essential airline, bicycle, hotel, and restaurant reservations. Although this east-west tour was chosen to flow with the 100M fall of the Loire river, we neglected the fact that the prevailing winds were y, which required more calories - which, of course, were easily available at all meals. The standard 1:200000 map while adequate doesn't have the topographical lines of the 1:100000 variety that warn of the hill climbing.

Bicycles can either be carried as standard air travel luggage; but we simply rented them in Paris for about $2.50/day for convenience and especially to avoid introducing non-standard bicycles to the Loire. Bicycling requires minimal special clothing and luggage. Panniers Kirtland (of Boulder Colorado) a pair of rubber-enpregnated nylon saddlebags, to go over the rear carrier hold from x to x' cubic inches or y to y' lbs, and a handlebar mounting/over the shoulder bag holds about y cubic inches. These saddlebags turned out to be beautifully designed for packing and protection against rain. The small bags, very loosely packed are adequate, as the tendency to take too much will be discouraged. In fact, the ideal solution is simply filling the bags with credit cards and money, purchasing necessities to meet the weather, and dress codes. Since EMS who supplied the gear, didn't have adequate dress to fit the panniers, and meet the dress codes, a Brooks Brothers work and wear suit was used while women wear seems natuarally made to roll-up and still look well when worn. Double knit could probably be used to good advantage in the fall if one is capable of wearing it. Two extra changes of mini-underwear (masqueradable as an extra pair of shoes, several long-sleeved shirts including a swim suit), warm woolen one and a pair of long pants can suffice. All clothes should be the rapid-dry type both for overnight cleaning and also because they dry rapidly after being rained on while worn. Of course, good foul-weather gear (including rubbers and rain pants) is a must in the spring and should be selected for the lowest wind drag profile to avoid being a sail. Standard biking ponchos are not recommended.

If our tendency to be prepared by having a complete tool kit, corkscrew, cutler's lotion, solarcaine, hot water heater, extra camera batteries, too much film, too many clothes changes, too many paperback books is characteristics is normal it should be curbed. All the extras go into a weight and size and more wind loss. However, a good 6" crescent wrench and a swiss army knife are essential!

Having redecided that a 3 speed, versus 10 speed bike was adequate and preferred because we wanted to see where we're going, and then how handlebars and brakes made it essential to always be bent over, bikes, we rummaged through a collection of green, ---- brand bikes settling on numbers ---- and ----. These had working brakes, lights, bells - one of which later fell off, relatively flat tires which we inflated and more or less working gears. We collected a complete tool and tire-repair kit from many of the other bikers, because, we rationalized, they weren't needed in the light cycling around Paris and would get stolen anyway just as ours had.

The train to Bloise left from nearby Austerlitz station, and since we hadn't the foresight to get a schedule, we luckily arrived with one half hour before the express left. This proved barely adequate as we ran around like crazy trying to get the bikes on the train - ultimately they were accepted by the baggage department of the railroad - an independent enterprise.

We arrived about 6:20 in Bloise and proceeded on our first 2 hour 24 Km leg over relatively hilly terrain. The distance should have been only 20 Km since we left town on the wrong road through no fault of our excellent map and very well marked roads! Fortunately, enough daylight was with us because we weren't sure the generators worked nor did we want to introduce anymore drag on our bodies. Contrary to friends suggestions, we did not "get in shape" before cycling, instead, we did on-the-job getting into shape because we saw no point in getting tired and sore until we absolutely needed to. This proved to be a good decision, but we might have found that our range was only 15 Km/day. It's recommended that cyclists have some rough idea of their capability.

The Domain des Hauts de Loire in Onzain where we stayed the first night was fully worth being sore for, and worth its two stars. We were only able to have a very quick warm bath prior to dinner starting with asparagus with mouselline sauce and their own cured ham. Although a fish course is really basic, especially in the Loire, we went right on to breast of duck with green pepper sauce and quail. The duck was so large that for the first few bites there was some question as to whether we hadn't gotten an order of chantenbraud? Fresh apricots were used for the tart and we had cheese last so we could finish off, so to speak, with port. The Loire is famed for Chavrignon (chav) a goats cheese, but generally we ate cheese from other regions. We had a non-descript red wine of the Loire recommended by -----. At this point a 10 hour sleep was called for.

We got off to a relatively late start after toasted brioche that really melted in our mouths and croissants to return to *** Bloise. The *** chateau on the hill was closed when we arrived, so we decided to eat fruit and pastries near the river and to go on the short distance on the south side of the Loire to Candee, where we had reservations at a newly *'d country inn called the Hostellerie de in Guillere. The inn was full for lunch, taxing the kitchen and service to the limit, so our decision to not lunch there was a good one. Dinner was a strain for the staff but it was well prepared. We had a 75 Vouvray with crab and white fish tourine and asparagus in puff pastry. Salmon and sole filled with salmon and carrots were the main course. Both included a spinach and egg timbale. A chicory salad was eaten in lieu of the meat course and we went onto cheese. This time we tried a diversity of new kinds and we marvelled at how well we did by pointing with no knowledge of the language and little knowledge of the cheeses. We subsequently observed that most Frenchmen get their cheese by pointing too. Again we had fully opened port. The desserts of carmelized Charlotte and strawberries with creme frisch were the high point.

The next day's travel, partially in the rain was via Chaumont where we dined at the Hotel de Chateau across from the ** chateau. But first it was necessary to earn the calories. The chateau was a pleasant walk by a tree lined hill, the guide said little, the Green Guide and handout they supplied was adequate. The ** chateau's, particularly those in a small village, have several outstanding virtues: they are less crowded than those with *** and the guides are less pretentious and less likely to ramble in their relatively narrow ways.

The lunch was superb. Our waiter guided us through the fixed menu of duck gallantine, grilled/fresh river fish with spinach, cheese and rhubarb tart and floating island. He also recommends a 78 Sauvignon bottled by Maurice Barbon at

Oisly as we were in the Touraine region.

As we left the rainy Chaumont on a full stomach and proceeded up the hill from the Loire? crossing over the Cher? we began to feel the pain of travelling under these circumstances. For real cyclists there are probably rules and we vowed to get a rulebook. We also learned that the bikes had little or no braking capability when used in the rain, making travelling a triple thrill; being dampened by the rain; no vision; not being able to stop except.

The ** castle at Chenonceux was our destination for the day and we checked in at the Hotel de Bon Laoureur at de Chateau. By now the rain had stopped, and riding the last few minutes in the wind and sun had a nice, drying effect. The chateau was operated by Merrier? of the French chocolate company. Chenoncenx is built over the water and turned out to be our favorite because of its scale and simplicty. The Mellier? company does an excellent job of operating it as people are free to wander through the rooms at their own pace...the French government would do well to copy private enterprise. Also they operate a very tastefully done cafeteria with high quality and relatively low prices.

The restaurant recommended a specially bottled cremant. The soup was poor but crayfish quenelles more than made up the start. We had a reasonable grilled chicken and better veal medallions for main course with homemade chips. For dessert we had pear embedded in almond paste and cherry tarts.

The next day we travelled to the ** Chateau d'Artigny at Montbazon to spend two days, which included 4 spectacular main meals and wines. Of all the places, we found the staff the most pleasant and the food up to its ** rating. Since most people arrive in Mercedes or better, we were something of an anomoly, although not unique. They allowed as how maybe a half dozen people who arrived by cycles every year. The wine steward was part English, originally from Brittany who was also writing articles on wines and interested in promoting Loire wine. The menu was small, though entirely adequate and fixed, no doubt for a long period of time.

The first lunch was light as we had our eye set on a full 6 course dinner! It included a 74 Vouvray (clos du Boung), Chateau salad (artichokes, lettuce, tomatoes, pate', mushrooms, triffles, asparagus, beans, finely chopped spinach with vigagette). Dessert was individually baked rasberry souffles and they always pushed a plate of bon bous at us which were difficult to reject.

Fortunately there was a swimming pool, but on entry it proved to be what we thought was 65 degree which was too cold for us, but we did do several laps. On exit, the 65 degrees air seemed hot.

Dinner (at only $45.00 not including the wine) was the first meal we had in France and a bargain. We had a '62 Chinon decanted and by the end of the meal the wine was essentially sweet! The touraine of veal sweetbreads a (duck pate' started us off). The fish course included salmon in a lemon sauce with decorated tomotoes adoninus and lotte (river fish) and small onions. A rasberry sherbert and lean liquer were served to clean the palate. We then had pigeon, pear-shape pototoes and salad; and breast of duck with a small carrot souffle sewing a colorful with spinach layer.

Our vows to never eat again were broken when the breakfast arrived! It included four breads: the usual croissants, and rolls toasted biroche that melted in our mouths; and the finest bread. Gwen thought that it was a dreary day though a warm heated room, the only thing to route us from bed to bed! There must be a reason why European beds, even in ** chateus are really soft, bumpy, and generally awful for American backs. Possible Europeans are stronger or possibly all the back nerves are concentrated in the palate. To add insult to injury there are two kinds of pillows: one is rolled up like a giant sausage and fixed under the head; the variable pillows are large and heavy, quite possible for pillow fighting to reduce on after a meal! At any rate, the Michelin company might consider giving a bed rating for hotels as well!

We did lunch with Chinon Rose, artichokes mouselline and green beans, and a dessert of supposedly flaming strawberries and purce which the avartress didn't get to flame, poured over sherbert. Dinner was also relatively light. The first wine was '62 St. Nicholas (des valles) of de Bourgueil for noiseltes of lamb and for beef. We had spectacular vegetable puff pastry pies of leak, tomotoe and mushrooms. We did a repeat on the rasberry souffle, this time with a sec Vouvray.

The next day, there were large, photogenic clouds and we were off by nine for Langeis. At a critical junction we chose to go up to visit the village, which specialized in weaving rush function, baskets, etc. The results were good, but fortunately we had no room to buy and carry tales and baskets, so we settled on photographing them. About noon the photogenic clouds got together and produced rain just at a time we were on the hill heading back to the Loire. Fortunately, on arrival at * Housten in Langeais we found the heat, on so we took baths to warm up and dry out and put our critical clothes on the radiator. Hosten is right around the corner from the *** chateau. Housten is operated by the ? family and the food was up to the rating. They started by offering us a prime wrapped in bacon and a cheese tart. Although we dived lightly, there whole cooked, small duck special was quite good, especially with the 74 Vouvray. The salad and hot cold sewed asparagus with sour cream weren't memorable. The dining room was cozy and small, and like many dining rooms didn't have adequate airflow to remove the smoke put out by the majority of the diners! Europe has more smokers, and non-smokers are tolerated. Still overfed from Chateau d'Artigny we had a straight shot of 58 Km along the Loire to les Rosiers. This took 5 hours and we stopped at ? to visit the wine caves which bottle sparkling wines using the champagne process. We also visited a care set up as a museum which exhibited mushrooms growing.

The chef, Albert Augerean, and his family operated the Auberge Jeanne de Laval. The small hotel was pleasant and so the chef was very proud and hospital. The dining room was small and 3 women and a young man waiter did a better job that many of the larger places which had twice the number of waiters per guest! We should have canned out a simple experiment to correlate *'s, size, kitchen, dining room staff, and ownership...but we didn't take the data! (Anyway that's the subject of a scale study next time.) We had a local Gratien and Meyers cremant that was excellent especially with the small pork tart they handed us to start with. The first course was eggs and triffles and a collection of creusse, pickled zucchini, pate', mushrooms also greek, and standard pea and carrot salad. We had sandre with plain butter sauce and crayfish in what seemed to be a creole sauce. Strawberries and creme frisch topped the meal off.

The next morning it was raining - hard. We'd observed that large clouds collect during the day and then it rains in early afternoon; or it rains all morning and then it clears a bit. As a backup, we could take the train at 1:30 to Angers, but were reluctant to. At 11, the rain changed to a light sprinkle and we left on the remaining 30 Km journal of our 250 Km, eight day trip.

We backed a strong head wind as the unsheltered highway went right next to the Loire. Though beautiful, we didn't enjoy the headwind and we did stop once to get out of the downpour.

*** Angers has an incredible chateau that held 400 feet of 12th Century tapastery. Since we hadn't reservations, we settled on the last room of a small hotel near the station. For dinner we listened to one of the hoteliers convenience us not to go to one of the two * restaurants. He was wrong, but we did have a spectacular dessert of meringue and shaved chocolate.

The next day we and our bikes went back to Paris. The final thrilling hours of bicycling consisted of riding from the Montparnasse station back to Paris velo near Austerlizt station. Fortunately, it was Sunday and lunch time, so we made it back safely.

Dear Jean-Daniel:

It was nice to hear from you again and I've forwarded your letter to Sam Fuller, who heads our research group and to Forest Baskett. Sam will discuss your request to visit the Laboratory with Forest.

Since the Lab is quite small, and quite goal directed, it may not be feasible to visit there next year. Sam or Forest will contact you regarding the September visit.

Gwen says Rick is bringing over his SMAKY.

Sincerely yours,

Gordon Bell

I know you thought you'd never hear me say it, but...we need a different approach to editors (and their continued creation). This feeling has come about based on the following:

0. Everyone has a very personal feeling about editors and wants minor or major changes to any given one.

1. There are many different editing tasks to perform that can use different editors.

2. Observing two editors for creating attribute:value kinds of information for our BURP (Financial Product Measures) and for the creation of entries to the MUSEUM data base. We got <u>big</u> factors (2-4) in productivity over a standard text editor by having the editor check the fields, duplicate, and skip fields and otherwise have highly specialized knowledge, about what was being edited. Also these were question (editor) driven. I don't think a FORMS language such as FMS comes close enough to what's needed or can be done here. Here the system actually paces and checks the user!

3. Reading and believing in the approach used in M.I.T.'s EMACS as given in their paper.

4. Watching EMACS being used for LISP, PL/1 and text. In the various programming languages, it "knows" the language and automatically fills in keywords, identifies, etc. and handles indentation and punctuation. For text, it appeared considerably better than WPS.

5. Discussion with Nico Habermann at CMU who has used the C editor and is doing a research project on this.

6. InterLISP advocates who provide a similar environment.

Overall it seems like a move sound approach to design, used by EMACS (or TECO) and our command languages is:

1. Provide (hardwire) a set of primitive functions in the editor;

2. Provide a control structure to extend the editing language and define/tailor further capability.

What I'd like to see:

1. Bring in EMACS on the 20 and evaluate it.

2. Consider using it plus the language-based extensions as a product (especially for COBOL).

3. Convert it to VAX.

4. Take this more general approach for future editor design.

SUBJECT: GOING INTO THE COMPUTER ENGINEERING EDUCATION

BUSINESS

I'm on the panel of Computer Science and Technology Research Board of the National Research Council and we just looked at the problem of training people in computer technology.

The big problem is that there's only 200 phd's per year coming
out and this isn't enough to build computer science departments.
There are all sorts of hang-ups in the university/federal science
picture: universities are overloading the faculty and they leave
to go to industry, the fed funding is controlled by the regular
science establishment and they won't divert money to CS from physics and chemistry, the CS departments won't give up the teaching of any of the courses (causing their overload) because
they believe that only they can teach computing, etc., etc.

I was initially against Wang Institute as I thought the universities
should be doing this work. Now, I'm worried that the ponderousness
of the university and scientific funding system will not meet the challenge. On the other hand, a number of CS faculty believe that CS could be taught in 2 year colleges and technical
schools very effectively.

The question I have:
Is there a business here for us, especially since we are already
teaching quite a lot already and must continue for our own and others?

Should we be supporting others somehow?

In the far future, I believe that CS will become CS rather than

the teaching of Programming. A pure CS dept. will look very much
like a math or physics dept. All depts will teach the variety
of computer engineering they need to incorporate the computer into
their discipline as a tool or component of the systems they build.

SUBJECT: RE: ENGINEERING SUMMER SCHOOL

Ken has an excellent point, we want engineering managment to run the Burp program and spend a few hours with it to get an idea of the sensitivity analysis that it has. Let's take his situation as a home problem that we as everyone to have looked at before they come to the course!

We have made light years of progress since the time we used to bring in products, open the boxes, run and wear them out on systems, fix em and then ship them and hope they were not broken again in shipment. This took 2-3 months at least.

Now we ship from vendor to staging area, and we still have 1-2 months of inventory.

Ken suggests we ship labels to vendor and they ship direct. This is great. Everyone should understand the numbers. Let's
set up the example, run it through and say compare it with the old historical stuff and the situation if we made it. This is an excellent way to learn by example that we can ALL do now... as an entrance to going to the course.

OTHER MATERIAL
This instils the notion of timeliness. We want to do the same analysis and the effect of getting the Xerox printer there earlier (A burp capability too).

Responsibility and simple management are the other key messages of the course.

I want some of the course to be devoted to the problem of getting LESS output when you have TOO many people! This is understood from reading about Software Engineering from Brooks. EVERYONE SHOULD READ "MYTHYICAL MAN-MONTH" EVERY YEAR OR TWO. THIS IS REQUIRED COURSE READING!!!! There are a few papers too that show the numbers too.

SUBJECT: MANAGMENT IIA: WHAT IS IT?

The preview of what the attendees of Management II will suffer next week was awful. It brought out the tremendous waste of human resources spent in listening to ill informed historical sociologists present poor and erroneous case data (note the one on the computer industry) to middle aged, illiterate, folks who think they missed something in their youth (US) and the misguided, potentially creative youth (the MBA candidate who may have had substantive training in a useful profession such as engineering) who is seeking a micro-veneer that allows him to look at real live cases in an equally superficial way. He is spared the hard work of content, and can suvive by hit and run as an advisor to corporate leaders who, by now, are equally unskilled in content and must rely on process and the glib superficial analysis of another bright body to illuminate!

Why an hour videotape of the author, Quality Is Free? This is a relatively poor quality book, certainly violating my basic definition of quality (CLARITY, MEASURABLE AND NO EXCESS). Why deal with the immitation when we could get the great person, Demming either in person or on tape? Read Demming.

THE CASE STUDY METHOD TAUGHT TO US REALLY IS BAD
There's a branch of sociology that looks at society by analyzing garbage dumps. In the case selection, it appears that by looking at British Steel, Philips, Ampex, Zenith, we are looking at only the old bottle section.

The only thing I've learned from cases is that TI had an incredibly complex decision making system called OST.

Reading the case said it was good. Talking to them I knew it was killing them and a few advances occurred in spite of it. They flushed it last week and could now be a competitive threat if they haven't lost all the creative people.

Having written several books that used cases both real and generated, I believe in cases for analyzing complex systems with two provisons: the principles come first, and the cases are only a verification that the principle is correct. Giving how to do it really right is better than trying to enumerate a few of the ways to do it wrong. There are always more wrong ways than right ways. The reason the professors give the stupid cases is because they can poke fun at others.

We may have been presented a vinette of some principle we were supposed to learn from by watching a movie to add some drama and to break the boredom of reading those dreary cases:

1. It takes all kinds to make a world
2. Different people have different management styles
3. It's important to match the person to the job

The follow-up on the principles was awful in terms of giving us some real depth into what we were supposed to learn. If it was item 3, then the framework for doing a good job probably takes more than a few hours.

In short, would you want your son to get a Harvard MBA?

WE NEED TO CONTINUE A POSITIVE MESSAGE TO THE ORGANIZATION
It seems to me it has to be based on statements and stories by
Ken regarding responsibility. I don't think this has changed any
despite the amguity that you folks tried to introduce today.
It's individual initiative and responsibility, much more "he who
plans does", focus on your own work to get the output we need
("engineers engineer, manufacturers build, marketers market and
salespersons sell"). Minimize layers and cross functional no
sayers such that the proposers (engineer, marketer, country) get
a direct answer to their proposals.

It's vital to have a good message here after the announcement
because we need the engineers to keep engineering to get the
product out, the builders have to help us, there's lots of work
in the marketing world to handle the products and of course the
salesmen have lots of orders to get in. WE HAVE TO KEEP THIS
ORGANIZATION HIGH... IT REALLY IS NOW!

WE DO NEED A MANAGEMENT PROGRAM
There has to be something substantitive that can be taught about
management, including techniques and games that we can play
(Roger Cady and I tried to beat everyone making Greeting Cards).
I want a really good one for engineering this summer to teach
basic management (especially self reliance), quality and for
several areas how to manage complex projects that result from
some of our big products and big chips. I really appreciate the
one Puffer and Ed Roberts of the Sloan School did years ago.

Looking at dinosaur bones and tracks in an unstructured fashion
sure doesn't look like the way to learn. It may allow one to

build an organization to sell soap, but I don't see that it has
much to do with managing a high technology company!

WINNING AND THE JAPANESE
The Japanese companys are really fun to work with because
discussion is about innovative products: how to build them, what
they are and who might use them. The selling of them is a detail
they leave to Fred and his friends of Xerox. They work the
content (substance). We work the process (form). Content which
you hold and use sells better every time.

MESSAGE ID: 5177410266

SUBJECT: MIT LIFETIME EDUCATION PROGRAM DEVELOPMENT AND US!

On Saturday I attended a conference on Lifelong Education at MIT
celebrating the EE/CS department. The program is predicated on
the fact that the US is not doing the necessary preventative

maintainence on its engineering talent due to the expoential knowledge explosion. They are also concerned with the faculty
keeping up too. Fano tried to differentiate training and acquistion of know-how (which can be purchased) versus knowledge
which is dynamic and must be nurtured and acquired. The prescription is a strong program between industry and academe.

HP- John Young of HP got many points by being one of the sponsors
of the Stanford/HP connection for continuing education. In particular, Prof. Jim Givens, is credited with TVI (Tutored Video
Instruction = 6 students at a video tape with an "approved" tutor/student who learn together). TVI has better performance
than with conventional classes. HP taught 48 courses at 46 universities. HP is giving $6M in forgivable loans for PhDs training for teachers. MIT is also designing chips for them and
using their VLSI process lines.

The MIT "proposed" program is going to their faculty. It is to
make TVI a reality so that industry students can get MS or ME degrees without full-time residency.

MY AGREEMENT WITH MIT
Joel Moses said there has to be a local, strong leader and Digital is the only candidate. I concured and agreed, but with
the proviso that MIT and Ken also agree we should do it. I have
absolutely NO reservation about continuing education. We must
have it... to the tune of about one course per year. A massive
upgrade of many of our engineering groups is long overdue!

My only reservation is the roteness of a program because I

think
there are people who can actually learn without the necessity of
taking a course and working to a degree. (Some folks have to have merit badges and degrees for motivation and security that
they are learning.) Other forms of learning should be recognized
and applicable: teaching, writing, even reading, etc. For example, I was overjoyed to learn that Dan Dobberpuhl's book with
Prof. Glasser on advanced VLSI was in progress... easily worth a
PhD's worth of merit badges in terms of usefulness and knowledge!

For now, I want help to work with MIT on building a first class
Lifelong Education program. We need it for collective survival.

SUBJECT: EDUCATIONAL COMPUTER; EDU MARKET PLAN, PRODUCT AND

PC SERVER

Ken is pushing us to define a computer that would be let us get the education market, or some segment of it. I'd like to get together asap and address this.

THE PC SERVER
My cut (bias) is still that the highest priority need we have in
EDU is a PERSONAL COMPUTER SERVER! I've tried to get this considered in EDU for the last year and I can't even get a response to a request!!! This is something that the P/L could
have and should have been doing as their highest priority! That is, we have in the past established ourselves as the system
to control the various other systems including networks. All programming for the peripheral computers is really done on our
machines. We've let the price drift up for these machines and we
should have gotten in there to control this base.

THE EDUCATIONAL COMPUTER is also worth persuing while at the same time we demand the education group provide, for once, decent products. Ken, will you please ask the Edu folks to come and describe their plans for the entire educational market, at least as a way to get it clear what it is
we are talking about? and where it fits (eg. home, industry, primary, secondary, college, trade school)?

I'm a little bit sanquine about getting involved this way because I remember trying to affect their thinking on GIGI. In no way are we going to operate a golden rule project...

Avram,
Will you convene us here and see what we can do?

ECS will assign Bill Wise and Charlie Rose to do this task.

We are anxious to get started. The approach is very consistent with ideas we have evolved over the past several weeks.

Gordon, please contact either Bill Wise, Charlie Rose or myself with the name(s) of your representatives.

Regards,
Bob

SUBJECT: EDUCATIONAL COMPUTER: IDEA, CUT AND REQUEST FOR REQUIREMENTS

As I understand it, the CT base that Wim, Hampton et al put together for the contest and is a front runner for the VT201 has also microcode space that could be used for the user!

Is it possible that this is the very low cost educational computer that Ken wants?   Wim gave a demo of it running in a swapping mode over a serial line.

Given that we are going to produce these as terminals in high volume, then it stands a good chance of being the right base.

My cut at an educational computer would require graphics, would operate in a cluster, would have some romable programs, would alternately be a terminal.

Avram has suggested an Atari maybe modified to have a T in it, and running both DEC and Atari software.

Rather than waiting for a meeting, Bob, why don't you simply put your goals (what you'd really like) together with some weighting for them, Constraints (what you MUST have) and some objective function (how a user would evaluate such a computer)
on EMS by 5 tonite to start this ball rolling? (It clearly shouldn't be much more than a page or so)!

ELECTRO-MECHANICAL GENERATION

The critical inventions for the electro-mechanical generation were fundamentally in place by 1900. These include the use of electro-magetics, electric-driven motors, battery-driven circuitry, and relays. Links and switches with telegraphy and telephony were developed throughout the mid-nineteenth century. Power for the early telegraphs was generated in conjunction with the railway system. Most early systems were point to point, with simple mechanical exchanges.

The Hollerith tabulator and sorter developed for the 1890 census provides an example of a truly significant project leading to a new generation. Its first commercial application was not until 1895, when a version was installed for accounting at the offices of the New York Central Railroad. (Randall 1973, p. 126). The 1900 census saw improvements in the system with the addition of automatic card handling mechanisms. In 1901 the first patent application for a motor-driven calculator was made. (No. 726,803 "The Universal Accountant" issued to Frank C. Rinche, April 28, 1903). The electric motor driven calculator was not produced in quantity until the 1920s (Chase 1980).

The infrastructure of electricity generation and transmission systems was essential to transform these devices to useful tools. On September 4, 1882, the first American power company, the New York Edison Illuminating Company, started generating electricity at the Pearl Street Station (Stein, 1976, p. 244). Edison and others had difficulty raising money for these capital intensive projects and electrification had to be established as the infrastructure to support the use of electric-mechanical devices. Like the adaptation of card-driven looms, once the systems were installed and available, the application diffused widely and rapidly. By 1900, electricity was available in many U.S. cities and towns.

COMPLEX

ACCOUNTING TABULATOR

THE 1890 U.S. CENSUS SYSTEM

Working as a statistician at the United States Census Bureau, German-American Hermann Hollerith first conceived of using punched cards as data carriers for the 1890 census. The 1880 census had taken over seven years to complete, the population then numbering over 50 million and increasing rapidly.

Hollerith's solution was to introduce a rectangular card divided into 240 squares, in each of which a hole could be punched according to a code. Each square corresponded to a question; a punched square represented the answer "yes", an unpunched square a "no". In that way one card could contain information about a person's age, sex, ethnic background and so on. The significant innovation that Hollerith developed, over that of the other two entrants in the competition, was a reading device in which there was parallel processing, counting the total number, registering the number in a particular state, and sorting the data card on yet a third category.

Hollerith developed his methods further and started a company which, in the following decades, was to provide the business world with a whole family of punched card machines for bookkeeping and statistics. Hollerith's company flourished and became one of the cornerstones of IBM, founded in 1912.

<u>The Hollerith Electric Tabulating System</u>, Reproduction by Roberto Guatelli, 1890 (1981), tabulator 75x120x90 and sorter 90x35x75 cm, Brass, Oak, Glass, (D231.81).

Cards were read by the machine. The card was placed on small containers holding mercury, one container for each row of holes, and then the die with electrically conducting pins was brought down upon the card. The holes permitted contact between the pins and the mercury containers, and the coded information was registered by the comptometer - the dials on the front of the machine. The upper left dial counted the U.S. total, and the others corresponded to the state total in which the particular "card" lived. An additional characteristic could be hard wired into the sorting device so that an appropriate lid would open for depositing the card.

<u>Keyboard Punch (Hollerith)</u>, Reproduction by Roberto Guatelli, 1890, 10x40x50 cm, (D242.81).

Blank cards were punched by using a enlarged pantograph of the layout that could be easily read. Locating the correct whole on the template and punching it then transferred a punch onto the card.

TELEGRAPHY

Telegraphy has played a significant, but not central, role in the deveopment of computers. Teleprinters were the first effect easily interfaced human to computer devices.

Early in the nineteenth century, two Englishmen, Cooke and Wheastone proposed the principle for electric telegraphs. But Samuel B. Morse in the United States and Werner Siemens in Germany were the first to translate these ideas into workable electrical hardware capable of providing telegraph service. Although Siemens' needle telegraph operated, the simple code of Morse based upon an on-off (binary) principle, was to become the industry standard for many years. Communication at the time, Morse and Siemens were operating in the US and Germany depended on the length of time of an ocean crossing with tranfer to rail and horse-carraige transport. Their two projects could be thought as taking place simultaneously. Morse first demonstrated his system in 1837 (Everitt 1976). The first system, funded by a government grant to connect the 37 miles between Baltimore and Washington, was operational in 1844. Werner Siemens patented the needed telegraph in 1847 and installed the first system, funded by a government grant to connect the 300 miles between Frankfort and Berlin, in 1849.

NEEDLE TELEGRAPH

In October of 1847, a week after Werner Siemens founded what was to become Siemens Company, he received a patent for the needle telegraph. He wrote his brother on 11 October 1847, "I have already spend 8 days in the new building. Above me there is already a lot of filing and rasping going on. Halske lives two floors up. We still badly need machine tools." A year later the company received an order to set up with minimum delay a communications link between Berlin and Frankfort so the the high level political decisions of the First German National Assembly in Frankfort could be discussed as soon as possible in Berlin. On 28 March 1849, the election of King Frederick William IV of Prussia was transmitted electrically over 500 km in the same hour as its announcement. (Weiher and Goetzeler 1977)

ELECTRONIC GENERATION

In 1950, the computer era had been established: at least seven orations had announced their intent to build computers -- Zuse AG, anti, Elliott Brothers, Ltd., J. Lyons and Co Ltd., UNIVAC, and -- and the ERA 1101 was on the marketplace. (Science Museum, 1975)

Industry itself and its leaders had been changed by the nological advances of the war period. Goldstine states:

In my opinion, it was Thomas Watson, Jr. who played the key role in moving IBM into the electronic computer field. When he came out of the Air Force in 1945 his experience as a pilot had apparently convinced him of the fundamental importance of electronics as a new and prime technology for our society. He therefore exerted considerable pressure on IBM..." (Goldstine, 1972, p. 329)

COMPUTER

LGP-30 - Librascope General Precison Computer (X14.81)

Word Length: 31 bits, including a sign bit, but excluding a blank spacer bit

Memory Size: 4096 words

Speed: .260 milliseconds access time between two adjacent physical words; access times between two adjacent addresses 2.340 milliseconds.

Clock Rate: 120 Khz

Power: 1500 Watts

Arithmetic

element: Three working registers: C the counter register, R the instruction register and A the accumulator register.

Instruction format: Sixteen instructions using half-word format.

Technology: 113 vacuum tubes and 1350 diodes.

Number Produced: 320-490

First Delivery: September, 1956

Price: $47,000

Software: ACT I (Fortran type compiler)

Successor: LGP-21

Achievements: With the Bendix G-15 the first of the desk-sized computers offering small scale scientific computing. Revolutionizing the computer industry with the potential for low-cost distributed processing.

The Maniac

"The Maniac", Los Alamos Scientific Laboratory, 1957, Color, 3/4" videotape, 29 min. running time (V5.81).

This 1957 production describes the MANIAC computer's architecture and operating principles for a general audience. The Los Alamos-designed machine features cathode ray tube memory and binary-coded-decimal input by punched paper tape.

Architecture and Implementation in Generating the Computer Generations

Basic Model of GCG. Emphasize revolution, not simple evolution.

.Architecture without implementation ala Babbage is dull

.Definition of roles: architecture (quote Brooks, Stretch), implementer, engineers, master builder and city planners

The process: start, continue (looping) and halting.

.The test at each step: proceed, loop, suspend, or evolve

.Architects may have impeded computing more than any other factor. It's caused perhaps a factor of 2 in spending (say Z80/8080 and 6502; recent comments by people who would not just build and use the Manchester Dataflow machine. We should have had a factor of 2 or 10 less. The belief, "quote Saul Dinman", editor of Computer Design, was that architecture was the creative part. Architecture is the last resort of change.

Set up the problem: create goals, constraints, ideas & obj.

fcn.
   .Stds. are great constraints, use em
   .Technology is a constraint. Use it or do it over.
   .Goals
   .Obj. fcn. approx.= use and need. Are you the average user and is your experience valid (Wilkinson) and GB average man. Have someone, not somebody (1 customer) as archetype. The benchmarks can be misleading ala early 11. Criteria are simple ala MCF.

Copy or Evolution, revolution or death: Control of big process
   .Beware of changing tech, arch and use. Don't change all at once
   .If you copy, do it exactly (eg. 360/370),
   .Unless you want to catch and then entrap (Z80/8080, FIV/FV, all the Basics)
   .One more bit ain't a reason to deviate (eg. ddp 19 vs pdp 1)
   . Know when to stop evolving (card, address space, data-types)

When you do the first one, it will look quite complex!
(Deuce, Arithmometer, CDC 6600 refrigerator)

BASIC PRINCIPLES OF DESIGN
   .Quite likely ideas will be copied from our own models of organizations ala Conway's observations. Committees don't invent. For this it is quite natural that we invented the Unibus and Ethernet; IBM invented SNA and tree structured uniprocessor. Another reason why multiprocessors are unnatural to us.
      .Another form of Conway's law. N people mean N boxes or N passes.
   .Know the good ideas and use them. Build on others.
   .If you ever have good ideas use them, document them so others can too.
   .Do it right or do it over. Don't ignore symmetry. The European standard modem of 1200 baud/75 baud is a good example of breaking this and Conway's law. They are getting

1200/1200.

.Don't try to foil others (the rumour is that by picking fsk frequencies, the telephone company discourages acoustic couplers on 1200 baud. The result, on a crappy line, only the non-compatible acoustic coupler will work. The standard won't.

.Keep it simple, stupid. (Deuce, leave it out. First micro was designed to a chip size and won against a special purpose K.) The languages such as Algol 68, and various airplane designs all fly off into the sunset and are never used.

.KISS leads to the ultimate in simplicity, the stack. But who is it simple for: architect, users, compilers, the machine implementers, sales person. Cite the glea of winning against the B5500. Stack based machines don't represent something one would recommend to their friends.

.Be elegant. Every feature contributes 2 benefits. Every part contributes two functions. A way to insure that a part is left out. Architects say Less is more.

.Generalization is the ultimate in elegance. The stored program, the n-state, the general register, Unibus and Ethernet are all examples of this. It's interesting that the ring and Ethernet provide exactly the same function, yet we each perceive them as different in terms of being forced to work to a common goal and being allowed complete autonomy. IBM and token passing requires a central authority.

.Too much elegance is trickery. The two's complement (ala Comptometer) versus one's complement many be an example. We went ultimately to 2's

.Decide what to do and then encode it. Form Follows Function.

.Sometimes, Function follows form as in VLSI. Let the Si tell you. Also, note Hoff quote of having experience on the 8 to do the 4004 (the famous ad). If ted had first programmed the 360, it would have been several years before the micro would have been invented.

.Flexibility and generality have to be bound sometime. The trick is to decide when to do it. When building something, do it asap so as to get on with the design. We have all sorts of examples of poor binding times: microcode and user microcode; operating systems in rom; particular languages; isp's; B1700 was a really bad idea as it let float an especially uninteresting design choice: the isp by allowing

complete flexibility to the bit level.
.often time the trick is deciding what it has to do. orthogonality, the important data types, etc. risc vs a large set. This means you do the i/o too as in algol... otherwise it'll get screwed up by a committee.
.Pick a small number of primitives and then design with them. Cray uses 2 ic's; vlsi allow's too many... regularity is great. Poor designers always think they can design more by redesigning someone elses stuff. microcode, gate arrays, vlsi, rom, etc.
.Make the design small, but extensible for all you forgot. "Hoare quote". in address and data types. because
.a good design can be extended at least once.
.Don't use all the ideas. Enumerate the possiblilites: capabilities, Huffman coding, multiprocessors, new undefined language (ADA), ... Know when to stop adding. Less=more. 432 is a good example.
.Of course the ultimate in generalization is one more turn of the wheel of reincarnation. Use Pio's, ala 360, 370, 6600 etc.
.God is in the details.

Now Built It
.Forrester story on implementation at univerities and problems.
.Do it yourself and don't let go. Don't seperate arch and
implementation. Quote FB on arch and implementers. The greatest designs are in one head. The iteration process is clear and tightly coupled. Fortran, Pascal, the first Basic are all good examples. Also, all Cray machines are this way. Note, the designers all warmed up on small systems: Algol W, the Cray machine where they learned design.
.If seperated, the coupling has to be clear and the conflict is enormous. Apl, VAX.
.The biggest kludges come from committees because they contain no implementers as implementers are doers and not committee goers. PL1 and Cobol. And the biggest committee of em all may be the defense department! An example of the worst designs are the evergrowing number of communications protocols as opposed to the day when it might have been done by some competent person in an org. ISO did a great think in

putting fort a model, it had enought sense to say it couldn't do a design. The communications interfaces to deal with data switching are so baroque and bazar that I fear we'll be set back many years just implementing it. The attendees should have implemented something AND to propose, the protocol should be in operation somewhere. We can clearly understand why comm protocols are poor since the problem is not able to or allowed to be put in a single head. Need to recognize Conway's law (and that Computers are an extension of our culture) don't have any international languages for communications al x25. Also why it took ? years to get direct dialing after the dial was invented and after it was operating at the country level for 15 years. There's an enormous market for translators in computing among x25 protocols, DECnet to SNA, SNA to SNA, etc.

.Now when partitioning to build it, the organization can dictate the design as in Conway. npasses, n functional boxes.

.Final segmentation is a way of limiting comlexity as long as it is being partitioned. MAke it work for you.

.Hardware software segmentation is a good example of making a good segmentation. Maybe this is a better place to talk about binding the variable as in user microcode, rom o/s,

Produce It

Use It

.A machine can't be programmed until it exists.

.HW follows SW (need and use)

.SW follows HW on occasion

.Advesary designs create opportunites and ideas (1 level store)

.the way to be humble and self critical (show evolution of the pentel pencil from old drafting pens to wooden pens to rotary)

.the o/s and applications are the ultimate test, not the diagnostics. Having specialists here is bad.

Finally, describe it. Go around again.

SUBJECT: EMS (VS. WPS) AND OUR FUTURE PRODUCT

Subject: EMS (vs. WPS) and Our Future Product: The Way to Computing in the Office?

GB0005/18/EMS

The more one considers Electronic Mail, the more it seems to be the clear vehicle to get computers into the office. It stands to be more important than Word Processing because the cost savings are greater by being able to get rid of paper, the carrying of paper and filing it. The direct use versus via a secretary will increase. We'll all have terminals just as we have telephones, and the terminal is likely to have the phone built in.

For DEC, I see a problem because of the approach we have taken in our EMS design. We have based the program on MUMPS, and it's file system; and MUMPS runs stand-alone, or as a special system on VMS at some undetermined future time, cost and performance. I think we want EMS to be written as a standard applications program and have it work with a standard file system. EMS is the first application program for the office, and the editing of these memos or messages (which I'm claiming may be the bulk of word processing) could be a close second or could even be considered to be part of EMS. After these one or two applications, the frequency of programs used will fall off rapidly, but we will need a common user interface and file format and lots of communication among EMS/WPS and the myriad of applications that follow:

tickler, meeting scheduler, telephone manager (call back, look up and dial, etc.), retrieve address, for insert into a letter, fill out expense account, simple file box, arrange goals and objectives, pick-up/distribute the mail on other systems, fill out and check a particular form, retrieve information in organization chart form, submit a purchase requistion and get all the appropriate approvals (note if not signatures, what is it?), order travel tickets, check a computer configuration validity, ask for a computer quotation to be printed out or submitted to a customer, etc.

Note, these are variable in size, the list is open ended, and it looks very much like what customers use computers for, except that there is not the usual intermediary key pucher or data entry person! Coding will be done in a myriad of languages (especially COBOL) because many will be based on interfacing to some existing system.

In summary, it seems likely that the office computer system will grow out of EMS (and the text creation of mail...call it Word Processing if you want). Subsequent applications will be numerous, varied (in terms of data they access, computational need, and program size), and should be written in a language(s) running on a general purpose system we support. Compatibility among the systems is a key. Every attempt should be made to keep a strong file standard such that there is not a different file type for every program.

We aren't going this way internally, and given the amount we are spending (when you consider all the users of the system and the amount invested in their training), I think we ought to clean up our act quick! The market will be upon us and we'll have to catch-up.

SUBJECT: BASING THE MAIL SYSTEM ON VMS, NOT EVERY SYSTEM

This is to confirm the discussions at MK on friday, and in particular the agreement that Glen Reyer and I made... which I believe he is now responsible for closing with the Product Lines.

The EMS per se will be designed to explicitly run on VMS, although it may be possible at some future time to move it to other operating systems. The critical design issue is time to market and having it have to be runnable on every system can seriously affect this parameter, together with making it unnecessarily restrictive. Mail, will come in the OFIS program through some other method, most likely as a virtual terminal via some other system. It is assumed that we will use every available tool and facility of VMS that's available (eg. teco, edt, mumps, datatrieve,...) in order to build the product.

In short, design it to run on VMS, don't worry about or have meetings about how it might run on some other system at some later time.

Let's get it!
gordon

PS.
I would like this confirmed before the Marketing Committee meeting because I want it clear(er) what we are and are not doing in OFIS! (This is part of a growing program I am personally conducting to remove features from our future systems in order to get some alignment with what I think we can deliver. I trust you all support me in this aggressive program!) I want to return to getting some sleep about where we are in this area, and I assume that you folks would like to sleep too. If you are resting comfortably now, then maybe we should talk.

SUBJECT: RE: RE: BASING THE MAIL SYSTEM ON VMS, NOT EVERY SYSTEM

Ok by me. Let's make sure we know how to say this so our customers understand and we don't get trapped or imply someetthing we can't deliver on.

Let's get what amounts to a current requirements document under a formal process of eco prior to going into Phase 0. Please join me in my pruning process that each week cuts something out to converge on what I think the architecture is and what it will support with what we are comitted to. I.e. I see a big expectations gap in terms of what I know to be the internal architecture and what people want. You work on convincing me we can build anything and I will proceed to cut back on the features that have been sold to the p/l's. Hopefully we will converge in a few months.

Now, I have little confidence in our ability to architect, design and build any software in this area! It is clear that our customers have been sold a lot (by us) and want much. Frustration is correlated with this difference!

SUBJECT: COMMENTS ON YOUR COMMENTS:

1. PROPOSAL STATES EMS IS TO BE WPS COMPATIBLE. SURE LOOKS GOOD TO ME.

2. MUMPS ISN'T SUPPORTED, BUT DOES IT NEED TO BE? WHY NOT VIEW IT AS AN INTERPRETER ON VMS THAT IS NOT ACCESSIBLE? (LEASING MUMPS PROBABLY ISN'T SO BAD EITHER - IF PRODUCTIVITY IS AN ISSUE.)

3. WHY NOT USE A WPS TERMINAL ON A RSTS SYSTEM AS A VIRTUAL TERMINAL?

4. WHY NOT USE WPS ON VAX (WHEN IT GETS THERE) TO TRANSMIT INTO EMS?
(THIS LINK WOULD HAVE TO EXIST IN EITHER SYSTEM.)

5. TRUE. THIS SOUNDS GREAT TO LIMIT EMS THIS WAY AND TO

BEGIN

BEGIN TO GET OUR USERS ON VMS. LET'S HAVE RSTS USERS STAY ON RSTS MAIL AND HAVE THEM USE POST OFFICE.

6. DEC MAIL (NOT YET THROUGH PHASE 0) WOULD BE COMPETITIVE. HOWEVER, I'D LIKE TO NOT MARKET IT WITHOUT DEC INTERNAL FIELD TEST. (THE ENGINEERING NETWORK COULD DO IT). MY GUT SAYS DEC MAIL IS TWO YEARS OLD AND AT LEAST TWICE AS EXPENSIVE. (HOW MUCH HAVE WE SPENT TO DATE?)

THE TWO REASONS I DO UNDERSTAND:

1. IT DOESN'T RUN ON RSTS -- BOTH GOOD AND BAD.

2. IT IS GOING TO BE DIFFICULT TO INTERFACE TO THE FILE SYSTEM IN MUMPS . . ., BUT I'M NOT SURE WHY ONE WANTS OR NEEDS TO EXCEPT THROUGH A WELL DEFINED PORT.

OVERALL, I THINK WE SHOULD NOT RULE THIS PROPOSAL OUT SO HASTILY. I WANT EBOD OR THE MARKETING COMMITTEE TO REVIEW THE TWO ALTERNATIVES AT THE PHASE TRANSITION.

SUBJECT: EMS PRODUCT PLAN 7/18/80 BY PASLASKI

THE PLAN IS REASONABLE AND WOULD SATISFY A LIMITED NUMBER OF CUSTOMER REQUESTS. HOWEVER, IT IS OUR (COMMERCIAL GROUP) BELIEF THAT USERS WILL WANT TO INTEGRATE EMS, WPS, AND DP OVER TIME WITHOUT A MAJOR RETRAINING EFFORT; WE BELIEVE THAT EMS SHOULD NOT BE RELEASED AS A PRODUCT AND THAT WE SHOULD WAIT FOR DECMAIL.

REASONS:

1 EMS HAS LITTLE COMPATIBILITY WITH WPS TODAY.

2. THERE IS A MINIMAL SUPPORT STAFF IN THE FIELD FOR A MUMPS BASED PRODUCT. MUMPS IS NOT A MAINSTREAM COMMERCIALLY ACCEPTABLE LANGUAGES.

3. THERE APPEARS TO BE NO CONVENIENT WAY FOR A WPS USER ON A SHARED RESOURCE SYSTEM TO USE HIS TERMINAL FOR EMS (ASSUMING THE TERMINALS ARE LINKED DIRECTLY TO THE PROCESSOR.)

4. A HYBRID EMS/DATA PROCESSING CAPABILITY WOULD BE AVAILABLE ON VAX; WPS WOULD NOT BE AVAILABLE ON THE SAME SYSTEM EXCEPT THROUGH VT278'S.

5. A RSTS HYBRID WORD/DATA PROCESSING USER COULD NOT USE EMS UNLESS HE HAS A DIAL UP TERMINAL.

6. EMS TAKES AS LONG AS DECMAIL TO GET OUT AND THE COST IS ABOUT THE SAME.

I BELIEVE THAT WE DO HAVE LEADERSHIP WITH EMS AS WE KNOW IT IN HOUSE.
HOWEVER, WE SHOULD LEVERAGE OUR EXPERIENCE BY PROVIDING A SUPERIOR
PRODUCT.

NOTE***TRAVIS AND STEWART - PLEAST GIVE COPY OF MEMO TO KALIN AND WILLIAMSON. THANK YOU.

SUBJECT: MASSIVE PRODUCTIVITY FOR EMS USERS

GB6.6

If we really looked at EMS productivity, it may be much less than what
we expect because the response time of shared system is so poor due to
overload. Clearly, limiting the number of lines is needed. However,
there's another way.

We must go to unattended operation that will work with DECmate, PRO,
Rainbow, and Personal VAXen.

I envision having a PC that would call a system at a specified time
(e.g. off peak hours) and send mail. Many would do this now, i.e.
simply having a command file to send EMSes. Similarly, it would call
up to pick up mail.

Maybe this is easily doable by extending command files in the PC (we
ought to try it in VAX first where clock and command files are
available.

We should be prototyping and using this in house now. How about it?

SUBJECT: EMS PRODUCT PLAN 7/18/80 BY PASLASKI

Believe you have the job of responding to the proposed EMS project. Paul Paslaski wants a response by August 1... which sounds tight.

My reading of the plan:
.it's an aggressive, but doable schedule based on the past performance of the group

.technically and architecturally it sounds great, by being compatible with wps and building on what we have by tuning

.its on vax, allowing us to focus on the product strategy and get into the market in a controlled way. (I see no reason to have this product on all systems in the short run, or perhaps even in the long run. We can use a simpler system for message transmission, if such a facility is needed on these other systems.)

.the team who did the original is doing the tuning, hence there
is the greatest productivity and shortest time to market

I still think EMS is an important product need. We do have the leadership with EMS as we know it in house and use it. This uses the programs as is and refines it for ease of use and compatibility.

Furthermore, this would free other resources in the development
area to work on the WPS area for the 11 which we also badly need.

All in all, I believe this is most likely the best way to go!

When can we get this looked at? The decision should be at least reviewed by EBOD and perhaps even the Marketing Committee.

PS
It pre-empts a proposal I was going to make to have CSS take the
EMS product as is and to offer it in limited configurations to
various customers in order to get experience with real users who
aren't computer companies.

GB1.S5.59
Bob'll send information on computing environment they're trying to build. They're switching to Ethernet, having played with old Ethernet and Chaosnet. It seems like everyone's wanting to go to personal machines - mainly because of the long history of machine service overload. He sees: super terminals or workstations ala SUN, HP, or? where graphics, editing and possibly small LISPS are run. This environment has to be compatible with big machine environment where bigger problems are run. He wants 750's for this. He's not enamoured with the 730 for this due to CPU. I think he may be wrong - or at least I hope he is. HP's putting (has) LISP on a 68,000 at Utah.

The LISP conference will be a place to get much info as everyone's trying to get their machines benchmarked. (3 x 780's = KL = scheme chip = 4 x 68,000) The 2060's the benchmark - thus, we could have a really nice LISP-server when we can get the 2080 built! The fact is: the community is out of cycles and needs a very high performance machine for attacking new problems.

Neal Goldman will be in Boston next week. He mentioned their software for multichip projects. IBM's sending someone there to visit.
January 12, 1982

A.B. Crawford, Jr.
Corporate Manager, DIS
Digital Equipment Corporation
129 Parker Street
Maynard, MA 01754

Dear Al:

This is in response to your query regarding my observations on the impact of our internal EMS implementation.

As you well know, EMS with word processing has become an essential part of my office and work habits and a key to improving the productivity of both myself and my secretary. The "rough spots" resulting from your early pilot and productive service were well worth the payback, in my opinion.

I can attest that our internal EMS has become a vital communications means used by all senior officers and managers in the company. It is particularly valuable as an alternative to the telephone -- short, informal messages with a time urgency -- with the ability to easily broadcast a message to multiple addressees.

Further, the lessons your people have learned from their pioneering efforts have directly contributed toward our being able to offer a better, more timely EMS product to the external market place in the form of DECMail.

The synergy of our product development staff working with your Information Services people has truly been of great benefit to the company.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

GB:mal
ID#GB3.S1.49

I'm not able to come to your meetings.

I think you're doing great without me!

We must drive like crazy for the Two Board Scorpio Processor (gemini) systems! (Congratulations on a masterful piece of thinking!) This first system should come out concurrent with Aztec! Is it also SUVAX? The OC would like an update on the aggressive plan.

With a much more supportive service and manufacturing environment and the risk of a Venus or Scorpio slip, I believe we can cheaply introduce, systems.

I agree: Introduce then cost reduce!

Ward McKenzie has agreed to co-sponsor a review of the 16-bit product set. The CT folks should present their work too. The purpose is to look at the complete set for the next 5 years. It should include:

chips,
the use of II to get low cost 1 board systems,
Unibus options,
4 versions of the Qbus options together with its evolution,
all the CTs (can we use Micros boards in any systems?)
and the Systems evolution (Unibus, Qbus, Pluto, and the CX systems). What disk/cpu combinations and packaging.

The software review should include:

RSX, RSTS, RT, IAS and MUMPS,
support of UNIX,
CTAB and how it is compatible with the overall architecture,
special systems for Pluto and HSC, and

File and Print Servers (here, we ought to encourage the
talented, M group to propose doing this work.

I'm concerned about the systems overlap, the inability to use board level designs to build systems (how can our customers do it?), inability to easily field upgrade Unibus systems when J is there, and the competitiveness in the DOOMESDAY SCENARIO [all hardware is standardized to 1 or 2 ISP's (8086 and 6800), software is UNIX, and there is a standard bus (Multibus)]...
to name a few.

It would be nice to keep this review small.

Can you get together with Ward and propose the review?

EMS 13-JAN-79 14:46:33
340 1
To: Al Crawford, Claire Messier
CC: Len Halio
From: Gordon Bell
Date: SAT 13-JAN-79 14:46:33 EDT
Subject: mail and junque mail

I've been seeing some junque mail floating around in the system which I would
sometimes just as soon not get, on the other hand now I see a real need for it
Len Halio and I were talking about the fact that he hadn't goten any mail
yet (his bss isn't a member, nor his his group). Thus, 1 need for junque mail
is to keep the subscribers tuned in so they can be into the system, even if
the rate of letters is low.

Occasionally I don't use the system because I'm afraid that the subscriber
will now look in his mail box or the person isn't on the system so I will have
to put out a memo anyway. To me, there are these 2 critical

needs: 1. If a
person isn't readin his mail, at least dump to him the fact that there is mail
there. This could be done once a week. Preferrably, he can (at his option)
have the mail dumbed too in the interfoffice stasck so theres no need to
read it. If this is the case, then the message shouldnt be recorded as
destroyed, since he may just be getting around to reading it before the mail
is delivered, but on the other hand, it should be placed in a file that is
different from the unread file (eg, sent by surface mail file). 2. If a
personisn't on the system, we need a way toget the mail put into the surface
mail. This is an oldy. B

Note both of these would get the utilization up ahell of a lot... and make
the system indespensable. Ie it would alwasy send mail to a person not at
their option (like surface mail) and it would get to people outside the
subscriber list. This first point was at variance with Claire re privacy,
but I think it is critical for the users who send messages to feel the same
way about it they do about surface/interoffice.

PS the editor is poor.

My opinion, biased as it may be.

We would be insane to build corporate EMS on MUMPS.

What EMS needs can be supplied more than adequately with RMS multi-key files,
with the code wirtten in PL/I, Bliss, fortran, basic, etc.

I would be happy to expand myopinion in detail, in person, at any time.

I agree with Peter. We aren't going to push it. Sorry I let this go so far
without comment. Jack Gilmore is ultiamtely going to provide thei and we
probably should go with him. I would say either stick/muddle by with what we
have or help Jack make his the one in 2+ years or so. Let's not pick the road
to nowhere that this would be.

Command:
The Computer Science Research Board of the Nat. Res. Council reviewed the situation in Robotics on Friday. Pat Winston, MIT AI Lab. and someone from the Schlumberger Robotics lab (formerly of IBM Research) gave position papers. I was

impressed with the work and the level of Robotics. The direct use and indirect effects to real time control, vision, image processing, languages, inspection, and various transducers may be more important than the products built in the short term. (For example, much of the processing is on arrays and they need both special purpose and general purpose instructions. Most likely lots of the functions will be built into special chips such as a vision chip that does a 2 dimensional cross correlation with a filter to do blurring so as to find surface lines on an image.)

Pat Winston presented a depressing picture regarding Japan. They are absolutely committed and are working very hard. They are building a really advanced LISP machine, are assimilating our most advanced language (Stanford's AIL), and they are structured to form an engineering discipline based on software. In the past they have systematically seeded every US research lab to train their PhD's, while using their own universities to train Master's students. The PhD's then head the teams that do the work. (I've observed this too!) Hitachi has a machine for wire coating inspection and lead bonding control. They are about to release a machine to work in their factories for solder blob and PWB inspection (something we've been after for years!). In general, their work follows an engineering, versus science approach. They do little to advance the overall state of knowledge, but they take the current ideas and apply them in a systematic fashion. (Sort of like DEC in this regard.) I enjoyed the discussion with Pat and got an invitation to spend a day there... despite the fact he complained about the number of visitors in their labs.

The Board's position was:
We believe that Robotics Research is a vital part of computer science and we are particularly concerned about recent advances of Japanese robotics research and products. Furthermore, we would like to sponsor a review to assess the state of the art here versus Japan at the National Academy of Engineering meeting next October. It appears that there is better coupling between American robotics research laboratories and Japanese companies than to American companies. The level of American products versus the

Japanese is lagging and we believe that both research and coupling to research is the key to competitive robots.

The work going on at the universities and our work is important in order to ultimately develop and apply robotics. The direct- and side-effects will be quite large.

SUBJ: RX50B, TEAC/RX50, AND ENGINEERING IN JAPAN

I say go with TEAC for the RX02 compatible version (RX50B). This would be used to get 5" disks for media transfer. Then let's work at a version that plugs directly into the 278 bus that uses the RX50 drive as an alternative to the RX50B.

Let's examine the $750K cost. It may be the basis for having a really good engineering group in Japan.

According to the Xerox experience, their Japanese engineering out perform both by a factor of >2 in time (3 years vs 7 years) and are able to design products a factor of 2 lower cost.

IBM also claims significant performance from its Japanese lab.

TI, Intel and others do engineer these.

25 November 1984

Mr. Erich Bloch, Director
National Science Foundation
Washington, DC 20550

Dear Erich:

Thank you for the support at IBM and your personal support to the Capital Campaign that helped open the Museum on November 12.

The physical realization has turned out to be much more exciting than any plan could have communicated. The staff made a very large "stretch" to open a range of galleries. The reviews have been positive and it is easy to spend a half day in productive learning. Knowledgeable teenagers are spending their days at the Museum. The most flattering comment to date has been that it is the first American technology museum to be at European standards. Dr. Oliver Strimpel, who did the Museum's Image Gallery has just become the Associative Director and Curator. Oliver was formerly the Curator of the Mathematics Section of The Science Museum, London. The long collecting period and five year breadboard at Digital really paid off in collecting artifacts, building exhibits, doing lectures (ranging from Amdahl to Zuse) and gaining widescale support from computer people and companies.

I want to see this phase aimed at:

. putting a formal educational program in place,

. continued collecting of artifacts (whether letters, films, manuals or machines) in order to record the significant, information processing events, and

. getting broad public support from computer-knowledgeable people who want to learn more about the past and future history of computing.

Since the Museum is quite unlike the plan you saw, I hope you can visit the Museum with me on your next trip to Boston and see the transformation. The perspective you now have would also be beneficial. If you have time, I hope you could join Gwen and I for a meal.

Sincerely,

Gordon Bell

SUBJECT: RE: RE: LDP'S EMS VS THE STEALTH MIRAGE (DECMAIL)

EMS/VMS is an exact functional equivalent of DECmail, so why are we doing a product when we already have one that is working well and can be evolved and meets the exact functional
needs? You might note that getting PL's to a VMS only position was the first step in being able to use EMS/VMS.

The thing that shook me up was really based on facing the immense
workload associated with building this product. There has been
NO OUTPUT of the group to date, nor have they gotten to anythig
resembling a phase 0. It has no management, no identifyable output in terms of an internal architecture, a list of unknowns
about 1 page long, people inexperienced at DEC and in this kind
of programming, no feasibility arguments which I have repeatedly
ask for (like size of program, number of instructions that have
to be programmed, etc. ... something you should be applying as
a sanity test to check the commitments and expectations you set
when you jointly sell a product). I do count the people as enthusiastic, but then again I don't see them working 70

hours
a week, and hence they are not that enthusiastic. They are bright,
but that can only carry one so far. However, I've yet to see
a really clever approach necessary to address the large amount
of work they have to do.

I want the expectations set in line with what we have demonstrated
or can plan. So far, I have not seen any output to convince me
that I'm wrong. What is the greatest puzzlement to me is why you
believe this is doable? I asked you and Bob to give me the
arguement some time ago. ... I will resend the request!

We have a big credibility and communications gap here, and I would
like us as managers to close it. It will only be closed with
data and performance not words. I am patient and will wait for
DECmail, but not to the exclusion of a product (particularly one
I consider on a better basis and having a better chance and being
one by a better (more experienced and dedicated) group). Alternatively
you can show me that it is viable by a schedule (plan) that faces
all the naughty issues and details like getting the code written and
defining the file structure, etc. The group has been in operation
for several years and the schedule is always a year away. Why isn't
the best prediction of their output to say that the product is
always one year away?

Please, let's understand this. I consider it a management
morass. Unfortunately I also have a dirty mind and ask if

this project is typical of others there?

SUBJECT: STEALTH MIRAGE FEASIBLITY APPROACH AND GOING FORWARD WITH EMS/VMS

Here's the approach I was interested in using to try and understand when or whether we might get DECmail.

Given that EMS/VMS is here, and there is no understanding or idea
whether the Steatlth Mirage (DECmail) is feasible, and at what
cost or time scale, I believe it is worth going forward with EMS/VMS.

SUBJECT: MAKING EM/VMS AVAILABLE VERSUS WAITING FOR DECMAIL

Just came from a local sales meeting where we are losing to Prime at mit, harvard and first church. Since these are not in Fortune 500 we can give em up according to the folks in marketing. Frankly, I'm greedy! I don't want to give up these
customers (reasonably ours now) to Prime! This is just the tip
of the iceberg, and we have to say something, rather than lose
the customer. I say go out on a very straightforward basis (no
cost) with ems/vms. I can not see why this is not compatible with our future product. Let's find out what the real needs are by doing this rather limited user test. Am still concerned
about DECmail availability and whether it is going to be any better than ems/vms. The data so far indicates ems/vms is better.

This decision as to whether we have some limited availablity of ems/vms should be a P/L or Marketing Committee decison.
Can we discuss it as such?
How do we bring it up? (Andy, Marc, Bill, Joe)

I think we may have screwed up in not going out with ems/vms instead of bringing in Word 11. We could totally confuse the marketplace by selling ems/vms, which I think is really leadership,
versus introducing Word 11. At a personal level, I believe there is much more productivity and functionality with ems/vms
coupled with our current wps products versus adding another wps product oin the wps area (word 11).

GB1.S7.42
LOW END was the main topic. We want to continue winning with lower cost competitive terminals (and also getting the high functionality VT200) AND we want to get a lower cost CT for the OFFICE products that are coming. The goal is to have the strongest possible CT offering. There's a seperate memo on this.

We discussed the issues on the Office and CTAB software vis a vis compatibility and have to report back on our plan. In the review on Thursday evening with the developers, I think we may be ok. The critical issue now is make sure the goals are right and then support the plan! I think it is quite good and we can win, assuming a few of the details are reconciled. We have more compatibility of languages, files and interfaces than any competitior. Furthermore, the OFFICE specs look great and we can win there too! But we have to implement.

Personal Computing Clusters and various Servers are not yet moving fast enough. Why can't our hot M team to get into this?

PRODUCT RESPONSIBILITY AND PROFITABILITY IS TO BE IMPLEMENTED:

.one person must be responsible for a product, and
.Engineering has the profit responsibility for a product.

We must stop introducing products that have below average profit
... because we are responsible for product success (ie. profit)!
In the event products are planned (or have no plans) which violate the profit goals, we must ask the Operations Committee for guidance as to whether to introduce. We must review:
.VT278, pending and ideas(278T, 278RL, 278 Mini floppy, CT278)
.11/23 RL package
.CTs in all the desired versions
.Robin

PRODUCT AND PRODUCT AREA REVIEWS. There is a proposal that there be a major review of all products and product areas. Note that, Jack Shields' staff reviews the service plan for the 50 majors.

Ward McKenzie agreed to co-sponsor a review of the 16-bit products from chips to systems.

Marcus was concerned about not being informed of the move to Reading of the Office Program. We screwed up and have to report back to OC on this now regarding the status. BJ's plan is ON!

We got the offer of support from Ken, Julius, Si, Win and Ted to discuss the importance of CT and OFFICE with the development groups. Avram and Bruce, feel free to schedule any of us to talk about the importance of these programs.

LOW END MASS STORAGE AND REMOVABILITY IS OF MUCH CONCERN! Grant must lead us through the morass of possibilities. We have lost the low end COEM business by high markups, but I'm still concerned about getting the straight story here about total cost (including DEC storage and transshipment, FOB charges, handling, portability, high cost of backing up with either floppies or RL's, etc.) of alternatives. How viable are the RL's? What are we going to do on the CT?

THE USE OF SOFTWARE ENGINEERING AND PRODUCTION TECHNIQUES ON HARDWARE ENGINEERING

The Fifth Generation Product transitions are going to require major transitions in the way we engineer and introduce hardware products. This is similar, if not identical, to the transition that occurred within Software Engineering in the mid 70's as we built more complex (100,000 instruction) programs.

SOFTWARE ENGINEERING UNDERSTANDING TO AID HARDWARE DESIGN

The Engineering Strategy Overview lists some transitions, but these will be difficult without major changes in thinking. About ten years ago, there was a major awareness that software was getting very complex and the response within the software community was to deal with this by treating the design and construction of software as an engineering discipline; hence several concepts were introduced:

- The Discipline: Software Engineering, together with the Software Factory and methods and environment for building software (eg.Programmer's Workbench)
- Design Methodologies: Structured design, Softech's SADT Structured Analysis and Design Technique, Yourdon's top down structured design and implementation, various notations for specifying the design independent of the implementation, code walk throughs, continued integration (bottom-up) versus full system test, HIPO
- Organizational structures: chief programmer team, program librarian, software quality assurance,
- Tools: Development Support Library, High Level Languages, Automatic Documentation, Structured Testing Aids,

At Digital, we have evolved to be out of control in our hardware engineering as evidenced by stetched product gestation times and the inability to predict the outcome of a design in terms of function, cost, quality and schedule. It is exacerbated and masked by the size and structure of

Digital, but nevertheless it can be observed at our leading edge products in VLSI and in large systems where the organizations are small and focused!

The application of software engineering techniques will be described elsewhere.

THE ENGINEERING FACTORY

It isn't clear whether software engineering benefited by a name change, or there was ever a software factory, but we do need some concept around which we can rally, that signifies the enormenity of the task ahead.

Although I don't want to distract from our product focus, we must increase our emphasis on engineering processes, tools development and overall factory management. Thus, the notion of a factory (eg. auto build, machine job shop) may be a fine idea because it connotes managing:

. workers who use the machines (i.e. designers). This implies training workers how to use the machines, and the use of learning curves so as to maximize output by doing many designs.

(In a recent paper, I argued that by specializing to design gate arrays, we gained a factor of 2-4 in terms of designs/person by not having the system logic designers do gate array design. This also applies to the way we practice module layout.)

. machines, such as a CAD program, a computer or testor, giving us process step capabilities that are symbolized by capital equipment expenditures. Note, a new machine should be well characterized in terms of its cost, capability, capacity, and set-up time. We should be able to examine the tradeoff of capital versus labor and make versus buy to get a particular job step capability.

(There should be no broken machines or tools as we do designs that can never be finished on a particular machine.)

. an assembly line characterized by a sequence of process steps. A line would mostly be used to build a set of components (eg. modules) which form a system.

(Note, while a car assembly line is set up to make several hundred Kilocars, WE SET UP A LINE TO BUILD ONE CAR! We lash together a bunch of machine tools, which are not very well characterized, and then proceed to build one design with the process. In the building, we often break each machine.)

. the total set of machines may create one or more well understood assembly lines that characterize the factory output. A factory can be tuned to give any result in terms of throughput and turnaround (response time). U. S. high volume factories may have poor turnaround, whereas job shops are built for flexibility and are aimed at having good turnaround.

(The engineering factory must be aimed at fast response. This implies having spare capacity so that work doesn't stand in queues.)

. production control of one or more assembly lines. When a set of processes are set up to produce a particular design (eg. a complete module), there must be someone responsible for the flow of work through the well-defined assembly line. Computers are ideal for shop floor control.

(We tend to distribute this control function of work back to the designer (factory worker) or his manager who must push something like a module through all the steps. This incredibly trivial function of expediting should be completely automated! Anyone connected with any part of a project should be able to query a production control machine and get the complete status of all parts of a design! Here, we should be able to use an automated shop floor control system for job shops.)

. a discipline that allows no building to take place without a specification

. the whole notion of quality and quality control. (Currently, engineering feels that the notion of quality does not apply to it. In actuality, managing engineering like a factory would make it clear that to get output, we must have quality output at each stage in order to avoid the massive incoming inspections that now occur among all organizations (eg. DMT, module producibility).)

. production metrics.

(For designers, it's clearly something like good boxes (transistors, gates, registers, microwords) that we design per unit of time.)

. a complete organization aimed at the design and operation of the factory as distinct from managing the factory workers who carry jobs from machine to machine in order to get work done. We need process engineers, assembly line engineers and managers for the process steps and assembly lines.

(We have tool builders, and process step managers. We do not have assembly line designers and assembly line managers! We do not have a production control system! The act of both finding the assembly line and then moving work through the complete assebly line is left as an exercise to the creative designer!)

I believe we have to completely revamp the way we engineer along all fronts. I'm now confident the two disciplines of software engineering and production management can be helpful in our redesign. I want to try out some of these ideas now.

What you think?

Loc: ML12-1/A51 Ext: 223-2236

I'm feeling good about our current and next few years of products; but I'm terrified about '83-'90 because I think we'll enter a more cost sensitive, commodity oriented market. The challenge will be great in products-, process-, and manufacturing-engineering.

The three competitors of concern are IBM (everywhere), TI (only at low end and as a supplier) and the Japanese (Hitachi, Fujitsu, and NEC; also maybe others). Although each have some unique strengths and weaknesses, they have the following ordered strengths in <u>common</u> [our position is given []]:

1. Strong discipline in their engineering and manufacturing processes with relatively few, and aimed at volume. [Poor, lots with incremental evolution and freedom to define alternatives vs. use standard.]
2. High degree of plant automation. IBM has the best understanding of robots and Japan is second. Also increased focus on productivity. [Poor, no activity outside of test. No automated material flow. No good measures of productivity.]
3. Very good internal source of semiconductors; all but IBM supply externally. [We only make a few of our needs.]
4. Very good disks (except TI). [Need better mid/high end.]
5. Basic understanding of all kinds of materials. [Little or no work.]
6.

Very large research groups. [Weak. External R+D to couple to.]

7. Aggressive engineering and product positioning. [Ok; many products.]

8. Strong emphasis on quality (here, I exlcude TI). [Ok; improving.]

9. Willingness to change and move rapidly whether it be product, pricing, or market method (e.g. channel of distribution) and manufacturing. [We're strong; getting older and conservative?]

10. Understanding of learning curves, market share and use of forward pricing (including IBM). [Ok; except too many products?]

There are selective strengths and weaknesses(-) no particular order:

IBM

1. Very strong CAD/CAM tools and effort.
2. Disciplined processes and engineers who use a small number of PCB, Backplane, and common semiprocesses rather than evolving every possibility to get slight gains.
3. An incredible customer base and sales force capable of devouring most of any product.
4. Highly automated assembly lines with independent test and production flow controls.
5. (-)Many competing architectures and problems to evolve networks.
6. Applicators programming knowledge.

Japan

1. Ability to quickly assimulate products or processes from others.
2. Experience with low cost products like TV sets that will be model for terminals, small business system, etc.
3. Strong concern for standards as a way to the market.
4. Large population of engineers, including manufacturing engineers.
5. (-)Channel of distribution.
6. (-)Programming.

TI

1. Semiconductor strength.

2. Good terminal and low cost product base.

3. (-)Programming.

Our Strengths

1. The best general architecture/product position potential.

2. Product lines to focus on various users and channels of distribution.

3. Rapid turn-around, dedication of individuals to their plans. (Are we getting older and more lithargic?)

4. Strong Systems Programming to orient to generic, profession and other applications.

I'm not sure I've assessed things correctly, but I'd sure like your opinion and our staff's too. Then, let's get together and discuss whether we might want to change direction.

SUBJECT: PROPOSED ENGINEERING PROCESS BASED ON QUALITY & PRODUCTIVITY

A project is being organized in LSG to build a one week

turnaround for
correctly stuffed PWB's from SUDS input. The project crosses several
organizations: LSG, LSG-Manufacturing, Physical Interconnect,
Semiconductors, etc.

As we start to implement a one week fast turn-around project, the
greatest use of capacity and hence, hinderance to turnaround, seems to
be the correction of errors that should not exist at a particular
stage, especially in design.

Currently it seems we have:

- too many changes on the first pass, indicating an incomplete design which we rush because turnaround is so poor because it's fixing too many errors

- too many passes to get FCS

- too many ECO's

Already it's clear we could change our processes to significantly
improve productivity and turnaround by:

- doing it right first where it's the least costly; and
- checking the output before forwarding the results to the next stage versus having front-end checks at each step (group) to filter for and correct earlier errors.

The steps of the entire process would thus be:

Design Engineering -

- Design using a functional specification and enter design into SUDS
- Check design (logic against functional spec) using either a structural walk-through or separate checking with full sign off by an independent designer or product support or diagnostics or quality organization
- Simulate the design
- Submit test data (topology, DC, AC tests, etc.) for testing final board

Drafting (beginning of one week turnaround) -

- Accept SUDS drawing, for PWB layout, subject to having a correct design with the two sign-offs by designer and design checker

- Layout PWB with guidelines from designer. Accept NO changes at this stage
- Using PWB checking rules, check PWB for manufacturability
- Prepare plot and drill tapes, check tapes and drills against SUDS

Manufacturing -

- Prepare plot, checking plotter if necessary
- Build boards

. Check board continuity against SUDS
. Burn-in and 100 percent check all IC's
. Insert chips into PWB and inspect
. DC test modules
. AC test modules
. Send correct module to designer

While these are major changes from how we do things today, I would like to start now to make them as I see our designs deteriorating under increasing complexity and module loads. We are hurrying to submit poor designs because the system is choked correcting designs.

In case of modules made using wirewrap or multiwire, I believe we must keep the same checking discipline: Design it right, check the design, build it right, then give it to the designer to verify that his design was correct! Now we're using these early breadboards to do the design!! We have to eliminate the old style designs which are done by wire guns!

Fundamentally, the proposal is simple:

.do it right the first time and check it...otherwise don't go to the next step; and
.stop building breadboards we know are wrong and will not work and that have to be changed.

I propose we start this today, and in no case do I expect it to not be in effect, September 1, 1981!

What do you think?

SUBJECT: ENG. PROJECTS STRUCTURING (DRAFT), PLS COMMENT

Everyone has their own priorities and agenda for MOCW. I'd hope
we can segment our thinking into various kinds of issues ranging
from schedule slips of products we intend to introduce in May to
strategic questions as to how we're going to compete with the Japanese 5th Generation systems.

Let's minimize the review of current projects simply to allow the
people to continue to work "flatout". Status only reports.

There may be tactical, mid-course corrections to 1-3 year
projects underway that we should deal with.

Finally, there are some very important decisions that will affect
products over the next 10 years such as VAX physical
interconnect. I believe the most important issue is our basic
ability to design competitive (timely, cost-effective) products.

Here's my list, relatively prioritized, by category:

PROJECT STATUS AND UPDATES (0-2 years)

1. Local networking (NI, Pluto, gateways, broadband)
2. Large clusters (CI, 2080, HSC, 780, Atlas, HYDRA)
3. VT's (which one next?), LA, CT, Suvax, and LCP's for May
4. Nebula
5. J-11
6. Venus

TACTICAL CONCERNS (1-4 years)
1. Scorpio (project organization, process, CAD)
2. Nautilus (time to market versus product cost)
3. Low end mass storage and tapes
4. CTAB/OFIS and small OFIS CT

STRATEGIC OPPORTUNITIES (0-10 years) in priority
1. Engineering Capabilities to design and introduce products
    a. Designer skills for complex systems eg. Venus, Scorpio
    b. Semiconductor capability and effectiveness
    c. Competitive, timely engineering process for std. products
    d. CAD capability and effectiveness by site
    e. Physical interconnect evolution
    f. Packaging
2. VAX- vs Scorpio and J
3. VAX busses, packaging, options and PMS structures (eg. BI)
4. PC's and PCC's (Clusters of Personal Computers)
    a. Ethernet vs a standard HDLC multidrop for cluster I/C
    b. PCC software for CTAB, Ofis and servers
    c. PC servers for foreign PCs
    d. Competitiveness of 17+ bit, PDP-11 architecture
5. Lo end disk area make versus buy
6. Big VAX
7. Competitive Communication Components
8. Providing systems in a commodity hardware/software environment
9. 5th Generation computing

I'd sure like to make certain these issues do get addressed.

Could I get some feedback here as to completeness and priority?

FROM: GORDON BELL
DEPT: OOD
EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: ENGINEERING ORGANIZATION

Let's set aside significant time to go over the engineering organization, what each group's charter is, what it's doing and who everyone interacts with before the August Woods and possibly the joint M/E Woods.

It feels like everyone is responsible for everything and the reporting of products seems too low.

The areas of concern:

Semis: 3 diverse technologies and needs all mixed together. NIH. May not be able to compute as we all diverge. We are dedicated though.

Terminals: Line printers including for Mid and hi-end, old products
and enhancements, low volumes via Gigi, and VT/LA 200 together with
color and high resolution, lack of coupling to get A/D work done.

Mass Storage: Delegated product responsibility, too many get us too
little, too late. Poor semiconductor capability, poor ability to use
emerging semis for low end.

Small Systems: Range includes cabinets. We're getting killed in
smaller configurations.

Mid-range: Very concerned as to lack of output, to lack of technology
focus, to control systems, and departure of Rothman, Armstrong, and
Cane on COMET, given its status. We have a pending disaster? Their
schedules are so unreasonably long as to get us nothing. The spending
there is the largest (considering Hydra) and probably in worst shape.

LSG: Too many products for the budget will get too little, too late!
(Also, unrest and uncertainly on 20.) Note, the O/C concern about
morale and our fire-walling and stability of 20 budget. Andy is
waffling on what I thought was a basic selling posture.

Thompson/Holman: Generally decoupled from both plants and engineering
developers.

Tech. Director: More architectural focus needed plus use as

a
sounding board, and test vehicle for our direction.

Research: Really quite spotty and generally decoupled.

A/D: Not installed adequately in groups. But hope.

GB:swh
GB1.S5.9

Thoughts on Engineering Changes 2/14/82

Our Productivity Review is the catalyst to undertand and make the organizational changes. Every organization is moving faster. I see no fires, but a number of changes are necessary.

Fine: BJ, Grant,
OK: Gutman, Lacroute, Fuller, Fagerquist
Overloaded: Avery, Demmer
Unclear: Teicher
Change: Holman, Thompson

Autonomy requires managers that can walk and chew gum at the same time. Ulf failed, among other reasons, because he had lots of folks who were irrelevant to designing products: Venus, Jupiter, Technology Developers, Computing, an A/D project, two individual helpers, personnel, operations, finance, CSSE and Mfg. co-team members, all of which had a vote on something. Cause or effect?

Our managers spend far too much time on personnel, finance, space getting computing facilities, and operational issues. Have I encouraged them to be more general at the expense of products?

CHANGES
1. Still too much centralization, too little direction and unclear output in TOPS and PTD. We need a technology manager.

2. Too much on the Demmer plate: (Bill knows and is on

products)
.32 bit program (he's letting this one go with less direction)
.Microvax (Croxon and Moffa are driving this)
.Scorpio Systems
.Nautilus
.730, 750, 780, 782 and CI
.Workstations

3. Too much on Avery plate: (The May announcement drives em.)
.VT old and new
.CT
.LA
.LP
.278
.Robin and Cat
.Monitors

4. Semiconductors - We need more from the 100M/year we spend. I think Hudson's fat and we need change. We aren't getting enough designs or designers! Jeff and Steve acknowledge this.

5. We want to consolidate some mechanical and packaging groups.

6. CAD has to be much more effective. The Productivity Review and susequent detailed CAD Reviews are needed first.

ENGINEERING REQUESTS TO MANUFACTURING PAST AND FUTURE

1. Processes (technology) requested and not committed, -2 years
-Process-process for determining essential processes

2. Processes requested for +3 years
-Process-process and responsible soul (other than Jack Smith)

3. Requests -2 years from FAT for field integration
-Processes st Field Integration is possible
-Experiments with the existing dock merge components (eg.

LA,VT)
and Packaged Systems (eg. Minc, 11/70,11/780, 2020...)

4. Requests +3 years from FAT for field integration
-see 3. Aggressive trial for key Packaged Systems.
-Information system for controlling flow merge of products
-Forecast and control by system versus piece parts

5. Is field integration likely until an exogenous force (e.g. expensive transportation or high interest on the extra 3 months of finished goods) occurs even though a significant number of the components are dock merged and a large fraction of business is in a small number of packaged systems?
-Probably not, could occur after a good order processing system

6. Do I believe the FAT organization is mostly redundant, misdirected, and mismanaged, as I might have implied in my meeting with Jack, Jack and Win last Tuesday?
-No, Never! I have privately apologized to each of them and hereby apologize publicly!

(I have also declined a Playboy interview regarding my heart's feelings)

WHY IS FIELD INTEGRATION UNLIKELY

There is no "buy-in" that field integration is a goal, possible, desirable, etc.

Even with a goal, it takes bright, hardworking people to put processes in place. "Jack is the brightest person in the company", says Ken Olsen and the only progress he made was to install part of the APT and CSI lines after constant encourgagement by me. I don't want to supply this encourgement to Jack's successor.

All budgeting is a linear extrapolation of the past. There has been no change or commitement to FAT cost reduction independent of the dock merge program or Packaged Systems.

All organizations grow in a self-perpetuating fashion

The FAT coupling with P/L's builds even greater size and inertia

"Hell must freeze over first" - anon

1. GB PROCESS IMPROVEMENT REQUESTS -2? YEARS

Process-process to determine the essential processes from the desirable, possible, requested, and cute

Planning process for physical interconnect organized about systems
Process to "know" where we are (i.e. metrics) wrt competition

Sort out the morass among Acton and the plants, particularly wrt Modules and test technology

Cost analysis and prediction with an error bound, versus situation on COMET chips and TS04

Significantly improved ECO turn-around time by having sufficient wip knowledge and ability to transfer data among computers controlling the process (i.e. insertion, and test, but ultimately including kitting and flow control)

Significantly improved turn-around for low volume and product start-up using the multi-wire process (Recently rejected)

Elimination of clandestined paper tapes on all process computers to be replaced by APT connection (see previous)

Process to filter out the open loop processes by review of every product build plan. For example, all sets of modules that form a disk control built in a hv site remote from disk plant would be checked to dock merge quality.

Machine readable module or sub-assembly type, lot and serial # for:

Production flow control without manual transduction of data

In line process control of insertion and test

ECO control

Labor saving and error reduction where test information is essential (eg. MR memory test)

Future automated handling

Control when consumer business tracking is required

2. GB PROCESS IMPROVEMENTS +3 YEARS

Develope a really great process architect

SEE 1. Get Will Thompson to get a plan together. Change organization to get quality and output not hassle, old boys, and a fat organization. Spend more if necessary. Couple these folks to the plants somehow.

Couple Capacity Plan and CAD Plan to Process-Process Plan

Process control on all assembly lines that matter

Semiconductor Plant Process Control that is no more than 3 years behind others in the semiconductor industry

Automatic parts handling for kitting

A first breadboard of automatic flow of wip modules

A first breadboard of Marvelous Module Making Machine using available technology

A first use of an industrial robot for mechanical parts fab (eg. Combined keyboard assembly and keyboard testor)

Fine line for small modules in low end (form factor)

Large Modules with fine line, 4 layer, controlled impedance for EC with local build (Maynard?)

3. GB- FAT CHANGES FOR FIELD INTEGRATION -2 YEARS

Clear segmentation of system class types by size such that everyone knows the process that can be used to achieve FI on all systems. Some systems may not be FIable and will continue with std FAT.

Finish the APT work along the orginal plan both as a vechicle for significant cost reduction and a method to check and improve qualtity during pre FI phases

- absolute control and data gathering for all options
- round the clock test with 8 hour repair
- BOM control
- software production

Do essential experiments st complete FI is possible using MINC, 780, 2020 and WP78

Do essential experiments using main line Packaged Systems as in the case of the 11/03 and 11/70 which constitute about 50% of our systems either by unit or by $'s.

Use exercisors versus hard disks to get cost reduction and better tests and not use the disks or terminals being shipped because of capital equipment constraints.

4. GB- FAT CHANGES FOR FIELD INTEGRATION +3 YEARS

Move to get system level, not component forecasts to solve memory, terminal and disk imbalance (the so called mix problem) idiocies

Establish BOMS for all systems and processes for FI

Make Field Integrateability the goal instead of Dock Merge and have this automatic on all future products, except low volume (11/74 mP)

Do 3, especially using concept of FDS (Final Disassembly and Ship) to get to FI by taking out the necessary options of a processor that comes from HV prior to ship. This can be implemented as per the original plan to get the 780 numbers up and out

Install the various communications and control mechanisms such that FI is possible using hv cpu plants to directly supply the cpu part complete with memory and comm options. Use the FDS method to get the appropriate parts shipped. Drop ship disks, tape and terminals

Remove the needless gates and the gate generator in the Comet Dock Merge Plan

1. ENGINEERING REQUESTS FOR -2 YEARS

High quality modules and backplanes for high performance systems st the systems come up and work without burn-in

Larger Modules and Backplanes

Standardization on Modules, Backplanes and Grids

Thicker Power Planes for large systems

Testing of all processes st a process remains calibrated and problems get fixed at earliest possible place

Process control st there is minimum person to person variation (Process sheets for all products that matter)

Tape manufacturing processes and ability to generate them

Memory and analog testor strategy and ability to develope testors

Process data collection in all plants (see also GB)

Ability to ramp up faster based on a faster release cycle

Piece part tooling and component engineering at plant

More uniform process development, probably checked by a good review process

Overall process to strengthen ME and QC

Engineering and Manufacturing must get together st outside resources can be used to layout and produce modules

Ability to build outside designed modules st we can make license deals if they make sense

Significant jump in ability to do in circuit test and diagnosis of LSI devices

Elimination of the use of models and use more modern methods of process control and QC

Method to determine screening st right module build strategy is used particulaly wrt ssi and discretes

Clear producibility criteria with streamlined review

Power supply test method development with technical backup

Useful failure data collection, analysis and feedback

Process data st decisions such as burn in can be reached without hassle

SINGLE CORPORATE AUTOMATED PARTS LIST

NPSU procedure review and development st the process is clean and easy

New product inventory tracking so that ECO exposure is known in this critical phase

Process to decide when process support should be carried out at plant verus engineering--Plants have yet to pick up mature product in MSD area

More stability in process design by stability in plant and personnel areas

Plastic mold making and molding capabilities

Ceramic substrate process design is in sync with use and needs

Semiconductor developement process developement is sync with CAD and the appropriate circuits effort (eg. clear plan for 4 micron, before we get the technology)

Keycap assembly automation as a vehicle to move us to learn about high volume assembly

Better tooling of print head process with universal machines versus special processes

Process for determining second sourceness of chips with appropriate review (eg LA chip second source is lacking)

Process to measure gloss, texture and spectrum for the specification and control of matching products in a system

IDENTIFICATION OF WIP WITH REVISION USING THE NEW CODES

Modern approach to analog testing, especially the Power Supplies

Kitted control of cabinets, versus loose piece (cost reduction)

Configuration control st orders are electrically and mechanically repeatable

Wave soldering of fully assembled power supply boards

Plastic trimming with lasers especially for molds

Process knowledge and ability to get to zero burn in on hi volume products (eg terminals)

Standard IC grid resolution

2. ENGINEERING REQUESTS FOR THE NEXT +3 YEARS

Do some of the items in 1...especially the critical ones

Pilot process for cost-effective disk media production

HDA assembly as per Winchester technology

Clean room operation

Materials process control necessary for precision head manufacturing

Better response in plants st we can get into mfg quicker and be more competitive given the rapid changes in both semiconductor and disk processes. Both of these technologies seem to be evolving at a more rapid rate.

Process for resolving hassles between corporate and plant sites st work is done, not hassling

Heat pin planar packaging for high end

Surface mounting of components using solder reflow process

Automatic assembly of LSI

Do the MCA

Methods to do cost reduction on a rational basis. There will be much pressure for vertical integration and we have to test this.

Trade-off of early test versus FAT through in process control

PROM burn and test at plants

Investigation of manufacturing items like screw machine parts, motors and general purpose molding

Understand competitive issues like TI's automatec assembly and have ability to apply as they make sense in the increasing labor cost market

Fiber optics parts assembly

Ability to adapt to new packaging materials

Conductive coating

Product safety testing and configuration control

Automated assemblies and test techniques enabling drastic reduction in labor content and skill levels

More aggressive CAM for turn-around, cost and flexibility

Insistance of built-in test and diagnosis and ways of adding on when not built in

Better standard parts control with fewer parts

Computer product ECO and documentation control using DECnet linking all sites and having the automatic transmission of production information

Really fast semiconductor turn-around for design!

Two micron MOS

Good recipes so that we can run the myriad of processes easily and reliably. Also this will be necessary as extra plants are put on line.   Tend toward the HP philosphy in semiconductors although we have to stay away from process proliferation!

Automated hybrid assembly that can be distributed to plants

3. ENGINEERING REQUEST TO FAT FOR FIELD INTEGRATION -2 YEARS

Process to supply appropriate data so that corrective actions can be taken either in engineering or test

System parameter testing

Plan from FAT to do something

Reduction in paper flow st it is possible

Process to get competitive lead times of add-ons by the shipping/forecasting/slotting process that seems non-existent

Feedback if there is any dock merging

4. ENGINEERING REQUEST TO FAT FOR FIELD INTEGRATION +3 YEARS

Direct ship to customers from volume plants in the same way all our competitive suppliers such as Memorex do now!

Less than 30 day ARO on add-ons

Clear segmentation as to what is done in FAT and what is volume

IQL visibility and measures

Better response time on getting to dock merge or FI. Fix the process so that it is not roadblock generating and self-stopping the way it is now. When a product gets off of DM, it has to get back on quickly.

High integrity data base on customer configurations--ultimately needed for liability issues. Clearly needed for add-on.

Earlier involvement for FI plan, if we ever do a DM product

Designing the appropriate test process to support the flow from volume plants

Documentation and data base st options of varying revision can be combined to form a system, rather than trying it and seeing if it works (This only adds cost and it can not be tested, it can only be broken or worn out.)

CUMMULATIVE SHIPS (by $) OF DOCK MERGEABLE COMPONENTS

Organizational Change Ideas 2/14/82

The current engineering organization is:

PEG(8): Ulf, Bill, Mike, Bill, Bernie, BJ, Grant, Walt

Technology(3): John, Will, Steve

GB Staff(1): Sam

LP Staff(6): Joe, Rick, John M, Pete, Bruce, John R

This gives a total staff of 20 of which two are VPs. The principle product developers are only 7+2, but both Demmer and Avery are overloaded. There are too many direct reports.

HELP TO RUN ENGINEERING
No matter what kind of organization, I need an associate head to help with the administration.

Some of the candidates not in engineering: Long, Yen, Metzger, Crawford, Hamstein, ... Bloch, Heart,

Some of the candidates in engineering: Demmer, Teicher, Daley, Heffner, Rose, Croxon, Reilly, Will

CHANGES
1. Will and John organization can be run by Metzger. Maybe it should go back to being part of manufacturing. When we do this, the mechanical design centers can be set up and consolidated.

2. Too much on Demmer's plate.

3. Too much on Avery's plate. Walt is an alternative.

4. Personnel can be fully decentralized and distributed to line.

5. Semiconductors must be more effective.

6. CAD must be more effective.

CHANGES TOWARD MANUFACTURING/ENGINEERING PRODUCT GROUPS
Jack an I believe there is another path which we should explore which combines engineering and manufacturing into a products group. If we did this, then these product groups could report into the company in a different fashion. Rather than proposing many changes, we should try several changes:

1. 16-bit Systems group consisting of hardware and software engineering, manufacturing and possibly the micros engineering.

2. Printing terminals group- all the LA type printers

3. Printers group with all the LP type printers, associating this with the LP buyout activity that CSS engages in.

4. A low end VT/CT group. Andy is the main customer now.

SUBJECT: A BETTER? SEGMENTATION OF MFG/ENG/MKT(IN SOME INSTANCES)

It feels like we could have a cleaner coupling between manufacturing and engineering. Also, we need a better segmentation of product flow among the plants. There is an assumption that each major product grouping is quite vertically integrated, at least back to include modules and special packaging. Since we are stressing point of manufacture and field integration, the organization is set up to focus on this.

Although this structure is focused mainly on the

Manufacturing
Engineering coupling. In several cases it could conveniently extend to couple to the product lines, such that it would be possible to have a segmented business unit of manufacturing, engineering, and one or more product lines. In nearly all cases, products sold on the open market would also be sold internally as part of larger systems (eg. terminals). Note these groupings:

Group name	Customers	Suppliers
Semiconductors	MS, T, S, M, L	Ext. too
Phys. interconnect	"	
Microprocessors	Ext., S, M	Semis, Phys. I/C
Mass store (MS)	Ext.?,T, S, M, L	Semis, PIC
Communications and networks	Ext.?,PLs	Semis, PIC
Terminals and T-based systems	Ext, PLs	Semis, Phys. I/D, MS
Small	PLs	Micros, MS,
Medium	"	Semis, PIC, MS
Large	"	"

Semiconductors (M/E)
Behavior is like a semiconductor supplier! Supplies chips and occasionally a set of chips carrying out a well defined function and mounted in a single or multi-chip carrier.
.The big issue is how to segment this to get the necessary charter protection among MOS, Bipolar TTL, and Bipolar ECL?
.Also, how do we tradeoff between manufacturing and engineering resources (product ships versus new products)?

Physical Interconnect and Packaging (M/E)
This group would develop and sell this components (chip carriers, boards, modules, and back planes) to both develop groups and to

plants. It would operate a manufacturing facility in which automation is tested and it would work on leading edge processes that are not done in a specific product group. This might include: very low cost PI or PIP, the high performance packaging needed in Venus/2080, and chip carriers. It would have: component development, cad development, process development, and test development. I would like to see us try to segment this effort and see whether such a group could exist. Some questions:

.What would it include?
.How does it couple to the plants?
.To the groups it serves?
.How is it funded? (The measures of this technology are quite clear!)
.How much of power?
.How much of packaging?
.How much is in the higher level-of-integration groups? ETC.

This is very important to look at, but very tough to do (assuming the people are not emotional about looking at it.)

Microprocessor board and box-level components (M/E/Mkt)
Fundamentally this group would develop module-level components for higher level systems sold through the PL. It would also sell its components so that a Small systems group could build conventional End user and OEM products complete with disks, comm., etc. Other systems groups would buy modules.
.Should we look at it, given the opportunity of it all coming together in Hudson?

Mass Storage (M/E)
Clearly a seperate entity.
.With the purchase of new board shop, is there a way to further clean up the interface so that modules are in their purview too,

i.e. how can we get them to a fully stand-alone vertically integrated division and out of the rest of the M/E planning, etc.?
.Should the low end be part of the Terminals activity? (probably
not, given the work needed to deal with better video, comm., intelligence and sw).
.I'm still convinced that it is desirable and maybe even necessary to sell disks on the open market to be truly good here,
.How can we get a look at this objectively?
.How can we get a better interface between disk and the systems
groups to avoid building expensive, segmented sub-systems (ala
floppy)?
.Getting right DM package ala the RL's?
.Dealing with what I describe as Type IV packages (where all the
stuff is in one cab. and we currently need FAT)?
.Why aren't these built into the disk instead of a CPU plant?
.Taking advantage of the HSC such that this is also the high end
11 system rather than returning it to NE for FATing?

Communications and Networks
With the new interconnect structure and the increased focus on
networking, it would be very good to have a strong emphasis again
on these products within all parts of the organization, including
the field. In some ways, the product strategy lessens the product focus need because all products must have built in connections. There will be more emphasis in terms of: communications concentrators ala Mercury (part of Hydra and other
products), Hydra itself is structured this way, Gateways to IBM,
x.25, and the phone companies, and voice switching. Electronic
mail systems per se might be sold through this channel. This

group would supply standards to other systems and products per
se.
.What is the best way to provide this focus?
.What is its product charter?
.How are M and E coupled?
.Is there a need for a better PL focus?

Terminal and Terminal Based Systems (M/E/MKT)
This one is clear I hope. I'm deadly afraid of seperating dumb
and smart and intelligent, cause they are just a few Kilobytes of
RAM away from one another and differ by whether there is
secondary memory or not. In the not too distant future, I see
the convergence of all our current dumbs to have local
intelligence and sufficient secondary memory, versus being all
dumb. This follows the Xerox and Datapoint models to a certain
extent.   At any rate, the customers are: all systems, Terminals
PL, most of WPS, and Retail.
.How can these best be coupled to form a business unit?
.How to segment into various price and function ranges? .
.How to integrate the base software?
.The applications software?
.Is there a need to have the mass store as part of the group?

System groups (M/E)
Currently this is a disaster by every conceivable measure:
inventory, cost, time to get something to market, forecasting,
order processing. Jack's edict that we are not going to have any
more FAT, but instead are going to ship from point of manufacture
beginning in year ?, is the beginning of what should bring about
this change. We still must deal with the turning of the corner

of what we produce as components and what some customers and
PL's, believe is an ala carte approach to building systems.
The
interconnect fully supports this approach! Some of the
questions:
.How many, and what is the segmentation? (by type, $-amount,
architecture, technology?)
.How is the corner turned so that PL's "feel" their
inventory?
.What are the rules to deal with "specials" ... which I think
are
minimum?
.How to plan the transition associated with the products and
back
up if there are any slips?

Diagrammatically, the product flow, through the various M/E
and
possible M/E/Mkt groups to PLs would be as follows:

```
Semis    PIP (lead technology only, not dominate supplier)
!        !
--------------------
!        !         !
MS+PL?-x Micro+PL-x!
!        !         !
----------------------------------------
!        !         !         !         !
T+PL?-x  C/N+PL?-x S         M         L
!        !         !         !         !
----------------------------------------
         !
         OEM and End user PL
         !
         x
```

x = customer

This is hardly meant to be final, but is rather something we
might
discuss from. I think it would acccomplish better interfaces
and

more autonomy among the groups.

What you folks think?

Hopefully it might help in the Woods discussion on Wed./Thur., although it only deals with trying to segment a small part of our world. Again, please don't take it as final. (There is another memo that deals with the various dimensions I use to work on segmentation.)

d i g i t a l **interoffice memorandum**

Subject: **Modifying the ESG Buyout Terminal and Getting Graphics Expertise**

To: Si Lyle, MR1-1/M42

CC: Dick Clayton, ML12-2/E71
Ulf Fagerquist, MR1-2/E78
John Holman, PK3-1/P84
Bill McBride, MR2-3/E70
Jerry Witmore, PK3-1/M40

Date: 1/17/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

follow up 2/7/79

I understand that ESG is planning to bring in a high performance graphics terminal for the market, and I clearly support that need and direction. There is no other way to get there so fast.

If we can get the graphics strategy together (and possibly even if we can't), I would like to urge you to consider giving us (CRT and terminals) the contract for this work. At this time, we could have a single, consolidated thrust in graphics where we try to bring this all together and get all these products, with a single architecture to the marketplace at one time. We have a rare opportunity in time, and if our experience in programming is true here, it's necessary to be under a single manager. Even if we can't have the common architecture that we should be able to get, we are doing enough graphics work such that the added understanding from a critical mass will make future terminals better.

What you think?

Bill, can you get the critical people together here to discuss?

Ann Arbor, MI 48109

Dear Art:

Thanks so much for your slides. Do hope you are planning to dub the ENIAC film with a sound track for the Museum -- at our expense. If this is impossible for you, perhaps you could do a script that we could then prepare. Whoever speaks, we won't have a professional media-type.

Could we set a firm date for your Museum lecture next winter?

Thanks again.

Sincerely yours,

Gordon Bell

Vice President,
Engineering

DEPT: ENG STAFF
EXT: 223-2236
LOC/MAIL STOP: ML12-1/A51

SUBJECT: CONTINUING TTHE DIGITAL ERGONOMETRIC COMPUTER... 278 TYPE

I'm delighted that we have some outside review of Product Line Projects. For years, I have apparently terrorized the incompetents, calling out, a priori, losers. Mostly they just go back in their caves and knaw away at making poor products. In this regard, a recent memo pointed out 30 of these, virtually all of which I flagged both before and then after (when it was obvious). The memo of the dirty 30 also gives the why it happens. Si is working with Stan to take over the hardware development of these products since they are all concentrated in RPG, Micros, Terminals and possibly CSS. There are enough bucks here to do the right terminals and CT, provided we get it organized and stop the marginal stuff.

I think you'll find that my record of actual stopping anything is pretty poor. The DECset product was delayed a year, but for the dirty thirty, I had no affect. On the other hand, I'm marveling how rapidly you are able to get things done on the 278, simply by doing it independent of the decision vacuum, budget, and possiblity to sell it. At some point, we'd better worry if we are working with a sow's ear. Since you never stop anything, and are probably the greatest protector of the underdog, we have a problem in terms of how to make all the stuff fit into either a factory, or into the product line forecasts. Therefore, I worry more about you than me.

If the meeting is unsuccessful at getting a decent product strategy in the low end, based on organization and products I can be proud of (you have the 35 simple heuristics that feel appropriate), I intend to propose that we make the necessary changes that will at least get us good products.

Assuming that I'm able to sell whoever you want me to sell (the OC, GVPC, BOD), then it would seem appropriate that we begin to get some plan as to how they might be distributed.
This one worries me greatly, cause I don't have the detailed heuristics, only instinct that we have been in abyss, are in one, and there is no leader to get us out of this.

All of us have really been working hard here, and intend to win, but it would seem that it should just be a lot easier to get things done.

Ken,
I frankly believe that the reason the dirty thirty were built was because we have operated so long against the magic engineering percentage, and that these have always fallen outside, when voted on by all the product lines, and hence have not gotten done right (low cost, operational hardware, appropriate performance and functions, and software).

I certainly do not intend to let this situation continue.
We have to build products that I think will sell in our current
organization considering the fact that there's no marketing channel (or virtually none) for them ... cause the marketing folks in this area are all desigining their favorite hobby computer, instead of marketing. Alternatively, you might let engineering set up a product line to market, where we would not hire any salesmen or any marketing people or open any
stores. Then we could develop products and save all these variable costs that hit the bottom line and get us no market share.

Si omits the other project, the electronic disk for the

278.

PS
I started this last nite, woke up early, depressed and sat down 30 minutes ago to get this off my chest and onto yours.

SUBJECT: 278 DEVELOPMENT

SL1/S3/2

At the present time, we have a hardware development team in place that
is finishing off the RX02 and RL02 versions of the 278.

Once this work is completed, it will be necessary to decide whether we
want to keep the team together for follow-on 278 work or to assign them to other development tasks. This decision has to be made shortly since some members of the team have moved to other projects as their part of the 278 was completed.

The specific decisions required are:

1) Final configuration package for 278/RX02.

This decision is required this week so that we can use the new package for FCS and the NCC demo units.

2) Final configuration package for the 278/RL02.

This packaging problem is tougher than #1 since acoustic treatment is required to make the RL02's acceptable in an office environment. Because of this, we cannot make changes as close to FCS as we have done in #1. We should close on a packaging arrangement as soon as possible.

3) Implementation of the T&E floppy on the 278.

This project will take 30% of a 10 man team. Since these are key individuals, I do not want to leave them wondering what their next task is so I need a go ahead by April 10, 1981.

4) Implementation of the graphics hardware option.

The project as you have seen is at the breadboard demo level. The decision required is whether this should be completed as a product.

5) Implementation of an acoustic coupler option.

Ken asked that this option be included so that technical evaluation of the implementation alternatives will be completed for review and decision. The decision will not be on whether we go ahead but on the implementation.

6) Re-engineering for cost reductions.

Cost reduction is possible within the current 278 but depending upon the nature and extent of the work it could involve resources currently working on CT related or 11/23B projects. Because of this, I believe we should set some criteria on how much payback we expect and what magnitude of investment would be considered and then use a one shot task force to come up with possible solutions.

Since you fund all of the 278 hardware activity, I suggest the following steps to close on these decisions.

A) You indicate which of the above 6 items you want to consider and/or list other possible projects.

B) I will respond with cost and delivery.

C) You make final selection.

D) I will commit to the completion of the selected projects.

I would like to complete this cycle as quickly as possible so let's
discuss it when we meet on Wednesday, March 25th.

These decisions will also play a role in the 278 hardware and software
product strategy vis-a-vis the CT. I have asked the CT Program Office
to prepaare a 278/CT product strategy so that we can understand the
role the 278 can play in seeding customer and distribution
opportunities for the CT.

Although it is your market and your money, I would like to interject my bias. The 278 can be used as a seed for the CT just as we saw at our Chicago visit, so, I believe we should do retail type packaging for items #1 and #2, and do #3. I am on the fence on #4, but would do it if we could get an outside group to do some graphics software or could capitalize on some of the internal software. I would not do item #6 unless we could show a return greater than what we would get out of new competitive products.

See you on Wednesday.

Subject: **Some Thoughts on ESG Marketplace**

To: Jack Gilmore, Bob Joseph,
Bernie Lacroute, John Leng,
Si Lyle, Larry Wade

Date: 28 APRIL 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

CC: Marketing Committee, OOD

The possible engineering marketplace (based on ESG customers, competitors, sales and marketing people) is really exciting to me, as an engineer, but alas I think we aren't really going to capitalize on it.

<u>Summary</u>

1. We need a <u>single</u> catalog of ESG hardware and software products versus the plethora of garbage we barrage our sales and customers with.

2. We need a way to offer and sell the complete WP system which includes FORTRAN and/or BASIC and/or possibly the Bus languages.

3. We need a VAX Promotion and Sales Plan for the RT/C market...including ESG!

4. We need an effective Marketing/Product/Sales for the ESG market versus a totally random, opportunity outlook to the market.

5. We need to manage the availability of internal and external software for this market. We need some interface between our internal development and ESG!

At a talk to 50 ESG customers and 10-20 sales-marketing people, I observed:

1. Our salesmen mainly talk to other salesmen even though there are plenty of customers around. Our affinity to focus inward is everywhere!

2. We still do not offer a WP-BASIC-FORTRAN calculator personal computer for this market. WP is a unique P/L and there's no way to package and sell it with other software as a product. (I trust we may move when HP puts a good WP system on the HP45.) We have a unique -- and <u>great</u> product here if we could have

a. a brochure and/or manual;
b. a way to sell low cost products.

3. We have an unclear method of having graphics terminals -- and many customers want it.

4. We're writing DDP papers for the ESG marketplace, and it's unclear what our products are.

5. The silver applications brochure helps...but is meager. It doesn't include our standard products or ESG products.

6. The collection of literature to the ESG user is at best a repository of garbage. There are 20 rinky dink brochures on products (10, 20, 11, VAX, WP), software (Cogo, Silver Brochure, etc.), company (annual report), and users (how x uses our y). We need a single coherent product catalog that makes it clear to our sales and customers what we have!

7. There was interest in buying Engineering's design tools (on the 10). We aren't co-ordinating our internal and external development with this market to provide software.

In discussing the graphics market (if there is such a thing) with Tektronix, it seems clear that ESG applications are a part of their plans. They understand the need for a clear, user interface integrated with a language (e.g., FORTRAN or BASIC) and graphics -- but their view is limited. They still underestimate the need for large memories and applications. Our view is even more limited. We don't have a model of standalone vs central computing. I discussed the possibility of a small VAX (e.g., 1 or 2 hex), at a slow speed. They understand and want it -- we haven't had any requests for such a system.

The head of the Manhattan, New York Regional Office, who is from the commercial marketplace, believes we aren't in the ESG marketplace. We don't have the tools, etc. His view is that the 1130 is the right machine. No, his salesmen probably aren't calling on the plethora of large engineering houses, who are mostly in FORTRAN and could change, given a large cost/performance incentive! Note, a virtual 1130 (on VAX or 11/60) could run the IBM O/S and applications SW directly.

We could identify key accounts for each Engineering area (e.g., Philadelphia Power or American Electric Power), sell them and use them for future reference sells. We fundamentally appear to have no coherent Engineering (by area) plan!

There appears to be no coherent sales plan to identify and target customers in any priority by size and application and especially for VAX! We should be able to cream scim for customers to replace old machines (e.g., 1108 and 6600's) and the off load large 360/370s.

For a small product line, like ESG, there needs to be a VAX sales training, and promotion plan that's attached to a large P/L.

SUBJECT: ESG'S PERSONAL WORKSTATION 11/M AND/OR VMS

F/U

8/1/80
We (Bell, Chapin, Flitterman, Ross, Smith) met and discussed ESG's need for an interim personal workstation based on the 23.
I came out against this because: it's interim; it detracts from
the 32-bit effort; it will split revenue and detract from getting
maximum learning curves in products and in support; an 11/23 and
Nebula would both be about the same cost; it is a tough software
problem for a 16-bit address space machine - hence it's going to
be expensive; and it DOESN'T SEEM GOOD ENOUGH when compared with
the new microprocessor-based systems which don't have the PDP-11
address space limits.

In the next few months Barbara is going to visit customers to formulate the requirements for this. She will include the SUVAX
A/D Team in some of these visits.

In order to make this decision it feels ike we need to answer various questions like:

1. How small can VMS get such that there would still be room
for user programs and data in a small configuration?

2. What is the configuration (primary and secondary memory)
required for VMS?

3. What would the schedule be for the two approaches? (The 23
would be targetted for 1 year from now.) We assume that
software packages will come out and evolve.

Let's do a real comparison of the two approaches. Could you please work with Barbara to define SUVAX and see if we can use it
instead of the 23?

SUBJ: Engineering/Word Processing Brochure

Date: 5 JULY 78
From: Gordon Bell
TO: Si Lyle, Ron Cohen
Dept: Office of Development
MS: ML12/A51 Ext: 2236

I'm honored to be the feature of the brochure. Somehow, I'd like to add something to it that is substantially meatier. Like so many brochures, it lacks one important item:
There are no product specifications...it's just a story.

The parts that I think are important are marked on the brochure, but it's essential to include:

1. The fact that it can stand alone and that an engineer can run BASIC or FORTRAN on it. No need to buy the specialized terminals that just do BASIC. Also, for the small consulting firm, there is DIBOL and Business BASIC, both of which give more productivity for report writing than languages we know. IT IS THE PROGRAMMING CAPABILITY THAT SETS US APART FROM NEARLY ALL OTHER WORD PROCESSING SYSTEMS AND THIS DIDN'T COME OUT IN THE BROCHURE.

2. The word processing system is really a media for communication. Communication can take place using 5 methods: 1. the paper--direct output of using the system; 2. the floppy -- can be carried, easily distributed, basis for field (remote) changes; 3. machine to machine -- more rapid than FAX; 4. via central system with everyone's documents; 5. floppy/people -- several people can work on a project at a time (e.g. I type memos or articles and others can read on/work on them).

3. Recommend that there be areas where engineers have direct access to them. This was aimed too much at the secretary and not the engineer or engineering manager. All engineers should know how to type and write.

4. Too much emphasis as a terminal, and not as a computer in its own right.

5. Maybe a section on how it is used, (as distinct from benefits) would get over my concerns.

6. We use it in every department. Personnel has various letters on it and their files for college recruiting. Engineering standards are on it. Purchasing letters and specs are on it. We keep a list of all our projects that get updated monthly. With this we can publish various reports from just one data base.

7. Maybe some vignettes ala 6 where there is a paragraph on each use. My own personal use would go like this:

Mary Jane insisted that I get my own word processing system at home so that she wouldn't have to retype memos from either typed/hand-editted or hand-written documents. Now, I type a document at home, bring it in to her system which has a mailing list corresponding to the names on my memo, and the memo and its mailing list address is run off. In a recent book, we did the entire book on the word processing system and then fed it directly into a typesetting machine. There are various letters on the system that can be recalled and printed easily. The system also prints an index to my microfilmed files.

8. The interface to the typesetting system is also necessary for those organizations that do a lot of printing, and/or want high quality typeset documents.

9. Although there is a self-teaching manual that tells all and takes about 3 hours to run through, the machine can be used quickly by an engineer. I have yet to read the manual and I can get nearly all the things done I want just by using it and experimenting with the keys.

10. There are various sized type fonts so that overhead slides can be made that people can read. It has sub and superscripts.

11. There is a problem which is quite fundamental...it lacks an organization.

A possibility might be:

Intro (what's there)
Overview of what a WP is and how it is used (roughly what's there)
The Four Styles of Use (see below)
What a Total System Might Look Like and What Are the Benefits
(This is what you have there now)
The Nuts and Bolts of a System...here clean up the

product definition act

- The software- the facilities a user sees
- The stand-alone terminal, storage and printers
- The communications with a central (DEC computer)
- Optional software to use the terminal as a gp computer
  - BASIC
  - Business BASIC
  - Fortran
  - Dibol

Any useful (to the engineering community) applications software

Some of the current uses within DEC (engineering):

- my own
- personnel
- purchasing
- engineering standards
- product management
- software document writing
- Peter Christy, John McNamara writing books

The Four Styles of Use

There are many ways a WP is used within an organization depending on the organizational size, style and function. At DEC, we are used to a fair amount of personal autonomy, hence there is no attempt to control or have any sort of centralization. Each potential user can obtain a system based on need. We have a range of uses from the one person office to the pooling of text entry for some of our manuals. The system we have provided makes four distinct kinds of use possible.

1. Stand-alone, supplement/change existing document production/storage.

   a. Indirect-The WP system replaces the typewriter.

   b. User direct-The engineer, engineering manager, writer, clerk, etc. creates the text directly. Subsequent changes etc. may be under someone else's control.

2. Communication among independent autonomous systems. Any WPS can communicate with any other one. It permits various sites or offices to communicate with one another. In essence it is a form of FAX...but unlike FAX the information can be then changed at the receiver.

3. As a computer. Unlike a WPS-only system, ours can be a gp computer with a language suited to this distributed computing. There is no need to get a specialized BASIC-only calculator.

a. BASIC-faster than x, has features y and z.

b. Business BASIC-for doing the control programs

c. Dibol-best interactive business language

d. Fortran-the scientific language

e. Various applications langages...list the ones you'll sell.

4. As a total system with DEC central computer for files and or computation.

a. Economical central storage system (don't push this yet because they haven't even bought yet). You should say what cost/terminal is.

b. Computation at the central site, just get the software and you too can word process if you have a DEC computer now.

c. Computation and central storage of a single site. Communication and control of documents.

The reply card must have a price list and way of ordering the system without a salesman. The brochure should make it clear enough what it is. Put various manuals in the price list so the potential buyer can buy a manual (refundable) and see for himself. Do the same for the BASIC, Fortran, Dibol components.

Somehow this needs something, and I hope this'll help.

GB:ljp

To understand computer structures, one must have a fairly clear idea of the process that produces and consumes machines; from research and development through applied technology, into architecture (the emphasis of these essays) and implementations, operating systems, and languages; and then on through applications, through marketing and sales and finally to the user community (consumer). The process (highly simplified) is shown in Fig. 1, in terms of both the physical and information (specifications and requests to specify) flows. Other entities (functions) in the proocess that affect the product are: government and voluntary standards groups, professional societies to provide intercommunications among all parts and, of course, the ensemble of all producers (the competition) that provide alternative designs. This flow is a pipeline process, and quite like other producer-consumer processes. Each stage has a transfer delay (from input to output) duration of anywhere from one to ten years (with an average of 2); so the time scale from basic idea to implementation can range from five to ten years...and up to twenty years. The emphasis is on mini(mal) (e.g., microcomputers and calculators) and other small computers (e.g., minicomputers).

ORGANIZATION OF ESSAYS

The process and resultant products are the subject of these essays. The first four essays (part 1) describe the environment for producing/consuming computers: this first one on the basic, underlying product and overview; applications (use) and the segmentation of the marketplace; technology (which I believe is the dominant factor in determining machines); and the organizations (people) and their interaction.

This first essay describes minicomputers and other small computers, then separates them from neighboring larger computers. A taxonomy is presented in terms of a hierarchy of the physical parts--called levels-of-integration, as a mechanism to let us focus and understand the computer on a piece by piece basis. The notion of a 24+ dimensional computer space that contains all computer structures is also described. Thus, a computer is a point or surface in that space.

The final set of essays (part 2) describes the machine and the software used to operate it. The first essay of part two describes the physical parts and the resulting computer structures in terms of the PMS (i.e., a computer's) components and notation*. An attempt will be made to show how design at this level, by the user, takes place in terms of the components in a fashion akin to circuit design. The second essay will describe various behavioral aspects of the Instruction-Set Processor (ISP) design and uses the ISPS notation*. The third essay shows how the various technology described in the first part implements the various PMS components in the cost/performance space. The final essay will discuss the software that utilizes the hardware and provides various language environments for final (higher) use programs.

Although the process, as measured quantitatively, is similar the results have been significantly different from nearly all other processes. Stored program, digital computers have evolved more rapidly, and over a much wider range than any other man-made object in the history of civilization...(except semiconductors)* and after only 30 years, we still regard computers as being in their infancy in terms of numbers and use.

A simple explanation for the rapid evolution is not possible, however one could speculate that they evolve based on market need which drives the design (and technology) which drives the production (at a lower cost) which drives the market (appearing to be completely elastic) which drives the...as shown in Fig. 2.

Perhaps the greatest factor is the pervasive nature of the user throughout the process and the dual role of each entity in the process as both a supplier and a user of computers. This dual role focusses each (entity) supplier on the goals of providing either lower cost computation or increased computational (functional) capability for wider application. That is, research, advanced development, architecture, implementation, government, manufacturing are all significant users with deep understanding.

The operating cost being about the same order of magnitude as the capital equipment (purchase or rental) cost permits a relatively high turnover of equipment and encourages use due to ease of decision making for capital expenditures. (This is in contrast to industries where little changes occur due to very high capital/plant equipment costs and there are relatively few suppliers or buyers.)

MINI(MAL)-COMPUTERS

Although trying to understand and define the mini(mal) computers versus micro, midi,...super computers may appear tedious, we believe it's worthwhile as this segmentation (and in some cases extreme lack of segmentation) has focussed the very rapid development and use.

Let's go through some definitions of minicomputers and understand the frustrating problem of formulating a definition, and eventually reach a point of diminishing returns. The need, although trivial sounding, is simply that the process including salesperson and buyer must have a common language and way of identifying one another.

Computing Europe, as late as November 6, 1975 was very frustrated: "When is a minicomputer not a minicomputer? Surely it is time the industry faced the problem of evolving a standard definition." I believe providing a simple definition is difficult, unless a flowchart is permitted. But this is probably not the kind of definition that most readers would like. As a good reporter, he collected inputs from all those who had time and energy to output, hopefully reproducing their definition without adding too much noise. One observation was "announcements from minicomputer companies aren't, by definition, minis". For example, although DEC is regarded as a minicomputer company, I must say that many machines it makes aren't what I would call minicomputers.

Some of the definitions used price as the discriminating attribute and it was suggested that a minimal configuration should cost less than 20,000 pounds (or $50,000). The maximum price definition is reasonable, very often, although one has to beware of currency variations. Also, one has to be careful of a price discriminator as some low priced computers tend to be short lived due to their high cost of manufacture...and ultimate demise of the manufacturer.

Iann Baron (Computing Europe, December 1975) made the simplest, most useful definition; that is, "Minicomputers are a state of mind [design/applications]. It is not useful to define them in terms of price or capability because of the rapid changes in technology." This corresponds to perhaps the earliest definition (Bell, 1971).

"Minicomputers (for minimal computers) are a state of mind (or the design minds); the current logic technology, and the characteristics found in larger computers, are combined into a package which has the smallest cost," (i.e., the lowest cost, operational computer). Note, this definition includes processor-on-a-chip (i.e., microprocessor) based computers or microcomputers as minicomputers. Thus, the sole goal is cost;

hardware/software tradeoffs are made to transfer any hardware costly operations to the software.

Although herein we define a minicomputer (hopefully happily enough to live with), it is important to understand why a minicomputer is difficult to define. Thus, a minicomputer is a computer that is hard to define.

A price-based definition can be exacerbated by people who collect and base analysis on time varying data; so one is comparing different machines at different times in their lifetimes.

The wide variation in configurations causes the greatest complications in comparison and definition. That is, each instance (application) of a specific machine model varies greatly. I recall being asked by a telephone company engineer whether he should install a dozen 100 megabyte discs (each cost about $25,000) on a PDP-11/70 (approximately $125,000) to do a job that he used to do with a 370/168 (approximately $3,500,000). It was a data base problem and he wondered whether he really ought to be doing that with an 11/70. My only doubt was not that it should be an 11/70, but whether he could use a lower model number like an 11/40 (approximately $60,000), and thus get the attendant less parts and higher reliability. The notion of balancing a computer to handle any task in a general sense just does not usually apply to minicomputer applications;

that is, trying to process average job mixes with maximum job flow through a batch processing center (where any job can be run) just is not what minis are all about. This is like designing a factory to make automobiles, and only being allowed one machine type to handle the foundry, metal stamping, conveying, welding, assembly, etc. for steel, aluminum, plastic and glass parts! Minis are generally applied to specific tasks, using specific configurations, and operated with specific software rather than being configured to handle any situation. The configurations vary so that, in the case of the large data base problem, one could have a $5,000 or $10,000 processor and several hundred thousand dollars' worth of disc. That is, in principle; users more often succumb to their other instincts and get the biggest machine they can to drive the data base, (to be safe) even though it does lower the system reliability. Many engineers applying computers don't understand the need for processing power to access a data base, unless it is to execute the overly general operating system that has to do everything else...but won't in this environment.

One comment in Computing Europe, (December 1975) summed this up; "The difference is similar to tungsten or fluorescent lamps...lower efficiency...or higher overheads. Fluorescents are undoubtedly more efficient for business lighting, but have a minimal share of the Christmas tree lights market".

MINICOMPUTER ANCESTRY

Now, each application area (or company) claims to be the father, mother, midwife, or purveyor of the minicomputer. How did it come about? Did it come from control, switching, computation or data processing? When I started to think about this, I had to admit that, in a sense, everybody was right. This means that a minicomputer, is a philosophy (or style) of design. Cambridge University's EDSAC was, what one might think of as the first minicomputer that had significant use. The Manchester University Mark I prototype to test the Williams Storage Tube was probably the first operational computer and it was clearly a minicomputer! Both of these computers operated two years before the larger, U.S. computers as they were designed to be minimal such that they could "test" the technology. The small computer still continues to be a "test bed" for technology.

It should be noted that by working early, at a slower speed permitted more instructions/year versus the theoretically higher, but non-operational instructions/second. Thus, all minicomputers combined tend to execute more instructions than their larger relatives.

I would classify IBM's first minicomputer as the 1401. It was a data processing computer and distinctly a change in design philosophy at that particular time. It was the lowest price of any of IBM's computers...as opposed to a design oriented to the greatest performance/price ratio, or the greatest performance. In fact, the 1401 as initially conceived was merely a stored program replacement for the former, hardwired controllers used to interconnect card readers, magnetic tape units and line printers in an off line batch support system. The 1401 was not designed as a computer in response to a market, nor was it part of a market plan until a long time after it was operating. The designers, merely applied the best technology...the stored program computer, to the problem at hand.

Minicomputers also originated from a computation base. The most famous (U.S.) computers were the Librascope/General Precision LGP-30 and Bendix G-15 of the early 60's. These were used for computation in engineering and scientific applications and eventually control.

Control applications are also clearly a part of the ancestry, and the part

I identify with because they emphasized the direct coupling of the external process to the computer. The CDC 160, introduced in 1960 at a price of about $60,000, was I believe, the first high performance, low cost, real time computer. Like the 1401 it was designed as a support computer to a larger machine and as a computer to test peripherals...not to be sold as a programmable computer. It subsequently was applied for control, scientific computation, and NCR bought and used them for commercial computation.

Various aerospace control computers can argue that they are the true minicomputer antecedants because of their small size and short word lengths. Although interesting, I would argue against their inclusion because of price, and because they were usually military based, hence relatively unknown within the main computing community.

At that time DEC introduced the PDP-1 in 1960, an 18-bit computer, a direct descendant of MIT's Lincoln Laboratory TX-0, and its predecessor Whirlwind (the first 16-bit minicomputer). Again, the TX-0 was not designed for computation in its own right, but to test transistor circuits for the large TX-2. The TX-0 did operate as a general purpose, laboratory experiment control and computer at MIT from 1957 to 1974. The early chain is shown in Fig. 3. The variations in word length reflected the change in character encoding from 6-bits (hence, 12-, 18-, and 24-bit) to 8-bits (hence 16-bit). With the exception of the IBM 1401, all early computers had very good interconnection to the human user with typewriters, although Whirlwind had interactive CRT's.

Another factor that complicates finding a definition is that one often designs a machine to be implemented as a range of computers. A machine that performs and costs a certain amount is a minicomputer, yet other implementations of the same basic architecture, may not be...such as we have done with the PDP-11 series. This, again introduces much noise to the definition price-based.

Finally, the notion of a computer being a hierarchy of physical parts in various levels-of-integration, completely rules out a price-based definition. Levels-of-integration, is the nested application of hardware and software in a hierarchial fashion such that the resulting structure solves a particular application problem. Note, from the definition, one can stop at any level. The current levels for hardware are: semiconductor chips; printed circuit boards; frames (or boxes) holding printed circuit boards; and interconnected boxes. The software levels begin with hardware and include: the operating system; language; and application programs. Each level, of course, may be repeatedly nested as a structure.

The question is how much of the computer or how the parts are tied together (i.e., integrated) do you get for a particular amount of money? Now, for $10 you can get a computer consisting of some small amount of memory, a processor, occupying about 200 x 200 mils of silicon, and being packaged as a dual-inline-package...no power, no way to mount or use it. If one doesn't mind doing testing, making printed circuit boards, or need an interface to the outside world, e.g., lights, switches, or other transducers, software, or want it to be otherwise powered, used or applied, then one has a computer. Clearly it is less than $50,000 and it also fits the style of design for minicomputers as it is the minimal computer that one can get from technology.

-I-

COMPUTERS AS POINTS AND SURFACES IN COMPUTER-SPACE

I believe the best way to consider a computer and (set or family of computers) is a point (and surface) in an n-dimensional computer-space. Each dimension of the space represents a functional, structural, or performance attribute of the computer with the provision that several dimensions are nearly perfectly correlated with one another. Calendar time and price, although possible dimensions should be considered as dependent variable, as a given structure will dictate a particular price at a given time.

Although the notion of an n-dimensional space may feel uncomfortable, it is in reality, what's being used when we make tables to describe objects. A definition (Bell, et al, 1971) of a various computer based on this approach,...and still quite valid if we ignore price:

NAME	Mp.SIZE	BASIC PRICE	C.P. 1971	WORD LENGTH (BITS)	Pc.STATE (WORDS)	DATA-TYPES
MICRO	8K	5K	8-12	2	(1-2)	WORD,BYTE,

INTEGER,BOOLEANS

MINI 32K (5-10)K 12-16 2-4 (3) +
ADDRESSES,
VECTORS
(INDEX)

MIDI 65-128K (10-20)K 15-24 4-16 + DOUBLE
INTEGERS +
. FLOATING-
POINT
.
.
MAXI

ALL ARE: 5-10 MHZ CLOCK; TTL MSI LOGIC; T. CYCLE 0.7-2 USEC; FIXED TO A SPECIFIC, SINGLE TASK.

Figure 4 shows/applies the notion of a computer space using the 5 dimensions of the previous table which are relatively orthogonal to one another and observe just two of the dimensions (in K$) and how new machines traverse the space with time. The price is on the vertical axis, and is the dependent variable; at that time, in 1963. The minimal machine, a PDP-5 with 4K, 12-bit words and teletype for program loading and i/o, price was about $27,000. In moving through time from 1963, one can either keep price constant, providing increased functionality with the technology, or one could continue to design the minimal configurations. The simplest indicator of performance is memory size, so as we traverse time, the amount of memory increases (giving higher performance). If you look at some of the other dimensions and where we are now, the current definition of the "average" minicomputer is a word-length of about 16-bits with somewhere between 2 and 3 data-types. This is not a "minimal" computer, since the true "minis" are called microprocessors and have an implementation of 8-bit width with smaller memory, run slower, and cost less.

For example, the first DEC minicomputer, the PDP-5, was introduced in 1964 primarily for real time data collection and control. In fact, the machine was built in direct response to the Atomic Energy of Canada's need to have a data recording display and alarm monitoring system independent of a controlling computer (PDP-4). Clearly, as computer designers the only possible solution to such a complex device was a stored program computer. The cost was constrained to be as low as possible to be competitive with the fixed hardware. The PDP-5 had a hardware processor state of one 12-bit accumulator, 1-bit link for overflow and multiple precision arithmetic, and 1-bit interrupt enable bit. The program counter was held in primary memory. Also, an analog-to-digital converter was built into the accumulator and was controlled by a program instead of using a separate converter. Now, processor states of 8-16 words is common!

The PDP-8 was the successor to PDP-5, and was based on the PDP-5 ISP (Architecture). It was delivered in 1966, ($18,000 for 4Kw, with teletype). The significant contribution of the PDP-8 was to use a wire wrap technology developed by IBM and Gardner-Denver, enabling significant higher volume production. (It's interesting to note that the technology was introduced to DEC to enable large machines to be fabricated more easily (with relatively error-free connections.)

<u>USING TECHNOLOGY FOR DESIGNING PRICE AND PERFORMANCE COMPUTERS</u>

The advances in basic technology can be translated into either of two fundamentally different designs based on: constant performance and minimal price, or constant price and increased performance. The following table shows the effects of the two design alternatives.

<u>Table</u>: Comparison of New Technology Constant Cost, Constant Performance Designs

Introduction time	t	t+1	t+1	t+1
Design style	base case	constant cost	constant performance (Mini)	constant performance (Mini)
Application	base	base	base	new base
Computer price	1	1	0.5	0.5
Operating costs (range)	2-4	2-4	2-4	1-2
Total cost	3-5	3-5	2.5-4.5	1.5-3
Improvement (in cost)	1	1	.83-.9	.5-.6
Performance (and improvement)	1	2	1	1
Performance/price (and improvement)	1	2	2	2
Performance/ Total-cost	.33-.2	.66-.4	.4-.22	.66-.4
Improvement (perf./cost)	1	2	1.21-1.1	2

The first column gives the base case, with a price, performance and performance/price ratio of 1. As the computer is applied to a particular environment at cost of 2 to 4 times the original price of the computer, the total cost of the computer becomes 3 to 5, and the performance/total-cost ratio is reduced to .333 to .2 (depending on the total cost. Now assume the same environment, with the same fixed (overhead) costs to operate, at some time, t+1 later after technology has "improved" by a factor 2. Both the constant cost and minimal cost designs give the same basic performance/cost improvement-when we only look at the cost of the computer. However, when one considers the high, fixed overhead costs, there is a relatively small improvement in cost performance/cost, although there is a savings of 17 to 10 per cent with the minimal design in the cost assuming no inflation for the operating costs. The greatest gains come in applying the computer with greater performance and getting the attendant factor of 2 gain in performance and in performance/price.

The final column shows how a new market is approached with the minimal machine. Namely, all the indicators are the same as with the constant performance case, but it is clear that the computer must be applied to smaller scale application processes.

Which approach should a producer pursue? Throughout the history of computing, one can, to a first approximation, assume the market is infinite, hence it doesn't matter as long as one can meet the competition of the chosen market. For an established company with a user base, a way of designing, manufacturing, selling, and applying computers, there is really little question. A supplier is forced by the whole system to provide machines at the same price levels by the whole process given in Fig. 1, because:

1. The user (market) has fixed overhead, and requires improvements in productivity since the internal balances of his organization have already allocated funds. The operating costs are likely increasing due to inflation, and although a lesser priced machine could hold performance/cost constant, no productivity gain would come. Requiring less or equal funds, will ultimately translate to loss of own power (based on people, capital expenses, ability to provide increased service, etc.) In fact, the pressure among him and his peers in other organization is to "work-up" to larger, more powerful machines. The most significant cause of inertia is the tremendous investment in software that prevents change and requires compatability at time t+1. A user at time, t, is virtually locked in at time, t+1, assuming there is a need (e.g., growth) to have a different computer.

2. Sales as information transmitters, respond mainly to loss of sales because of poor performance, and functionality performance is more straightforward to sell. Price is secondary and considered when performance is equal. More fundamentally, the salesperson's habits are based on the amount of work he has to do...where work is measured in sales yields, and then directly to the number of systems sold. If a salesperson is selling a given system with a given performance, and the price is reduced by a factor of two, then he must sell twice the number of systems...which means working significantly harder (although there is

elasticity in the price). Within DEC, for example, a salesperson may sell one large system/year...and at the low end sell, 1500. The differences are based on the particular distribution/reseller/applications chain where a customer buys many systems.

3.Marketing reinforces the inputs from the salesperson (with its own biases) and presents the conflicting definitions of what the next new product should be...reflecting lost sales and last sales request. There is virtually no transmission of sales that were lost due to substantially lower priced or newer market potential products. The new product must have the performance of the current most competitive machines, the price of the most marginal competitor (who is possibly losing money to buy the market); the software of all the competitors (since each differentiates itself by unique software functionality and languages); and with all the service of the largest (highest price competitor). To make matters worse, highly technical people are in the market function, and provide not only all the conflicting demands but many product solutions (i.e., constraints)...rather than the price and functional goals and constraints. Marketing virtually guarantees building constant price, increased performance more than any other function (e.g., the DECsystem 10 group).

4.Development. Much of the input is from marketing to improve performance, and the technology push is to use the various new components that have more performance (since the suppliers of technology behave in a fashion that's nearly identical to the computer supplier). Although there are various styles of designs (and designers), the most common tendency of the designer is to use new technology and to provide higher performance, and solve all the problems inherent in subsequent designs rather than working to reduce costs again.

5.Manufacturing is subject to the same constraints and planning as sales. A given plant is measured in units, quality level, and price per unit giving a net cost productivity. By radically changing the costs and thereby the volume to get the same net cash flow, requires totally different approaches to planning, materials movement, testing, etc. Since the basic time focus is so short term within manufacturing, radical changes required for a higher volume (flow) business (i.e., long term planning) is a total paradox.

USING PRICE AND PERFORMANCE TO DEFINE COMPUTER CLASSES

The previous section predicated technology which allowed complete trade-off between price and performance, giving two equally valid approaches to new products. The essay on technology will examine the validity, but we will proceed on the basis that such a trade-off is possible. The simplifying assumption that it is entirely trivial to determine performance as a single metric...as opposed to the n-dimensional space as previously discussed, will be made. Figure 5 plots price and performance planes for three times, t, t+1, and t+2. Names are introduced to identify each computer by particular price ranges. The names are: sub-micro (to come in the next 2+ years), micro, mini, midi, maxi, and super. Very simply, a given named computer occupies a particular price range even though mini has been used poorly over a much greater range. At each new technology time, the performance increases by one category (e.g., midi performance is available on a mini); and a new type of computer; the mini(mal) computer is introduced at a significantly lower price level.

In this model, there are discrete times t, t+1, t+2 which are discrete. Hence technology advances in revolutionary steps. In reality we tend to see evolution take place in a number of technologies (e.g., semiconductor and magnetic storage density). However, on a post facto basis, it is possible to go back and mark certain events as significant in the computer's evolution. These are shown in the following table, and are denoted as generations (we're now in the fourth).

Table: Four Generations of Minicomputers

	MIT WHIRLWIND	DEC PDP-1	DEC PDP-8/1	DEC LSI-11
GENERATION	first (1950)	second (1960)	third (1968)	fourth (1975)
PRICE	?	$120,000	$10,000	$650
PACKAGE (processor and memory)	Building	4 Cabinets	Box	Board
SIZE	50'x50'x20'	8'x2.5'x6'	2'x2'x2'	8.5"x10"x5"
POWER (Watts)	150,000	2,500	250	50
SPEED (Memory accesses/ second)	80,000	200,000	600,000	833,000
TECHNOLOGY	Vacuum Tubes	Single Transistors per package	Integrated Circuit(IC) (many transistors per pkg. forming logic ckt.)	Large Scale IC (1 processor-on-a-chip)

In Fig. 6, a simpler 2-dimensional plot is given showing price versus time for the "named" machine types together with lines of constant performance. The three styles of designs are noted: Minimal cost; Performance/Price optimized designs, subject to the constraint that the machine cost less than a given amount; and finally, the largest machines, that can be built with a given technology at that time (the super). While the mini(mal) type design pervaded for nearly 10 years, and carried the minicomputer name, the semiconductor based, processor-on-a-chip (called a microprocessor) computer (called microcomputers) name identifies a significantly lower priced computer-based products...to displace the lethargy growing around the now constant price minicomputer of the mid-1970's. In this way, more radical thinking permits different customers (i.e., users) to be identified and the price to decrease. The sub-microcomputer is predicated as a complete computer (with both processor and program memory) on a single chip, although it is hardly as radical as the microprocessor which moved users to apply computers based on interconnecting chips (on boards) and interconnecting a small number of boards (as opposed to designing boards to be placed in minicomputer boxed computer configurations). As a given computer becomes more and more powerful, clearly established (via a name), and taking on the characteristics of an earlier successor (e.g., at time, t+2, the mini is as powerful as the maxi at time, t), significant pressure is applied by the various alternative organizations to apply a mini, versus, the higher performance of the current maxi. The cost, performance/cost, and performance improvements of the mini capture the well defined applications which are "discovered" when using the "general" maxi...but are too expensive to apply.

Figure 10 shows how inertia in the various producer-consumer pairings (of Fig. 1) can cause a market to move away from a set of suppliers and users. Here, we assume only two machine types 1 and 2 (each covering a range of prices). With new technology, there are no subsequent truly higher performance implementations, only lesser priced ones. In reality PC pair I goes on to build and apply higher performance machine types 3 and 4 at times t+1 and, t+2, with the attendant danger of not being able to build or utilize the attendant higher performance. Similarly, consumer set II, who may have secondary users of PC pair I, now can become fully independent at time t+1 with their own machines. This phenomenon of migration is clearly visible as users of large, central computation centers, (e.g., a small part of an organization) gets its own minicomputer at time, t+1. Then at time t+2 the individuals of the small organization get their own computers.

Figure 7, another representation of Fig. 5, plots the price versus performance for various times, and for the computer types. Here, another measure (or test) is introduced--namely the notion of economy of scale--so the performance and costs among the species can be compared.

Herb Grosch (1953) suggested that the performance/price relationship between various computers (at a given time):

$$\text{Performance} = \text{constant} \times \text{Price}^2$$

A great deal has been written as to whether this is true for a given set of machines, or whether the relationship is used in pricing, etc. It is clearly desirable that the performance increase more rapidly than the price. This relationship has been tested for various computers, and computer families.

Pricing can be based on the desirability to have performance increase more rapidly on more expensive models. According to the IBM Telex papers, the goal of 360/370 models is to provide a factor of 3 (not 4) in performance each time the price is doubled. The PDP-11 models will be analyzed in these terms in a subsequent section, and on the underlying technologies that would affect the price, performance relationship.

It can be argued, on a fundamental basis, that performance increases as the price squared:

1. Processor cost is negligible (optimistically); memory size and speed can be traded-off equally to give a certain performance (their product). Note, thhis is akin to saying the performance of an automative vehicle is the product of its speed times the number of passengers it carries (or its payload). Such a performance measure is probably quite reasonable, (i.e., passenger-miles-per-hour). Therefore:

$$\text{Performance} = \text{memory-data-rate} \times \text{memory-size}$$

2. In 1977, 4K bits of memory sell for about $25, hence:

$$\text{memory-size (in bits)} = 4K/25 \times \text{price (in \$)}.$$

3. Each 4K memory chip can be accessed at a rate of 2mhz, hence:

$$\text{memory-data-rate} = 2M/25 \times \text{price}.$$

4. Therefore, assuming an arbitrary number of chips can be accessed in parallel with no loss of access time. Therefore:

$$\text{Performance} = (8 \times 10^9/625) \times \text{Price}^2$$

5. Alternatively for various fixed width processors, the performance only increases with memory size since there is not simultaneous access beyond the base level, processor limiting access-rates.

The following table shows various computer implementations. It assumes an architecture that accesses 32 bits of instructions and data for each instruction executed.

Processor Implementation	Memory Data Rates (Mb/s)	Insts/sec(Mips) = "Balanced" Memory-size (Mbytes)	Performance (Mips x Mbytes)
8-bit	16	0.5	0.25
16-bit	32	1	1
16-bit with overlap of 2	64	2	4
32-bit	64	2	4
32-bit with overlap of 2	128	4	16
64-bit	128	4	16
64-bit with overlap of 2	256	8	64
64-bit with overlap of 4	512	16	256

Hence, for a given processor, performance increases only linearly with price as memory is added since the data-rate is fixed. The performance (using Mips x Mbytes) for the set of processors does increase as the square of price provided we assume that a "balanced" computer requires one byte of memory for each instruction/sec executed* since the price is just proportional to the amount of memory.

The design styles of mini(mality) at low end, optimality (in middle) and greatest performance at extreme further greatly suppress and extend the basic access-rate performance beyond the above predication) for the processors.

The following table segments the named computer types into different attributes. Note, with this segmentation, one should be able to "tell the players".

Figures 9 and 10 give DEC computer prices and logic (price) with time. Notice that a constant performance, minimum 4K work PDP-8 has followed a line of diminishing cost, although the average price has remained relatively constant, and occupies a price band at the low end as a function of configuration. The PDP-1, 4, 7, 9 and 15 have tended to follow a constant price curve, which turned out to be of the order of $100,000, although the minimum configuration price of $120K in 1960 declined to $25K in 1970. It is properly a minicomputer, although the average configuration was priced over $50,000 for a long period of time. Figure 4 also shows how the PDP-11 was introduced as a family and then was implemented as micro-, mini- and midi-computer at various times to span a price range of a factor of 500 ($600 to $300,000). The PDP-10 has followed the traditional constant cost curves (at about $0.5 million and increasing) with increasing performance. The recently announced DECsystem 20 is an attempt to reverse this trend and provide lower cost (and performance) computation.

LEVELS OF INTEGRATION

Figure 11 illustrates the levels-of-integration as applied to computer prices. The price depends partly on implementation (and architecture) word-length; so, as the word-length is made shorter, there is some economy particularly at the minimal machine. Note there is not a 4-bit computer shown at the board level, but only as chips. In fact, most hand held calculators are implemented using 4-bit, stored program computers with fixed programs. We see a movement in price versus time that is parallel; for various different scaled machines--which means that all constituent components have the same fractional use. An astute marketing-oriented person might ask, "How, with all the technology can we do something unique to get off the curve?" One answer: "Let's reduce prices by not providing a power supply and mounting hardware. Let the user provide it and mount the computer as needed...in this way, the total cost is reduced. We'll sell at the board level." So we start stripping away items and make a "skeleton machine". Computer Automation introduced this idea in 1972 to get at the problem of the lack of progress in packaging and power technology, and trademarked the name, "Naked Mini".

Figures 9, 10, and 11 show the effects of levels-of-integration on the DEC PDP-11 series. In 1970 DEC introduced the PDP-11/20. The average prices of the various model PDP-11's is given in Fig. 10 with lines of constant performance. A Model

05 was subsequently introduced at .7 x performance and .5 price. Model 40 overlapped the Model 45 in performance, but at about the same price as the Model 20. Hence, one can see that a board and 4,096 words of memory, for the LSI-11 can be obtained for about $600. The boxed version costs?, reflecting negligible improvement in packaging. The price-performance successor to the 11/45 extends to $300,000 maximum, (the 11/70). Thus, various implementations of the architecture span a price range in the order of 500 to 1.

Note that the lowest level of technology, semiconductor chips has the greatest price decline. Boards have a lesser price decline because they are a mix of: chips, printed circuit boards, labor (and capital equipment) to insert the components), and testing labor (and capital equipment). At the board level there have been negligible gains in fabrication and printed circuit board technology, and increased labor costs yield an over-all cost increase.

At the box level-of-integration, power supplies and metal or plastic boxes increase due to labor intensive nature. The only gains are by-products of using less power and less space. Finally as boxes are integrated (by people), and applied (by custom, people intensive programmers) the prices begin to be constant (hopefully not increasing).

In about 1971, Intel, North American Rockwell and other semiconductor companies had gone through the marketing exercise of trying to decide what to do with the higher semiconductor densities. They had been in the semiconductor business, and had assimilated logic design. They were frustrated because they could say to their customers, "We've got a silicon chip, and can put on the order 1,000 gates on a chip to give you some function. What do you want that chip to do?" Their customers could only reply "We don't know what you can do with 1,000 gates on a chip (besides memory), since adders don't take that amount of space." Their logic designers had integrated adders and adders are kind of trivial anyway, although academicians still write text books about adders and the technical community generally devotes too much time and journal space to them. But the semiconductor companies did not know about all the exotic adders (as most of the engineers (including me) don't read that much); even though they could have been building 1,000 gate adders, to add faster. Various users asked "Why not make something truly universal. Would this be a finite state machine or a sequential machine?" They then discovered what almost everybody has discovered about sequential machines. First, people cannot do any interesting or useful design based on this approach. One can minimize things in the order of 10 states but since most useful designs are much larger, it's useless. Sequential machine design was designed by the academic community to write papers and texts and to teach. Second, even though there's a theory it's generally neglected (due to inapplicability), but there are many errors that people make due to the combinatorial nature of the problem. They then discovered that the best finite state machine that one can make is just a simple computer because it provides the finite state machine plus the useful functions that are not covered by the theory. Finally, as it is used, many of the pitfalls of finite state machine design are avoided because one is forced to think of the states sequentially! Thus, the power of parallelism is double-edged, since it can't be applied correctly.

So the most interesting finite state machine, as far as I am concerned, is a general purpose, stored program computer. The semiconductor industry discovered this and said, "We'll put a processor on a chip. Never mind your logic designers, we'll make processors, at low cost to be applied universally." Furthermore programming is understood, can easily be re-invented as it was for large, and minicomputers; people enjoy doing it and nearly all of us can learn to do it better. And the semiconductor industry has provided the computer at a very low cost. Processors-on-a-chip have followed a very steep price decline of up to 50% price reduction/year. You can currently get a processor for anywhere between $5-10. So, if you need a processor, the price is generally not a barrier. It is just a small matter of programming to do something useful and we all know that this only costs $1-$100 per instruction.

Bob Noyce, head of Intel, presented Fig. 12 in October 1975. It illustrates what is happening in the semiconductor industry; and I have added to it slightly showing the technology that DEC has assimilated with time. It shows the breadth semiconductor manufacturers have in technology, starting from semiconductor device level, through the various levels-of-integration continuing into end user applications.

It will be interesting to speculate how rapidly and how well the semiconductor industry assimilates computers. As suppliers they have been superb, providing much impetus to the computer's growth. However, other industries they have tried to absorb have reacted agressively to prevent their entry (e.g., watches, cash registers, special terminals, super computers, calculators). Greed may not be a very good motive--more idealistically, one would expect to base an industry on constant return and contributions in that discipline; on the other hand, something so universal and fundamental as the computer is not a monopoly...nor can the existing industry expand rapidly enough to design, manufacture and apply completely.

Let's return to Fig. 11. There have obviously been machines at the top of the graph, earlier in time and they were following the downward trend too, and crossed the magic 50K boundary. Does something happen when you cross that $50,000 boundary? Is it like the sound barrier? Machines that were above that line as late as 1960 must now have fallen way below it. So where do you get the software ideas for current machines below the line? Obviously, they come from the earlier machines, above the line. So if one wants to know what is going to be in minicomputers in the future, there is really no secret; one can find out by looking at the larger earlier midi's. Similarly the microcomputer characteristics are derived from those of today's minicomputers. For example, the cache scheme originated in the early 1960's was applied in the 360 Model 85 maxi ($2.5M) in 1968, and subsequently appeared in the PDP-11/70 ($100K) in 1974.

Figure 13 assigns ordinal numbers to the levels-of-integration. The assignment to a number to what might appear to be quite fuzzy, is my attempt to be convinced that we can structure this knowledge in precisely this fashion. Note that this numerical assignment is quite possibly time dependent. The numbers correspond to the structure of mini (and larger) computers. Figure 13 also shows how a group of the levels are compressed, since the complete system, such as a hand-held calculator, only consists of one chip, board, keyboard and lights, power (perhaps a battery), package, operating system, and machine language application program.

The notion of the levels-of-integration is that elements at one level, are combined into the next highest level in a lattice or network fashion. Each level can, of course, be nested itself. A level also denotes that there is a single discipline or set of interacting disciplines which determine the function, structure (and cost), and performance of the constituent of the level.

Figure 13 associates the physical levels-of-integration with: the corresponding levels of the abstract machine (and its language); and with the various design disciplines at each level. One can start from the topmost level and go down below the chips and on to the atomic level. One could argue whether the world is analog or digital at the atomic level, which is roughly level 0. That is why I started at the top; and stopped at 2. A physicist could go down half a dozen levels beneath that. From our point of view, we start with finite state machine components; that is, data operators, AND gates, OR gates, even some adders; and flip flops to hold the state. These are implemented as interconnections on an area of silicon. The behavior is expressed as an electrical i/o transfer function, and the discipline is both that of the electrical circuit engineer, and semiconductor device engineer.

From these we build finite state machines and express their behavior as state diagrams and flow charts. The discipline is that of the logic design engineer.

From this viewpoint a stored program computer, a microprogrammed machine, language is formed. The design discipline is essentially that of programming with the emphasis on writing interpreters, and on managing the small amount of parallelism inherent (and necessary) in these designs. The resultant microprogrammed with its interpreter program is the machine language that we all generally know and love, as expressed in the reference manual of the machine.

Whereas the lower levels implement the machine and are "implementations", the ISP for Instruction-Set Processor, was originally synonomous with the notion of architecture. While architecture has been extended, it was originally the machine as seen by a program (or programmer) and distinct from any physical implementations.

Using the hardware (architecture) as a base, we typically extend it with an operating system. There are now several levels of the operating system machine. A kernel machine, which deals with the management and diagnosis of hardware components (e.g., disks, terminals), providing synchronizing capabilities so that multiple processes can operate quasi-concurrently. Then one starts building policy elements in the operating system, such as file systems, resource management facilities accounting, and basic utilities. At this point, looking through the operating system, one sees a much different machine than that provided by the basic hardware. In fact, it is hardly recognizable as the machine of the symbolic assembler level. It is, but with much more capable i/o and the ability to be shared by many programs.

We say that people need all these facilities so that they can implement a standard language: e.g., BASIC, FORTRAN, ALGOL or

COBOL or any of the other hundred standard languages and their dialects (all language dialects are about the same, but just different enough to prevent the transportation of programs between them). At this level, a user observes a common language machine.

Often an additional special language is used because an application can't use the standard language per se and it's necessary to get into the domain of the problem. Finally, using a special language, various application subprograms are written to enable a particular application to be written. One then may build an application and finally, if all is well, an applications use will drop out, provided there has been the right set of primitives.

In 1976 Jim Bell (no relation) and I were invited to edit a book from an IFIPS conference (Bell and Bell, 1976) on minicomputer software. As the papers arrived, we wondered whether the conference should be held because many described techniques had already been applied to larger machines...although usefulness is generally not a prerequisite for most conferences. Surprisingly, the conference was useful or rather we were able to rationalize that it was. The outcome showed that the difference with minicomputers was that the machines were in significantly more dedicated, particularly in the operating system area, in that one did not provide the full generality possible and did not have the overhead associated with that generality. Hence, minis were leaner, more responsive, and specialized to use. When people designed minicomputers, they sometimes got carried away too much in terms of cost per bit; the emphasis in general with the mini was in fact on performance and on size (perhaps to the extreme). The mini had also contributed significantly in education and understanding about operating systems, simply because people could afford to experiment.

The issues of the conference tended to be programming languages, productivity, portability and also user microprogrammability for extending architecture. The ideas overall were:

1. A minicomputer is not just a scaled down large computer.

2. The limited size of minicomputers can be an asset, because of the discipline.

3. One of the key barriers to minicomputer use is psychological; one must face it without the massive support organization generic to large machines.

4. Standardized (compatible) languages are more important than better languages.

5. Portability of programmers is as vital as portability of programs.

6. Minicomputers are for those applications not feasible with maxicomputers where cost, response time (performance), human or machine interface, ultra-reliability, are important.

7. To minicomputer users, old technical papers are more valuable than newer ones.

8. Minicomptuer software is shaped primarily by applications, yet forces most programmers to be systems programmers.

9. Differences: a. Dedicatedness (e.g., operating system to a task)

b. Memory size is a constraint (although cost/bit is cheaper and memory size is increasing).

10. General issues of importance: a. Programming languages (structured-type),

b. Productivity,

c. Portability,

d. User microprogrammability

PRODUCER/CONSUMER PAIRS BETWEEN THE LEVELS

Since each level is a separate type of physical structure with it's own set of design disciplines, a significant problem is the interconnection of the levels in terms of quasi-independent design activities. The levels arise in large part from the need to have well defined interfaces so that users can build (and rebuild) from common materials. That is, consider these common levels:

1. Applications interface

2. Cobol - transportability among machines and people

3. OS/360 - transportability of programs for different machine implementations

4. PDP-11 ISP - transportability of operating systems across machine implementations and time

5. PDP-11 Unibus - interface common peripherals across all models

6. Logic signal level - common voltage levels and logic design convention

The levels appear to operate as interconnected producer/consumer pairs. A lower level provides an interface or langauge which is consumed (used) at the next highest levels and the producer level is the consumer for its next lowest level machine. So one design determines another and there are a set of boundary conditions that must be met at each level.

In marketing parlance the producer-consumer pairing is also biassed either on the basis of a technology-push or marketing-pull, depending on whether the next lower level producer (technology-push-input) or the next higher level consumer (market-pull-output) dominate mostly to influence the product. It should be clear that each level is different, although the hardware appears to be dominated by technology and the software (function) by the market...with the understanding that various language (market) requirements rapidly feed down to affect the hardware (given that technology will support the need).

Whether the consumer decides the design of the producer or vice versa depends on the way one works and thinks. In the programming discipline, "top-down" design is "in". Therefore, from a "top down" viewpoint and wondering why a machine was designed a certain way, we would say, "Obviously, we knew that we were going to write a certain type, payroll package and that's what determined the AND gate circuits for the machine." This is, of course, utter nonsense because there are very many different levels, different pairs, and it is almost impossible for people to talk to one another even across a pair of levels. However, if we were following this purely top-down structure, one would start at the payroll package, or the scientific package, and work down to finally determine the circuits.

Fortunately, there is also bottom-up programming. Hardware designers are always accused of starting with the circuits and pushing up so that eventually, with luck, somebody may be able to write a payroll package on the final machine. Then there is the "start in the middle and work out" model.

I do not believe we have a good enough model of the whole notion of design to say that any of these approaches is what we actually use. Where do you start in this process? I tend to think of the overall design problem as being a "boundary-value-like" problem. We start everywhere at once and negotiate like hell at each boundary until there is convergence. All of the design activities operate concurrently. The more interesting (better?) designs stem from having the best coupling between the levels, and then having the best performance at each level. A single individual with tremendous breadth is then preferred to do the complete design, or at least define the interfaces among the levels. The innovations in computer structures appear to be the movement of an implementation level across a boundary, or the interesting interaction of many design disciplines (e.g., logic, cabling, and an electromechanical subassembly) within a boundary.

Some interesting examples of trade-offs across levels are:

CRAY-1: Vector operations - (transfer software->hardware)

PDP-11: Stacks - (transfer software->hardware)

PDP-8: Minicomputer (transfer all hardware to software to minimize hardware cost)

PDP-11: Interrupt (transfer operating system software to hardware for scheduling)

CDC 6600: Cooling (transfer heat to save time and increase performance)

Intel 8008: (early processor-on-a-chip trades off programming for logic for user)

Similarly poor design often comes from lack of precise definitions between the interfaces such that lower level implementations can be changed subsequently without affecting the next highest level. Parnas has described this design principle as Information Hiding.

Rather than point out specific poor designs, the following interfaces have been classically ignored, hence there has been an inability to build on subsequent work:

1. Bus - method of interconnecting computer component.

2. Basic ISP - provides a single (not multiple) interface so that multiple models can be implemented over time and a performance range.

3. Operating System - User/Language Interface - provides the ability to modify an operating system independent of the user program.

4. Language run time interface - provides common base for multiple languages to be used to express a single program.

5. Subprogram interfaces - each subprogram can be changed, independent of one another.

DEC'S PRODUCTS VERSUS LEVELS-OF-INTEGRATION - THE NETWORK

Figure 14 shows various constituent components that form DEC's products. Here, it's interesting to note that while we presented the model purely as a hierarchy (and implicit tree structure), it is actually a network. A component at a given level is formed from constituent parts from lower levels. Each lower level part is often used in many higher level components. And similarly each formed component is used by the several systems (components) at the next highest level. Parts may be marketed at each level, or they can just be made for internal use.

Note that there is an attempt to structure the components on the basis of price.

ONION-SKIN VS. LEVELS-OF-INTEGRATION MODEL

A computer system can be described as a structured hierarchy consisting of layers, in a fashion resembling an onion...hence the "onion-skin" model. The layers correspond to the way various users may view the system's behavior (see Fig. 15). The layers correspond to the levels-of-integration previously discussed.

The inner-most layer (at the core), is a set of hardware modules which are combined together to form the hardware base (layer). With most smaller computers, a user can take the hardware modules, and build a hardware base using a set of interconnection rules.

The hardware base is then combined with two system software layers: the operating system, and a language (usually scientific- or commercially-oriented) to form a system of interest to a Direct Language User. Anyone who solves problems in terms of programming languages (eg. APL, BASIC, COBOL, DIBOL, Fortran, RPG, etc.) may use this system as a base to program a particular application. There is no need to understand the operating system or the languages not being used (i.e. the system documentation is oriented around the principle of hiding information unless there is a need to know).

In order to assist in the solution of problems of interest to the final Applications User a set of applications modules (libraries) are available for many commercial- and scientific-oriented disciplines. These modules permit the Applications Designer to interconnect them (sometimes with the help of programming languages) in a fashion to finally solve applications-oriented problems.

At the outer most layer, we finally see the Applications User, who, we assume, has no interest in information processing other than to get a particular problem solved. There are various applications systems, eg.

Word Processing for the Application Users.

The model is also useful in helping a particular user structure the information on the basis of his "needing to know". As one descends into (or across) a level of the hierarchy to gain performance or, to add functionality, increasing amounts of detailed knowledge about the system are accumulated. One should also note that using fundamentally different outer layers for a common inner set of layers creates quite different machines, hence a set of onions.
(edit/print date 11/22/77)

TECHNOLOGY PROGRESS, LEARNING CURVES AND ELASTIC DEMAND

The discussion of technology progress has been in terms of exponentially decreasing prices and/or exponentially increasing performance. Thus, a metrics of technology, t(t) at some time, t, is classically just:

$$T(t) = Ke^{ct}$$

This can be converted to a yearly improvement rate, r, by changing the base of the exponential to:

$$T(t) = T \;\; x \; r^{t-t}$$

where T = the base technology at t
r = yearly increase (or decrease) in the technology metric

This is the same form we have used for declining (or increasing) cost from base c

$C = c \;\; x \; r^{t-t}$

The questions that should arise as we observe all the previous graphs is:

1. Under what conditions does cost decrease exponentially?

2. Under what conditions does technology imprive exponentially?

Clearly there are manufactured goods that neither improve nor decrease in price exponentially, although they presumably should. The notion of price decline is completely tied to learning curves.

Learning curves don't appear to be understood beyond intention, and are (empirical) observations that the amount of human energy, En, required to produce the n^{th} item is:

$$En = K.n^d$$

where K and d are "learning constants". Thus, by producing more items, the repetitive nature of a task causes learning and hence the time and perhaps cost to produce an item decreases with the number produced and not with the calendar time an object is produced. Fusfeld furthermore conjectures that the technology of the $:^{th}$ unit produced also improves exponentially with the number produced just as in the case of the learning curves. Thus, using the technology measure:

$$Ti = ai^b$$

he found the following technology progress constants:

Item	Total Measure, Ti change	Quantity produced(i)	Technology progress(b)	Change observed in study
light bulbs	lumens/bulb 80	10^{10}	.04;.19	33
automobiles	vehicle h.p. 6;13	$3x10^{7}$;10^{8}	.11;.74	10
titanium	p.s.i./$/16 350	3 x 10^{8}	.3;1;1.04	10
aircraft	max.speed 56	2 x 10^{5}	.33-1.2	6
turbojet engines	fuel consumed, weight 2.9 x 10^{4}	1.6 x 10^{4}	1.06	2
computers	mem.size x 3.5 x 10^{12} rate	10^{5}	2.51	10^{9}

Here we note that computer technology has evolved substantially more than any other technology. This in part because there are so many materials to store, transmit and process information nearly all of which are electronic based. In the above technologies, most are mecahnically oriented with the physical associated limits. In essence we are comparing systems constrained by Newton's Laws with those determined by Maxwell's Equations.

Fusfeld also showed that provided the number of items produced increases exponentially (with time):

$$i = e^{c/b \times t}$$

Then calendar time and units produced can be used interchangeably.

Therefore, in our study of computer systems since we have exponential growth, calendar time can be used instead of units. Furthermore, calendar time is then simply an easier and more accurate method to measure learning curves.

The question of why the cost declines exponentially can be answered by using Fusfeld's observation that it is because of learning curves and the exponential increase in quantity produced. Furthermore, this exponential increase raises a third question;

3. Why is the demand exponential?

Very simply, the demand or quantity, q, sold per unit time completely elastic, or exponential, according to the expression:

$$q = k/price$$

This creates a positive feedback market system whereby decreasing prices increase demand exponentially causing decreased costs (through learning) which support the decreasing prices.

There has been no attempt to answer question 2 of why technology improves exponentially nor is the answer for why cost declines exponentially at all satisfactory. Simple production learning does not account for the rapid technology changes in integrated circuit for example where totally different production processes have been evolved to support the greater technology. It appears best to simply observe that the three situations <u>have</u> <u>been</u> true, and can be extrapolated to hold over the next few years.

Technology historians and futurists have made a number of studies and observations about technology progress:

1. Quantity produced is simply a good dummy variable to measure improvement. (With exponential increasing sales, we can use time as the dummy variable.)

2. Technical problem solving is correlated with business activity. Inventors tend to be stimulated by sales and slacken efforts when sales are low. (This is a counter-initiative observation.

3. Major innovations come from use (sales). Indeed with computing, most of the system development is done by the user to solve individual problems. This is opposed to innovation arising from a technical possibility for which use is subsequently discovered. For example, in the case of semiconductor technology, the computer designer (user) is responsible for many of the design innovation.

4. Production alone does not stimulate innovation. A lesser number of inventions are stimulated by production needs. Of these, the same user-supplier relationship is the best framework. The users of equipment (the producer for the end

product) stimulate the production equipment suppliers.

The gains in packaging (i.e., integrated circuits, printed circuit boards, backplanes, and cables) have been driven by production, versus product functional needs. Testing technology of all types has been motivated solely for production needs.

The cost of computing is the sum of costs which correspond to the various levels of integration we described in the first section. (see Fig.) plus the operational costs (see Fig.). In actual practice, each layer, or additional level-of-integration is often looked at as overhead. Using standard accounting practice, the basic hardware cost, at the inner layer, is then multiplied by an overhead factor at each outer level. While this may in principle work operationally, for a stable set of technologies it is hard to condone and we will describe the constituent technologies and resulting structures at the next level together with operational cost models. An overhead-based model will not adequately allow for rapidly evolving technologies or the elimination of levels, for example. By examining each part, we can then make observations about the use and substitution of technology. More importantly, we can draw conclusions about how structures are likely to evolve.

Table Costs gives the various technologies and other cost components at each level-of-integration. Only the major components will be discussed as marked. Sub-component technologies such as cables will be included in systems at the next highest level. Figure Memtax shows a taxonomy of the various technologies used for memory on logic technology.

Semiconductor technology is singled out as the main determinant of a computer's cost, performance, reliability and memory size. This technology is clearly at the lowest level of the structure. Magnetic storage technology of secondary importance will be briefly discussed and contrast with semiconductors, together with disks and tapes, will be discussed at the box (computer system component) level. We would also expect these to be of more interest to most readers.

<u>Technology Substitution</u>

Each constituent technology evolves at its own rate, hence the cost and performance of a system is roughly the additive and multiplication functions, respectively, of the parts. Usually when one component begins to dominate (e.g., packaging), then pressure occurs to more rapidly change and improve the technology to avoid the cost or performance bottleneck. Sometimes a slowly evolving technology is just eliminated as a substitute is found.

These substitutions have been ovserved for semiconductors:

1. Semiconductor memories are used in place of core memories. Since the latter has evolved more slowly in terms of price decline, semiconductors are now used to the exclusion of cores. (This has not occurred where information must be retained in the memory during periods of time without power.)

2. Read-only semiconductor memories are substituted for semiconductor logic elements. Using the technique of microprogramming, table (logic function) look up, and sequented (vs parallel) processing, this substitution is quite natural. In fact, it has been estimated that a single logic function of 1-3 variables is equivalent to 5-7 bits of a random access memory.

At a given time the slowly improving (or increasing) costs, like the packaging and power, may become a significant fraction of the total cost. Costs are additive and hance exponential improvements have disproportionate effects causing pressure for structural change.

For instance, although the PDP-8 is normally considered to be the first minicomputer, it post dates the CDC 160 (1960) and DEC's PDP-5 (1963). However, the PDP-8 was unique in its use of technology to reduce cost by:

1. Use of a separated small box for the processor, memory and many options. It eliminated the full frame cabinets used by other systems.

2. Using automatic wire wrap technology to reduce printed circuit board interconnection cost.

3. Machine insertion of components for lower cost printed circuit boards.

4. Use of the Teletype ASR33 (also used on PDP-5) to have a combined printer, keyboard, and paper tape i/o device (for program loading). It eliminated the paper tape reader and

punch.

Cost, Performance and Size

Too often we simplify the understanding of technology to have only cost and the dependent performance parameter. This simplification omits the most significant parameter, calendar time, particularly for a rapidly evolving technology. In a similar way, we have only briefly considered whether there is any associated economy of scale when considering the performance (utility) of a given set of devices. That is, do larger units perform significantly better than a set of small units when taken either independently or as a collection? Therefore, a more correct assessment of an economy of scale law for performance, assuming it holds, would be:

$$\text{performance} = k \times \text{cost}^e \times r^t$$

where
k = base case performance
e = economy of scale coefficient
r = rate of improvement of technology
t = calendar time

For many of the technologies in which we're interested, a second dependent utility parameter, size, is important because it is a useful alternative measure of performance. Occasionally size can be used as a performance tradeoff, but often the two must be taken as independent resources. For example, a certain memory size would permit a certain number of accesses. For some applications, we would ask whether the size were adequate and for other applications we ask whether there is adequate time to access the data. Thus the systems performance in such an example is bottlenecked by or the minimum of one of two resources. That is:

$$\text{system performance} = k \times \min(\text{memory-size}, \text{memory performance})$$

Figure Perfsize shows the various options of the amount of economy of scale:

1. Economy of scale holds. A particular object can be implemented at any price, and the performance varies exponentially with price.

$$\text{performance} = k \times \text{price}^e \quad e>1$$

2. Linear price performance relationship.
performance = k x price

3. Constant performance, no matter how much is spent.
performance = k

4. & 5. Only a particular device has been implemented. The performance (or size) is a linear sum of such devices.
performance = n x (k x price)

A memory system might permit an encoding to be used such that memory accesses could be traded for memory size. This condition is shown in Fig. Tradeoff for 3 points. Here, the effective memory size can be increased or reduced by either using memory system accesses for computation or for storing precomputed values. This tradeoff permits the operating region for the system to be greatly extended to either include the memory (by giving up 1/2 of the processor or 2.5 times the amount of processing/by giving up 1/2 the memory).

<u>Semiconductors</u>

Semiconductors will be described in terms of: the attributes that are relevant for computers; a model of how these attributes have evolved and are likely to evolve; and their application. Besides the logic for implementing computer componenets, semiconductors are also used as ordinary, random access memory. They replace and substitute for other memory technologies (including alternative semiconductor memories).

A single transistor circuit performing a primitive logic function within an integrated circuit (IC) is perhaps the smallest man-made object. Alone, such a circuit is intrinsically trivial; but the fabrication process for a set of structures to form a complete integrated circuit is complex. To the IC user there are only a few interesting parameters:

1. The function an individual circuit performs together with the aggregate function of the set of circuits.

2. The number of circuits per IC as a measure of the process capability.

3. Cost.

4. The performance of each circuit (as measured by the time it takes to perform its function) - semiconductor circuit technology - power consumption.

5. The number of pins (interconnections) to communicate outside the IC.

6. The reliability which is a function of technology, density, and number of pins and the operating temperature.

Figure ICtree shows a relationship of the various digital IC's that have been implemented. The main discrimination is by the regularity of structure and the amount of memory on the chip. With large scale integrated circuits there is a necessity to implement only regular structures. There are only a few useful, regular functions that don't have memory (e.g., arithmetic units, fast multipliers, multiplexors). The 2-level AND-OR or OR-AND structure, the PLA, is especially useful and is often applied in place of read-only memories which also can implement logic functions of several variables. Circuits with only memory will also be described in a subsequent section. The remainder of the circuits (at the lower part of the figure indicating increased number of circuits) are mostly computer related. At the extreme right hand, a complete processor occupies a single LSI circuit. Peripherals which are often as complex as the processor are also implemented on a single chip. Here, the tendency is to have both the processor and memory--a full computer-on-a-chip.

Although we consider the circuit function to be an attribute that's separated from others, it is clearly dependent on the number of circuits which can be placed on a chip. Thus, the single most important parameter is the number of circuits/chip. From this measure, we can predict the functions likely to be implemented just follow the tree. It should be noted that the nodes on the tree are stable, and increases in density simply improve a node. As density increases sufficiently, a new node can be reached. For example, the processor-on-a-chip started out as a 4-bit processor (or rather as 2 chips for a single processor) and then progressed to be 8-bit and 16-bit size. Similar effects are observed with the arithmetic logic unit, memories, etc.

The number of circuits per IC is the measure of density as seen by a user. This metric is the product of the circuit area and the number of circuits per unit area. Both these measures improve with time, reflecting process control. Semiconductor device (individual circuit) performance is just correlated with the implementation technology. The performance of circuit is also proportional to the power applied to operate at it. The speed-power product metric for a technology time is more appropriately a more refined measure.

The number of pins that communicate outside the circuit indicate the packaging technology level. Low and medium scale IC's often need more pins than LSI since the latter is capable of carrying out a complete function independently.

SUBJECT: EUROPEAN ENGINEERING LOCATION IN JAPAN

I AM DELIGHTED THAT WE ARE GOING TO HAVE A STRONG PRESENCE IN JAPAN THROUGH HENRY'S PERSON IN PURCHASING. FURTHERMORE, THE SAVIERS STORAGE CONTINGENT TO JAPAN SEEMS LONG OVERDUE.

I AM TO ASK BOTH GRANT AND HENRY TO GET TOGETHER AND FIGURE OUT A REALLY GOOD LINK SO THAT WE CAN TIE INTO THE MANAGEMENT IN THE OFFICE THERE. I TALKED WITH DON FROST ABOUT THIS AND HE'S AGREED FOR THE NEED TO CO-ORDINATE.

I WOULD LIKE TO HAVE MR. WATANABE, WHO HEADS CSS THERE, TO BE THE PERSON TO WHOM OUR PURCHASING/ENGINEERING PERSON REPORTS TO. AND IF WE DECIDE TO DO SOME MORE WORK THERE IN TERMS OF BUYING OR ENGINEERING, HE WOULD BE THE LINE. IS THIS WHAT WE'VE BEEN THINKING ABOUT?

WOULD IT BE TOO COMPLEX FOR WATANABE TO LINK TO US, TO GIA IN JAPAN, AND TO CSS HERE?

WE HAVE TO TIE TOGETHER, AND WE ALL THINK IT IS MORE SENSIBLE TO INVESTIGATE THE ENGINEERING POSSIBILITIES IN JAPAN.

CAN YOU START BY WORKING TO SET UP THIS LINK AND DECIDE WHAT IT IS GOING TO BE FOR SURE?

THIS MESSAGE ALSO WENT EMS TO: DICK CLAYTON, GERRY BUTLER, GRANT
SAVIERS, AND HENRY CROUSE

SUBJECT: EUROPEAN ENGINEERING IN AYR

Dennis tells me that there are 3 engineers in the ayr plant that are both good with hardware and software. I want to get started with engineering there, by getting them or someone off working on some of our comm. designs.

This is the approach that we used in colorado for disks, namely a small group (1 person initially, Fred Hertrich) was in place and designing the rl01. The plant was located and product was moved so that the plant startup was isolated to making an existing set of products. As the design progressed, the startup engineers were added by moving people from here to help and to do more designs.

In this case, we can give them some work, say a
modem or a board or even a system task of some sort, say
the testers. The design would be done there and integrated
into the factory.

The issue about where the budget would come from is clear.

Let's cap the engineering groups here, and add the additional
folks there.

No way should we get out of an area here until we
have some work going there aand some designers
who have proven themselves.   Similarly, Dennis O'Connor
is sponsoring some work at U of Edinburg to help in ai.

What is the problem of starting to get this going?

SUBJECT: SCOTLAND, FRANCE AND GERMANY FOR ENGINEERING?

Today we discussed the European Mfg. plan at OC as part of
the
Mfg. plan. Paul Newman presented the mfg./European
priorities:
France, Germany, and UK (Scotland).

France
This is the first time that I got any feeling that manufacturing
would reconsider France.

Remember, I unilaterally squelched an engineering group in Annency because of proximity to a mfg. plant. Annency is about
as far from mfg. as you can get.

Mfg. is saying they would now locate in France, NOT Annency though.
Frankly, I think it would make sense to have a core group of engineers in a french plant that is making terminals. We should
give them enough resources to plan a worldwide product. My reason for France: They are spending much on their Telemechanique
Program and they don't have the facilities to fully utilize the
ideas... we can really build off their architecture; they are working on low cost terminals; they have some technology in the low cost area which we need; and we can build off their modem
and communications understanding (if it comes). The main function of the plant would be terminals and small systems for europe. If they are able to propose a really hot product,
then we get them to build it for the world. There would be product support engineers in the plant.

Edinburg
Looks good to me. Let's go ahead and put some communications hardware there to complement the English software group. Also,
Edinburgh has a very strong AI group, they are one of the best in CAD and they use our equipment. Also, there is comm. expertise there (HP has a good group building worldwide comm test equipment).

Germany
Up to Bob and Grant. If we go ahead with the expensive

Munich
area, we could probably get good people. Siemens is there and they would probably like to work if we got them a good product area. Can we afford it though? I don't see that much technology except at a components or possibly basic communications link and switch level. Right now, I don't see engineering there.

Frankly, I'm ambivalent. Japan clearly has the best technology in all these areas, but our market is in Europe and we have to have engineers there to maintain the plants and do the customization.

What you think?
John, I trust you and Jim and Paul will be catalysts here?

SUBJECT: SCOTTISH FACILITY

I have heard that Larry is considering putting a small R&D group near Edinburgh. I think that is great, but I believe

that
we must coordinate such an action.

We are seen as one company is Scotland and are expected to act
that way. You may know that European manufacturing has been exploring the possiblity of a second plant in Scotland in the next few years. Ground work has already been laid for this possiblity.

If you are serious about this possible venture that you or someone
on your staff speak to me before they start looking for land or
talking to people in the Scottish Government.

Follow-Up: 6/15/79

I've just had an interesting time in Germany talking with the several senior sales support salespeople and they made the following points:

1. Junior salesmen sell standard products; senior salesmen sell the company and more complex, occasionally custom systems; sales support and senior management sell ideas. They would like much closer coupling to the engineer's doing the products so as to give input and occasionally for help and to be able to discuss our general direction. Now they have no communication.

2. These sales support persons in Europe have been successful salespersons and they are interested in the technical details of computer systems. They are attached to a geography for a long time and they have knowledge that lasts over several computer generations. They can be utilized, but are frustrated due to lack of coupling to where we are going and they need in depth information.

3. P/L's technical support is really poor because these are half-way jobs between marketing and sales and the people only stay in them for a few months.

4. How can these people at the District Sales Support level couple into European Engineering?

As a separate issue, getting software and other (maybe advanced development-type) engineers from ICL would seem worthwhile - particularly with the recent changes in management there.

WEST GERMANY

Dear Frank:

Total airline fare for my trip to Berlin was $348.00 (one way).

The talk at PSI was the reason the trip took place, but the balance of the time was business and pleasure.

Therefore, the only expense to be billed would be the above airline fare to Berlin.

Sincerely,

Gordon Bell
Vice President, Engineering

Wayne's pencilled comments are good advice.

There is an 11 ISP for > 18-bit physical address that our software supports (see Sam Fuller to further clarify).

Do these. We do not want enhancements to 11's that are incompatible or require <u>any</u> new software.

Proceed ASAP to spend energy on:

1. Fonz physical address extensions and;

2. LSI-VAX.

follow up 12/3/78

How good are we now architecturally with VAX and Cobol?

How does this compare with the 10/20 CIS?

What could we do to get much better?

How much better?

I understand we'll look at this after COBOL 79 generates code.

Who'll do it?

F/U 10/11

In doing smaller computers, can we build a kernel 11 with not all instructions, and put the other instructions in macro code? It's also desirable to handle CIS too.

This would ensure that we could build a 1-chip, fully program compatible 11 and it might permit a 3-chip, versus 4-chip

11/03 now.

Atlas extra code, PDP-10 UUO, and the TRAP are all ways of doing this...but we need more.

Architecturally, it may be essential to invent this now.

Can we?

Ideas?

It would probably be worthwhile to get Dan to do the above review to see how easy it is to build Computer Modules in terms of mapping and interconnection. A single cluster (up to 14) is operating now.

Also, Dan could review them as to their applicability for building reliable structures.

Perhaps the most useful review will be in terms of his knowledge of all the 11 implementations (as a student has developed an understanding and model which can predict performance based on the technology and structure).

SUBJECT: RE: RE: WEST COAST R& D FACILITY?

Maybe Zenith decided it should concentrate on TV or that it might lose it's shirt in the computer business (this personal
computer and high end PC segment, in particular).

Let's keep discussing Suvax with ARPA, directly cause they have the bucks. Hopefully the only contender is Xerox (who I doubt really wants to do this cause they've got their hands full with low end Japanese copier competitors) and Apollo, who should have trouble growing really very fast to

be a
threat before we get our machine. Then there's Apple who seems
to be having trouble getting chips from National, and finally Al
Michael's company that has good technical people, a potentially
winning strategy (from what I can see from the outside); but is
probably in trouble cause of Al. Ed Fredkin is incredibly
bright, hard working, and ends up on top... hence, Three Rivers
will probably be the biggest competitor for awhile.

MIT has still reneged on a contract we had with them to
do LISP. Dertouzous has probably got 50 deals in his
pocket, together with a $ pipeline from IBM, Exxon, Ewing Oil,
and others. I'd sure like to help them, but I don't think we
have anyone sharp enough to contract with them.

For now, the best move is probably to hang on to any and
all valuables, and to listeen to them. What youse think?

SUBJECT: YOUR PROPOSAL FOR FACTORY AND LABORATORY HARDWARE

GB4.S1.22

I sure liked the notion that your group would supply this for the whole corporation.

Rather than even worry about who's to do it, I'd love a three-part proposal by price band:

1. Real time factory computers -- this would have special i/o and cover a wide product range from the IEEE bus to marry point analog/digital. In addition, there would be special languages for analog and digital control (eg. Boolean equations, ladder diagrams, process control).

2. Factory terminals -- this would include everything from rugged
crt's to bar code readers.

3. Laboratory front ends -- this might be a natural coupling given the
analog commonality. The positioning would show price (probably
starting with the 488 or HP calculator bus) versus data-rate (with
the number of channels or a third parameter).

It's important to also include high speed digital channels using CI
to connect to Cray and lab instruments.

Also, we badly need a real time server that sits on Ethernet,
collects data as fast as possible and sends to a VAX.

C. Lester Hogan
Fairchild Camera and Instrument Corporation
464 Ellis Street
Mountain View, CA 94042

Dear Les:

I heard from Carver Mead that you have compiled a book on the origins of semiconductors. Could I please have a copy?

Attached is a copy of a brochure on the Digital Computer Museum which we have established in our Marlboro building to preserve artifacts. It's contents are less than 50% Digital related. Is there any chance you or someone at Fairchild would put together an exhibit on the origin and evolution of semiconductors for it?

Sincerely yours,

Gordon Bell
Vice President,
Engineering

Enclosure - Digital Computer Museum Brochure
July 24, 1980

Andy Grove, President
Intel
3065 Bowers Avenue
Santa Clara, CA 95051

Dear Andy:

I'm delighted that you could visit us on Tuesday.

Dick Clayton will be responsible for establishing and maintaining a process which co-ordinates and monitors the Digital (buyer) - Intel (seller) technical interface. As such, he is the contact for learning about and obtaining new escalating problems in this channel of buying parts, process interchange and joint development. The Engineering Marketing Group under Andy Knowles and Pete Smith is a separate channel to you as a buyer; however, we will co-ordinate internally as necessary.

Dick will set up what may be a two-day meeting so that we can learn about your future direction of products and processes in order to be a better customer.

On the second day, we would like to discuss a set of issues that impede our being a better customer. The agenda would hopefully be constructed via phone in advance. Some of the topics that I'd like to see:

- History of the relationship (what went wrong on the process transfer? Why did we reject your presentation earlier this year? Who said don't bother to come and sell us?)

- How are we going to interface in the future?

- Information about parts early in the design process that we may influence.

- Development of advanced parts by Intel, such as the Ethernet interface.

- Joint developments in what might be MITI-like:

  specific parts; 2 micron, double metal; computer aided design--here, we have a significant effort;

  computer control of processes with significant data base capability; development of operating systems and languages for Intel processors - in particular, P2 and P5.

- Buying significant, dedicated manufacturing capacity for DEC-proprietary parts.

Also, several of us would like to visit your Oregon group and learn more details about the 432.

Again, thanks for visiting us. I hope we significantly improve our relationship. Sorry I didn't have time to give a demonstration of our Electronic Mail System.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

July 24, 1980

C. Lester Hogan
Fairchild Camera and Instrument Corporation
464 Ellis Street
Mountain View, CA 94042

Dear Les,

So nice to get your short history of semiconductors and beautiful book, A SOLID STATE OF PROGRESS. We learned a lot from each of them.

We would like to use them as a basis for an exhibit at the Digital Computer Museum. Could you help us collect the photographs and artifacts that would cover the history of semiconductors, somewhat along the lines of your microphotograph book? However, we would like each panel (corresponding to a year in your book) to include: a microphotograph, a schematic, the specification, prices(t), a part (with magnifier) and the process steps by which the part was made. In some cases, there should be exhibits or photographs of the critical manufacturing equipment. As you stated it would be worthwhile to try to cover some of the contributions of other organizations such as Bell Labs.

I would like to encourage you to carry out this project and in addition, prepare a well-documented and illustrated book or small, highly pictorical monograph. I'd, of course, like to encourage you to publish it in our history series of Digital Press. (In case you've not seen some of these publications, I'm sending some brochures, together with a copy of the book, <u>Computer Engineering</u> on DEC's computers under separate cover.

It seems if you took the approach of collecting the above information, coupled with your article, a short monograph might be easy to write.

Please let me know what you think of my sketchy idea for an exhibit and book. What can I do to help?

Sincerely yours,

Gordon Bell

Subject: **Fall DECUS**

To: Development Managers

CC: Marketing Committee, OOD,
Ed Kramer, Bill Picott

Date: 11 DEC 78
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Having attended Fall DECUS let me congratulate you and your co-workers on their performance. It was one of the most intensely technical user-developer conferences I've seen and it was impressive to see the respect our customers have for our products and developers. (It was also much larger than the first FJCC I attended in 1960.) We want to keep up this communications channel.

The exhibits and talks were extremely professional and very stimulating. The VAX sessions, were crowded and the customers very happy.

I was truly proud to be an engineer at DEC.

Subject: **Manufacturing in the Far East**

To: Jack Smith

CC: OOD/Manufacturing Staff,
Operations Committee,
Bill Thompson

Date: 8 SEP 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

Given status:

1. We need/rely on the tax havens.

2. HK/TW are capable of making <u>anything</u> (especially complex, process-based stuff like cores) we can in the U.S. and probably better.

3. Future intrusion of Japanese into markets we now serve (e.g., terminals -- when they have systems that need them).

4. Lower cost to manufacture in the Far East in hours, quality, and direct labor/total labor.

5. Overcapacity (especially boards) in the U.S.

Why not:

0. Stop the attrition in the Far East.

1. Move quick to get products there -- plus some manufacturing engineering capability (e.g., the VT100 monitor).

2. According to Andy a 15% lower cost gets a 2X volume. Then lets do:

   a. VT100

   b. LA34 (old LA00) to get this market. It would also pave the way when/if we went into the typewriter/terminal business for mail, TWX, etc. with a higher quality device. That is, I think we want and need to build IBM quality typewriters.

   c. RL01 - to get a double whammy on the high costs of being in Colorado -- we could probably get this at 30% less -- or 4 x the volume. This might also get us in the iron business!!

d. TU58 drive and cassettes (especially labor intensive). This would then let us manufacture nearly all the PDTs except the hi end. (Don't bother with floppies to limit the scope.)

3. Close down some very small plants. This would get us reasonable cost again when running at low capacity.

4. Consider putting Augusta (F/S repair) in HK.

5. Use the U.S. plants as pilots for 1/2 the capacity (the system's and U.S. business).

SUBJECT: FAT/VOLUME CHARTERS (>2)

Restructuring the FAT/Volume charters for a different systems manufacturing process.

This memo describes the advantages of what we might gain by changing
the nature of the system manufacturing process by eliminating much of
FAT as we currently know it.

We agreed to hold a meeting with Demmer and Fagerquist and see if we
can continue to make progress and get the necessary commitments to
Systems. Also, Jack and I are going to examine the utility of a high
level reportee who will work on this problem and get at the numerous
issues in both manufacturing and engineering.

Here's why I do not believe in the current volume/FAT systems manufacturing process:

Production

1. Production learning curves are minimized by having systems of a
   given type built in a maximum number of plants (volume CPU + on FAT
   areas). In assemblying complex units, of numerous model types (we
   now have over a dozen basic processor types - and this is NOT going
   to decrease in the next ten years!) no real learning takes place at
   the FAT centers. By having an organization arranged by size and
   types and connected with the processor, memory, and

control options learning takes place and is contained at one site. If FAT centers have to exist, they have to be by system size and type so that learning on 8/10/20/11 (the 3 or 4 different operating systems types) and VAX-11 can be segmented. Each system has its own idiosyncrasies, and goes together in a unique way, requires support with APT and has little in common with its neighbor. In other words I don't think FAT should do anything but P/L specials (hardware, software, and burn-in) and to send shipping labels and building instructions to the volume plants.

FAT thwarts organizing to build systems by size, in such a way as to take advantage of the learning that already exists in the Processor factories. We must build to order PMK's in the various processor volume plants in the same way autos are built so as to get expertise on a system type basis (8/10/20/11-by size and operating system). It is not adequate to use the FAT plants as is to build for order as we now do. This will get us the cost by letting the volume plants really get good at the PMK kernels, and they will ship to the customer or to an intermediate staging area.

2. Multiple FAT sites introduces a second, redundant stage, at finished goods when we can least afford it using finished disk,

terminals, and the Processor/Memory/Controller Base Component (PMK).*

Thus, given that we can somehow build the right PMK Base Component for a particular customer, a system should be able to be customer site, or field warehouse merged. By having FAT, the tendency is to use it to build the PMK and to have to test the PMK (again!) by unpacking the disks and terminals in order to verify that the ports emanating from the PMK are working correctly.

3. The second stage amounts to at least 4 weeks when stockroom and transport delays are considered. These costs do not show up in the cost because inventory interest is not charged, except in the circuitous ROI calculations in the P/L. This saving probably swamps all others.

4. There is a larger inventory with multiple FAT centers, each of which has to have its own disk, and terminal. If two sites build the same system type, then P, M, and K components are also replicated. This inventory is in addition to the WIP additional delay in the process given in 3.

5. FAT is a costly QC function that should be doen some other way. Apparently the quality of the volume plants is low enough that FAT is necessary to check quality. At best, this is a noisy issue. My own belief is that the breakage and quality of a product

is a
function of handling. FAT simply breaks things, and does nothing
else, other than uses the dock mergeable options for testing PMK's.
Furthermore, a FAT plant is not equipped to make the fix, due to
the large number of option types. It mainly runs up labor costs
and in some cases bootstraps the product into a poor state.

6. FAT is the key inhibitor of attaining systems focus because it
operates on average costing. It is associated with the marketing
groups, rather than being a virtual unit that processes orders and
tells the volume PMK, terminal, and disk plants where to send the
units. We will continue to be able to define any option such as
the new ESG graphics terminal, or the LDP A/D converter to be parts
of legitimate systems because there is no incentive to define any
collection of components as a system, to not segment and get the
cost. The bright assemblers in FAT can make anything work, and the
tax is high, is averaged cost, hence will always exist and be
available to cover any specials or ad hoc systems that a customer,
salesperson or marketing person can dream up. Therefore, as long
as we have FAT, I hold little hope for having any systems focus or
discipline, because the cost doesn't matter. Any ad hoc system can
be built for the same cost of one that is restricted, because the

big costs of inventory, order processing and assembly are averaged.

7. Engineering can support PMK plants, and they will become the focus of systems, because there is only one per system! Now the systems groups can only support the volume processor plants, and any plant can order components and put system together. We need this in order to move from the era where the customer, P/L's, and FAT are the systems engineers.

8. Every glitch (e.g. having to build 300 more 11/40s) gets transmitted to all plants. There is no volume anywhere! Moving to segmented PMK's can be clear and used to segment (contain) the glitches on the basis of size, product age, system type, to maximize learning.

9. The lower costs, and implied capacity gains are enormous! Certainly there are many issues involved here. I want to help model, then because I think the gains in time, manufacturing and engineering, learning, distribution, inventory, support and getting to a systems focus are immerse! We should be able to model all the factors, and I think come to the obvious conclusion I have: we must drastically restructure our work between FAT and volume (especially processor) plants along the above fashion.

At our next meeting could we discuss each of these points and determine just how much each contribute to cost...and whether I've assessed them correctly or left out risks or benefits of the correct system? Let's get more aggressive this year in moving to a better process at a time when the increased capacity released, can go into the incredible 40% increase manufacturing is committing in 81.

I submit given this year's growth we must do something drastic in manufacturing plus support you in systemness!

*(Here, I want to introduce the part we ambiguously have been calling CPU's by segmenting the processor (P), main Memory (M), and Controllers-K, which are: internal processor options like floating point, communications line and printer controllers, and disk controllers. Hence, let's use the term, PMK, to reflect everything but the disks (which are sometimes internal as in the case of the RL01) and the external terminals and printers. Another document will give iron clad definitions so that we can talk about any part and have the same meaning.

SUBJECT: I TRIED TO DO A TRANSFER OF A DOCUMENT TO EMS

I tried the following message, and it was correct using a
65 character ruler. It got garbled in transmission. What's
the story?
Let me express my written thanks for the effort in gettng the
bubble into operation, reiterating what was said at the
ribbon cutting on Friday:
. to quote Ken: "it's amazing what a $28,000 balloon will
buy"
 it was done on a very tight schedule in 100 days ... one of
the
few engineering projects to be done this way. Normally
engineering projects are managed to yearly budgets.
 it had much teamwork and hardwork ... very much like VAX,
the
irst system to be tested there
t was a really significant piece of engineering as we hadn't
e like it before with the very tight schedule and
set of risks which got covered by extra $'s. Let's feel good
about getting it, not bad about overrun.
it had our combined support to be done.
. it is great to work on projects that are really necessary
and
 to be done in a timely fashion

Now, let's get on with the testing. We need it badly.
Congratulations and good work,
Gordon

PS
I hope various members of the Operations Committee and ring will see this very impressive structure, provided of course, that it doesn't interfere with testing.

SUBJECT: RE: FCC/11C03

No. I basically think you ought to use the 23 and make it pass, rather than going for a two step set of products. This will be very expensive for DEC.

We have to start doing it right the first time, versus introducing obsolete, interim junk that someone will get stuck
having to fix in 2 years.
No, am opposed!

SUBJECT: I'M GOING AHEAD WITH BOYLSTON FOR AWHILE

I think we want to continue the review and improvement of Boylston. We need a permanent site even though an air bag might work.

We are going flat out to get a Marlboro Air bag and I'm pushing
to get one started in Tewskbury too. In doing this, I think we can get the experience to decide (in a month) whether to stop the Boylston site.

I think this is the right way to go. I want you to look at the revised design... assuming we don't go to the air bag.

If you say no, then I'll call off the troops.

SUBJECT: BOYLSTON FCC TEST SITE

I met with Dayton T. Brown, test consultants today. They looked at the Boylston concept drawings and made several comments about the execution details. They reported that the two-level wooden structure was the best in their opinion. They further reported that Bell Labs/Western Electric have had some problems with their air bag. I discussed their concerns with Dave Brown and Peter Boers and learned that modifications have been made to the site design (such as a larger floor area and roof height) which answer their concerns. The FCC is testing with a three- meter site at present and would use it to verify any Class B that we might want to qualify. Apparently, the FCC test set-up is similar to the Boylston proposal. They (D.T. Brown) had a proposal to act as consultants to DEC during the construction and I believe some scaled-down part of the proposal would be in order in the outside chance that we might have over-looked something.

Their facility (sans toilets and fancies) they felt could be duplicated for approx. $110,000.

Bottom line is that we probably should go ahead with Boylston but look to see if some things might be pared from the cost. If the air bag works very well, we would replicate that instead of Boylston in the future. I do think we should have Dayton T. Brown look at our final drawings and critique them.

SUBJECT: RE: MINC, 11CO3, ETC., ETC., AND FCC

Dave is saying it right. Much better than I did. Let's go his way.

I really am not going to support the introduction of one more crappy, obsolete, average product.   We get average products by default when we miss on the good ones.   We must never start with the average in mind.

This product appears to be in a direct violation of Win's goal for Productivity and Quality for the 80's.

I would be strongly against announcing this product.

The product will have a much longer life than we think, hence going over to the 23 would make sense, it would seem.

Why not do it right? Interim things always seem to lose.

If you think so strongly that we should put it on the market, then it would seem that it should go the appeals route. In this case, I think the OC or Group VP Committee should do the waivering.

SUBJECT: THE FIELD MATRIX

Paul Lawrence wrote an excellent (small) book on this subject. Bruce Ryan (GIA Manager for SA, Mexico, Caribbean, and Japan) and I had an hour of interesting discussion on this subject. We even watched a SWS employee resign because of it. "The Matrix" clearly has problems for subsidiaries and even no doubt for regular offices.

Maybe you could help clear the air by helping with responsibility charting and clean things up.

May 12, 1982

Takuma Yamamoto, President
Fujitsu, Ltd.
Furukawa Sogo Building
2-6-1 Marunouchi
Chiyoda-ku, Tokyo
Japan

Dear Mr. Yamamoto:

We have been interested students of the public literature on the Fifth Generation Computer Program, and were most fortunate to have Professor Moto-Oka visit with us in January of this year.

We have expressed our interest in the Fifth Generation program or a possible participant. Hence, we were puzzled by the recent quote in the New York Times, attributed to yourself, that no U.S. company had "applied" for participation in the program.

Please consider this letter as a sincere expression of Digital's interest in understanding how we might participate in the program.

I would be pleased to visit with you or have our Japan Engineering Center, Manager, Dr. Tom Kobayashi, who is a resident in our Tokyo office meet with the appropriate program officials.

I look forward to hearing from you at your earliest convenience.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

SUBJECT: ACTUAL PRODUCT DATA VERSUS BURP PLANS: WHEN???

I thought we were going to have some actual versus Burp
business plans for the engineering overview and the April
Woods. When are we going to get something done?

The projections we do for Burp fine. I'd like to use revenue
accounting to verify how we do against the plan. Your
response
in requesting this is unacceptable, and is why I have a basic
problem in understanding financial folks... because
it is basically the difference between accuracy and precision
(a
concept that apparently isn't taught in accounting school).

You do not make these comparisons because our data is not
precise
enough in terms of field service, sales, manufacturing costs,
etc. True. This is not where we blow it, nor do we give a
damn
about these costs cause they are being managed already from a
different viewpoint.

The real issue is accuracy: namely we don't need to care
about these cause the difference that swings everything
is how many units we make, possibly the cost, and probably
the inventory. Since we aren't managing the inventory, I
suggest
the only thing we care about is how many go out the door
versus
how many we projected to. This gives to a first
approximation
the real measure.

If you can not get a set of numbers within some reasonable
time frame that allows us to have a measure of these Burps, I
want all work on revenue accounting ad burping
stopped. We are spending incredible sums in these areas and
I have yet to see ONE number. This is the greatest
fiasco within engineering, and makes all our project screw-
ups
pale by comparison. (I doubt if you can even tell us how
much we spend in making business plans, maintaining, Burp,

doing all the revenue accounting, including the books. The real tragedy is that real people have to spend time filling out these very precise, low accuracy forms and reading the data.

In our new drive for productivity, this is the first set of forms and numbers that should go.

In order to test the system, I would like us to look at the true reveue picture against the Burps in the low end on some of our problem children in order that we don't go blindly on. The products include: tu58, la34, la180, pdt150, vt78, the current pdp-8's, the 11/23's overall. Unless we get some of these metrics fedback, we will continue to make head in the sand forecasts, not measure, and continue to promote and mix around the same crowd.

When could I see some data? (The hope was that this would have been in our overview book ... we really do have an obligation to help run this place on something other than a personality basis.) Also, I am really getting fed up of building some good high volume products and then finding that our P/L colleagues go blow the money taken in on crappy,new, money losing products. Our financial organization isn't helping at all here, and seems to only be reducing productivity elsewhere by requiring forms and pushing numbers that aren't reviewed.

SUBJECT: FINISHING THE 74 PROPERLY

Could you please get someone to take on the task of writing a journal quality paper On the 74 experience? It would tell just how well it performed and include the details (if wise to do so) of the cache invalidation for multiprocessors. It would give the details of M+ and begin to hype it, as it relates to more reliability. I'd be happy to interact with the crew to get an outline (Russ Moore, Kim Kinear, Frank Hassett?, Verell boae, and surely others should be candidates to co-author). There should be experience on the 4 processor case.

Get us together here. I want to learn and document this... and
I think it would be benefical for the designers, DEC and the computer community.

PS
I want to make one of these on the BI using Jaws.

Subject: **Some First Impressions of Japan**

To: OOD, OC, Dave Ballantine, Jim Bell, Max Burnet, Don Frost, Bill Green, Carl Janzen, Ron Smart, Dick Yen

Date: 24 AUG 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

Here are a few brief first impressions of Japan (having visited Sony, NEC, Fujitsu, five Universities and a Government Lab). As you see below, I'm impressed with their intense drive, technical ability and will to win. Also, I position my understanding of factors which support what I believe is a basic goal to dominate the computer market...just like they do other (especially consumer electronic) markets.

This is a one-sided view as to their ability to win in our market...I didn't see things to get in their way.

I was prepared to dislike the Japanese because they had been so closed and absorbing of our technology and work. I could not help but like them; they were generally open. Now, I fear them more than I was prepared to. Here's why:

1. As a group, they're (industry-government) the most competitive. It's really built into their culture and reinforced by training. The only reason they aren't competing in minis is they're still enamoured with competing with IBM and building mainframes e.g., Fujitsu's new M200 technically dominates the new IBM3033 and Amdahl V7 machines. (We must worry because of what they've done in quality cameras/optics, textiles, small cars, radio, TV, tape recorders, watches, calculators, their position in semiconductors and semiconductor-making equipment, typewriters, sewing machines, etc.) This also drives them to fast response and hard work.

2. They're excellent engineers and tend to be less NIH-oriented than us. This is derived from having less egos, although there is a strong group ego! Japan has acculturated customs, technology, etc. from everywhere for centuries. In the 16th century they apparently set up manufacturing of guns/gunpowder in 18 months once the Portuguese brought them in. Any good idea is fair game (subject only to strict patent technicalities). Having adopted an idea they want to understand it and improve it. (This can be seen looking at progress in all the above plus the research they do.)

3. The current computer manufacturers have a complete line of peripherals, and set of test and manufacturing equipment, taken from copying and improving counter-part U.S. products. [Just as we all learn something from touring another facility, so do they. Should we avoid having them visit our plants? We have to be careful about our discussion of technology!] Here, I'm somewhat ambivalent, because I think we should trade - buy/sell - with them. We (DEC - especially the 11, DG, HP) clearly influenced their minis.

4. All of the manufacturers have acquired their technology over a 10+ year history of dealing with U.S. manufacturers either as a joint venture or under license: Fujitsu (Amdahl/Siemens); Hitachi (RCA); NEC (Honeywell, GE, Varian); Toshiba (Honeywell, GE, Interdata); Mitsubishi (Xerox), Oki (Univac - actually joint venture); Yokogawa (HP); Nippon Minicon (DG). In all cases, the technology has been improved in terms of quality and manufacturability. For example, in the case of the Amdahl technology (that was at least started at IBM), I suspect Fujitsu is one of the few companies capable of manufacturing the miniature/hi-density PC Boards, backplanes and small cables.

5. They seem to be less oriented to technology for its own sake versus what it can do for them in the long run. For example, they moved more rapidly into gate arrays for their computers earlier. (Maybe Amdahl's influence). They clearly think both product and process together in what is a longer term view. (Here, let me reiterate: We must clean up our processes or they'll win by default. We can't make one shot products on a rigged up, ad hoc process). Again, here they're competitive and they orient the processes to 1. Quality first, 2. Volume second (for growth) and 3. Flexibility and turn-around in order to support the volume. This gets into:

6. The Japanese orientation is a strongly engineering versus strongly science-based culture! (We - the U.S. - do their research, wo why should they bother?) This comes about because of the competition through manufacturing novel products and their total dependence on export/manufacturing. For example, much of our federal training, funding, comes through the NSF, ARPA, and armed

services for research. Their funding comes through MITI (Ministry of International Trade and Industry). There's rotation among design and manufacturing engineers. They do have good central research staff and their flow appears to exist to the development groups. They both think they're on the same team. -- In contrast, research in many of the large U.S. corporations is a vast waste, e.g., GE, Westinghouse, RCA and Univac; the work is usually behind the average development and totally decoupled. It's clear how TV, Radio and recording was lost, but the engineers had help because:

7. We (U.S.) have a higher regard to business training versus engineering training. They're in good shape because they don't yet have all the business schools. Therefore, instead of getting MBA's, their students get engineering masters. This not only makes them better engineers, but doesn't reinforce the notion that engineering is the route through to the management ladder, or that an MBA is automatically needed if one is to supervise people. The MBA, oriented at every dual-career person being president, and epitomized by the content-free case study methodology, focusses on the quick buck. This is in contrast to the Japanese concern for the long term (an overall theme).

8. They've read the Boston Consulting Group monograph and are volume (and growth) oriented, subject to the quality-first constraint. Knowledge of the learning curves is everywhere, even the government research labs and universities. Their needs and goals are manufacturing/trade/industry oriented. This also means, like TI that they're will to dump and lose money for the short term in order to gain the market. Although they put on a good act that their products won't be competitive when the yen is so strong, having gone from 300/$1 to 100/$1, it's a big ruse because:

9. Roughly speaking, they have systematically transformed American business from inventor-manufacturer-distributor to simply distributorships. This is in complete keeping with the goals of American business and the modern business school, Horatio Alger, such as RCA, GE, Chrysler, etc. No investment, no planning, no risk, these simply distribute products for the Japanese and roi, profits look fine. All a person has to do to be successful is buy the right product for resale. RCA/GE don't have to worry where the money comes from to pay the Japanese (or Arabs). On the other hand a group who can only run a distributor is probably fairly top heavy and can easily be replaced say, be a hard-working Japanese group. [A solution here is to make someone at the Commerce Department responsible for each area. This should include the joint planning with industry and the prohibition of current manufacturers from being importer/distributors. I.E., RCA would not be allowed to remain in the business and import. The responsibility for an industry has to be delegated!!]

10. There's no way we can re-enter

various lost businesses now that we're just a distributor. The spirit, understanding to develop and manufacture are gone. It's too easy just to distribute. There are now no decent American TV, radio, Hi-Fi, or video recorder products/manufacturers for what are basically indigenous U.S. products and which the first invention or key patents apply! Somehow, these industries and companies have been grossly mismanaged. (I also blame the Department of Commerce - a faceless, leaderless nobody!) How? Why? It can easily happen to us!

11. They're more long versus short term oriented. Their history encourages this. They're capable of waiting us out in an area because we're so big bang (product) oriented and because they want long term business domination. NEC, Fujitsu and Hitachi, unlike Xerox, GE, Westinghouse, RCA, have all persisted with computers and now appear to be winning! This timeliness certainly affects their thinking on quality, and lastingness both in markets and products.

12. They believe computers are fundamental for the long term and they're prepared to wait. Machines are used in all products they build for export and they save labor - and labor is precious expensive in Japan as there are only 110 M people and 2% unemployment. They're considering raising retirement from 60 to 65 to get the extra productivity. They need computers to raise productivity! This is vital to their domination of manufacturing. (This is the opposite of the Australian attitude where there is high unemployment and a need/belief that computers must be eliminated. Australia is now almost totally dominated by Japanese products).

13. They are willing to give up profit for growth. For example, RCA is on a rug maker (or distributor), car rentor, book publication, TV Distributor etc., instead of an electronics company that really pioneered the T.V. Whereas there is extreme pressure on business for profit and return on investment, these factors are less in the Japanese companies. Sony is quite profitable, Fujitsu does relatively poor financially and I'd bet NEC or Hitachi computer divisions might even lose money. For now, they may still be buying in - clearly more acceptable than GE, Xerox and RCA. (This makes them doubly hard to beat...since they can lose money on every one and make it up in volume. They'll buy this business - DUMPING! and why not?)

14. Products are quality/detail oriented versus being the ultra-high volume, low-quality throw-away types. These are characterized by say, Sieko (versus Timex) and anyone of their cameras say, Minolta (versus Kodak or Polaroid which assume an idiot user with no concern for quality picture, but must have it now...again the time attitude). For example, while they make no instant cameras, perhaps due to patents, when they do they'll be quality.

There are zero defect signs everywhere! In the Sony VTR plant there was no burn-in of the recorder. All subassemblies had been inspected and tested. When it was put together it worked.

15. They are compulsively clean. In an indirect way, this really helps the manufacturing of small, precise goods (e.g., cameras, LSI, high-speed computers, some disks).

16. Even though they have a concern for long term, <u>they work the short term very hard</u>. This may follow from the competitiveness/growth. They engineer for quick turn around, they have good processes and the engineers at these large companies work very hard. The official work week is 40 hours, but a more accepted pattern is 50-60 hours...particularly to maintain schedule or to win against IBM, Amdahl or Hitachi (if you're at Fujitsu).

17. As the head of our Osaka sales office put it: the Japanese live to work versus the American need to work to live. He claims this is instilled at birth and trained. Work is a central theme, and the companies go through extensive screening to hire for life - e.g., some companies only get graduates from certain universities. Housing is provided for the workers and they have what amounts to a lifetime contract. This is bad if a person's incompetent, it also means that it's hard to breathe different life into an organization. On the other hand, turn-over is low to non-existent and a team spirit clearly develops as the various members learn to work with one another.

Their physical condition certainly reflects this work ethic too! On one hand there is a great deal of smoking, although a campaign is in progress to reduce it. However, nearly all Japanese are trim versus being basically overweight. Their diet (including excellent raw fish and vegetables) is conducive to trimness and better health, I'd guess. Although alcoholism is supposedly on the rise, the consumption in business I saw was certainly less than in the U.S.

18. The long term, quality products makes them build products that are hard to beat on a life-cycle basis. While it isn't clear they really consider all life-cycle costs, their cars now get good ratings - even though they may be designed to decay rapidly after say x years/y miles. In the case of computers, they always build multiprocessors because their customers invariably buy and want upgrades. Since IBM rents, the multiprocessor approach hasn't been developed. The multiprocessors they sell are also built for better Reliability, Availability and Maintainability. They seem to do a better job considering life-cycle costs than we do!

19. At a government/society level they appear to have their act together much more than we do. In both newspaper stories and in their products they seem to have clear, crisp ranking of goals and priorities. For starters, they know them, whereas nearly all our issues that start out simple become entangled as everyone (a new set of referees) enters the fray (e.g., human rights vs equal rights; full employment vs inflation, balance of payments; environment vs region vs country; capital vs labor; consumer protection vs business protection), but worse than a muddy set of design

criteria is a muddy set of decision makers and an unclear decision process.

Because of the need to export, there's very good support for engineering and many go into it. There are comparatively few lawyers, (factor of 2 per person), so the emphasis is on physical output rather than paper, and intergroup contracts, and bickering among semantic accountants.

20. INVESTMENT

As a simple explanation, more money is available for investment because of lower taxes. This clearly affects their ability to invest in industry. They're supposed to be willing to pollute for profit...I didn't observe this. (Maybe they only kill whales outside of Japan and pollute other environments). Their environment is fine - though high density. On the other hand, taxes can be low because:

21. <u>Their Government spending for military is far less</u>. (Nearly non-existent). Although there is some fall out of our military spending for computers and related research, it's small compared to what it could be if there were more directed goals such as the Japanese export goals. It's not clear what these goals should be.

22. The <u>Japanese don't have the waste, federal research expenditures, such as NASA and the Energy Department</u>. (Here again, they can rely on us if there's any output.) These are big expenses and contribute little. The Energy Research seems to still be the old Atomic Energy Commission, but dressed in new clothes. The labs do about the same work, with essentially no output. (At least at the AEC, their goals were clearer, and we had a consistent flow of big computer bangs...plus a constant market that's motivated to provide computers.) Here, the Japanese do some nice work in regard to funding and managing research flow. Their labs buy versus develop in a vacuum with no way to get the flow.

23. <u>MITI</u> and other labs <u>fund other laboratories and corporations</u> to carry out research that's oriented to getting experience that will assist products. This not only provides a system of checks and balances, but provides an incentive. This minimizes what I call the "dusty-lab syndrome". Many of our government and federally funded labs were initially set up for a mission, and once the mission has been completed, the lab continues to exist. Since there's no real need, or mission, or review, negligible new work is output. (Recall visiting labs in which the dust is blown off the equipment for visitors and the same demo is run year after year. The same equations are on the board, with the same usually vague, unattainable, immeasurable goal for the research.) A buyer-seller relationship can help check this to some extent. Also this brings the groups together and technology transfer is more likely to take place.

For example, NBS is setting up a lab to do standards research and industry is free to contribute interns to them - this is ridiculous! A more fruitful way to bring about the standards is to subcontract several approaches and have industry develop and report on them with NBS. In this way the staff is minimized at NBS (which will be obsolete and impossible to acquire) but they will get more quality through their buyer role. Foremost, there's a reason to interact.

There's a good understanding about the research flow mechanism. They use all sorts of techniques -- organization, people-rotation, having many visitors to the U.S. Labs, buyer-seller, space, etc. -- but they do have the concern because of the limited number of people. We seem to have too many doing too little with no concern for output.

24. Overall, MITI appears to be very strong and competent! The goal of MITI/industry is a strong industry! This is in contrast to our Department of Commerce which appears to have the standard 9-5 bureaucrats, who are in it for either security or power - but with no real way to make anything happen. Nor is there any measure. I don't know what's missing that they have (just quality people - as Reischauer suggests, the right longevity, power, process, maybe they segment responsibility and measure results with reward based on performance (e.g., winning in a trade area)). In a few samples, I believe it's simple people quality, and the right process enabling them to accomplish something. Being responsible may be the key variable. Here, this suggests we could probably eliminate the Department of Commerce and have no real change except more output.

25. While there doesn't appear to be Japan Inc., there is clear collusion (planning etc.) among the government, and companies. They actually plan to win! This includes basic strategy setting among the players to segment and go after various markets (e.g., Fujitsu/Hitachi are 370 plug compatible). The companies can talk to one another and do, but certainly compete intensively with one another.

Japan is quite a closed society and market. As the most powerful, homogeneous culture there is a long history of this. A quick trip, a pass through Reischauer's book, The Japanese, and an explanation of just a part of the tea ceremony make this vivid! Two years is a frequently quoted number to begin to understand this.

26. The language is a code to further segment. It's not clear how difficult it is to learn, but it's probably relatively useless without the societal understanding. We don't teach Japanese widely. On the other hand the technically trained Japanese have maybe six years of English in order to read the literature. (This is probably a good reason why we should use OEM's to enter the end-user commercial market versus translating the many manuals.) On the other hand, the lab, industrial, educational and engineering market may be open without extensive mail translation.

27. The tariffs support the establishment of any industries they target. Now the computer import duty has been reduced, but I doubt if this matters much

since their industry is strong enough to withstand imports!

28. By the society and the emphasis on personal relationships (not clear they're any more than French) it's hard for foreigners to break into or sell, especially on a one shot basis. (It remains to be seen whether an American manager say, could set up and effectively manage a Japanese office.) "Doing business" together appears to be done over a long time period and is almost ritualistic.

29. There is an amalgamation of the Japanese within an industry which creates something that's often referred to as Japan Inc. (I think the Japan Club is a better name, because there's at least a show of competitiveness at the market level.) Not only is MITI supportive, they also appear to dictate. What's worse is they interact with industry in what appears to be a helping way as described above. For example, DEC products were in the Computer Engineering/Science Departments when the 11 first came out, but with a Japanese mini industry we really don't sell there. I'm sure it's because of their recognition of this market (also they discount heavily in the universities and consider it a prestige sale)...there may even be some special tax incentive. There is incredible pressure to buy Japanese products!

The high cost of labor, limited population and full employment coupled with few natural resources, creates some interesting by-products.

30. The pressure to work is fed back, creating more work and output, since everyone is working.

31. Inventions are to labor-saving devices. I saw countless gadgets of this form. All the printers at computation centers had paper cutters on them with conveyors to bring output back to a single station. There are NO computer operators, tape mounters, etc. running around!

32. There's real concern for saving of physical resources too. At the computation centre, printout isn't automatic; it's queued and must be requested by badge reader, (also, lights - always fluorescent due to efficiency - are off in the computer room - the console is external with only one or two operators!) Of course small cars, taxis, a good train/subway are other indicators. The cars have bells that ring when the car is going over 100kmh!

33. There's measurement of and pressure for efficiency (i.e., work out/work in is high). In a taxi, there's an automatic back door opener so that the driver can load/unload faster. Of course, the factories graph everything. It feels like the notion of efficiency is taught to all.

34. Everything runs on time and at

full capacity (trains, planes, a supply of taxis, buses and especially meetings, tours, etc.). This is in contrast to the habits we've gotten into on scheduling and performing at meetings! Also, Yu Hata did an excellent job of scheduling customers, manufacturers and sightseeing. I accomplished roughly twice as much per day as in another western country.

35. There's orderly queueing at each server. The Japanese appear to be the world's best self-queuers. There's probably some protocol for resolving races when two persons arrive to the queue at the same time.

36. There is a range of basically human/personal concern. While the subways and trains jostle people pretty badly (at high density), and there's no segmented smoker areas (and many smoke), there's great concern for the feeling/privacy/treatment of individuals. Perhaps I had special treatment, but on arrival/departure at every organization, we were given hot cloths for refreshing (it was hot and humid - but taxis and all buildings had A/C), and either tea (occasionally coffee - to be really considerate of a westerner) or cold juice. The hotels though incredibly expensive were the best I'd ever stayed at in terms of quietness, service and general treatment. This included a large, but very well run chain hotel in Tokyo. In Kyoto I stayed at a tiny (fifteen room) old style, old Inn, and only once did I ever see any other guests (at the front door). The goal is to make certain that guests are totally alone, with incredible attention to simplicity, design and detail (e.g., there was a cloth over the telephone because it didn't fit the room decor).

Of course, the food is the ultimate in personal concern. Food served in seven, nine, or eleven courses varied from raw fish to pickled vegetables (e.g. potatoes) and flowers (lotus blossoms) with lots of seaweed and fish and fish eggs. There is western-oriented food like tempura (deep fried), hibachi grilled meat and fish and teryaki. At the first of the week we had western/continental/universal-style food because our hosts were concerned, and then we asked to have only Japanese food. We ate nearly everything (there's one kind of seaweed I found unpalatable). Of the sandwiches we had, the bread crusts were removed. There was much concern that the colors of the food matched - the physical looks were important.

There are Japanese baths, and these are great too!

37. Products are designed for people with attention to detail. The styling happens to be also attractive to others, but their technical, gadget-orientation really biasses them to designing technical looking, knob-intensive products (hi-fi, complex watches, cameras, etc.). It's probably impossible to have them design a product like the polaroid one-step camera. (Emotionally, I doubt if the designers can do it based on the picture quality.) Color monitors were used to control the larger machines.

38. Contrary to expectations they are working the environment issue. There were U.S. environmental people there at a conference, and the Japanese were politely ignoring them...and taking their conference registration fees. Nearly all cabs are LP gas! Although they're physical comfort oriented, they do work the resources too.

39. They seem to do "bottom-up" product design versus "top-down" market planning as typified by the expensive heavy, multi-volume market surveys. These usually report history and extrapolate it in a self-perpetuating fashion. Using this approach, we continue to build heavy, gas-consuming cars because the market has historically bought them (given few alternatives). They look at the needs, and take existing ideas (designs) and improve them.

<u>EPILOGUE</u>

On arriving at Sydney, I was struck with contrast to dense, intense, humid and hurried Tokyo. I was ecstatic to get back (after twenty years) to a life style, people and place I really like:

Sydney's beaches are the world's finest; the weather's great; people spend lots of time out of doors with sports, strolling and simple gardening (versus the subtle and very complex Japanese gardens); work starts late, runs slower and ends promptly; and the food (universal/continental/western), beer and wine are drastically improved having moved away from the early English influence. I look forward to a last weekend stroll. I'll enquire about the best reef for SCUBA diving (on another trip).

Digital **Interoffice Memo**

Subject: **Fixed (Non-Programmable) Applications Product Line (as a Dist. Channel)**

To: Marketing Committee   Date: 29 SEP 76
OOD   From: Gordon Bell
Jim Bell   Dept: OOD
Ed Fauvre   Loc.: ML12-1
Ext.: 2236
Bob Glorioso
Len Halio   F/U 10/6
John Holman
Jack Mileski
Steve Teicher
Jim Willis

I'm proposing that an engineering group work with several PL's to identify, design, and build specific, fixed application-direct hardware/software products which will be sold across many PL's (either on basis of their SIC-code orientation or their different channels of distribution).

For example, Word Processing can be looked at several ways:

1. Basic (evolutionary) editor, product available on a specific configuration to be sold through one or a small set of product lines (i.e., Commercial).

2. It can be confined to its own line.

3. Sold like any other software product across all product lines.

Is it worthwhile to think of an existing or new channel which is the "fixed program applications" PL?

With more intelligence at lower levels in terminals, etc. we're going to have infinite opportunities to bind applications to particular products, and it seems we have a basic choice:

0. Ignore the opportunities. Let's not.

1. Let our OEMs (1 or 2 forms) do the particular ones. Unfortunately there is only 1 program to write and no way for them to add anything except sell them.

2. Develop OEMs who distribute the fixed program things. For example, a single program to index microfilm will convert the DS31 into a microfilm indexing and retrieval unit.

3. Set up separately or as separately but adjunct to each PL, a part that markets particular applications systems.

What do you think?

follow up 9/29/78

Somehow continuing on the National Floating Point Standard is essential. Can you take Mary's place at meetings? or who should? Stone?

GB:ljp

It is possible to make a drive that looks like a floppy to a system, but is much faster and not very expensive. Consider making a drive with say 256Kbytes using 36 chips at a cost of about $5 per chip would give a drive of about $250. The pseudo drive would have a battery and would get rid of all the access times. Maybe it doesn't work well enough, but on the other hand, it is clear that all of our Personal Computers (278, CT, 18X, etc.) would probably use it if it were transparent to the software. Also, there is probably an outside market.

What do you think?

July 27, 1978

Ivan Flores
Flores Associates
Computer Consultants

Brooklyn, N. Y. 11215

Dear Mr. Flores:

Mr. Bell received your letter of June 21. He is away on an extended business trip and asked me to let you know that he doesn't believe we are interested.

If, however, you find yourself visiting out our way, please give him a call.

Sincerely,

Mary Jane Forbes
secretary to Gordon Bell

Subject: **Using Fonz and Tiny with Industry Standard Chips**

To: Roy Moffa, ML1-2/H26

Date: 1/8/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Don Gaubatz's work on multiprogramming at the microprogram level on LSI-11, Fonz and Tiny appears to enable systems to be built using these computers which also use industry standard peripheral chips. At least we have an 11 ISP that can use the standard peripheral chips in a software transparent fashion.

It seems there are several implications for you as chip suppliers:

1. Don should write it up, educate chips developers, educate users and try to apply it on several internal applications.

2. The new computers (eg Tiny and Fonz) must be able to support the method using one of the several methods.

3. We have to make sure the new product opportunities are identified, so we get as much bang as possible as quickly as possible. These include: very low cost systems; peripherals for existing systems which would use Fonz or Tiny as the controller to a Unibus, or possibly even a Q bus; peripheral systems such as the communications and HSC subsystems for HYDRA; and peripherals in general (e.g., LA34).

Hydra Evolution. Hydra is designed using a standard commercially available microprocessor family, the National 32032 (and compatible 32016) microprocessors which we rate at 0.75 Million instructions per second when instructions are run from the common, 32Kbyte cache memory and 95% of the references are in the cache.

The National 32000 family was selected based on these critical factors: ability to access large virtual and physical memories, having a wide range of data including IEEE Floating Point format numbers, and closeness to the highly successful VAX-11 architecture which enabling effective utilization of UNIX and other software. Texas Instruments is also designing and manufacturing 32000 compatible products. National has announced future microprocessors which operate at 2 and 4 Million instructions per second for availability in 1986 and 1988. Encore expects Hydra to evolve to 40 processors and over 100 Million instructions per second, and 256 Megabytes of memory within three years.

Encore software is written in transportable C language, in order to utilize microprocessors which meet data-type, compatibility performance (including floating point) and memory access ability for both virtual and physical memory. When faster processors are available, new cards can be intermixed with existing DPC100 cards for continuous and compatible upgrade, preserving customer investment.

<u>MULTIMAXX</u> <u>Performance</u>. Performance is highly application, basic software language, program location and computer configuration dependent. The ideal multiprocessor application utilizes the processor's registers, makes a high percentage of references to cache memory, and utilizes all memory cards equally.

Since multiple processors share common hardware facilities, performance degradation occurs when a single hardware resource is in contention. Also, the cache memory operates on the statistical principle that most references are to the cache which has an access time of 100 nanoseconds; when a memory word is not in the cache, then primary memory which has an access time (including bus access and transit time of ? nanoseconds) must be referenced. Two sources of hardware contention can occur:

- . Dual Processor Card - two processors access the common 100 nanosecond memory. We have measured a range of applications and have observed processor degradation due to contention among the two processors on the same card to vary over the range: 4% to 14%, and anticpate an average of 7%.
- . Shared Memory Card / Nanobus - When a memory reference is required, the bus must first be accessed, followed by the memory access. Since the bus is requested and access to memory occurs. Since memory contention is highly dependent on the location of a program and specific cache success results, it is difficult to predict the performance loss on an average basis. A simulator has been used to study a range of programs. Two cases can be observed:
  - . the worst case - all processors simultaneously access a common area of memory within two memory cards (this

condition can occur when all processors are interpreting Multos);
.the best case - all processors access memory distributed equally in all memory. (This is roughly equivalent of four of 16 processors accessing each pair of memory cards.

A simulation of /////

A similar phenomenon of software contention occurs when multiple processors must access common program or data. Contention of this type is systematically reduced by reducing common programs and data where waiting must occur. Experimental systems at CMU and other commercial systems have been able to accomplish the reduction so that negligible loss occurs.

Hydra Longevity and Its Application. The Nanobus provides the key to product longevity by being able to accept new, higher speed processors that will be evolve with CMOS VLSI. Real time data can be processed at up to full bus bandwidth (100 Mbytes per second) using all known methods of interfacing including: interrupts (? events per second), direct program control (? events per second) and direct memory access (DMA).

Hydra will be used for traditional timesharing, batch processing, transaction processing and real time where powerful multiprogramming is required.

In order to get started on the longer term process improvement program I'm calling Force '83 which you nominated me to look at, we need to progress rapidly on the interim process Engineering Process Improvement Program, EPIP (alias Operation Tourniquet). On Thursday, each of you are naming persons for EPIP to address processes and Pete will chair the overall program.

I would like to propose the following review for our education:

Engineering Staff would do a one day review of all the Force Lines (note below) for building hardware systems. We would ask the responsible operational process managers to present the various engineering processes which they run at the sites, together with the performance of the line segments. Alternatively, we might ask various Project Engineering Managers for a product or set of products to describe the Force Lines in use for their product or product set. Let's settle the approach on Thursday, or make it at the discretion of the site manager. In either case, I would like to have both Force Line and Product Force Line Managers there for cross checking purposes.

In particular we would review the Product Force Lines x Force Fields for:
.ML- Terminals and Workstations; and 11 Systems; Mass storage
.TW- Distributed Systems; Gemini/Nautilus/Scorpio
.MR- 2080; Venus
.MK- Distributed Systems; Commercial Hardware
.CX- Disks
.HU- VLSI; Various gate array Force Lines
.Reading- Distributed Systems

These folks would present:
.Graphs of the Force Lines broken into Force Line Segments for various Product types

.Organizational structure for the managers responsible for the complete line (if any) and each of the line segments. Also, comments on how information is controlled across the Line Segments.

.Performance in terms of time (versus pertinent parameters) of the Force Line Segments together the organizational interfaces and the queues. Bernie gave a review of UNA here that could be used as a template. Also, the metrics folks publish results across nearly all line segments for the module layout line segment.

THE DEFINITIONS:
.Force Field- collection of Force lines forming a single site

.Force Line- collection of Force line segments that operate mostly in a single thread, feed-forward fashion with virtually no merger with other force lines

.Force Line Segment- defineable and schedulable process step which corresponds to a work station operated by a single organizational individual or group on an assembly line (eg. design, module layout, module fabrication, assembly, product introduction). A segment is created anytime there is transfer of work outside an organization (2 levels usually).

.Product Force Lines- the set of lines used for a particular product. This can be as small as a Force Line when it is defined as capable of building a module AND the module forms a single product. Examples of a complex set of Force Lines include the Venus Force Lines that form the tree: MCA's (a line), Modules (another line), a collection of Modules forming a Box (possibly another line), the backplane (a seperate line), and the whole system formed from the boxes together with the mechanics to house the system. The PFL's correspond only roughly to the PERT chart of the project because a given line segment can operate on different parts of the project at different times!

|n looking at these various processes x products, I think it would let us really kick off EPIP appropriately. It seems to me we could schedule it very soon as I assume the whole set of proceses are very clear.

What you say?

Please comment so we can sanction this by Thursday and get into details!

.

Subject: **Fortran (not BASIC) Policy**

To: Ulf Fagerquist, Bill Heffner, Bill McBride, Larry Portner, Pat White
Date: 20 JUNE 78
From: Gordon Bell/John Leng
Dept: OOD
Loc.: ML12-1 Ext.: 2236
CC: RT/C POT, Andy Knowles

follow up 7/5/78

I believe our action with respect to Fortran has been irresponsible. We're spending much of our resources to fooling around with Basics after getting many poor ones to a fewer number; now we're adding more again (Basic-11, Basic-10, Basic + 2 (10, 20, 11, VAX), Basic LDP, RSTS and probably many more I don't know).

The fact is, RT11/Fortran is selling more than BASIC and our scientific users are Fortran. This may be because it is a standard versus the situation in BASIC (another name for Anarchy).

We would like to ask:

1. Where are we on all our many BASICs? How much did we spend, how long did they take to get, how big are they? What are they written in? What's our strategy on the language and evolving it? (Let's review history and let it help us guide the future.)

2. Do the same with Fortrans. Plus how are we coming on the necessary ANSII improvements?

3. With all our competitors (e.g., with HP's, Tektronix's, Radio Shack) building BASICS, how will we be unique? Maybe our buyers are saying something -- for serious computing (where it's

necessary to have subroutines, libraries, a programming discipline, and a community of shared users) they prefer Fortran.

As of now Basic will never be anything except a way to solve small problems quickly. (The first 1% of large problems can be solved quickly too.)

4. Review our strategy.

The first article of three on Digital, describes the situtation as the company was poised to enter the Fifth Computer Generation. The second part describes the various critical alternatives facing the company. The concluding part describes the chosen path and the market reaction.

Early in 1981, Olsen realized they were in trouble with respect to being a leader in the diverse range of products and markets. They were poised to only get a small part of the many explosive markets, while at the same time, lose market share for their traditional timesharing products. Specifically, DEC was:

. facing an explosive word processing and office automation market with a solid set of products. While each of the products were not best, the combined set gave the broadest product range, covering word processing, electronic mail, combined word and data processing, and typesetting. Unfortunately, marketing expertise in word processing was confined to a single, small group and management spent most of its time defining charters for its groups rather than on the tactics of winning the market by requiring all its market groups to sell the products!

. evolving its traditional 1970's, third and fourth generation "rack and stack" business to meet its mainly OEM customer requirements. Past customers had locked DEC into its historical product set; many of the same technical customers were however, busily designing with the emerging Fifth Generation non-Digital Semicomputer company Standards set by Intel, Zilog and Motorola. The OEM group was arguing to perpetuate the Unibus, the defacto standard interconnect of the '70s that came out with the original 11/20 in 1970. At the same time, they were introducing a new set of systems based on their later interconnection scheme used for their early fourth generation (circa 1975). Unfortunately, both historical packaging schemes were inadequate to permit competitive systems to be designed, since the Semicomputer companies had set substantially higher performance and lower cost standards through the defacto and the international standards bodies.

The first article of three on Digital, describes the situtation as the company was poised to enter the Fifth Computer Generation. The second part describes the various critical alternatives facing the company. The concluding part describes the chosen path and the market reaction.

Early in 1981, Olsen realized they were in trouble with respect to being a leader in the diverse range of products and markets. Don Knuth's Tau Epsilon Chi (T_EX) is potentially the most significant invention in typesetting this century. It introduces a standard language for computer typography and could rank near the Guttenburg Press in terms of importance. The T_EX system:

. understands typography from individual characters to page design;

. permits any typewriter, word processing system, computer-based editor, or T_EX system editor to be used as an input device with a standard language;

. can typeset various formats and languages;

. is structured to be user extendable to virtually all applications.

These characteristics represent a benchmark improvement in both typesetting and text creation. To date, computer-based typesetting systems have simply facilitated typesetting. The proliferation of word processing systems makes it possible for widespread direct transmission of text to typesetting without the intervening typesetting process--provided we use the standard language that TEX offers.

A direct link between text input and typesetting will permit a drastic restructuring of the arcane journal and book publishing industry, allowing it to be oriented substantially more toward the author. Even with word processing equipment, authors have not been able to participate in the representation of their message. Prior to the Guttenburg Press, manuscripts were conceived and designed simultaneously, and the author's hand shaped the entire final product. The results were beautiful and varied in contrast to the manufacture of most modern books, which vary only in cover design. With TEX, moreover, not only does the author again control his own format and representation, but he can also produce more accurate material that can be rapidly mass-produced, shortening the time between idea and dissemination.

TEX is significant as a standard language because of the way it understands typography using a framework of boxes and glue in a hierarchical fashion so that any font, page layout, or other typesetting parameter can be set. This is in striking contrast to most typesetting systems, which are built with no generality. Finally, the input form is user-defined by means of a macroprocessor so that virtually any text can be input and control the typography part of the program. It is this generality and segmentation of function that will make TEX significant.

The book is about much more than just the TEX system. The Gibbs lecture presents the twin themes of how typography can help mathematics and how mathematics can help typography. Although the lecture of Metafont is intriguing and useful and describes the use of mathematics in type design, it is the discussion of TEX itself that interests us in the short term.

While the emphasis of $\TeX$ is on mathematics, the systems is equally applicable to and will no doubt be used in many other domains. Don Knuth, in fact, shows us precisely how the system can humanize basic communications.

At DIGITAL, we hope to use $\TeX$ immediately. I urge others to adopt and use it so that the language standard can be established.

June 1, 1978

Mr. Guy L. Fougere
Vice President
Arthur D. Little, Inc.
Acorn Park
Cambridge, MA 02140

Dear Mr. Fougere:

Ed Vrablik is in charge of co-ordinating external acquisitions and he has tried to get our internal users interested in Space Graph.

Unless there is an external buyer who would put up the funds to further develop and buy the product on a low volume basis, it feels right to me that we not invest in it. I'd like to encourage you to work with our Computer Special Systems Group to get such a buyer.

Sincerely,

Gordon Bell
Vice President,
Engineering

SUBJ: FOUR WHEELS OF REINCARNATION

TO: DISTRIBUTION

Date: TUES 13 SEPT 82
From: Gordon Bell
Dept: Eng. Staff
MS: ML12-1/A51
Ext: 223-2236
EMS: @CORE

BACKGROUND

The new version of Computer Structures has a six dimension Kiviat graph to represent the rough performance and implied structure of all kinds of information processors, eg. teletype, PDP-8, Cray-1, database machine. The six basic dimensions are the PMS structure components: Pc, Mpmemory, Msmemory, T.human, L.communication and L.external (C, T, L).

Today there are predominately four higher-level types of information processing system types, labelled by their function:

1. General purpose processing or computing C := Pc + Mp, The function is to take some imput information and generate new . numbers, test, symbols.)

2. Database centered storage and retrieval, ie. backends or

   C.database := C + Ms. The function is to accept, hold and retrieve information in a suitable and reliable fashion.

3. Communications processing (the front end), or L.communications- -links to other information processing. The function is incestuous--simply communicating with another information processing system.

4. Visual display processing or T.human(visual)--a transducer that transforms information in a computer to picture information, usually on a CRT with an embedded computer.

OBSERVATIONS

1. Each functional type of system is based on special knowledge:

Pc(numerical, symbolic,...)

C.database(numerical, large, text,...)

L.communication(protocols for various links,...)

T.human(graphics, forms,...)

2. Within each function there's a hierarchy of levels of protocols and corresponding machines to implement them. These levels are quite similar conceptually and level by level:

Pc(microprogram, macroprogram, operating system,
higher level language)

C.database(physical block, logical block, record,
file,...database)

L.communications(physical link...7 ISO, OSI levels)

T.crt(bit map image, character/line/etc., forms)

3. With low cost ROMS, RAMS and Pc's, each function operates at an increasingly high level of intelligence, requiring less information to direct it at the higher levels.

4. Thre are now more (4) chances to have wheels of reincarnation --see Computer Engineering, p.201-202, 390-391--for a recall. Furthermore, we seem to be succumbing to this.

The problems with the continued addition of non-transparent, programmable processors as we traverse the wheel are:

1. Cost and complexity of many coupled, ad hoc machines, i.e. it's awfully easy to form a kludge.

2. In many cases, all that happens is many wasted cycles and increased entropy.

3. We start to support the programming of them and they're simply another ISP. The result is a new set of supported software.

4. A new set of special, evolving protocols between the two coupled systems is required! (The VS100 is an example of a potential problem.)

5. The last turn of the wheel is likely to be a net

loss. The addition of the final processor to off load actual loads all processors by requiring them to only communicate with one another.

6. There is a new software system to boot. Now, the main processor is totally off loaded, but has to do more processing to communicate with the off loader.

We should have stopped just as the specialized function is added. This is where the big gain is--not the off loading.

1. The classic display processor

The cycle is: direct point plotting (or bit memory mani-
pulation by the Pc as in the Apple). Adding character look-up and plot instructions, still under Pc control provides even more performance. As the Pc is loaded, DMA is provided. Next, a display list (actually a set of instructions) are interpreted and executed forming a P. display. Some examples:

VT200: DMA chip for picture maintenance, Bit Manipulation chip to interprint the picture, and we have and idle Pc!

At most, a DMA and pixel controller are required (bit blt operations).

In the VS100 case, the bit blt processor isn't even essential because the 68,000 is fast enough for many operations. By adding the bit blt, the 68,000 is completely idle (not really an important criteria).

2. Conventional Processing

Many array and vector processors are attached to both minis and mainframes. Ultimally they become simply general purpose processors with array data types! The FPS-164 is an good example of how one extends a special, microprogrammed, signal processor. It started as a device for signal processing, using separate memories for instructions, data, temporary address and temporary data. As it ran into the data transfer bottleneck, it was extended to do really all the processing for scientific tasks. With VAX, the remainder consists of file, (backend), communications processing, (front end), computing and debugging.

Is there anything to be gained by our building such a specific, attached processor, given the evolution?

3. Communication Front Ends

Here it's difficult to really off load very much as the two systems vie for control. It's easy to have a complete, system-wide loss of computing power as the added protocols between front end and host kill us. This is potentially solvable IF we decide that a LAW is a single system with reliable communication and start using "light-weight" protocols rather than the evolution of the multi-level protocols that have become so ROCCOCO.

Pluto appears to be the ultimate in ROCCOCO architectures with: four processing elements-Pc(11/24, 0.2 mips); two communications queue C(2901, 5 mips) Pc(console-8080, 0.1 mips); and two K(DMA's) for the Ethernet (the UNA) and the Signetics UARTS which had DMA capability, but were disabled.

A Pluto can only handle 32 lines requiring 32 kchar/sec. There is 10 million instructions/sec available to process each output character, or 300 instructions available, just to take a character from a memory queue, doing nothing to it!

4. C (Database)

This project appears to be potentially worse than Pluto. We're off a C(16032) so as to make a computer for databases. This merely means we throw VAX/VMS AND all the database software away and somehow get the o/s, languages and database reimplemented on a 16032. In three to five years, we'll have the breadboard of a database system which was to be the off loadee. While at the same time, we should be shipping a product running on VMS!

Why can't we merely:

a. Model and instrument the VAX/VMS database system we have today and are building so that we understand where we need additional, clearly specialized processing?

b. Take either a 750 or 780 and build a special processing unit which either operates directly on Mp (as in the case of the VS100) or operate in series with a UDA on the fly. Conceivably a UDA could be remicrocoded or appended because it has the ability to execute many mips. Make this work. If this is done on CMI (which is a clean, simple bus), then it might even be a product!

c. With Scorpio and BI, we hae a very good system:

```
                 Pc(Scorpio)-Mp....Mp
K(disk)   x  (special)
                 |                 |        |
|
                ------------------------------
-------------------
```

That is, whatever needs to be done, we build X as in b) where X is a K/controller that executes an instruction under Scorpio's control or a computer with its own very fast, specialized processor, eg. 2901. Note: it can NOT be a 16032-because if we needed one of these, it would be just another Pc(Scorpio)!

HSC should have taught us something because with a unique set of software and acting only as a disk server, we're unable to move the file service or higher level functions into HSC. Similarly, the HSC parts aren't bus compatible with those that connect to a unibus, CMI, BI, etc. Clearly, there's no way to have databases there, except by a whole new database system.

BOTTOM LINE

We should be very uncomfortable indeed with the basic PMS structure and resulting software that's coming out of the emerging functionally specialized systems. The positions taken in the wheel are either too far or not far enough.

Mr. Lloyd D. Turner, President
Floating Point Systems, Inc.
P.O. Box 23489 Portland Oregon, 97223
3601 S.W. Murray Blvd.
Beaverton, Oregon

Dear Lloyd:

It was good to meet you last Friday and discuss how our companies might co-operate more effectively. This kind of relationship, really parallel processing, seems unique within the industry. The discussion with Norm Winningstad, Bob Schuhmann, Emmons Miles, Peter Smith and you was quite stimulating. The 564 looks quite promising and we hope to have a complementary VAX to support it, together with a file system and system interconnect to make it more effective and accessible.

I understand that we have discussed the possiblity of doing office automation work on VAX with you. Many regard Digital in the top 2 or 3 in office automation, and personally I'm quite excited about this use of computers, especially for Electronic Mail to give much better, and cheaper communication. Within Digital, we have one of the largest Electronic Mail Systems with about 20 dedicated computers and 7555 subscribers. Al Crawford, who heads our Corporate Distributed Information Systems group, has written a prize winning paper on our office automation system, and it is also enclosed. While we can demonstrate these system here or at FPS, I'd like to extend an offer to install and let you try various components of this system.

Peter Smith and I would like to extend and invitation to your staff to visit our various facilities and discuss the details of how our future products will work together better. At that time, you could look at how we are using our computers for office automation and computer design. You also might want to visit our Colorado facilities where our disks are made. We are starting to discuss the sale of disks on an OEM basis, and this would make the coupling much better for both our customers. Peter will be communicating with Carmon Cunningham and Lynn Berg who work to set up a convenient date for the visit.

Again, thanks for the hospitality and stimulating interaction.

Sincerely,

Gordon Bell
Vice President of Engineering

Dr. F. Kurosaki, Director
Fujitsu Limited
1015, Kamikodanaka, Nakaharda-ku
Kawasaki, Japan

Dear Dr. Kurosaki:

The literature and parts arrived here in fine shape last week. I am in the process of collecting parts suitable for your museum and I will write you when they are sent.

However, at this time I am sending the following literature:

a.Computer Structures - a book by Allen Newell and myself discussing computer history in general.

b.Computer Engineering - a book by three of us at Digital. This book describes the first 20 years of the Company.

We are going to catalogue many of our DEC parts this summer and will send you some pieces in the Fall.

Thank you very much for the Fujitsu parts. They are a valuable addition to our museum.

Sincerely,

Gordon Bell
Vice President,
Engineering

Subject: **Fujitsu's M-200 (Compatible with 370)**

To: OOD, Sam Fuller, Alan Kotok, Dave Rodgers, Bill Strecker, Pete vanRoekens

Date: July 28, 1978
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

I've just seen what I think is a decent 370. It's supposed to be the highest performance one (1.3-1.5) x 3033 as a single processor. The beautiful part is how they do 2-4 processors. Two memory controllers arbitrate requests on two separate buses for the 16 Mbytes in the memory modules. The memory controllers multiplex requests from 4 processors and 4 multiplexors from the I/O channel groups as follows:

```
                Mp          Mp          Mp         Mp

T.-K(system)---K(Mp)                            K(Mp)-----K(system)--T.console

         Pc1    ...  Pc4                  S1               S4

                                           Pio...            Pio...
```

A failure anywhere can be tolerated. The K(Mp)'s have separate power. T.console communicates to all modules. Pc has a cache (write through) and each K(Mp) broadcasts writes to all Pc's on a physical memory basis. They're after reliability and incremented upgrade (since their customers buy and want more capability). They're also going after the performance title! The O/S modification was <u>very</u> hard, due to the structure of IBM's system.

Loc: ML12-1/A51 Ext: 223-2236

Follow Up: 6/29/79

Let me suggest an idealized goal of future terminals:

> We should have a mix and match approach to terminal design such that a combination of line interface, modem, protocol, fixed or programmable intelligence, mass storage, graphics, and basic terminal can be combined over 2 terminal generations. Thus, a user can add capability in the field to an existing terminal as it becomes available and not throw away his old one. Our approach would sell modularity, range through upgrade and preserving one's investment.

Obviously this ideal is not fully attainable, but it is much more possible than the approach we are now taking.

Could we sit down and brainstorm the goal? Art please set up.

Digital **Interoffice Memo**

Subject: **FY77 Engineering Budget Overrun Request**

To: OOD
Operations Committee

CC: Bob Lander

Date: 13 DEC 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

We are currently headed for a $1.0M budget overrun for the year. If you authorize it, we can keep current projects on schedule.

Without this increase we must cut back to our original commitments at a cost to one or more projects. However, we must have guidance from the Marketing Committee or Operations Committee as to what's cut back.

The alternatives we see now to cut:

1. **High End/New Mid-range VAX** - the culprit of much overrun. However, this group is the only one on schedule. Also, I believe we need the products (STAR & COMET) most. The group is the most competent and motivated; hence, money spent here is the most effective.

2. **Medium - PDQ or 11/34 Enhancements** - By shutting off PDQ we incur a high loss in manufacturing and profitability since we'll ship 11/34's at lower profit level. The 11/34 enhancements (cache and CIS) would be delayed.

3. **Low - Krypton/DK/LSI-11** - Since this area is in it's formulative stages, and we're probably in the most competitively poor position, we probably need more effort in LSI, not less. There's not enough money here to make a difference.

An across the board 6% cut for Q3 and Q4 would be too disruptive to all groups and ought not to be considered because we're likely to pay a 10-20% penalty for a 6% cut applied to all projects.

The budget (situation) is attached.

Digital **Interoffice Memo**

Subject: **Operations Committee (and others) Concerns about OOD; Our FY77 Budget Overrun Presentation January 3 and 4.**

To: OOD
Bill Thompson

Date: 20 DEC 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

F/U 1/3

We obtained the $5M contingency for FY78. This means that the results of the Spring Red Book Budget are to be $61.4!

The 5M is to be unallocated during this pass!

Larry, will you please co-ordinate our approach for the January 3 and 4 meeting presentation? We are to interact with PL's for 1.5 hours and to help get resolution of our budget problem. On Tuesday, the Marketing Committee will either grant the $1.0M overrun, or give us guidance on cutting back.

Some suggestions:

0. Find out where we really are budgeting and what we really need! (I have negligible confidence in #'s now. Arny is soon to be full time...and none too soon.) I don't want to go back in March or be over for the year.

1. Get any $ direct on tincup (PL/by/PL) basis now before the request.

2. Get the presentation ready. There are all sorts of possibilities:

   a. Would they like to understand details of the overrun?
   b. What the %'s are in area?
   c. How do we manage?
   d. Does the grant mean we'll be OK on all projects now?
   e. What are some reasonable cutback alternatives (list 10)...and effect to strategy?
   f. Did we pay anything to change a support plan?

Other concerns raised in the meeting:

0. We have to revamp planning and communication now!

1. Ken Olsen - All PM's need a single boss (not clear if we can show hierarchy and levels-of-integration).

2. Ted Johnson - PM's need a charter (or since each level-

of-integration has different problems, a set of charters).

3. Stan Olsen - Because Julius is having schedule/budget problems, only proves CE is bad, no matter where it reports.

4. Jake - wants regular interaction with Larry on where things are.

5. We have to educate/prompt Ed Roberts. This is one chance we have to communicate with our peers about the development process! Bob, can you get several sessions with me to review the course with Roberts?

6. We have to continue peer-level interaction all the time to avoid this problem of continued uprisings. I for one am not spending what probably will have to be 20% of my time listening to MC/PLM's instead of looking on products.

7. Henry's mix #'s of cpu, memory, and disks are cuckoo. Dick, your hardware system's management is supposed to focus on this and provide sanity checks/configuration plans.

Subject: **FY78 Recommended 8% Engineering Budget Increase**

To: OOD
Operations Committee

Date: 13 DEC 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

CC: Bob Lander

As a budget strategy, we would like the corporation to set aside $5M as a "line-of-credit".

Expectations of what engineering can deliver are getting too high. The Red Book will address specifics. We want to cut back to what we can deliver for $61.4M, but this is going to make noise. Even with cut backs our $61.4M plan is too tight.

We want to propose to the Marketing Committee (after June 77) specific uses for the $5M on the following basis:

a. Technically innovative projects at the early project phase.

b. Market driven significant program or spec changes.

c. Schedule enhancement opportunities.

d. Return some to corporate profit.

Dear Bernie,

Since, I have had nothing of substance to do with the Annals, my role is that of a critic. I have three problems with the July issue that I consider to be quite serious. They are taken up in order of seriousness.

1. Criteria of articles to be published. Neither the Williams, Milligan, or Weiss articles should have been published. Williams sets a very bad precedent for vanity publishing about a course. Editorially no comments were made by you in "About this issue" that points to the fact that other courses have been taught and are being taught. Would you like me to encourage everybody else to send in their outlines? Or, would my associates who teach courses have their articles refused? I think you are trapped.

The Milligan article again is vanity publishing -- her story of an insignificant journal. It is quite different to have an inventor tell about the experiences designing a machine or language. This article would be ok in a magazine devoted to publishing. Not one on the history of information processing.

The Weiss review is not a review of the The Computer Museum, it is a description of the exhibitions and peoples reaction to them. This is appropriate for <u>Abacus,</u> that does not claim to be a journal of record, but not for the <u>Annals.</u> A review looks critically at an institution and its policies. The role of the Museum in collecting, publishing, and programming are not touched. You could have required this as an editor. As the head of the institution, all that I could do is correct is mistakes. I don't believe in vanity writing. A person in the Museum business that I showed this to, thought it was a joke.

In News and Notices, I don't think anything should be used from a press release. The Science Center is not history so it should not have been included. The Proposed Brtish Computer Archive notice does not fit the information that I know about. Was this from a news release or did someone check it out?

2. Editiorial standards. These problems were all compounded by the lack of editorial work to make the material focus and be understandable.

In the Tomayko article the circuit diagram illustrations are insufficiently captioned. I couldn't make head nor tail of them and didn't know why their had to be so many. The Scientific American has captions that explain what is going on to the reader. I believe this should be the policy of the Annals.

The Williams' article was poorly edited.
  para 2 -- run-on sentence (try to parse it?)
  an editing policy to change all reference's to time, "now", "today" etc. to exact dates is important in a journal of record.
  last sentence, p. 241 - Does this matter in a history journal?
  para 2, p. 243, starting "Obviously," ditto.

In the Milligan article, the inclusion of the part on "The Look" and then the two contrasting pages seems to be ludicrous. The Annals is not a design journal -- its like a computer architect article on the placement of the corporate logo and how it changed. That is appropriate for industrial design and the people who know how to judge it. Not the Annals. The article might have worked had it been edited down and put in some greater context.

3. Design, layout and waste of space. The paper just does not lend itself to photographs. The layouts are very wasteful of space and not terribly interesting. Many other publications get one-third more information on a page and are better designed and produced. Page 223 is a wonderful example of how pictures aren't worth words -- one was enough and they are hard to see and just waste space.

If the Annals feel that readers subscribe because there are 100 pages, I think they are wrong. Lets make the quality better and have some standards.

Sincerely,

Gwen Bell
President

cc: Arthur Norberg

Jeff's observation on the use of gate arrays is something that we should act on because it speaks to our competitiveness. Products coming from Japan (eg. Sony, Sieko, Sharp, Brother) all use custom parts as a matter of standard practice. On the other hand, our products are neither based on the commodity micros (excepting Rainbow and Robin) nor are they aggressive enough in cost, or form factor. CT has twice the parts of the IBM PC. Somehow we're content to settle for a hex full of logic when the design should fit on a quad. This requires much extra packaging, power, cost and servicing. Can this be the cause of our lack of product competitiveness?

An addenda to Jeff's message shows that gate arrays not only get lower product and powering costs, but the servicing cost is drastically less. Comet experience verifies the tremendous advantage of using VLSI.

EVERY engineering group should be orienting several designs using gate arrays in order to be competitive in the 80's and to orient our engineers to VLSI design. This means a major change in skills toward correct designs, with top down design and verification and simulation.

This may mean fewer, better designs. Within a few years, because of the orientation to quality and verification, we should see a tremendous increase in productivity.

What's the plan for your products?

SUBJECT: EARLY FEEDBACK FROM THE GATE ARRAY CENTER

As I've indicated to all of you, we have set up a small Gate Array activity within the Acquisition and Test Group which has been functioning now for about 3 months. The primary focus of this activity is not towards the high option rate users such as CPU's, but the large volume of SSI and MSI which is used by eveyone else in the Company. The Group is focusing its efforts on trying to get the gate arrays designed in and supporting existing systems as opposed to trying to develop something new and wonderful. So far things are going extremely well, with about 23 options to be processed in FY83 in other than direct CPU application. At least one of these is a cost reduction program which we hope to turn around in about 4 months from start to finish. We've got everyone signed up from gate array, through module, through requalification at this time.

However, the purpose of this memo is not to talk about the progress of the gate arrays, but rather to indicate what we've learned about design style and how people are making their choices of components. This is only an early reading, and clearly does not apply to all groups. However it seems to be typical and while I ordered them in what seemed to be the priority of decision making, different groups may use a slightly different priority. By understanding the motivations, perhaps we can turn the tables and get people to change their design habits and increase the level of integration.

The following seem to be the primary decision making criteria.

1) Form Factor

The primary forcing function seems to be size and form factor. We understand what size module needs to be built, and use essentially the lowest level of integration (simplest to understand) which will fit on the module. Once this basic boundary condition has been satisfied, the motivation for an increased level of integration wanes dramatically. In one specific application that we looked at, it would have been possible to replace an entire hex module of TTL MSI and other components with a couple of LSI packages and four gate arrays. This is one of the projects that was rejected. In doing so, a fairly senior person commented that if he ever designed a hex module with that few components on it, he'd be ridiculed for overkill. While the comment may have been made light heartedly, the fact that it was made at all is somewhat indicative of the overall evaluation process. What's missing from the thinking is that even though that particular product may have been very sparsely populated, at some point in the future someone could have put a lot more functionality on the board or designed a new board using the already developed gate arrays, such that the second product would be advanced because part of the job was already done. Since we don't seem to plan on re-using work, this kind of thinking apparently does not figure into the decision.

2) Debug Style

A very large number of our engineers are not familiar with using simulators or other debug means other than a scope probe. In order to use LSI components, particularly gate arrays in which the overall function is not easily quantified, it's necessary to develop a whole new set of debugging skills for the person actually using the component. Since you can't put a scope probe or wave-form analyzer on the internal node which may turn out to be a critical source of data, whole new methods of debug which involve a combination of logic simulation and traditional debug need to be developed. While the large CPU projects are now using these techniques, they are by no means common throughout the rest of the organization. In fact, quite often the equipment is not even there to attempt it. As a result, one of the tasks of the gate array group now involves helping some of these people to adopt new debug styles and to provide them assistance in getting solutions to some of their problems.

3) Component Costs

There seems to be a general tendency when making component decisions to go for the lowest component cost, independent of the assembly and other costs that might be attendant with the component chosen. Again, while this is not true with all groups there is much less consideration given to the ultimate maintenance costs, assembly costs, or for that matter even the opportunity of going with lower cost PC Boards than there is with the base level components themselves. In addition, there are a couple of financial barriers to people using gate arrays and other such technologies. First of all, if you are an engineer and want to bring in a unique component, you have to pay for its qualification costs. Often that weighs against bringing in an LSI device if there is any way of solving the problem with SSI or MSI. Additionally, when people add together component costs they're influenced by a quirk built into the system. Presently, we have set up different acquisition rates for SSI and MSI than for LSI components. Some of that is due to the fact that LSI components have a much higher component of test costs in them than do simple devices. Within the Semiconductor Industry tests costs have blossomed enormously in terms of their percent impact on final selling price. Beyond that, there's the fact that the equipment base and program development costs have all been written off on these older TTL devices. In total, this means that TTL MSI and SSI have an acquisition cost of 10 to 12%, and LSI has a present acquisition cost of 26%. While this latter number is totally unacceptable (down from 32% on custom devices last year) and will be brought down in the next year to a number which is much more competitive with the TTL MSI etc., it will never be as low as the simple devices. So when an engineer tries to make a decision about component costs, he actually see LSI carrying these added burdens. It drives people in the wrong direction.

4) Trade Off Risks

People are still concerned about the risks associated with implementing things in custom or semi-custom LSI. Fundamentally, I think it goes down to the idea that people only trust what they can control themselves. Since designing in LSI requires a lot of implementation issues which are outside the normal scope of experience and control, these are seen as large project risks. Rather than trying to go out and work that risk and invest energy into it, it's just much safer to continue doing things the way you've been doing them and are familiar with, especially if you can meet the other boundary conditions.

5) Power

In some situations, people run into power dissipation limits which make it impossible for them to implement the system in question. At that time, they will often go to LSI to get rid of the unwarranted dissipation associated with SSI and MSI. Again, however, this is generally only true down to the point where the solution fits the problem space, and then it no longer becomes a significant issue.

6) Reliability

There have been a couple of cases identified now where reliability is a concern. By eliminating some of the SSI and MSI components, people can see means of improving the overall calculated reliability of the system. Again, this is one of the situations where you need to get the solution within the limits of the problem and that's generally the end of it.

As I indicated upfront, these are early indications about the way people are making decisions on components in a large segment of the Company. By and large, these are probably the people who design in the most SSI and MSI today. Perhaps as we get deeper understanding of the motivational aspects, we can change some of the boundary conditions to force people to innovate and find it to be in their own best self interest to use the kinds of LSI components that are becoming available.

SUBJECT: CMOS GATE ARRAYS: WHO, HOW AND NEED ON ROAD TO VLSI?

Camille reported that CDC used CMOS gate arrays to build a 10 mips 7600 using 8K-12K gate chips. Six chips are packaged on each side of a 4 x 4 inch ceramic substrate. The cycle time is
25ns with 10ns interchip time. The machine uses 19 chips (with 9
unique) and the Cio is on a board. A chip is < .5w, 3 micron features, 160 pins, and 2ns gate delay. Motorola and National make the chips and Kyocera makes the substrate. FCS '82.
The Japanese are shipping products with large CMOS gate arrays.

We need a concerted effort to use these larger gate arrays:
0. We're in trouble if the CDC is real and marketed to kill.
1. Our low end products need fast turn around glue chips since we don't use fully industry standard VLSI. Even if we did, having gate arrays would also be advantageous.
2. We are continuing to perpetuate conventional msi ttl designs.

A histogram showing gate count for chips points out the problem: .4ssi, .2msi, .05 lsi (processors), .35 vlsi memory.

For example, ct has 2 times the chips as the IBM PC

3. In the foreseeable future, many of our systems will be one chip. We must train and evolve the designers to do these designs. The CMOS gate array seems like an entry.
4. The tools for these gate arrays look to be substantially like the ultimate VLSI in that they do NOT have video input or interaction. A design is specified like a program, and is compiled, routed and gets test vectors automatically.

Prakash is putting together a plan so that each group can do gate arrays. A group is investigating various design systems.
Jeff says that the users support this plan. I'd like to see this effort accelerated by having persons from each of the groups (16 bit, terminals, ct, comm, mid-range, and storage) contribute a benchmark design so as to evaluate the systems with real designs. Let's bring several of them in (eg. Lattice Logic) and try them on several designs by Q183.

Is the need absolutely clear? How can we get this effort going so as to make the system decision and then let people work?

follow up 2/7/79

The VT125 and the very low cost terminal in a keyboard, GIGI really look great! The architecture is a real, conceptual breakthrough since it is transparent to both operating systems and languages. Hence, it can be attached to any/all computers immediately. At last, it looks as if we can and must put together a set of four, compatible graphics products:

1. GIGI, the lowest cost simple graphics (including color) keyboard
2. VT125, the main, high volume base of the family
3. Bring in and see the, high cost, color Tektronix 4027 (modified to DEC architecture)
4. Making the ESG high cost, high resolution buyout terminal part of the family.

This would entail defining hardware and software architectures to encompass the above four terminals. Each member would have various levels of capabilities, just as we have in the 11 Family, but better controlled as to subsetting and evolution.

1. Take the Tektronix 4027 Graphics part as the base terminal architecture (ignoring their forms and editing architecture) and extend it to cover the wide range of terminals above. Put in TEK 4010 compatibility too. Use our VT52 and VT100 as the base of alphanumeric data types.
2. Define our own DECPLOT Interactive Graphic Interpreter (DIGI?) which would go well beyond PLOT10 in terms of capability as the software architectural base. (For example, although this is interactive, programs should be able to call it too.)

Thus, the terminals would be introduced to be a family, all of which could have the same capability at least when viewed through DIGI. We would come out with DIGI in a software package which would support all the terminals and have modest capabilities. Little, by little, we would add data-types and capabilities to DIGI, while also moving the software into the various terminals as they are introduced. (Fonz and TU58 in the terminal would allow an instant migration.)

Although this is a sketchy idea of my understanding of your direction, we can, if we really plan and drive it, get there quick. Let's not miss this opportunity.

When will the general direction be clear enough that it can be presented to us all?

The big problem is the unavailability of a decent simulator that you folks can run. Tewksbury engineers don't trust the 10 there because you have such a decrepit engineering process and facility.

You might be able to use the MR facility for simulation off shift.

We're scheduled to start the total board debug on the simulator on 2/15... so that will give us all more confidence that this is the way to design. Why don't you at least look at the effort required if you simulated? (It might give you an earlier product and reduce a pass or two at TI.

The deal I made with George Michael is that we would supply 50% off on a 784. Would you please review his proposal to us so that he can take it to various funding agencies for approval. He plans to go ahead with it.

I think the question we want to ask is whether we also inlude PPA in the proposal because that would make it a much more attractive rationale for them to get the 784. I view this is an ideal way to kick off the parallel processing effort especially since we are working together with them on the dataflow work.

Let's do it!

Tom, it is up to you to coordinate comments on his proposal and to get him a configuration that would do our job experimentally.
The Office Manager reports to the Director, the secretary to the DEC Operations Committee and a DEC Supervisor. Reporting to the Office Manager are the Secretary, Business Manager and

Store Manager. (This area needs clarification from Gwen.)

A. Management of office
   1. Supervise secretary
   2. Supervise Business Manager
   3. To ensure smoothly-running operations, act as interface to Digital service organizations such as Facilities, Field Service, Payroll, Personnel

B. Assist Director with Fundraising

1. Goal - coordinate 100 solicitation letters per month (over $100)
   a. Director provides lists of persons/groups to whom letters will go
   b. edit Director's letters for format, accuracy, style
   c. input list into list processing
   d. mail letters
   e. copy to correspondence file
   f. copy to Office Manager's Monthly Solicitation file (green folder in O.M.'s desk by month)
2. Month-end Membership Report
   a. for Executive Committee
   b. shows how many new members in each category
   c. includes list of all current solicitations
   d. who responded
   e. what results
   f. filed in Executive Committee Book (white book in Business Manager's Office)

C. Manage Annual Cost Center Budget
1. WHAT -- $60,000 from DEC
   a. includes O.M.'s salary
   b. aviation expenses
   c. supplies from Stationery
   d. miscellaneous shipping
   e. other
2. HOW --
   a. make up budget

    b. track it monthly
    c. keep Director aware of status
3. Budget overrun -
    new process to be worked out with Director to voluntarily reduce contribution from DEC to compensate

Other activities of the Office Manager

A. Proposed installation and management of 11/45 computer connected to all museum users
    1. in location off lobby
    2. work with Field Service of DEC to install
    3. obtain correct programming for each function
        a. accounting
        b. correspondence
        c. members lists
        d. mailings
        e. librarian-archivist procedures
        f. program dates
        g. others

B. General Assistance
    1. mailings
    2. travel arrangement
    3. museum events and functions
    4. others

C. Supervision of Store Manager (?)

Floppies used:

A. GERI - correspondence and other
    1. filed in O.M.'s office (2 drawer file, under Floppies)

B. BUDGET - Director's floppy
    1. updated monthly
    2. filed in Executive Committee Book (white) in Business

Manager's office

3. contains Monthly Membership Report

C. SOLCI

1. filed in O.M.'s desk in "solicitation" folder
2. contains Update Form
    a. updted monthly solicitation lists
    b. positive or negative responses recorded
    c. paper file - left desk drawer under "Project - Solicitations over $100

SUBJECT: RE GIGI SUPPORT

Andy,
I tried very hard when I had been excited about Gigi (before I knew about how we had botched it up relative to the VT125 and VT100) to get it into our systems. Pete Jansen doesn't have the foggiest idea of what this meant...
it is really very simple:
IN ORDER FOR A FEATURE OR TERMINAL TO BE INCLUDED IN A

SYSTEM, IT HAS TO BE WIDELY AVAILABLE TO THE DEVELOPERS!

Pete didn't do this, nor is the terminal very easy to get... as you have to somehow get the Barco monitor.

I don't have any strong opinion now, but I do believe the big issue (aside from the abysmal lack of architecture which is clearly engineering's screw-up) is that the product management did not include getting any support (I don't even know who it is or was except Pete.)

I do believe that EDU had better spend its money building PC support (which a university can probably give), s that we can get big systems business, versus flogging what may be a dead terminal.

SUBJECT: USING GIGI TO MAKE MANY BIG AND GOOD, SMART TERMINALS

It seems to me that if Graphics takes off in any sense as a terminal, we have an interesting gadget in Gigi. Here, I would add some very simple rom, probably just a rom socket or preferrably a socket that can be plugged in from outside, to start with.

The purpose of the rom would be to use the 8K Microsoft Basic that GIGI has as a programmable device to convert the

terminal
into various simple "smart" versions. For example, why do we need the 134 when we could write an emulator? Or why not an emulator for the tecktronix? Or for the expensive IBM color terminal?

I do not believe we should be building the terminals that are being contemplated in TPG, but rather we should be honing our existing terminals and doing things that get volume by combinations of programming in the terminal and on our systems
(ala the ECS work). Here, I think the roi is potentially very high if we take this approach and we can follow it up with
even better versions of CT100 and CT25 (Gigi 1.5). The money is there and the talent is too, if we just direct it. This way gets us much more volume on existing terminals.   Let's make Graphics an essential part of terminals design. Gigi looks like a good way to do this.... also, it can be used in some very interesting way as a forms filling terminal, etc. in the transaction processing domain, using various character sizes, filled in areas, colors, etc.

I think the same statements can be made if we try to use Gigi in the MDC market for Mimic diagrams.

Summary:
Let's put rom in gigi asap and make it the base for fixed function "smart" terminals. The number of products we can build will be high, and they could all be money makers.
What youse think?

SUBJECT: RE: VK100 (GIGI) INCOMPATIBILITIES WITH VMS

There are clearly about 3 items:
1. Get an architectural group for terminals. This is a crazy situation. The 125/gigi incompatibilities are dumb too.
2. Fix Gigi. Make it right! We can't support all these variants.
3. Start by working the issue... clearly past due.

GB2.S5.68

Glossary

A/D- Advanced Development- a group within each development group whose goal is to show feasibility by building working breadboards

Beige Book- all project plans and resources for each group for next 3 years

CAD- Computer Aided Design. Covers use of computers to engineer computers and includes every aspect from simulation to analysis and design

Computer Engineering- book by Bell, McNamara and Mudge for detailed definintion

Computer System Component- the part, we call an option, from which a Computer System is built. The components types are: CPU's (which is actually the processor, primary memory, and controllers for other options), secondary memories (currently disks), tertiary memories (currently tapes), printing and CRT-based terminals, and special hardware options. Other components include the software, cables, and all documentation.

EBOD- Engineering Board of Directors (subset of Marketing Committee responsible for reviewing and approving product development strategy

EMS- Electronic Mail System for creating, storing and sending messages to all persons who are subscribers to the system.

FAT- Final Assembly & Test- manufacturing site where various parts from high volume are collected, inventoried and assembled to fill customer orders

Field merge- computer system component or option that is part of a larger system that the customer buys. The option or product is capable of being built in a high volume manufacturing plant, shipped to the customer and connected to the systems by Field Service (and eventually by the customer) with the expectation that the combined system will work. This also denotes method of manufacturing.

GIGI- a product designed for Education marketplace which is a CRT controller packaged in a keyboard. The next version of the prouduct includes the processor and primary memory.

Individual Development Plan- a career plan made by individual with manager

Interconnect Task Force- group to assess position in Physical Interconnect (see below) and recommend how we improve it. Encompasses the technology, capabilities of CAD and of plants to manufacture the technology

Large Systems Development Group- responsible for systems selling for over $250K

M/E- manufacturing and engineering

Mass Storage Group- products used for secondary and tertiary memories. Includes disks, tapes, magnetic bubbles, video recorders

Mid and high end disks- disks for mid and large systems

Mid Range Systems Development Group- responsible for systems in range $16K-$250K

Network Interconnect- the means by which all our terminals and computer systems are connected together. This includes the network structure called Ethernet which we are jointly specifying with Intel and Xerox.

OFIS- a set of projects including word processing and electronic mail for use in offices

PDT- a small system that packages processor, primary memory, secondary memory, terminal and communications options together in a co-ordinated fashion

Performance Analysis Group- responsible for measuring and understanding why products perform the way they do

Personal VAX- a VAX computer oriented to a single user which has a 1000 line, high resolution CRT

Physical Interconnect- the scheme by which Integrated Circuits are coupled together. This area covers chip substrate carriers, printed circuit boards, backplanes, and cabling. See Computer Engineering book for details.

PMC- Product Manager's Committee- Si Lyle, Product Marketing Manager, staff

PMMMM- Si Lyle, Product Marketing Manager for all products

Point of Manufacture- a manufacturing organizational structure which Jack Smith is implementing that eliminates FAT plants such that various computer system components are built in high volume plants and field merged

Product Strategy- same as Red Book

Red Book- development strategy with past and future products for Product Lines

Research- group mostly concentrated in a single group. Oriented to several focussed projects, such as building a secure computer system, a personal computer system or a Database system that can be queried via forms. Projects are not oriented to making a particular product, but oriented to getting results or building an experimental breadboard by which a product can be made.

Small Systems and Terminals Engineering- all products up to $16K selling price

Stratton- an annual, three day meeting of 250+ representatives of all the engineering groups. Plans and direction are presented for many of the groups. Video teleconferencing was used to extend audience by 250.

System (or Computer System)- an assemblage or combination of parts (or computer system components which we call options) forming a unitary whole. Note this is the standard dictionary definition as applied to computers.

Technical Director- part of Office of Engineering. Responsible for Performance Analysis, Architecture, Standards and Advanced Development.

TRAX- a transaction processing system for commercial market. Very good specifications, but poor implementation. Delivered only 12 and withdrew it.

VAX- our 32-bit computer architecture, also used to mean the total system we have introduced as the VAX-11/Model 780 running the Virtual Memory System software (VMS)

Venus- follow on VAX Model 780 that will sell for about $250K

VT100- a CRT-based terminal that connects to a computer system

WPS- a Word Processing System

11/70mP- a multiprocessor computer system based on the 11/70 designed to provide both performance and higher reliability and availability. Described in Computer Engineering book. A superb product, but came in behind schedule. Sales on the VAX picked up and as a result we decided not to market it.

Subject: OOD Goals (and Objectives) FY80 [and how we did against them]

To: Ken Olsen Date: 8/7/79 [edited 8/26/80]

From: Gordon Bell/Larry Portner

CC: OOD, OC Dept: OOD

Loc: ML12-1/A51 Ext: 223-2236/2471

Grade (Bell/Portner)
Goal - (8/7/79)
Performance (8/16/80)

0.
B- Build products as per Red Book (show 3 years and 5 years till end of life)
C and corporate strategy.
B- Manage according to budget and schedule.
D Poor schedule performance. Spent over budget, but understand why.
Operations organization installed and helping. There's good plans.
We have a fundamentally new and consistent phase planning process.
A- Stability, yet excitement.
Turnover is relatively low. Projects are stable, aggressive and exciting. We decommited TRAX (C-) and 11/70mP (A-).

1.
A- System orientation: make Small, Medium and Large Systems independent and
B+ the planning centers.
New system configurations reflect this.
B Have really clear charters and contracts by site, with only minimum

B+ central support and inter-dependence.
Power and packaging are coupled, -physical interconnect proceeding.

B The systems centers will work with Mass Storage, Semiconductors to the technologies they need for their viability.

A Mass storage product manager is resident and coupled.

C There is a process to couple users to producers of MOS and Bipolar.

2.

B- Significantly couple with the product line engineering groups where joint products and planning is essential for avoiding replication, insuring compatibility and leveraging base investment.
We sit on the group product line staffs!

3.

B+ Start to move to applications, versus base systems focus as per Product Strategy on the basis of measured funding by level of integration.
OFIS program for WPS and EMS is a major accomplishment.
Groups and components are going on the Personal Vax.

4.

A- Continue to improve EBOD, PMC, product marketing support through PMMMM.

A EBOD is working. Programs for product marketing in place.

B- Aggressively support marketing organization and improve coupling.

B+ Coupling through staffs. Doing product positioning vs market.

B- Use the contract process for product decisions and pricing.
This has been established.
Showed by example, through Venus, of a comprehensive plan which includes all aspects of the product's life!

F Review product profitability against the plans.
EBOD has been given this directive. We can examine VT100 and VAX.

5.

A- Build a first class architecture identification,

specification, and
A control function such that the Corporate Product Strategy can be implemented.
All groups exist, with connection to Technical Director.
A Make the Network Interconnect charter of Medium Systems a key interface and control organization.
Happened very well! We have the structures coming along to build
and interconnect computers for the next 10+ years.
B- Establish Small Systems and Terminals architecture.
Being exercised and tested now.

6.
B+ Keep our people and make DEC an exciting place to work and have high morale.
see 1
B- Get a human resources plan (HRP) so that we are able to have a resevoir of technical and managerial talent.
The Individual Development Planning part of the HRP is working.
C- Have available, almost trained replacement managers for two senior levels of engineering.
This review hasn't happened yet.

7.
B+ Get metrics for all products and processes permitting a better method of
C resource allocation based both on position and strategic need (market).
Several Redbooks (sets of plans) have been formed; including CAD and
Performance Analysis.
An Interconnect Task Force has started to work on this
critical area. Very high quality product positioning data and
benchmarks are available in nearly every area.

8.
B- Review for all our groups at least annually.
A- We had a 2 day major program review and set up a review cycle. We
have started to review every group based on the Beige Books.

9.
F Review our ability to produce reliable, quality software

in a timely, cost-effective fashion.
Did not do. Intend to use the review process above. However,
we do have a clear plan, together with some advanced development.

10.
B+ Review our R and D position by getting advanced development in
C development groups.
The RAD Committee reviews. Nearly every group has an A/D function!
The R and D group is now R and more research oriented.
B+ Get plans for 80's show possible 85 products.
C The systems in the mid and high end have been layed out till 90.
We need this for semis, disks, terminals and low end. Ok till 85.

11.
B+ Increase overall effectiveness by managing the Engineering and
C Manufacturing interdependency.
Had first joint meeting! Strong intent, less progress. Have common
issues list and people working on them. Have proposed a segmentation
and coupling which must me consistent with Manufacturing
reorganization.

SUBJ: **OOD Goals (and Objectives) FY81**

TO: Ken Olsen, ML10-2/A50
Date: 9/3/80 Wed
From: Gordon Bell/Larry Portner
CC: Operations Committee
OOD
Dept: OOD
MS: ML12-1/A51/ML12-1/T32

Ext: 223-2236/2471
EMS: @CORE

OOD Goals (and Objectives) FY81

0.

Build products as per Beige Book (shows 3 years and project end of life). Update and clarify the corporate strategy in the Red Book and rate us. Manage according to budget and schedule.

1.

Continue to build a systems organization around products by size, and have clear alignment with various manufacturing sites, focusing on problems. Streamline Engineering (reinforce accountability and facilitate decision making) in terms of Product Development Engineering (PDE) and Office of Engineering (OE) such that more people are working in PDE with less matrixing. The OE will manage by formal review approval and inspection versus hassle. Build a single packaging/power/physical interconnect (PPPI) organization with a clear charter which is understood by product groups and plants.

2.

Increase the percentage of software spending for applications and increase the number and quality of groups in this area.

3.

Keep our people and make an exciting environment with high morale. Get a human resource plan that is well understood within organization. Have trained, replacement managers for two senior levels of enigneering.

4.

Review all groups annually as per their Beige Books. Review selected programs as appropriate. Especially review our ability to design and build software systems.

5. Review past product performance against plan so that we can better understand resource allocation, especially consider induced investment and ability to manufacture in a timely fashion. Review new products in terms of total resources (expenses, capital, computers, space and people).

6. Increase overall effectiveness by managing the Manufacturing and Engineering interdependency. Cooperate in the Manufacturing reorganization to assure the best coupling for planning and execution (product introduction).

7. Establish a long term strategic frame work to guide our investments in technologies, products, and related processes.

Subject: **OOD Goals FY79 and Performance Against Them as of 7/28/79**

To: Operations Committee

CC: OOD, Barry Burns

Date: 6/13/78; Updated: 7/28/79

From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

ORIGINAL PERFORMANCE AGAINST GOAL

0. Build products as per Red Book.

Product Strategy and needs caused changes, else ok.
Manage according to budget and schedule.

Underspent by 2M (indirectly causing slips)
Hold organization together in face of lower growth (budget), and evolving market organizational changes.

Organization, new people, Larry and charters feel very
good now, despite changes. Turnover is still low.

1. Improve management process by clarifying organganization and organizational boundries.

Major improvement this year. Next year will be better.
Includes technical director function,

Solid and necessary to get Strategy going. Other parts

of organization are considering similar roles.
communication engineering,

Have it together finally under Demmer (Plowman).
commercial engineering,

Fauvre left, Daley is really good. Product position is

improving rapidly (eg. Cobol, TRAX).
CAD,

Are finally getting there...still needs work.
physical interconnections (PIC),

OK, but still can improve in direction and coupling to

systems groups and to manufacturing.
small systems,

Really great...have got it together.
architecture,

Very strong, and must be for our future.
diagnostics,

Being decentralized, also strong central technology.
microprogramming/microprocessor support.

Finally we have a good group (Bill Segal).

2.More development dollars (from base systems) into applications in line with group product line strategies.

Are holding base systems. Resisted many new base systems. Must move to more applications as per goal. Need measures to manage resources.

3. Work to make EBOD,

Feelings about EBOD were mixed. Si, Larry, and Andy are

committed to make it much better.
Marketing, and

VAX was moved to Tech. Prod. need to do this elsewhere.
Long Range Planning more effective.

Finally have two year planning horizon...next year we

must go to 5 years!

4.Get strategies and metrics for all products and processes with outside comparative data!

The RAD Committee has made this work quite well. Most
areas have measures of goodness.

5. Make the Product Managers more effective.

The PM Committee formed and solved several problems in planning, systems definition, product introduction, and

role definition. Si Lyle managing this should really
make for an effective organization...we're ready.

6. Focus processes and design factories for:
LO (NMOS and by-out microprocessors) I/C,

Pretty good, note Fonz and future direction
Mid (Bipolar and HMOS) I/C;

COMET, our first gate array work, had surprises.
Hi (ECL and follow-on) I/C,

We depend on Motorola, our CAD looks good.
Marvelous Module Making Machine - 4M (so as to reduce product cost turn around).

Didn't touch this one. Probably can't.
DECnet moves into distributed processing (production versus craftspersons), and

Shipped Phase II. We lead, but IBM's moving up fast.

Still want more technology here.
Software (implementation language, interface management, piece parts, portability, verification, and performance analysis/measurement).

Made progress in all parts, especially performance.

7. Establish some inter-group forum for team building across all of engineering (especially those in P/Ls). Communicate products and requirements so as to identify duplication and basis for future building.

We did not do this. It needs to be done and now I have

much more support in CE and PL's (eg. Stan and Bruce)

to improve next year.
Engineering management should understand products.

I feel better that they must and do.

8. Formalize management, especially planning and review process for non-product part of OOD budget.

Tools and RAD are working very well. Will be more

specific next year by area (eg. project management).

9. Make Research and Advanced Development more effective.

Excellent coupling to Small, some in Mid, little in Large and Software. Finally people are seeing how to

and why to build advanced development of their own.

10. Given that we can't excel in all products/technologies, make a statement as to just what we are good at and intend to dominate.

The Product Strategy came from this goal (and visits

last summer to customers). The result is more focus

in engineering.

Personal Goals...described after the fact

1. Make an everlasting organization which is composed of quite independent parts, several of which have to work together,
independent of much energy from me.

This is finally happening...or I don't see it isn't.

The main gain is seeing several next generation people (10-20 years younger) to raise quality.

2. Make a substantial technical contribution and delay technical obsolescence as long as possible. (Know where I am obsolete!) The temptation is always to define and assign.

The strategy took much energy. There are little

things, but I want to do more.

3. Build an interesting environment for understanding computing.

Have encouraged Digital Press, am trying to get a hi

quality museum with surrounding talks and papers so

that our people can interact with some great people.

4. Stimulate basic research in computing.

Served on NSF panel arguing experimental use of computers. Advise IRCAM (computers in music). Selective talks. NSF referee. On NAE nominating committee.

5. Understand a few business and engineering management issues.

Visited Japan. Wrote and presented a paper on it

internally, at Dartmouth conference on innovation,

and at Harvard Japan study group that included

Ambassador Reischauer (under Vern Alden's sponsorship).

From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

0. Build products as per Red Book. Manage according to budget and schedule. Hold organization together in face of lower growth (budget), and evolving market organizational changes.

1. Improve management process by clarifying organization and organizational boundries. Includes technical director function, communication engineering, commercial engineering, CAD, Interconnections (I/C), small systems, architecture, diagnostics, microprogramming/microprocessor support.

2. More development dollars (from base systems) into applications in line with group product line strategies.

3. Work to make EBOD, Marketing, and Long Range Planning more effective.

4. Get strategies and metrics for all products and processes with outside comparative data!

5. Make the Product Managers more effective.

6. Focus processes and design factories for:

LO (NMOS and by-out microprocessors) I/C
Mid (Bipolar and HMOS) I/C
Hi (ECL and follow-on) I/C

Marvelous Module Making Machine - 4M (so as to reduce product cost turn around)

DECnet moves into distributed processing (production versus craftspersons).

Software (implementation language, interface management, piece parts, portability, verification, and performance analysis/measurement).

7.Establish some inter-group forum for team building across all of the engineering (especially those in P/Ls). Communicate products and requirements so as to identify duplication and basis for future building. Engineering management should understand products.

8. Formalize management, especially planning and review process for non-pots part of OOD budget.

9. Make Research and Advanced Development more effective.

10. Given that we can't excel in all products/technologies, make a statement as to just what we are good at and intend to dominate.

GB0004/28

OOD GOALS FY 80 (GENERATED BY OOD) 8/2/79

Products and Plans

0. Build products as per Red Book and Corporate Product Strategy. Manage according to budget and schedule. Stability, yet excitement. (GB only)

1. Ownership/Leadership by OOD to a clear, written Product Strategy, showing 3 year plans and projected end of life to 5 years, with a committed implementation plan and supported by underlying technical (technolgy) plans.

2. Lead to get all Corporate

Product Development plans explicit and aligned with important strategy dimensions (eg. quality, ease of use, compatibility, networking).

3. Understand how we are competitively measured in terms of total cost (to buy, service and operate) effectiveness and establish a strategy for positioning (whether leadership or not).

Systems Emphasis

4. Clear, unambiguous systems responsibility and focus with organizational simplicity and clout to execute.

5. Explicitly understand, contribute to and support the base technologies of mass storage and semiconductors necessary for the effective systems.

Product Market and Quality

6. Be perceived as #1 by our customers in product quality and ease of use.

7. Be the most desireable alternative to IBM.

8. Be demonstratively and viably unique in the type of solutions we offer, recognizing that once we achieve leadership we will be imitatated.

9. Establish programs that contribute to ease of doing business with DEC.

10. Provide a strong Product Business focus. Use the contract process and review history of products.

Engineering Processes

11. Develop an understanding of the Design Processes for Technology, Tools, Processes and Competition.

12. Develop an R and D strategy for

DEC in the 80's.

13. Identify and eliminate the barriers and hassles within our processes to enhance productivity.

Interfaces among all engineering, service and manufacturing

14. Increase DEC effectiveness by managing the interdependency between Engineering and Manufacturing.

15. Develop an joint goal sets with Customer Service Organization to enhance DEC effectiveness.

16. Establish a collaborative and supportive environment across the engineering organization. Concentrate on modelling this behavior within OOD.

Personnel and People

17. Establish and maintain a positive, "people oriented" environment.

18. Make the company feel good about engineering by demonstrating capability, responsiveness and performance.

19. Sponsor an environment that allows and encourages entrepeneurial and creative behavior.

20. Understand our future staffing need 3-5 years out and develop specific programs that address those needs.

To: Operations Committee

Date: 8/7/79

From: Gordon Bell/Larry Portner

CC: OOD Dept: OOD
Loc: ML12-1/A51/ML12-1/T32 Ext:
2236/2471

0. Build products as per Red Book (show 3 years and 5 year till end of life) and Corporate Product Strategy. Manage according to budget and schedule. Stability, yet excitement.

1. System orientation: make Small, Medium, and Large Systems independent and the planning centers. Have really clear charters and contracts by site, with only minimum central support and inter-dependence. The systems centers will work with Mass Storage, Semiconductors to get the technologies they need for their viability.

2. Significantly couple with the product line engineering groups where joint products and planning is essential for avoiding replication, insuring compatibility and leveraging base investment.

3. Start to move to applications, versus base systems focus as per Product Strategy on the basis of measured funding by level of integration.

4. Continue to improve EBOD, PMC, Product Marketing Support through P^4M. Aggressively support marketing organization and improve coupling. Use the contract process for product decisions and pricing. Review product profitability against the plans.

5. Build a first class architecture identification, specification, and control function such that the Corporate Product Strategy can be implemented. Make the Interconnect charter of Medium Systems a key interface and control organization. Establish low end architecture.

6. Keep our people and make DEC an exciting place to work and have high morale. Get a human resources plan so that we are able to have a resevoir of technical and managerial talent. Have available, almost trained replacement managers for two senior levels of engineering.

7. Get metrics for all products and

processes permitting a better method of resource allocation based both on position and strategic need (market).

8. Review for all our groups at least annually.

9. Review our ability to produce reliable, quality software in a timely, cost-effective basis.

10. Review our R and D position by getting advanced development in development groups. Get plans for 80's show possible 85 products.

11. Increase overall effectiveness by managing the Engineering and Manufacturing interdependency.

<u>Additional Goal #11</u>

Get a Larry Portner replacement by January 1, 1979!

First follow-up October 2.

Present a definition of PM's job, what they're responsible for and how they're measured.

Andy is to review their performance.

The strategy is to be presented at EBOD on September 20 (please schedule) for review and recommendation and to individual staffs (Stan, Julius, John, Ted) before this. The Marketing Committee will approve.

Golden Bee Museum Collections
Dept. TF-9
P.O. Box 7000
Greenwich, Connecticut 06830

Dear Sir:

Please send me a catalog. I'm especially interested in replicas of computing devices.

If you do not have some of these, how large an order to you need to make and design such objects?

Sincerely,

Gordon Bell

Vice President, Engineering

GB:ljp

GORDON BELL AT STRATTON V: PBS ALTERNATE STRUCTURES

I made the mistake of not having GIGI-generated slides, and as a result they penalized me by only showing them at half-scale (laughter). Which I think is right: if you don't keep up with the times, you get the shaft. (laughter) But on my second talk on Friday, I will have GIGI-generated slides. They will be generated during the course of the next two - next three days. Somehow, Jan has said, "Oh, this is..." - STRATTON is a meeting that she says is mine. Well, I think it's not mine. I think it's clearly yours. I'm really impressed with the - with what's been achieved here in - I guess in many, many dimensions: the quality of the presentations, the demonstrations, just what we've gotten done, and in fact, it's so good that we're going to schedule a STRATTON in some of our plants so that we can get some of our products shipped that we have promised and scheduled (laughter), so there's going to be something called a Distributed STRATTON associated with each product now, in order to meet some of the deadlines that we've got. But seriously, I think that it sort of shows what deadlines will do, and also just what a lot of money will do in terms of going after some advanced development and having the right set of goals. It's exciting that we can now have some - we're seeing the signs of having better products, probably spaced longer in time, so it's really counter to what some of the arguments have been. I think we'll really make out a lot better that way than having a lot of products that are obsolete when they come out and I see some signs here of having some very good advanced products when they come out and I think that's a better approach.

Actually, this is three talks in one: one on Distributed Processing, which has to do with the - really, the root of Profession-Based Systems - because, like Dick's theme was balanced, I want to balance Dick's balancing by saying that to me the professional systems that I think are going to be exciting in the - probably in the near term and then even over the long term - really are predicated on a significant amount of distributed computing and we get two concepts mixed up here in professional - when we talk about the professional systems: one is low cost and personal - and the idea of having profession - and I don't think - I think we ought to keep those things separate. Not that we shouldn't strive for low-cost systems. But I think we should strive for cost-effective systems. I want to make sure we keep those ideas separate. The other thing is to - just to give some of my thoughts on Profession-Based Systems - and then the third talk is really on some of the human engineering details that I think are important about personal - or when dealing with people who have to use these systems which I - some slides I took last week of some of the systems that I use. Okay, the first slide.

So, really these are the - notice the - I hope you can - some of you can read them. They can be read in all of the remote sites

because I told them, "Cameras, zoom in on those." I can read them. I hope you can. Fundamentally, that it - that the profession-based system and - I'll say for large organizations, because I think that's totally different than the retail products store kind of problem where you're selling small systems to a small organization. That, fundamentally, there's a hierarchy of computers, including personal computers, that is, computers associated with an individual. That's sort of the first talk, and - which is really cleaning up a lot of last - the tail end of STRATTON last year, which is where we left off about a year ago.
It's - the second talk is really on the first - I'll call it the first level of profession-based systems. Let's not worry so much about the profession - each of the specific professions - say for the next year or two. Let's get what I call generic applications dealt with, namely, things that everybody has to do in a large organization; that is, handle text, handle graphics, handle filings, handle communications, and in fact, Charlé's system there, I think, is probably one of the best I'v seen as - that may be the right kind of terminal for the - for dealing with this set of problems.

And then the third talk is really on "Hey, let's worry about some of the attention in terms of human engineering and the cost of a capability." Now, I want to coin something which is - which - I don't know - I haven't got the right buzzwords yet. I'm not a marketing person. So we'll - we need some marketing people here to tune the new concept out. But it's beyond cost of ownership. I want to introduce a thing called Cost of a Capability or Cost of Providing the Service. Because I think we all only focus on the cost of ownership and what we really ignore is what is the total cost of use. So maybe it's cost - let me say it's Cost of Use - it includes the cost of ownership but in fact the real dominant cost is having somebody sit there and look at the thing. So here goes -

These first level of generic capabilities, goals I'd like to have for 1985 - I want to probably revise those upward, given the SUVAX, because it looks like we can get there, but I just needed something to feed my imagination a little bit. And certainly, at the word-processing level, full-page, voice-input graphics, profession-dependent archives at document parts and all documents - that is, the ability to retrieve parts of documents and put them all together in a sensible way, not by having to call it out by with a programming language or by commands but by some other means, something - probably using something like the knowledge-based systems to generate how you put those together. User typesetting: I want to be able to do my own typesetting, to generate my own slides and that should be part of the capability - I don't want to go through the middle man of having to have other people generate slides. Filing cabinet: yes - very good electronic filing cabinet, ultimately searching on the contents. So be content with searching for key words that you imbed in a document but then ultimately we really want to be able to go in and look through the document. The mail systems: certainly we want voice there, computer-conferencing to happen, and then I'll say personal videoconferencing in sight. A pretty good idea of how we want to do videoconferencing by 1985. Communications: certainly all the interconnections with the other computer companies which we - which I think our official party line is called INTERNET. PACKETNETs, which are the public network message - message networks - and then I'll say the old nets or the non-computer nets: phone and TWX and other institutions that have networks that we have to be able to interface to. We want the system to be able to deal with that. So, to me, that's the sort of first - that's the level that I think we want to be operating on. That's essentially the FORTRAN, the cost-enter(?) systems by the 1985 area.

Yeah.

Q: Gordon, are you proposing that we recognize voice and turn it
into English?

A: No. On that one, I believe we're limited by our ability to sell - to provide systems by whether or not we have voice input. I'm proposing that we have some combination of voice/text recognition so that you can correct on the fly as you dictate. We've got a Demo, I hope, that shows what I mean by that, made by an unbuildable machine right now, but I believe that the speech recognition - with proper feedback, I think the speech recognition capability we have now at an isolated word will let us do voice dictation, because I really see that as the limit of use now. There's a whole set of culture - of people who are not going to type. Either they can't type or they will never admit that they can type. Let me say, my peers, for starters.

Yeah.

Q: Recorded voice: do you see that as well?

A: Recorded voice?

Q: Recordings of the voice.

A: Oh, I think that's an interim stage that we will deal with - voice answerback so that the thing will sit there and behave as an expensive phone answering machine.

Q: I was referring to actually dictating and sending that coded voice to some of the personal office(?)..

A: I think voicegrams are an - that's an interesting interim way to go. I think we've - clearly we've got to do a bunch of experiments here to see whether that's better - or getting the whole message up at once. I really think it depends on what the thing is. The whole - this was the point I just made on whether - is it personal or shared? And I want to point out that everywhere, with the exception of disks, the - all the economy of scale is disappearing. The only time you get better cost-per-something is with large disks. In terms of keyboards, they're hard to share - to make a great timesharing keyboard that we all play on (light laughter) or even a primary memory or a processor. Processors don't cost anything. The primary memories are getting so that they don't cost anything. We're limited by a tube and a keyboard that that are already fixed in cost that we can't share. So the strategy is one that we've outlined that Dick has talked about, essentially moving through - we've been providing very general tools, namely with these kinds - I'll liken it to the fact that we've been in the lawnmower business by providing wheels, gasoline engines, wood, and it's simply up to the users to build their own lawnmowers. You can build lawnmowers and cars and everything else with what we provide. But I think we're going to move into a much more general - from a general to the specific generic, and then go into the much more personalizable things, which is probably beyond this. So the problems are clearly distributing and sharing programs - programming and data among this network, and then the other problem of simply how do you use the stuff, because I really - I come up against that every day in the systems that I use.

Here's where we were - I wanted to sort of report how we've come over the last year.

This is roughly the slide that I put up a year ago, which was - this is the environment that we're heading to, that we're building. I'm happy to say that the Interconnect program under Dave Rodgers and George and Bill Demmer and Gary(?) has really come a long way. This was a - I'll say a virtual network last year and now I see signs of it being a real network this year. We are - we've got a lot of the details fleshed out. We start with the top level, the central-sited computers, and in fact, in my - can I have a pointer? - introduction, I describe these - this is also in the handout. So, I believe that computing will continue along the lines that it has today of the central-site computers, these local group-level computers, that is, a computer assigned to perform the function of a group, which turn out to be mini-size computers, and then going down to the professional personal computers, and personally I've been interested in how do you take a program and move that around dynamically through that network, or even how do you take any kind of a program, even on a fixed basis, and have it work with any of the next levels. So I think that migration and cooperation among the various levels in getting the right kind of operating well. Jack Gilmore's slide of trying to follow those - essentially at those optimum points is the name of the game here, because these really represent the three curves that he had. But the impressive thing is that we've got CI coming, we've got the NI that's just about to be - an agreement with Xerox is going to be announced in the next week or two, in terms of providing coupling within an organization, and then down at this level we're working on the communications. And then, of course, you see SUVAX here as a beginning to see an inkling of what one would provide there, plus, of course, all the proliferation of everybody building a personal computer for something.

This is roughly the slide that corresponds to what I have in the handout in terms of what are all those levels going to do. The only one that I really forgot was in fact the fact that what I think the central computers are going to provide more than anything else are communications among computers, and the communication-oriented services, like a central mail facility. Strangely enough, I forgot that. I think that these machines, in a sense, are going to be out of business in many environments and just be in a holding pattern, if people try to get off of them. They have to be there because the data is enmeshed in the computation and these big COBOL programs and you probably can never move it from there, and so there's - this is job security for many centers and I don't know - you know - but I don't think it's going to grow. But clearly it's going - nothing here is really - these are all specializations rather than economy of scale. The only thing that I think is really special, that you really want for the central facilities to provide, is the archiving of a lot of the file stuff, because this is where it really costs to have individuals be their own filing clerks, becuase they lose the data and they don't worry about backup, and again the cost per byte there is in the right order. The group level machines: right now I believe these are the most cost-effective because they are the best matching of what does the group do for that - there's a group function, like a design group or a word-processing group, and you get cost-effectiveness by having only a single program or kind of a set of programs for that collection of people. And with processing power, what it is - this is kind - you get enough performance here, and then you're really doing a very good matching of needs to resource. Right now these clearly win in almost every dimension when you - if you can cluster a number of people around a single function system, they win, and in fact, this is why many computers have come in. Now what we see is, in fact, these guys coming in saying, "Gee, why do it in a cluster or why do it centrally? Just give it to me and let me do it at a personal level, having computed now or - having computed and still computing at all of these levels, this one has its set of problems, which I want to - which we'll get into on the last - my last talk, because we tend to thing of them as a panacea, and what happens is we all end up spending time doing all of the things that somebody else used to do for us, probably more professionally and more cost-effective. And the ultimate in this is: take all the computers away from everybody, give them all TI calculators, and have them programmmed in octal or decimal, which is what you program in in those hand-held calculators, and look at what the costs are for that. Very cheap to buy but the cost of ownership is the most. So I think these are the functions that we'll end up doing at the personal level facilities, and the SUVAX is kind of my ideal of - slightly modified, of course (light laughter) - it doesn't recognize that several people may want to use the same personal computer, for example, and that your personal computer isn't small enough to take home, and you need a port into it, but it's a good start. I like the - the resolution on the tube's(?) just right.

The - this is a slide Terry gave me which is really the status of the Interconnect at this time, which is - the other - the first slide on its - actually, upside-down - with a bit of information added. The low - the terminals are here, small systems here, mid-range systems and the large systems, and what this shows is the various ways of interconnecting these various systems. This thing - this symbol is a CI symbol, which says all of these computers are tied together through CI. There's some - all the other slides - all the other colors, which are a little bit hard to read. I won't go into - but, in essence, these various systems are connected together all through an NI type of structure. It really is - with the proper transformation, it can be shown that the two map(?) ones - I'll leave that to Terry in his talk. But I'm convinced that they are the same and that we are building this distributed computing system. And I think this is where it's at; this has really been our strength, and we are, particularly the software engineering network is, really a testament to the fact that this stuff works.

Now I want to go back into my system, and this is one of the central systems that I compute on. This is the input communication link that we - this is why NI(?) - come in through the telephone to PK1, in through some patch panels, and hope that I didn't get cut off, lots of scopes to map everything to everything else. If all else fails, there's a T-bar here which takes all the communications on one system and throws it to another system. Then it goes into all the modems of the thing, and then finally it gets to the computer. So we think - we happen to think that the computer is the most central part of this, but in fact, it's really kind of peripheral to all the other boxes of equipment that - actually this isn't the system - the EMS system - this is a thing called RCS, which is sort of an electronic torn-tape system (laughter), which allows anybody to talk to anybody else. This is the EMS in PK1. But you do need RCS, because RCS is the only way you can get from one EMS system to another EMS system. So it acts as a nice transmitting unit. But - so, here we're seeing one of the central services that we all need and have to compute on.

This other slide that should be about twice as big is the engineering network that in fact exists today of having all of the sites from Phoenix to the Mill, Hudson, Parker Street, Reading, Tewksbury - Reading isn't on yet, but Merrimack - and having them all tied together through a DECnet link, so that - in fact, here's another system that one computes on, that have access to - through - a group-level machine today, and can go in to several of these - I guess I have an account on the Corporate Research computer, and one somewhere else - can come in - the whole system isn't shown - and can compute in a true - at a group level or through this central thing. Here are the details, unfortunately, all of the links shown.

Now I want to get into - sort of, this is the second talk: What is the PBS system that I'd like to see - this sort of 1985 - by 1985, having it out there. The physical system is: a processor, a primary memory of a megabyte, 100 megabytes of fixed memory, no removable media - I don't want to mess with the file problem - I've got floppies that I can't find my stuff on now, and I don't want to have cartridge tapes that I can't find things on too. (laughter) So, I want to get them off to somebody else who will take care of my files and not lose them. I believe we need two to four CRTs per personal machine, because there are a bunch of persons that happen to use this personal system, which is really a database. Black-and-white or color monitor, high-resolution black-and-white a la the SUVAX - I think that's the right thing as long as we can make it so that it can either be this way or that way and display full 8 1/2 by 11.

Q: Gordon?

A: You got it? Yes?

Q: One of the things that's bothered me is (unintelligible) SUVAX structure.

A: Right.

Q: (unintelligible)

A:No, they're all going to be mapped out. (unintelligible) large organization they're all going to be networked.

Q: (unintelligible)

A: What?

Q: (unintelligible) small organizations, too.

A: Yeah, but they're not going to sell them. They want -

unless it costs two dollars they're not going to sell it. And let them beat their brains out trying - they can't cost-justify anything to their clientele. I want to build computers to people who really understand productivity and the minute that you get...

Q: (unintelligible) you don't have to work in that mode.

A: What mode?

Q: (unintelligible) you don't want to have to do it. You want to have to take the (unintelligible) When you're in a large network (unintelligible)

A: Right. Yeah, if somebody can figure out how to deal with the floppy problem why, great. I mean, that's...

Q: (unintelligible) work for Digital (unintelligible)

A: Oh, I'm not going to outlaw them. I mean, we did (laughter) - no, I mean I...

Q: (unintelligible)

A: Oh yeah, I just think it's a crock anyway (laughter). I hope we don't have any on our systems. No, I think people will get past that. I think the research so far in these kinds of machines has shown exactly that, and it certainly agrees with all the experience I've got in terms of the personal machines, of - get rid of that removable medium. The system has to know about that, and why turn us into (unintelligible)?

Q: (unintelligible) removable media...

A: Yeah?

Q: ...and they're so dead(?) that I don't want to have on the central system, because I know there's guys who can get at it. It's my data; I want to be able to keep it quiet.

A: Oh, for you people who really have got all those secrets (laughter), you'd better have personal media. Maybe you should never tell the computer, either.

But - and then, certainly, letter-quality printing, and being able to print what we see, so that means if we've got color we need a color printer(?) somehow.

A telephone dialer, a phone answerer, a voice output, and I somehow left off the voice input - something to really deal with the telephone. I really don't like the telephone. And I want this - the personal machine to really deal with the telephone. Certainly a link to the systems of the same type, and the ability to do things across systems. That may include actually both tele- and computer-conferencing, and videoconferencing. So the ability to share pictures across the network. And at the 10-megabit rate it seems to me that we get. We can transmit pictures on the thing, and particularly at the cost of current television cameras and the low-cost, low-resolution cameras that were coming, this is the kind of thing that we should have.

Yes?

> Q: (unintelligible) why do we have to bother with an LI. I mean, the telephones (unintelligible) communicate over the other networks.

A: Well, there's - I'll talk - I've got some slides about why you have to bother with the telephone company. There are a couple of reasons why they are important.

Q: (unintelligible)

(laughter)

A: There is this other world out there. But (unintelligible)

(laughter)

And then, I want a link to the central system for filing, printing, typesetting, slide-making, distribution of documents for people not on the system, and probably accepting documents for people not on the system, some ability to get stuff into the system. And then, certainly, electronic mail systems and other systems, so that they're providing the kind of capapbilities that (unintelligible). And then, video and voice I/O - that's kind of the physical system that I'd like to see us head toward. So, if we were sitting here in '83 - '84, say, then, having this same thing and having the next level of voice I/O and having communication among the various systems, really having the systems know what we're saying and the ability to share...

Q: (unintelligible) micro... (unintelligible)

A: Micro - microfiche? I think microfiche is an absolute crock. I - you know - I hate the stuff - I mean - I - until they invent a zoom lens for microfiche, it's totally useless. Every time I - talk about compatibility - if you - how many people use microfiche to any extent? Do you ever worry about compatibility? Do you have any problems with compatibility? Do you mind turning the little different knobs? (light laughter) I never have the right lens - I guess I (unintelligible) microfiche from outside.

What?

Q: Assuming that it's better...

A: Assuming that it works, that it's better? I don't know. I just see it as an out-in-left-field kind of thing, that external documents will come into for a while, but there's got to be a better way. If we could get the data in magnetically, then why do we want to muck around with the microfiche? I just find microfiche very, very painful. Accessing and compatibility, and another thing around that you have to tolerate. I think we can have - as an organization, we can use microfiche for specs and stuff like that. That I like it for - DEC standards - to collapse that many DEC standards into that much space. But to further clolapse it, put it on a disk, I think we'd be - we might be better off looking now on microfiche internally - having some of the stuff that we use microfiche for internally, having that on the database. Having direct recall from that, from the mail system or something else. I think it's - I hope it's an anomaly, because it just doesn't feel right in this (unintelligible). Because the system doesn't understand it, so it means every time we deal with it it's got to be translated, and that's going to a pretty high cost. These are sort of the functional levels that I was - at least, the way I think of the profession-based systems. We've come from an era of which - let me call it the profession-based system route - that is, hardware-operated systems, languages, networking and databases, are given. And I think we're just getting to that point. As soon as we have DBMS-32 and a good relational database we will essentially have the roots to build with. And there'll be extra languages, and we'll argue vehemently whether an ADA will surpass PASCAL, and whether everybody should turn off to APL, and how much (unintelligible), but I don't think it's - those are critical decisions to going beyond that. So there'll be the roots. And then, this next level of modules are the ones that we really have to concentrate on the next few years: generic modules for communication. As, dealing with text, for filing, electronic mail, these office procedures and forms filing: the tickler file, and (unintelligible) file, processing, and then these interfaces to these other systems. That's something that I think everybody needs. I think even LDP needs it. I mean, I think that those people communicate pretty much the way we do. I mean they use graphs, I think. The last time I was a scientist I remember doing that. But engineers also - actually, engineers and scientists use the same display forms and even the same natural language. So it's conceivable that we can make a text-processing system that a large number of users (unintelligible). I think even accountants use English to communicate, when they're not using numbers. But that level is something that we're into now. Now we move up a level, and we get into a whole bunch of - let me call them generic professional - general professional discipline modules. These are the ones - Engineering is one such discipline. So the best analogy:

this is a Dean, this is a Department, and this a Compartment. And namely, that Engineering, Electrical Engineering, and then RF Circuit Design, so that - there's a lot in common with that, but as you go more and more specific, then this commonality disappears. It all started from Calculus and then worked down to a specific set of laws governing different physical behavior. And the same holds, whether it's in the School of Business or School of Arts, or what have you. But this is what I think - this will come after we've dealt with this problem of communication. Essentially this is just another (unintelligible). I'm really using that for office automation. Definition - this came out of a report. In essence, it says "If the evolutionary use of word processing and electronic mail to improve office productivity through a bunch of different kinds of - really substitutions - we're substituting for typewriters, for torn-tape systems, for common carriers, for paper files, for keypunches, and so on. And then, the office of the future is a - I was amused - I (unintelligible) this out because I think it's in the definition. So it's a use of equipment which allows drastic restructuring of the office work among a different composite working force. And I paraphrase - I read a long report - it wasn't that long - three pages - they were trying to describe what Office of the Future was, because I'm always looking for a definition of something. And, in essence, paraphrasing it: if a secretary uses the equipment, it's office automation; and if we all use it, it's Office of the Future. And - oh - (laughter)

This is - now this - this is the third talk. (laughter) This is (laughter) - we finally - I was looking around for - in terms of - Charlé's got the person he wants to design for. I wanted to find me an average man (laughter) and so - yeah - and so - it turns out we finally got the blueprints (unintelligible) the way everything matches. My boss normally gives me a hard time, because when I say, "Hey, we want to put this capability," he says, "The trouble with you is, you can't - we can't base it on your thing, because you're not average. And so this is a proof that I am (laughter) (applause). Now we've got a bread(?) prototype, so when I say - when you say, "Hey, who are you designing for?" you say, "Well, the average person." Well, boy! am I going to come on strong, because I found him. (laughter) Okay. So, the average person last week - I went through the average person's computing last week. This is a typewriter that the average person has (light laughter) and it's bought because it was so pretty, actually. Every time I buy one of these things - it's an Olivetti, and I did it just because it's a classical thing - it'll - it's actually for the museum. It's mine, but it - but - the interesting thing about that, or I guess I'd talk to Dick last week about this, but the trouble with Olivetti typewriters, they have the - well, aside from Italian design (light laughter) they - you know, they really look nice - but then you sit down to play on them, and they really feel crappy. And fortunately, Olivetti is dominated by designers. There are no engineers there, and so we're safe. (light laughter) That's one extreme, and then you go to, essentially, TI, which is essentially - there are no designers there; there are only production engineers, and if it isn't cheap, it's not good. And I think we've got a wide open market. All we have to do is make a (unintelligible) look nice and have it work. That's the unique market. (laughter) And I think we can get that market. All we - just - only two things - but Olivetti right now has got the design market and TI's got the schlock market for cost. But I think the market we want.

This is what the average person's word processor looks like in an office environment. Note an IBM typewriter over there, that

still has to exist. There are two modems, because the 1200-bod modem and the 300-bod - 1200-bod is 1200-bod only and the 300-bod is 300-bod only, and never the two will be compatible with one another, and I happen to be on two systems, and it's simply a matter of - I'll show you how you change from one to the other. It's a very simple (laughter) operation. And then - no - and note all of - oh, and this is - people worry about storage of (laughter) - can they have the whole phase(?) Notice the two-drawer filing cabinet and the printer up there. (laughter) That's where the printer is stored. It occupies a predominant altar in my house, and - I will - believe me, when people say, "What do you want - what about hard copy?" I say, "Oh, God, I would like to do anything to get rid of hard copy," because it - I just can't stand it looming over me like that. (laughter) And besides, does anybody know - when you turn that printer on, it adds about 6dB at 125 cycles. And - oh, the other measure I - the average person - in my house - actually, the noise level is under the sound meter, so it was less than 25dB. Then, when I get everything tuned up and turn the radio up it runs up to about 40dB, then up to 43dB with the printer off, and then 48dB. But that's on the A scale, and if you flip over to - look at the cycle bands, there's 62dB at 125 cycles. So - we may get by with the right kind of - we'll get our lawyers to work in Germany to make sure that we can pass the test, but it just ain't very comforting and so probably what I would like to do is move the printer somewhere. And, sure enough, the cables are long enough to deal with it.
Documentation is really an important part of (laughter) of systems, and where do - and there's, of course, lots of room to store documents. This is my filing system for documents. There's a convenient shelf provided under the word-processing system (laughter), where I throw everything, and in the last resort, if I can't do it by trial-and-error, I will get the information out of the manual somewhere. There's only about - there are five manuals there, and about, oh, five hundred pages, and that usually only takes me ten minutes to find the stuff. So, documents aren't really cost-effective. Oh - here's how you change the modems: you simply get up behind (laughter) or pull the thing at your own risk - pull the thing out because you're afraid a few of these cables are a bit fragile, unscrew that EIA connector there, move it over to that, and then there's a little knob back here, conveniently located (laughter), that

you can deal with by a TV repairman. (laughter) A mirror, but I don't happen to have that option. But it would be nice to be able to change the speeds, particularly in that environment. So, Ken has his slide of Engineering or Marketing. This is mine. Note: here's Average Man sitting with knees crouched at the terminal. And all of these places of little tags on there: that's the ready reference manuals to deal with the three or four systems I use of tight dollar signs - well, we don't have any dollar signs and things, but log-in, remembering what the passwords are, and project numbers and so on, on the various systems. And then, also, all the various protocols of - there are only three different mail systems and they are all, of course, totally different, with how you speak to them. And then, this is getting enmeshed in the system here (laughter) - there are a couple of phones associated with these terminals, and normally the phone wires are entangled in this desk chair. This is me reflecting at the terminal (laughter). If you - I don't know - do you all often reflect at the terminal? (laughter)

VOICE: I glare at it.

You glare at it. (laughter) Well, it glares back. I wasn't glaring; I was reflecting that day. Actually, it was - oh, and things are better when you go to a shared system, because you don't have to take care of it any more, and that's the best thing about the shared system, except there's - the thing on the - the modem on the left is the GANDALF switch that can go to several systems. There are a couple of other - there's 300-1200 mod modems. Then you simply get up from your desk about 50 yards away, grab the terminal, go over and dial this thing in a very convenient cost-effective way, and - it got its cables too, of course. This is an advertisement for NI, in case people did - I hope it's better than this, but - this is a 248, full-house, 4 modems, 4 printers, and 8 terminals. So there's a hell of a lot of cables coming out of that (unintelligible). And then - now, here's a nice - now, this is why we need the telephone company. I wish you could see this a little better, but that black ribbon cable about that big is simply - now in the Mill you can get away with it, where we don't really control the esthetic qualities, namely, Field Service can come in with hammers and all kinds of units and put in this very black, wide black cable and run it up and down over the ceilings. I have - there's a lot of offices - ugh! - actually, I went to IBM, Armank, actually, a week ago, to look at some of their historical stuff, and - I just - they had this wonderfully - designer award-winning building there, and with people around that looked like IBM people running around. (laughter) And you didn't want to touch them - nice robots, and (laughter) they - you know, they wouldn't let us install a system like that, where with this big black cable which you simply tack up on the ceiling and run down the thing (laughter). So why we need the telephone company is to install all of this stuff, because we really don't know how to install cables like this. This was our - and this is a kind of a lesson in compatibility: here's the phone thing. At least it comes up under - at the floor. There's the big black ribbon cable that goes into the printer. This was our last aborted attempt to deal with terminals. That was still left on there. This is a four-wire phone jack with - but that's probably the one we would want to use if we'd had the phone company install it. It wasn't phone company installed. I mean, the phone company installed it where you can't see it. In our case, the guy installed it where it's the most convenient for him to put - he doesn't want to get too close to the ground, because if you're trying to put screws - wood screws - in, you don't want to do it down there. It's at user-level height. (laughter) And that didn't work, and we've now switched to another system. But frankly, I would like to go back to - this is the back of - Dick Schneider says that you're not supposed to do that - put coffee cups out - and then you also - there's a tilt mechanism here (laughter). It's two books - that way. And then we switched to a new jack back here. I want to switch again to another jack. I want to switch the phone company jack. Really want to get there. So that that way we let the phone company install all the cabling in the machines, and if you don't like that, you can go to Radio Shack and buy these little four-wire pinjacks and connect the stuff, if you've got to do it yourself. But certainly having 15 - having the EI connector, and having that go over to the central machine - that's just not the way to run the terminal. So let's go to phone-compatible interconnections.

Mary Jane reflecting at her terminal. (laughter) That's - and in fact we both - I want to indicate - there are several of us that use the same system and - I want to put that plug in. Here's a document that was edited. This is a printed document. Notice the big block letters, and then there's some symbols down here. And now, as you map that into a word-processing system, that's all you can see, so this is a pitch for a full-page graphics, and being able to type all the special characters and fully general stuff. This is a thing I've learned to which is - almost learned to do, using EMS and talking on a speaker phone at the same time. (light laughter) So I found out that I can - or listening on the speaker phone, I can get two channels of input but it's hard to do two channels of output. When you get two channels of output going, this is what happens: the guy on the other end has this dazed look on him. This is Dick, while I was talking to him, because there are these lapses of - when you get the two channels mixed up as you're(?) typing (laughter). But it does say that you can use two channels simultaneously. And then - I was away for a while and the trouble with EMS is that I came back and there were 24 unread memos staring me - that was (unintelligible) for a day or two, and then - but that didn't take away from leaving the office with two briefcases that night. So somehow we haven't learned to deal with the problem. Electronic mail doesn't solve - doesn't reduce all of the other communication. You still get paper mail.

I didn't go into some of the other things I've learned about the EMS system or the various systems in terms of just the speed that it operates, and the fact that if you're on electronic mail, that it's probably more cost-effective to print out the messages, not - if you're only running at 300-bod then have somebody else - have the - have all the mail printed out for you, then do it on paper and then have it rekeyed. That's better than sitting there looking at mail coming out at 300-bod. It just ain't cost-effective to sit at 300-bod, and certainly it's one of the things I've learned over the last few months. You really have to be running at 1200-bod for this to be cost-effective. There's a good - satisfactory - or satisfying effect of being able to press carriage return and having - knowing that you've deleted something and it's gone away. It's like throwing something in the mail - in the wastebasket. But, I too am concerned about being able to get to a cost-effective - whether this stuff is

really cost-effective - we've done a poor - even though we've got an incredible - incredibly large experiment internally, we don't have very good data on how cost-effective it is.
I want to close by one comment by Lord Kelvin, which I fortunately found in a magazine this morning: "When you can measure what you are speaking about and express it in numbers, you know something about it; but when you can not measure it, when you cannot express it in numbers, your knowledge is of a meager and unsatisfactory kind."

Right now we're building some things - I would like to know something about them in numbers - like how many dBs, and how long it takes to get through a page, and this kind of thing. So there's - in order to sell the stuff, we've got to prove that it's really cost-effective for the users. And there are times when I reflect back I'm not sure that it's so cost-effective. So - that's it.

(applause)

Any questions?

Q: Gordon, in the beginning of your talk, you indicated that you would have a strategic shift form what I interpret to be tool-building to applications-building. But later on it appeared that we were building those out of the same components. What is your message about - what do we engineer versus what do we market?

A: What do we engineer...?

Q: Today we engineer and market tools. (unintelligible) applications...

A: No. I think that - I believe that we're getting this next base of tools done. That is, the databases and the languages, and now - the next thing that I think we do is almost the next level of tools. To me the word processing in a sense is more of an in-use(?) rather than a tool. That is, you don't have to pry with it, but it solves a problem by itself. Rather, it doesn't require a program before one can start using it the way it was meant to be used. So I think the shift iis simply moving to a next level of integration, and it's one that where we really (unintelligible) that everybody must have.

GORDON BELL AT STRATTON V: WHERE DO WE GO FROM HERE?

The conference so far has generated a lot of - certainly stimulated me through a fair amount - I've prepared a two- or three-hour talk based on all of that (laughter) which I'll attempt to give in 50 minutes because my university training still makes it impossible for me to talk more than 50 minutes. This is actually - I guess, a few sort of final remarks before I go into this final talk, which is essentially - there's - do I have to answer that? - I want to run without interrupt. Sorry. Later (unintelligible) systems off. The video was really an experiment. We wanted to do that. We want to make this some way of getting much more participation here, and sometimes I think it would have been nice - we could have - maybe sometime we will have a distributed STRATTON in three or four sites with all of the things, including the workshops. I want the Colorado people to know in fact at 6 o'clock a lot of people were up here, too, from the night before, usually. (laughter) That's why the camera detected a lot of sleepy faces from time to time. I want to apologize to all the people who would like to have been able to be here but weren't. Notice - I would like to have had a lot more Product Line participation, Marketing participation, Programming, because programming is really what PBS is all about, and in particular, one crew of people that are really important to PBS are people who do technical documentation and already we're going to have a special conference that's being set up in Tewksbury with some people who complain about the way I talk about documentation. So it's going to be an n-on-one where (laughter) they'll give - they can - that we can interact about this because, hey, documentation is really important for these systems and finding a way in that people can use things, so I want to apologize that I don't think that we work that issue here at all. It's vital and we're going to go out now and work on that as something that has come up repeatedly as being important. Okay. Now, the three talks.

One, I just couldn't help, during this thing, of doing a little bit of sharing (unintelligible) and it may come across like an educational seminar, but it in fact comes across because I think I have a perspective - there are a few things that it is - that you do get by meeting regularly with people across functions, and I probably do that more than anybody else, just because of the meetings that I hold with the Marketing Committee and the Operations Committee and customers and things like that. So I've got to figure out how you can get into some of that, but certainly there's a bit of that I'd like to share - some reality and education here.

The second talk is really on realizing the passive - if in the past I've been able to set goals or help set goals because of some perspective I may have, why, that often ends up - I'm not trying to design all the systems, but by helping to set goals, hey, it provides a focus for people to work in, and I know that's not popular at DED for managers to have anything to do with establishing goals. It's supposed to bubble up and somehow the managers are to be able to have a process to let you decide which way - how to do your own thing. I would like to focus a little bit where you do your own thing at, which way - your own thing we go. So I'm going to interject where I want to go, and that's called goals. And then finally there's - got a tremendous frustration of the wide diversity of what - when we talk Profession-Based Systems - an incredible array over cost, size, depth, you know, many, many dimensions - physical architecture and want to start sharing some of that taxonomy. I've been playing with taxonomies throughout the last three or four days. I'll sort of share some of that with you too.

So, on the first part then, let's go on this, which is - I guess the - in fact, the reality - I find that we're really decoupled from the users because of what I hear, namely, that in fact - hey, folks, we're already building a Profession-Based Systems now. Now, the question is, "How are we building?" I heard four methods come up in this. Let me characterize them. Let's call it the Marketing Textbook approach. And we saw that in a flow-chart form. It's called the ask 'em/tell 'em approach, namely, you go out and you do some stuff, and then you provide a thing and then (unintelligible) a feedback that was described. And that you don't take them out of captivity, but you try to figure out what to feed them and maybe they'll die, maybe they'll eat the food. (laughter) Market survey is absolutely straight - straight conventional marketing text. I don't think it works worth a damn in - for complex things. I don't think that's been the secret of our success anywhere in and can't be except in conventional things where you ask them and it's COBOL 79 and it's clear because that standard is there and they know that that's what they should say, and you go back and do it. Now I heard the other one - let's call it the zoo approach, which is bring them in and let them tell us. We'll interrogate it and we'll build them and ask them. That's essentially just moving the animals in and try to find out a little closer what to feed them and see if they - but, in fact, when they come in they really aren't animals any longer. They take on a lot of our flavor and they can't run. They can't do any of the things that they used to do. And in short they're not professionals any longer. They absolutely have disappeared as professionals in that environment. They are - you know - that's how - in fact, well, I'll say, that's how we get a lot of marketing people when we're going to "go in the insurance business." Somebody might have sold insurance once for their father and so they came in and now we're, by God! we're in for an insurance business. So there's the zoo approach. Those animals are probably the most dangerous animals because they're in captivity and they can't do any of the things they wanted to do before, and they're asked to be translators. So - and then there's another form of that which is the zoo plus a genetic mutation form where we try to turn the animals also into an insurance-agent programmer, and so you essentially - you've got this new animal. But in fact you may get a great programmer out of him, but you probably have lost his view as what is means to have been an insurance broker. I don't think Tom McIntyre will say right now that he's a physiologist. I don't think he'll claim he's a physiologist any more. And we're glad to have him as a software engineer. And in the fourth - I think those may - that one may - conceivably might work in some limited thing. And then the fourth point is essentially: leave them alone in their environment. Do some genetic mutation of them. They've got to do it themselves. If you look at the MITech - MIT - result on where are complex instruments and tools built, God dammit, it's clear. The users have to build them. You give them as much help as possible with tools and I think one of the hidden tools we've got to supply is some programming languages that are non-sequential programming languages and Charle' - we saw one in Charle's slides - the Demo didn't quite make it, but if you know what that problem is all about, man! that's probably one of the most impressive pieces of work - being able to - he went up and changed the line on a 1040 and the whole goddamn thing changed and there wasn't a program sitting back behind there. He had expressed those in relationships. Man! that's impressive! And that's not programming like we used to know it. That's the way to do it, probably. Getting rid of sequencing: sequencing is only natural if you love computers, and I - the world, I don't think, thinks sequential. I mean, think of all the people who can't, who, given a watch - I mean, I got to meet a guy who used to be vice-president of an insurance - a retired guy - came over at Christmastime and said, "Hey, I got this watch and I can't set it. I wanted this electronic watch and I can't - and man, that was before it had four buttons. I think there were only a couple buttons. I mean, if you threw the Seiko manual at him, that guy never could - I mean, literally never could set a Seiko watch, and I must admit that I did have to refer to the manual a couple of times (laughter). But I had to put it in terms of a (state?) diagram (laughter) and I got it on one (laughter) page - I had to figure out how it worked and then it was obvious what the thing did. But in fact, trying to read it from the manual was a bitch. (continuing laughter) Now, who we're doing it for now is - here are some of the product line - here are the results we've got now and I'll just go over the approach. There's kind of the ask 'em/tell 'em approach, but in fact we have a number of them in captivity and we're trying - we're doing it - we're providing that. That both - and the column on the right-hand side is - this is at the levels. And level is an important thing; how do you provide it is an economy of scale. That's both for personal- and group-level kinds of things through the 78 and the 248 kinds of systems and on larger systems. Hey, we've got a group which is improbably using the approach number - it's the - actually, I think it's approach number one: it's the ask 'em/tell 'em approach, which is the professional typesetting. We're doing that now, and we believe we can do it because we use the ask 'em/tell 'em approach for newspapers, and we're in that business. That's a hard job; those guys have made money in their - in that - in the typesetting/graphic-arts thing, but boy! it's a real bear, and it's perseverance that has to carry - or has carried that effort. I don't think that they would advocate that's the way to do - if you had to do every profession that way, forget it. Then, you go down into the physical and natural scientist kind of things, there I think we really are pretty much sticking with a very low-level tool. We're really not addressing that, although we do sell it there. And who's doing it? It turns out the users are doing it, and library-sharing is the vehicle by which they're doing it. Now you go in to the engineeer, educator, and small-business persons - there's a methodology that we use there. Hey! all of that stuff - we got tools there and they're all done, pretty much without exception, buying out. Now: the question is, "How do you buy out things?" and then - here's a process that we are going through now which is user's development. It's probably the only way. And it's really through OEMs who are or have been users and in general we are not. And the process is really one of evolution. And it's an evolution (unintelligible). We look at success in our business, providing language capability, this is evolutionary. It isn't after the animals go headlong into something. So here's the process I'm advocating, namely, improve the languages, in this case DIBOL(?) and, by the way, let me say that in fact, if I were to program in some of these application languages, it would probably either be in MUMS (?) or DIBOL(?). Neither of these are popular, for some reason, by these groups. Simply because they're the best languages. They have the right data types already, and if you like low - if you like to look at (unintelligible) to program, you'd love PASCAL and FORTRAN and lower-level languages like this. These things know about the data types that you're working in, and I don't know why we don't use them for that rather than going down into these very low-level programming languages. Certainly it's got to be well beyond the implementation-language levels that we have today. But I think the most productivity is going to come out of that approach. But first off, I want - have advocated seeing an evolution of DIBOL to make it a little more robust in terms of allowing users to do things like set alternatives, set parameters, state alternatives to the parameters, and then eventually express limited algorithms, so that, in fact, you've got an algorithm for computation of income tax, and the neat thing about certain kinds of these programs we're talking about

- they go in and they flow through sequentially for all records and don't tell people about programming and loops. So I think we can - the world can - we can get these people into processes for starters not telling them about things called loops, which aren't natural things to most people. Okay, select a profession market-size. Go out and do the regular marketing kind of stuff that one does: how many people are there, and so on. Now here's where I, being chicken, and probably as a corporate officer, begin to say, "Hey, find a program out there!" I would simply go out and buy a program, and by God, there are a lot of them out there. We've got a lot of users who've done their own thing and - a lot of OEMs providing these services now - and go out and pick that program up. And then, what do we do? We probably want to do it. It probably isn't up to our standards. We don't think it's got the quality levels. We don't think it can be enhanced. But go and do it by testing in QC, enhance it, document it, and sell it. Let's - and then we've got some information to work on. And we aren't starting from a PASCAL or a file system or some very low-level thing. Now, I think we want to sense additional - sense what's happening somehow, not sure how you do it. Probably by getting a bunch of users to come to meetings like DECUS and say, "Gee, what do you want?" "Well, I couldn't - they changed the income tax kinds of things and you'd better figure out a way to give us a new option there somehow, so I think by having groups combine or by networking - lots of mechanisms to do sensing here. And then, what would I do? I would then do it like we do now, Goddammit, within - by evolution. Namely, I want to reimplement the thing using the requirements. I want to keep the documents constant, probably I have to - unfortunately, I have to keep the file system constant because these users have now got a lot of information on those old file systems. I then do a better job of reprogramming the thing, if the program by this time, as it keeps being refined, is going to get a little bit smellier, or creaky(?), and may burn out. So, I think this to me is probably the approach that I think is going to yield success in there. And I think, in general, "Gee, a lot of us may not find that challenging." Because we're not working from raw technology, we're not working through this other process, but boy!?r I think it - I kinda like it, because I think it'll just make scads of money. To increase the Engineering budget. (light laughter) And that's really what drives (chuckle).

(laughter)
Okay.

Now I want to go on - that's kind of a piece of overall perspectiv?re about how I think we're doing - how we've done it, a?rnd how I think we're going to do it in some of these insurance offices, the dental, the small-business kinds of markets. Now I want to go into, essentially, these goals. And if I look back on past STRATTONs, well, first off, I could't get to Lorrin to find out what STRATTON I was. But in fact, on II we had VLSI - was the focus, and I think we've made results since then. Mass Storage was III - hard to judge. I think we've made progress there. IV: Distributed Data Processing - I think we did a lot when we focused on Distributed Processing. I think the HYDRA stuff has come out there on the DECNET Version 3, 4, and the direction there, I think. The Interconnect is clearly what we were beginning to focus on last year. And then one of the side benefits is - we had a Workshop last year and really went at the RAMP issue. And I said, I remember I guess it was Steve Rothman and, I think, maybe, Dave Cane and Bob Stewart, all said, "Look. We know - give us a cookbook of techniques. Don't tell us how to design it." And I said, "Let's get a good cookbook." And in fact I've seen such a cookbook. Mickey Smith wrote it. It looks very good as far as I'm concerned, in terms of coverage and approach. But anyway, you're going to (unintelligible). Okay, fine, okay. But I hope you'll read this book in terms of - it must have been (unintelligible). But anyway, I think that there were lots of side benefits of interaction that I can identify with. In fact, this one - it seems to me we've gotten some ideas about the next ones. There are a lot of candidates for sensing I'd like to know - well, maybe next year - have we cleaned up our act? I'd like to have a follow-on. But I certainly intend to devote a substantial amount of time to cleaning up our act now. And then, clearly one that's come out of this is the Manufacturing/Engineering team aspect. That's really - really needs a lot of work. And, so whether that's the next one I don't know - there ought to be a lot of ideas for new ones. So, essentially, let me - in the goal sense - I think - what I want to do is go over some of the goals, which is, essentially, I want to clean up our act and, in essence, get back to basics. Not BASIC. (laughter) That doesn't call for everybody going out and building their own BASIC version (laughter) because we've only got two or three, three or four, how many? five? six? We'v gotten it down somewhat. I know we've gotten it down by one. So we're back. (unintelligible) But basics, as far as I'm concerned, are what's going to follow. This root level, either finish or finish starting, the Interconnect, SUVAX, VENUS, SCORPIO. There are projects here that I think we want to, above all, get those things - get - that's the goals I have, getting this root-system level - I'm sorry, DBMS-32, some of the database work. Let's get the whole operating system language hardware, these bases done, including the small systems stuff. I think we know what they are.

Now, the next area - here's what I mean by the basics, which are the generic level. I want to master this level within the next year-and-a-half products - products or product breadboard - or products that are reasonable through tasks. What does that have in it? We've dwelt on that a few times, which is essentially among other things, a virtual terminal capability to other systems. That's been left off a couple times. I want to get it back. To make sure it gets back on. So they will communicate to the rest of the hierarchy. And right now we've got to get the word-processing stuff straightened out. I want high-quality, compatible WPS in the 8 area and be able to evolve the 8. Right now the 8, as far as I'm concerned, the structure of that thing, the number of versions of it, isn't in a form that we can evolve and enhance on it. And, in short, we're going to get killed, continuing work based on that current base. So we've got to get to a point where we can pack the market, given that we've got a piece of hardware coming out there. We're going to get creamed. Stand-alone - 11. Hey! Right now I look at being able to track the thing - we're just not going to be able to track it in the long run, based on PDP8, the PDP architecture. Hey, and that's hard for me to say, because I invented that architecture about 1963. It's sort of - and so it's kind of like a first love or something. But for the kinds of complexity and systems we're building it just doesn't happen from a software standpoint, even though we can build cheap hardware it's not good enough. Then we've got to get on and get that capability on multi-terminal, probably on RSTS and VMS, right now. So I want those systems all up and running, compatible, high-quality. And then, getting that, we've got to get the EMS in there with the WPS compatibility, probably on RSTS and VMS again. So we've got to bring our EMS work in and have an EMS - a working EMS product - let me say it's got to be running, breadboard, internally, probably this time next year, for at least three months. So on the engineering network we've got to have this thing running. I guess that essentially what it amounts to is DECmail. And then, certainly a file cabinet for the documents and the forms and the thing that I'm thinking there - probably if we limit it to VMS, then I've got the candidate and I want to - I think you know what that is. Phone management: some - a few words got left off here - essentially a probably a breadboard for phone management. I don't - in its full glory, I don't think we'll have that running a year now. So I'd say a phone management, a breadboard, some office procedures, some of these things, some breadboards here, and then certainly a voice breadboard. So, of the last three, probably are breadboard kind of items, not running basics - running "as part of the generic base." Voice-out: some level of voice interaction that's appropriate to the technology that we have. I think there's a clear amount of technology there - let's do it. So essentially here's - I guess this one really should have been that other one - I think probably QBF is the way we ought to go there, in order to get these - to be able to deal with these filing-cabinet kinds of things, and have that integrated in there. Having it integrated in with the other syntax and use. Now there are a bunch of things that essentially are understanding issues. I think we need to understand what features should be versus time. Hey, we're not going to be able to get it - I want to go for completeness next year. There are a lot of things we can't get in by then. Then let's have a planned thing of, Gee, two years from now we ought to be here, and four years from now we are out there. So essentially a set of goals - that's going to help - that's going to determine exactly what we should be working on in the advanced development and the research domain. So I want a lot of the advanced development to come out of product direction that we should be going to. And then the other one is essentially some understanding which is one-bound(?). Count it back up one.

This last one is Understanding and - I'm adding this new word, which is Cost Of Use, not Cost of Ownership. Jim Bell came up with a nice metric, I think, which is set for the professionals that we're dealing with. If you save an hour a week, that probably is enough to justify the system. So all we have to do is find things that can save us about an hour a week to justify the systems that we're talking about. There are issues of understanding: what does it really mean to be personalized. Now, it's clear to me that we can't personalize these things. This is the dual(?) of why we're in such a mess in the networks domain because every company and every network group is personalizing their protocols. And by this personalization effect, as you build systems you get the cost product of every protocol that has to go in every system. And therefore nobody can ever talk to anything else, and nobody is ever complete, because you can evolve, and personalization is an issue that has to be treated very, very gingerly. You can't build a (TICO-based, TM-mass, QBF?), and so on, with that syntax, because when you go off on a particular path, then it all has to personalize within that domain and the connotorial effect on every one of those modules just can't happen. Certainly the PMS structure processor memory switch: how are the boxes, both the - let me use PMS much more loosely - the PMS - hardware PMS and software PMS - connected - how are the things packaged, that is, agglomerated in different things - and what's the structure - the PMS structure - for each size? What's appropriate for the kinds of things that we're doing there? We desperately need something - something in there - because there are so damned many options and, in fact, we saw Al Shugart give us a new option. God! the last thing I wanted was a new option. I'd like to point out, in fact, that with Shugart's correlation, we think - I've had a model until recently that in fact the world was pretty much driven from semiconductors, certainly, but in fact the sizes - systems sizes - semiconductors drive that, but in fact it's disks that drive the packaging structure. And hey, the net effect of that floppy or probably the mini-floppy was the creation of the whole word-processing industry. If you really want to get right down to it, Wang probably is based on Al Shugart. You know, they can say, "Boy, they were fantastic marketing - boy, wasn't that great? Software and man, neatsy RTs and all of that and great management." But yet it was a piece of hardware there that in that sense created that whole industry and they probably - at Wang - let's not tell them. They probably don't even know that's why it happened. But at least my simple model says that's probably the reason why Wang exists. Up until then they were making little desk calculators that you could do addition with, poorer that a program and all kinds of other local things. Now, I want to go and then, probably another thing - some other comments here - this is not in terms of the - summing up the goals - essentially I think using the generic level will get a bunch of users ready for the professions specifics. So let's do them as a - it's not a bait and switch - it's a get-'em-in or - let's - oh, it's the Trojan - I don't want to use the word "Trojan Horse," because that's a good - that's a security number. It's like the Trojan Horse. It's - it's - you know what I mean: it's not the Trojan Horse that's - which is a well-defined concept in security, but it's like that, where we sneak this thing in and people think they're getting a free ride to do all their communication and take word-processing report generation, all the kinds of nifty things that way, and when it's in there they're going to find out - "Gee, why isn't that thing doing this?" And they may try to do it, and that's one way to do it, or they may get us to say "Hey, just put up for a few forms for me and let me do some of the stuff." But that's probably - no , that's clearly the way it's probably going to happen in the profession. And I say, "Stay the hell away from this for a year." I don't want to hear any more nonsense about professionals. Besides, we're a bunch of amateurs and amateurs have more fun, anyway. And we can talk about professions in another year. So, essentially, here, in order to talk about this in another year, maybe we want to understand some profession structure and rude size and cost each could use a function of time, so that in fact what a professional does is really an economic question of "Is this thing going to help him or not?" and to do that you've got to look inside the profession structure, and it's all that mundane marketing crap - you get (unintelligible) and you can have a good linear programming program go (unintelligible) big data bases and professions will pop out at you. Gee, there are a lot of those guys in - you know, we can sell all the dentists in Detroit, or something like that, with one package. But let's get some understanding there. I'd say maybe we want to understand some design approaches and perhaps build a tool that will help them build some of their things, and then perhaps design and understand one profession in addition to the professional systems programmer that I claim we're probably designing our systems for now. If I had to take any profession - if I were programming, by God, you know, that's the one profession I'd really want to serve. It's a self-serving thing, but, in fact, it's probably the right thing for us to address, because it addresses productivity and ease of use, all the things that are important to our environment. And - hint! - don't go outside and look for animals to capture or to bring in, whether they're friendly or we want to keep them or whether - let's use - find some inside. There are enough interesting-looking animals inside to use. The zoo's big enough. (light laughter) And maybe here's one - I don't know - just for an example - design engineers at DEC, perhaps including packaging engineers - I look at all of the stuff coming out. First off, they do the generic capabilities - I have an ulterior motive about having (unintelligible) people who do packaging to use this equipment. I think that, in fact, a lot of these things were their - really - they felt a little stronger because they were using that - things like noise and cabling - by golly, they might get a little more attention. Because there's nothing like having to use your own stuff. Right now, we're really worried about schedules, so I put PERT in there. Everybody needs that. And then I - I'd like to hold all - right now, we're getting a much more complex environment. I'd like to hold all of the DEC standards. I can't think of any reason why that is on microfiche. I can not! It really is - this is a moral for us not to use computing for these particular kinds of things. I mean that whole process, that ability to use this. John Holman, I hope - Bill Tays, God dammit, get that stuff on there now. (laughter) Independent of whether you're professional or not, (laughter) use - I'd like to have query, answers (unintelligible) program (unintelligible) - that you can probably steal - don't do any programming either (laughter) - and can let a bunch of people go on and interrogate that and do some stuff like the HYDRA system. And then if we go beyond that essentially, I like to go to do printing of that and microfiche publishing directly of those kinds of things. But I guess I've got another fear here - I'd like to be able to check some designs against some of these database things - gee, I'd like to know, "Have I violated a given - DEC standard 30, for example. We ought to be able to do a little bit of that kind of thing - maybe - let me put - that one, I think, is a little bit hard. So, let me not - this isn't - besides, this wasn't a gauntlet, anyway. I'm - I think this is an idea that we might do, except one we really ought to do. That's just one that happened to come to mind when some people were talking. Now, (give me some time - twenty minutes - okay - it's going to go quick) I was - for example - looking at, say, the physical system with the -

This is the third talk. Sorry.

We need some measures and understanding about use in order to do what we're doing even at the generic level, and to provide systems everywhere. And I, frankly, am worried, because a physical system - I interviewed a few people, namely system designers, builders, system manager types, some product line engineers, some software engineers, some disk engineer designers and builders, some disk manager types, and my informal survey here reveals no knowledge of file size, RSTS versus features, number of users, and what set of programs are run, who wrote them, and how they relate to one another. And, you can say, "Boy, are we (unintelligible)" That just goes to show you how good our users are in taking what we provide and doing something with this. And I think probably that we've got too many - I don't know - I don't understand why this is. I think we get security in having so many people around and you figure out - it's the distributed database problem. It's me - if you can - somebody has probably got that knowledge. I think that knowledge is in the organization. And therefore, there's a certain security that comes with having knowledge in the organization that you don't - it is - you don't have to know anything because somebody knows it, and all you have to know is who to ask. And, with so many people - I don't know, I tried and I don't even know who to ask. I was really disturbed on that, particularly as I was trying to dream up a system there and I just couldn't get any sense at all, because of, really of lack of knowledge of how that - what that thing really was and how it was used. I think it's easy - not easy to get, it's going to be tricky - but we certainly have to know a lot of that. So that kind of prompted a thing which says, "We want to go for some definitions and measures." I think this is really another set of goals - or it's a tailing in of the goals, which is - certainly I'd like to publish a glossary with accompanied taxonomy. I want to really go back and relate to the price bands. I want to go into some of the - these are dimensions of the taxonomy - certainly the physical structure dimension, the PMS structure dimensions, software levels, and the program structures dimensions, which are really extended PMS structure kinds of things. So a way of talking about these things - I don't think we've got a very - we can't talk about these things with each other right now. I can't do design - I mean, I try to do design with Tom Orr and just for a minute throw out a thing out there and he says, "Oh, you can't do that because of that," and it turns out it's a piece - because it's all based on a piece of folklore that he happened to have gotten from a marketing survey that somebody - whether it's a natural constant or a - but we don't understand - you know, we don't understand some of this stuff. So we've got to have these dimensions so that we can talk about various alternatives here. And then, essentially, this is one like that - I said before, in terms of the - of a particular structure, and that is, we certainly - the kinds of things - one reason we've got a problem talking is, we're talking about systems - to me, my profession-based system costs thirty - sells for thirty thousand - I think we can - oh, I don't know whether we can get it out there for thirty thousand dollars or not, but it's a bargain if it produces the results I think it should produce. Thirty K is really quite cheap for one of these workstations, because if you look at some of the workstations that we have in a large KL-10, it's a forty-fifty-thousand-dollar workstation. When you put a KL-10 - central KL-10 - divide the number of actual users of that system in some of these design stuff, we're spending fifty thousand dollars a terminal. So thirty thousand - if we can come down to thirty thousand dollars for some of the things and get some benefit, that sound - to other people, they - Avram and Ken can talk about their professional-based system and they're only a factor - their dream is only a factor of ten apart. And in cost - and then to Tom - we heard a three-hundred-dollar - was his - he's got a system there that he's trying to build for three hundred bucks. And so we've got a factor - easily a factor of a hundred that we're talking about. So no wonder - and let's assume price - you can't always assume - that price has some relationship with capability, but say it did for the moment, then we're talking about a factor of ten or a hundred in terms of what the capabilities of these systems.

So I'd like to get some understanding of how we justify these systems, because I'm into that a lot on the case of, say, EMS. Why do we want more EMS terminals? Does it really make it more productive? And - for a select group of you, I'll let a secret out, that - I asked about, "Should we have touch-tones in the Mill?" And - I won't - please don't respond to me on EMS - oh, do it, do it anyway - but we wanted to find out a little bit about that, and see how do you go arbout - I wanted to know how you justify some of that. How do you go through the analysis of that? And, by George, I got a couple different points of view. Alan Kotok had a point of view. Mitch Kur had a point of view that Alan Kotok knew, of course, that he would have, and then Peter Christy has a different point of view, and then I like BJ's point of view. God dammit, I'm sorry (unintelligible) all this bitching - let's just do it. So, anyway, that was an exercise in how do you go about understanding this. What I've been trying to do is understand that. So if we look at - here's a set of - for those of you who don't - either haven't been exposed to - let me offer a notation - it's called PMS - as a way of describing things - I'm not going to talk about it here - this is just to refresh your memory as to what the words really - what the characters really mean. It has the advantage that you can type it on typewriters, and, forgive me for not putting boxes around all components, because everybody knows that components have to have boxes around them. The chemists didn't know that when they have their molecule diagrams, and I wish we could have EMS without boxes. But, forgive me for doing it here. But, look at some of the alternative structures that have evolved over time. In the beginning, people had their tertiary memory on cards, their file systems and - this double dotted line is a communication link - it was called "walking upstairs" - dumping it into a transducer, a card reader, putting it into the computer - and maybe having a secondary storage for programs and for mag tapes, and you walked off with - well, one of the things that you walked off with was paper - isn't - don't have it there. In DEC minis what we did was essentially - we put all that stuff in a room and you walked up to a terminal, which was connected to the computer and - these single dotted lines are - that's one integrated system, not going through a communication line, and that computer was connected with some kind of a memory that was both secondary and tertiary file, some - initially, it was tertiary, that is, a paper tape, and ultimately it evolved to mag tape and DEC tape, and in fact DEC tape was such an ideal tape. So LINC was an example of that kind of very, very simple structure. Well, then we got the bright idea of - it was called time-sharing, and that says, "Hey, keep - put the terminal with the user, go through some communication links, the three dot - the ellipsis means what you think it means - there are a bunch of those terminals. They're connected to a computer and there - that computer has both secondary and tertiary memories. So you keep your files there and you get rid of all that old problem." Them we built the 78 and we put the terminal and the computer together in a package, and then we have a link to the secondary/tertiary file store and the double link there is a communication link because it's got to communicate with other systems. And then the PDT says, "Hey, that's a dumb idea! You don't put the terminal with the computer. You put the terminal alone and you put the computer with the mass storage, so we went down that route. And tried - and we put them all - the terminal goes through a cable to the computer and the secondary/tertiary store and then the double dotted line for communication goes there. And now, Al Shugart, and Jesus Christ! what that allows you to do - that really frustrates me - you can - there will be - if we could get our competitors to really play fair, we could really do well. (laughter) And you know what's going to happen? Everybod's looking at that damned - that 5-megabyte thing - they're going to stuff the computer and the 5-megabyte in the terminal. That's unfair, because everybody knows either you go the PDT route or the 78 route. And what that does is get a lot of cost-reduction out of there. It gets a lot of the file storage. It gets rid of a lot of paper because - say I take a megabyte of that and run the last megabyte - I just simply allocate that - let's call it paper - and - which is four hundred pages of paper, and I simply scroll there. So I've got - I've now combined my paper input and my wastebasket in one unit. (laughter) No. I want to say - that wastebasket - because if I ever want to get at something again, I simply scroll back down that paper. So I've got the last four hundred pages of garbage that this thing has - well, of these words of wisdom that have come out of this system, or what have you. So, it really provides a very neat system. The trouble is, that's not - I've got a couple of other systems I'd better introduce here - and the other thing is - the small floppy that Chuck found - gee, that's got some interesting possiblities too, because then you can take the - do the same thing. And if these guys hadn't built these small units we couldn't stuff it all in one box and get that low attendant cost, we would continue selling what we have and we wouldn't have to do any work and we could think about profession-based systems rather than having to do something. And it's a lot more fun. We wouldn't have to interact with Manufacturing so much and gee, we could be philosophical. But we've really got to get back to work. (light laughter) And then this link here, I think, is - the possibilities there are to - oh, by the way, this one kind of should be up there, namely, that that's to - this is only a secondary storer, in our parlance, right now. It may end up to be a tertiary storer if it turns out to be so reliable and you can think that that's as reliable as the paper you have around, or it's not going to burn(?) - because things happen to paper, too - you spill coffee on it, and all kinds of other junk - and the alternatives that we do there is simply put that link into a tertiary storer to hard copy and other systems for shared use. We've totally changed the structure of the system. Not like the one we've ever had before. We've never seen an animal like that in our hardware zoo. And, I don't know, that may be an alternative, and if you looked at the di.. - if you looked at Xerox's stuff upstairs - that (?) - that's their model of the world. Those guys are doing it. And if they - let's not tell Xerox about Shugart - can you - Shugart probably won't ever talk to Xerox about that. There's probably no communication out there in Silicon Valley at all, and (light laughter) we can simply do all of our - continue all of our product planning based on the fact that those two guys will never get together. And the Xerox thing upstairs, which is a 5-megabyte hard disk, non-removable disk - they don't know what we know, that you must have removable media on the thing. We've got a history of removable media. There's no way that that system will work that they built a thousand of up there. All of those users can't be right (laughter), because after all it was a laboratory thing anyway, and when they really have to face the hard world instead of giving those to the White House and places like that, they will find out that it's no good. And so, what we've got to do in 1985 is go back to where we think the world is, which is - hey, let's go back and - it turns out - by God! lo and behold! it's exactly where we were twenty years ago. We've got a bunch of terminals connected to - through communications lines - to a computer and secondary storage and tertiary storage, with a couple of dotted lines that go out as communications options because these things have to talk to one another. So, in a sense, maybe there's nothing new under the sun. The thing that is new is, in fact, neat packages like Tom Orr has, which this is all really really quite small - it goes under a desk - and we have made a lot of progress, because in '65 we could barely get it in a room with air conditioning. Now we're sitting there and it easily fits under a desk with a hell of a lot more capability. So that's one way of looking - just wanted to throw that out as a way of talking about systems, namely - a little of the grammar - when you don't put lines between them, that means they're all in the same box. When you put a line between them, they're connected by a cable in different boxes. Anyway, it's a slight bastardization of PMS, but that's what happens when you take something from the academic world and try to apply it in a real-life application. And I think this allows this to go and brainstorm and look at a lot of things, maybe in a non-threatening way, and then look at what the alternatives are and what you can do with each of those. Now there's a taxonomy here that I've been pushing, not very successfully with Manufacturing, but it really has to start within our shop, which is really a packaging system type, and - I hate numbers but in this case - it's really based on scale and modular index, whether something is either, that is, the size, plus whether it's modular or integrated and that's an important thing because, again, when I talk with Manufacturing about "How do you build something?" somebody will talk about an 1134 as the epitome of the way to build something and somebody else is talking about MINC, and we have no way of focusing. Conversation about how to manufacture something is just a nightmare, because in some person's mind it's a terminal and in somebody's it's "How are we going to connect the cables on a big hydra structure?" And so, let me offer this one, which is Type One. Why say - why I want to bind it - when I bind something, it's putting a number on it, and that's about the worst thing you can do in my world, is actually assigning an index to it. And hand-held is Type One. It's an integrated system. Type Two is either a fixed or - I don't know - Two-A is a portable terminal like we saw with Field Service thing - those are integrated things. Type Three is really stackable. It's a modular and we saw Type Three, really a lovely thing, up there by Tom Orr. And if you like the lightweight version, you'll like the industrial design. The non-(?) version and the lightweight model, but if you've ever tried to compute on a bunch of styrofoam, it ain't that easy - you know - and the signals propagate somehow. There's no paper required, and - but, in essence it's a - Tom did an embodiment of the modular stuff that in fact - with the neat white box. The next version of our stuff certainly is going to get down in the white boxes, so we have to make the styrofoam versions first, but we've got the bigger versions now as things that are real, and they look - that looks like a neat thing. I think, whether you stack them vertically or horizontally matters. I think you can - probably there's - I don't know - maybe they have to be vertically stacked - and sort of Three-A is whether they're either a bench or a table or a desktop; B is whether it's on the floor - sort of a bottom-up design; and C is whether you put it in a cart as you did the MINC thing. And then Type Four are the rack things that you somehow bolt it in - and those are integrated systems, too. These, by the way, are the ones that, in a Manufacturing sense, are probably giving us the most trouble, because you're trying to pull a lot of different units that don't have as clean interfaces as one needs and make those all work as a system. And so, when we talk with Manufacturing, the world - somehow there's a view that everything is Type Four. My view is we're going to Type Twos and Type Threes and then - and we've got Type Fives, which is really collections of cabinets with big disks, and they are integratable. And then Type Six, which is the hydrastructures, collections of computers. So, this is another taxonomy. I'd like tro keep us saying, "Gee, are you talking about a Type Two system or a Type Three system?" So we are able to focus how our thinking went, rather than one person's three-hundred dollar terminal and somebody else's, well, three-million-dollar system. So it's a taxonomy I like to - let me skip past it - this one's a little messy - there are five - I think only five things matter, it turns out, but let me not get into that one. That's - how do I say stop? - okay. Now, let me turn the interrupts back on. Sorry.

Any questions?

I overloaded the channel or (laughter) or the tummies are underloaded. Probably it's tummy underload rather than information overload. (laughter)

VOICE: We have a scheduled one-minute break here.

GORDON BELL: Oh, there's a scheduled one-minute break.

VOICE: Go ahead, Mike.

(pause)

Digital **Interoffice Memo**

Subject: **Grant's Comments**

To: Lorrin Gale
Date: 4 OCT 76

From: Gordon Bell

Dept: OOD
Loc.: ML12-1
Ext.: 2236

Grant's comments:

Considering LSI as strictly a packaging alternative a 1001C hex module takes about 1 man-gear of engineering = $100K. Or $1K per package.

the 31 1C equiv. ECC chip costs about $120K to develop. Or $4K per equiv. SSI/MSI package. cost about $90K.

Parts costs LSI vs SSI/MSI about equal. LSI takes longer, makes ROI harder to get. May save board space, therefore $.

Conclusion: CAD needs to improve by a factor of 3-4.

Why not talk with him?

Subject: **Graphics: Why We Recommend What We're Doing**

To: Win Hindle, ML10-2/A53
Andy Knowles, ML10-2/A52

Date: 4/3/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Since there is some controversy a to whether we should be spending Central Engineering money on the VT125 instead of the VT100L, let me indicate why I believe it is essential that we go ahead as we are:

0. HP is there. Others are too. We'll lose system sales without it.

1. We were given the Graphics Charter several years ago and have been successively beaten up year by year because we have built no products.

2. It is the follow-on to the VT100. In the printing terminals, and in our computers we continue to build constant cost, higher performance or more capability products as the first priority product. Invariably, these products are more successful than when we build lower product cost products, because they fit into our existing marketing and distribution structure. The VT03, 05, 52, 100 sequence is the relatively constant price model. The

VT100 adds a lot to the 52 (note the 50 at a lower price wasn't particularly successful), and the demand is twice as high as the 52 even though the costs aren't that different, reflecting a response to features.

3. All a VT100L will do is to cause phase-in/phase-out problems and cause us to lose NOR as users buy the same product at a lower cost.

4. Graphics in terminals is inevitable and necessary. We have the people and product idea to establish the standard and get the whole tube market over to graphics. Hence, the real market is here, not a lower cost 100.

5. With the cost of people sitting at a terminal, the cost of ownership favors getting the maximum productivity and use by having the most functions.

6. We have a companion product, GIGI, that further supplements the Graphics standard and graphics line. Instead of doing a 100L, GIGI should be put into even higher volume to get us an even bigger market.

7. There is a lot being spent on Graphics now in DEC. We badly need it to avoid loss in the Technical Market, and if someone like IBM adds graphics to their terminals, the need will be accute in the Commercial Group. I believe the Terminals Group would be far better selling a VT125 with Graphics than competing in the glass Teletype market which they are not in and have ignored.

Dick, Roy, Len, Charlie and the group working in this area are doing a great job. Let's support their direction and get the terminals market by having unique, great products. We can always do the cost reduction bit (like the 8/L, 8/S, 9/L, VT50) after a great product is in the market.

SUBJECT: RE: MORE ON ALAN KAY VISIT

The ooffice systems group in ZK have used a 100 to simulate the ct100 graphics with multiple screens, etc.

I'm pushing building a graphics architecture definition that could be implemented in various places: nebula microcode, vax code or in the suvax processor. For now, I think we should put the architecture in vax code and get the arch right using the bit maps and high res tube, then put it in microcode in the high performance processor when it runs. This would let us get a system out now with nebula and high resoluction and work the right interface. Otherwise we'll spend enormous time trying to get the grpahics processor debugged, coded and produced ... costing us a year or so.

GB2.S5.22

EMS 13-JAN-79 14:33:50 540 1

To: Len Halio
CC: Dick Clayton, Bill McBride
From: Gordon Bell
Date: SAT 13-JAN-79 14:33:50 EDT
Subject: Graphics terminal progress.

I'm really impressed with the progress here. I conveyed this to Andy and to Jerry Witmore. Jerry wants to take on the role of Market sponsor to ge a product defined and done with haste. Furthermore both of them are enamoured with the possibility of haveing a complete range which now contains (in my head): 1. Gigi as the ultimate, low cost, graphics included terminal 2. VT125 aas the main line, high volume terminal for every offic and professional 3. Tektronix 4027 buyout high cost, color...but modified to our stand ared 4. a Terminal that we were/are buying out that is high reolution graphics for the engineering market...Si is out there buying now... and Jerry will convince him and John ot be compatible with the architecture

Note, we have a once in a lifetime opportunity to build a family of terminals
and put together a terminal architecture becasue there is nneed, knwoledge,
and projects in place. It is critical that someone be assigned (left free)
during the next 6 mos to be theh tight fisted architect of the hardware and
software. It has to reside in 1 head....plus we have to be doing the
dataplotting off to the side. How can this be structured?

I'll send a memo to the world with this plea...and direction. (see that Roy
and Charlie get this one)...Why aren't they members. of EMS? Bill will you
contact Jerry annd John and then possibly Si, with Jerry. LDP is also
relevenat , but I assume that Bill McBride represents them We should not push
too much to solve every problem a on the first draft of the terminal and
software architecture. The right approach for this kind of definition is to
put down all we know, solving all the problems outlined above and then to
evolve it when the other needs come out. The framework is robust enough to
proceed this way, because it is so open ended.

SUBJECT: GET GRAPHICS ARCHITECTURE AND PRODUCTS FOR KO AND SUVAX!

I would like you to take the responsibility for convening the groups to deal with what I think we need in the graphics products area. Currently, I see five independent efforts:

0. Gigi I and VT 125, with glimmer of GIGI II, which I want to hereby define as KO graphics.

1. KO- we have defined and must have 2 or 3 grahics generators for the design in order to compete effectively as a personal computer. The general characteristics are designed. We must immediately get specific in order to know how the whole family fits together.

2. CRG designed high resolution graphics- intent to build 10 with the attendant cost and maintainence problems. This one is clear, stop it and move the resources to 1 today!

3. Suvax graphics- lots of capability, much of the work for 1 is in it, hence I want to find a way to transfer some knowledge to work on 1. Must have for Suvax. Looking for a Mfg. home. CSS is a candidate.

4. CSS- lots of hardware, no architecture, some occasional

software, travelling swiftly along the road to nowhere. Does
represent a resource to build high performance (not the high cost, low performance stuff now being built).

We must have a hardware and software architecture, otherwise we
are going to continue to fail with these products. Please address how you are going to do this, NOW!

SUBJECT: GETTING TO A SINGLE 11 SYSTEM'S GROUP

Dick and I talked today about how the 11 group would evolve.
I
want Dick to get an organization in place that can deal with
the
current charter of personal computers BEFORE dealing with the
larger question of Departmental computers in cabinets from
the
03-70 and running rt, rsts and m overall.

I'd see this as having a strong software person who would
direct Gil, deal with softare projects, inteface to other
software programs like KO/wps, the special P/L applications
groups, and take the responsibility for software for KO.
This group would get larger with time as we begin to migrate
other software on to the KO. Nevertheless, we should keep
the KO focussed on being a personal machine, versus having
it be a departmental computer on which rsts and m run...
although we may run these systems on ko in abounded fashion.

A seperate 11 systems group focussed on departmental
computers
would include all the Q and U bus development, together with
the multiprogrammed operating systems would be established.
This would be gradually phased away as VAX takes over this
product space. People would move from this group both to
VAX and to the Personal computer. It would be responsible
for the software so that users would migrate/coexist with
VAX. Also, it would also be responsible for various support
of the personal systems such that our existing customers

would want to buy KO's because of greater productivity
for their existing 11 computers.

It would make life easier for Dick to have this ability to manage
the interface so that we get the personal computer work done using these people who really understand 11's.

Fact: Given our position in the personal computer space on hardware... especially with terminals, I have trouble in recommending that we do this because I believe Dick has his hands full in getting the hardware team, getting the hardware,
and then getting the software organization. Also, I see little
interaction with the current 11 software organization.

What I would like to do is to agree on a person who will ultimately report to Dick, and to intitially hire that person who will handle the 11 departmental computing work. This person would initially report to Larry as we get the organization
set up. When Dick has the personal work going, he would take this over.

I'd like to get going now on building an aggressive personal computer group, and I don't want anything to get in the way.

Let's discuss how we proceed.

Dr. Ugo O. Gagliardi, President
General Systems Group, Inc.

51 Main Street
Salem New Hampshire 03079-3195

Dear Ugo:

I enjoyed the brainstorming with you, Ted, Archie and the Italtel people. It certainly was a hard day. I hope it was beneficial to Italtel.

I was a especially impressed with Maurizio who appears to really understand the products and technology. Mrs. Bellisario was especially insightful and focused; it was a pleasure to work with her for the day. It seems like Italtel has the potential to be a major company under her leadership. The only disappointment was that I learned very little about the state-of-the-art and details of their switch and capability. I hope to receive more information about their product and company. Encore has forthcoming computing products that I believe will fit well with their switching architecture, thus I hope we can get together later to explore this.

I'm anxious to see the Macrodata/Olivetti computer that you gave the Museum, and hope it has supporting historical data and documentation. We are also delighted with GSG's decision to become a member.

Enclosed are several brochures for your visit to Olivetti, in addition, I'm asking Michael Oleksiw to call you to prepare a custom proposal for joining the Museum. Most likely, it will be necessary to have them visit the Museum before they commit. Please extend this invitation. Also, I'm inviting Italtel to join the Museum.

Attached are my expenses for the day.

Sincerely,

Gordon Bell

Nobuhiro Hamada
810 Isobe, Hitachi-Ota
Ibaraki, 313 JAPAN

Dear Nobuhiro:

Last week I returned from a trip, which included Japan to find your letter to me in July, your August 29 post card and the lovely Japanese fan. I'm sorry we weren't able to meet either at CMU or in Japan.

Your paper on the Design of Cooperative Operating Systems for CM* looks quite interesting. I've sent it around to others who are designing systems of this type. I can see the approach is something of an extension to the hardware modules and structures work that we've been interested in at CMU.

Again, thanks for the fan. Perhaps we'll meet someday. I've tried to gather some of the handbooks you wanted.

Sincerely,

Gordon Bell

MESSAGE ID: 5183715678

SUBJECT: HARDWARE SPECIFIC PRODUCTS FOR APPLICATIONS GROUPS

Aren't you tired of listening to Ken complaining about getting
market specific products such as Cash drawers that would be useful, and indeed I would think essential in particular markets?

Why can't we make a list of what the products are that are needed in these areas and then simply go about getting them? For starters, it would seem that it would be a great idea to buy them out, and possibly to define and use some standard interfaces like RS232 to connect them easily to all of our computers.

For commercial, the list might include: Cash drawers, credit card readers/mag stripe readers, bar code (ala CSS... see we have one), document readers, fax interface (i/o), bank teller terminals, etc. At the very minimum, we'd have a list of these devices that we support at an interface level.

For Factory, why don't we simply adopt the AB form factor and make a controller out of 11's to drive their electronic equipment? I hate to see us go after another bus and the attendant high investment to get the relevant power conditioning
and transducer modules. Given the numerous systems we now support within the P/L and CSS, it would seem that this is a very high priority item.

For LDP, I know we all agree there's a crisis in being able to provide cost-effective i/o. What could we buy out? Why not buy an Analogic AP500 to do the front end processing? or is it simply too expensive to OEM?

A BACKWARD INTEGRATE/TOP DOWN VERSUS FORWARD INTEGRATE/BOTTOM UP
APPROACH

Let me strongly advocate that as systems sellers, we want to provide the complete solution to a customer buy either doing it directly (eg. making a cash drawer) or preferrably by

reference selling one. The main thing is to decide the system
component, provide the software interface and then have us either sell it to them, or let the customer buy it from the component supplier. I.e. I strongly don't believe we want to make these components ourselves... we simply want to make it easy to buy and use them!

GB2.S4.36
Digital **Interoffice Memo**

Subject: **Hardware/Software Activity (?) in Microprocessor Interface Support and Potential Products**

To: Ed Fauvre
Lorrin Gale
Roy Moffa
Steve Teicher

Date: 4 OCT 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

F/U 10/11

In discussing the microprocessor support with Celeste, it's clear we're losing ground at much faster than real time. I.e., the users of the 8080 are hiring Applications Programmers (e.g., BSR's, LA120, DK) because the group isn't supplying them. Furthermore, the activities need in support alone are growing very fast (e.g., need for programming standards). There is also significant need for hardware support!

1. Ed, did we make a mistake in the organizational position? Should Celeste (as Microprocessor Applications and Support Programming) be moved to CAD, LSI, or within systems programming versus individual users?

2. How are we going to get full-support (i.e., both software and hardware)?

   a. Coding standards?

   b. The Intel $10K system for debugging? If we do nothing, we'll have 30 of these in DEC soon...and the 8080 is going to be interim.

   c. Should we not do b, and do the hardware (based on 11V03) and finally Krypton?

   d. Roy, isn't this something you'll have to have for 11 designs (and also useable with right interface for the 8080)?

   e. Right now, several groups are doing hardware development systems based on 11's. Who's going to do this hardware?

   f. Coupling between hardware/software? who? I'd like people who read this to respond. I'm frustrated with inactivity, and want to charter or have someone else charter these activities so we can get action. There's none now!

   g. A standard test system for

manufacturing.

Mr. Harold S. Stone
University of Massachusetts
School of Engineering
Dept. of Electrical Engineering
Amherst, Mass. 01002

Mr. Bruce W. Arden,
Professor and Chairman,
Princeton University
Dept. of Electrical Engineering
Brackett Hall, Engineering Quadrangle
Princeton, New Jersey 08540

Dear Harold and Bruce:

The revised copy, Draft 4 is an incredible improvement over the sum-of-parts. I would hope Harold can now do a fairly major revision on this to further integrate, reduce, and tune it to be a first rate section. It looks like there's hope now. I can almost see a structure.

I've enclosed an essay that you might extract parts from which has

among other things: an explanation of why or how we get newly named computers (e.g., minis and micros) from the technology; the levels-of-integration; and a discussion on a performance measure. Since I'm not sure of the eventual outcome of the essays or even their existence and am unhappy with their current quality, please do not reproduce or use them <u>except</u> for COSERS work. (Bruce, some of this might be helpful for your section.)
If this is of any use, a forthcoming section maps all machines into a 6 to 12 dimensional space which is essentially the resources of a machine, and can be nicely plotted on a 6 decade, log Kiviat graph. (The first 6 are: Pc(access/sec); Mp(size); Ms(size); T.human(data-rate); T.computer(data-rate); and T.external(data-rate). It should be noted it holds for microprogrammed, macroprogrammed, and language machines alike. The reader can easily see the difference of computer (information processing) structures like typewriters, teletypes, hand-held calculators, real time, timeshared, store-and-forward switching, high performance, etc. computers, as well as the language machines from a performance and structure viewpoint using human pattern recognition. It doesn't (yet) capture notion of reliability.

I'm enclosing the pages I've made marks on. I'd like to see the tables next go around. I'd like to stick with the word "memory" throughout, and never use "storage".

As to where it belongs, here or in the overall section, I believe there needs to be a strong structuring of the ideas that have been introduced into computer hardware. They really are quite simple and natural when presented right. That is, the great ideas really need to be divided into a few great (revolutionary) ideas, and then everything is a refinement (evolution) on those ideas. The revolutionary categories:

1.The whole notion of a machine ala Turing, and possibly the stored program computer is evolutionary. For example we're coming back now and rejecting some of the original ideas - stack vs 1 AC or separating data and program simply to protect the data (or program). This is where the notion of levels of language interpretation should come in: basic hardware or sequential switching circuit: the micro machine; the macro machine; the operating system (and sometimes a virtual machine); the language machine and the subsequent higher level language machines that get built up from these structures.

A section on this would really address and show how we move software constructs from the language (and use) into hardware. These include stacks, index registers, various data-types (e.g., arrays, strings, floating point)...the great ideas. It would also include how one can map an entire language into the hardware of a machine's instruction-set. This accounts for microprogramming, and virtual machines, for example.

2.Memory hierarchies - a broad principle of the nature of how information is stored and processed in most physical systems including humans. Namely, that an information processing system has varying amounts of information that can be accessed in varying times and at varying costs (since economic man is building it). This principle accounts for the application of memory technology into a hierarchy of basic needs: registers, the cache, main memory (and then in pages or segments), secondary memories of various sorts, tertiary and archival store.

3.Parallelism - the notion that there are many operations that can be performed at the same time and generally brought together to form a single system (e.g., arrays, vectors, sets, multi-program or multi-tasks, independent programs).

4.Fractional parallelism/time-multiplexing (i.e., the sharing of a single computer for what appears to be independent activities). This includes multiprogramming and timesharing, but it also calls for the invention of the correct synchronizing primitives.

5.Redundancy to provide arbitrarily reliable information processing structures (includes parity, ECC, TMR, voting, etc.).

6.Device technology - this would show how the levels of interpretation, and other parts of the machine have provided a natural structure for use. We should point out that some parts (e.g., IC's) evolve rapidly because we're the dominate user, whereas disk storage is generic to our structures...and only evolves 1/2 as fast. Also we must point out that technology just does the following for us:

a. Allows us to build higher performance, constant cost, machines which integrate software concepts and needs.

b. Allows us to build lower cost, minimal performance structures (e.g., mini, micro and calculators).

While I don't claim that it can yet be a revolution, it's revolutionary to me to realize there are only a few pure, information processing components (i.e., links, switches, memories, transducers, and data operators) and from these we build more complex structures of the same type, and even other primitives (controls, then processors, and computers). From these we can describe and analyze everything from a teletype to a large scale computer. I think we've missed an opportunity in the report to orient the world and show them that we have a science based on primitives that we understand and synthesize with. I'd like to see the hardware section do more to help dispell the mystery.

Just as we dehumanized the report to credit individuals, should we do it for companies...(e.g., page 57) with the provision that we must have photographs?

I've attached some copies of slides on multicomputers, networks, multiprocessors to help the area around page 70.

It might be worth contacting Dave Evans to get photographs of displays which are used in Flight Simulators. These tend to have highest performance. Also the sector is dry and needs some photos.

I'd sure like to see family trees which tie together various technologies, e.g., semis, memory (like the sketch I sent last month), transducers.

In the paper I sent earlier, I outlined a number of problems in computer systems design that I thought were worthy of hardware research. Some of them not already in should be included. For example, before we can do much with computer design as an engineering discipline, we have to have a better way to describe the characteristics of an information processing task so that it can be allocated to various uniprocessor or other structures that we conjure up to handle the job. I feel we would get something that could ultimately work much better than the seat-of-the-pants method we use now.

Sincerely,

Gordon Bell
Vice President,
Engineering

February 4, 1980

Messrs. Dobson and Pennington
Harris Semiconductor Group
P.O. Box 883
Melbourne, Florida 32901

Dear Messrs. Dobson and Pennington:

I'm sorry we didn't have the opportunity to discuss WP at Harris when we met a week ago Friday. I've reviewed your letters of 12/6/79; 1/4/80 and status of 1/25/80. The problems seem to cluster into three timescales:

1. Getting the WPS200 running smoothly.

2. Enhancing the existing WPS78 and WPS200.

3. Specific direction (e.g. Voice, FAX, OCR) over next 5 years and beyond.

On point 3, we are committed to becomming the significant supplier in the office market which, to me, simply means having those products necessary to succeed. By this, I mean we have the drive, manufacturing, and understanding. This includes standards, components (i.e. terminals, CPU's disks, network), performance analysis and measurement, human factor understanding and a very strong programming group who understands interactive computing and distributed processing. Similarly DEC now runs the largest Electronic Mail System anywhere, I believe with over 2000 subscribers on 3 nodes...and we are developing products in this area to complement WP. This belief in the long term has been what's prompted the recent organizational change (note the attached press release).

I have personally spent a great deal of time in this area and am going to make sure our products are right. Based on experience in shared and standalone interactive computing, WPS200 (the largest 248 system of 4 RL01's, 2 DP's, 2 LQP's, 8 VT100's, 3 dial in/out Communication lines, and 1 hardwired line to our DP/EMS systems is installed in my office area), and the WPS78 (and its successors) I want us to rethink the question of shared versus standalone and how WPS systems couple to DP systems. A week ago, I was convinced we should move to larger, shared systems with integrated DP facilities along the lines implied by your vendor long term questionnaire. Today, based on my feeling about large WPS200's (assuming they work well), I'm less sure!

Here, I'd like to interact with you after we've got some hard data and have internal consistency, yet some flexibility so we can test it with knowledgeable customers like you.

A very aggressive, cost-effective standalone system based on your latest PDP-8 CMOS chip will form the nucleus of our WPS, beginning in a year. Re your 1/25/80 question of commitment to Office Automation, I must say: Yes, very committed.

On point 2, given that we have to market a high volume of systems in the WP and Retail marketplaces, we must add capabilities along some of the lines you suggest. In some instances, customers feel we have made commitments for various extensions. Right now, we're sorting out the requirements for releases 5 and 6. We'll be happy to discuss the future when the product enhancement direction has been scheduled, but in no case will we make a commitment to deliver <u>until</u> the capability has been desiged, implemented, and tested!

Point 1 - getting your WPS200 reliable, documented, trainable, and becoming a part of the DEC organization vis a vis communication. Stan Olsen is working diligently to solve the organizational and communications with the users problem via the Word Processing Product Line. The Engineering organization under Bob Daley and Bruce Stewart, in Merrimack, is working on the software and user documentation. We have more people working on version 4 now than a week ago. Some of the effort includes a remote terminal emulator which enables a PDP-11 to behave as WP terminals, so that automatic testing can occur. Currently we do not have a complete work plan to address <u>all</u> the known problems. This should be forthcoming by mid February. When it arrives I will make sure it is communicted to you.

In summary, we are doing everything possible to make our current products in the field reliable so that you'll be happy and therefore more WPS can be sold and installed. We are planning enhancements to these base products so that they can be competitive as possible in the next few years. (Also, we must have products that use the PDP-8 chips in the quantities we've committed to you.) Our general product strategy of interactive and distributed processing is aimed at the office. We intend to be an innovative, quality supplier in this marketplace. I hope we can continue to have you as a customer.

Sincerely yours,

Gordon Bell
Vice President,
Engineering

February 26, 1980

Messrs. Dobson and Pennington
Harris Semiconductor Group
P.O. Box 883
Melbourne, Florida 32901

Dear Messrs. Dobson and Pennington:

A copy of the WPS 200 Version 4.3 Maintenance Release Plan dated 8 February, is enclosed, as per my letter to you of February 4, 1980. You will note that the plan is reasonably complete, but lacks some of the dates that depend on external groups for Quality Assurance, etc. The plan is being continuously updated to get these dates. I have discussed the plan with members of the WPS development group, but I have not personally reviewed the plan in terms of the various problems and resources we are committing to it. Overall, we believe we have as many people as can be productively applied to the problem. There are four full-time people and five half-time people working on the release. I am meeting with the developers this week and if I believe we aren't able to meet these commitments, I will contact you. Currently, the weekly schedules are being met.

You will note that we are going into internal Quality Assurance 31 March. Because it will be August before we have a complete release to the field, Stan Olsen is advocating that we distribute a document describing the failures so that users can avoid them.

Our restructuring is helping segment our resources into the various problems and future plans. Also, there will be organizational announcements shortly in the marketing domain that will also help our field communications problems.

Overall, I am quite positive that we are progressing to be a serious supplier of WP Systems.

Sincerely,

Gordon Bell
Vice President,
Engineering

Dear Sir:

Attached are copies of the two bills of sale (Invoices 20572626-7) for Coleport Blue Wheat Tableware I purchased from C12213, in dept 772, on 14 March 1984. They were supposed to arrive within ten weeks.

Where are they?

Sincerely,

C Gordon Bell

As strictly party talk with Laarie Bogorad (495-4292) and J W Hastings (495-3714) of Harvard's Bio Lab at 16 Divinity in Cambridge, I found:

1. Somehow they don't have

a very high opinion of MINC. For some reason it doesn't do what they want it to, or appears too restrictive. We are using their lab as a demo area for customers to view it, so it would be really important to find out what it is that bothers them.

2. They think the APPLE is great. They do like the prices of $300 for 16Kb of memory, but there are other things too. (They also bought add-on at $85 for 16Kb.) What is it about the APPLE? Can we get one or at least a description? One thing was the graphics, and the ability to have color, even though they didn't buy the option.

3. They really want Word Processing on 11's to add to their existing systems. They are doing true word processing and really want it as opposed to SOS, TECO, and EDIT. It seems like if we could get a system put together here, we would have a great, instantaneous market everywhere. It is conceivable the DX11 package, together with the VT100 with the White Tornado gives us the best deal...namely, no new software (which has to withstand piracy, etc.) and best of all we sell a specialized terminal for it. They will also then want it to be applicable to all their old terminals, but that's life.

4. Most of all with Word Processing, they want a school they can send their secretaries to. They don't want to teach them, and they want to use the systems themselves, but mostly they want publication of papers and reports to continue in the same old fashion where the secretaries do the editing. Jack, you should get it together with the technical people... and the terminal may be the vehicle.

Dear Tony:

Ken asked me to answer this. I've checked the list of attendees (enclosed). I'd think 15 should be the limit. I've looked at your paper. The taxonomy was interesting and should be published more widely. Why don't you use your taxonomy and see who's critical to cover it, relatively uniformly?

Given that a small, representative group is likely to produce better results, I'd say we should let IBM and CBEMA represent computing. I would like to see the <u>results</u> of the workshop made widely available. If this is not the case, then we might want to attend. If we are invited, the invitation could be sent to me.

Sincerely yours,

Gordon Bell

Dr. Harry G. Hedges
Member, Computer Science Board
Michigan State University
Computer Science Department
Computer Center
East Lansing, Michigan 48824

Dear Dr. Hedges:

Thank you for your kind offer, however, I don't think I could be away for four weeks (despite the fact that it would be very beneficial).

Several of us are finishing a book (due in September) on Computer Engineering in which we try to write most of what we know about computers -- even though it's just about DEC computers. The book might be useful, and it's possible that we might get the various contributors (e.g., Sam Fuller) from here to come and give their various viewpoints. The book has received many very good intermediate reviews, but it remains to be seen how it'll finally be received.

Sincerely,

Gordon Bell
Vice President,
Engineering

HEURISTICS FOR BUILDING GREAT PRODUCTS

Products goodness is somewhat like pornography, it can't fully be described, but we're told people know it when they see it. There are lots of heuristics in the book, Computer Engineering. Since quality and competitive products must be our number one focus in these next generations, these heuristics are intended to help us. Only the five following need be attended to:

.a responsible, productive and creative engineering group;

- understanding product metrics (competitiveness);
- understanding the design constraints;
- knowing when to create new direction, when to evolve, and when to break with the past; and
- ability to get the product built and sold.

ENGINEERING GROUP

As a company whose management includes mostly engineers, we encourage engineering groups to form and design products. With this right of organizing, there are some responsibilities:

- basic notion of excellence and quality;
- understanding leadership who understands the product space and who has engineered successful products;
- having skills and disciplines required in the respective product area, eg. ergonometrics, acoustics, radiation, microprogramming, data bases, security, reliability;
- having skills on board to make the proposal so that we adhere to the cardinal rule of Digital, "He Who Proposes, Does"; Approving a plan, based on no implementers violates this.
- having open-ness, external reviews, clearly written descriptions of the product for inspection;
- as a corollary of being prepared with leadership and skills, we occasionally enter very new areas, requiring research and advanced development; Product commitment should not be made until fully operational breadboards exist.
- as a corollary, start up groups with no previous or poor previous track record, may need review.

PRODUCT METRICS

Since most of our products are evolutionary, engineering is responsible for knowing their product area, in terms of:

- major competitor cost, performance and functions together with what they will introduce over the next 5 years;
- leading edge, innovative small company product introductions.

DESIGN CONSTRAINTS

Design constraints such as acoustics, radiation, are basically useful because they limit choice of often trivial design decisions. We should meet the following design constraints, and if unacceptable, go about an orderly change:

.DEC Engineering Standards covering most physical structures and design practice for producibility; These assimilate the critical external standards such as VDE, and FCC as rapidly as possible.
.information processing and communications standards, such as Cobol, Codasyl, IEEE 488, EIA;
.information processing standards as determined by the key supplier, such as IBM SNA; For example, all eight versions of VISICALC we are implementing, should be compatible with external VISICALCs.
.the architecture of existing DEC products; For example, future editors should be compatible with the past editors, unless it can be shown experimentally that there is a significant (x2) benefit to change. These include:

> .ISPs of the 8, several 11's, 10/2, VAX-11, 8048, 8080 and are likely to include a 16-bit micro;
> .physical busses for interconnect; Fundamentally this insures that future products can evolve.
> .file, command language, human interface, calling sequence, screen/form management, keyboard, etc.

.we must not be undone by historically poor standards which constrain us to poor products; Currently, the 19" rack and the metal boxes we put in it, and then ship on pallets to our customers, act as constraints on building cost-effective PDP-11 Systems. This "mind set" standard is impeding our ability to produce products that meet the 20% cost decline. A target should be the shipment of systems in cardboard boxes which the customer assembles.
. ability to be implemented easily in any natural language, given that we are selling products in all countries.

WHEN TO CREATE A NEW PRODUCT DIRECTION OR WHEN TO EVOLVE THE OLD

Given all the constraints, can we ever create a new product, or is everything just an evolutionary extension of the past? Also do we know or care where product ideas come from? There are a whole set of places to look for products, but that's another set of heuristics, and the object of these heuristics is simplicity. The important aspect about product ideas is:

. Ideas must exist to have products!

It is hard to determine whether something is an evolution or just an extension. If you look at our family tree of products, like the one for our computing systems, and which every product group should have and maintain, the critically successful products all occur the second time around. Some examples: 6,KA,KI,KL,2080; Tops 10,Tenex,20; 5,8,8S,8I/L,8E/F/M; OS8-RT11; 11-20,40,34; RSX-A... M; TSS-8,RSTS; various versions of Fortran, Cobol and Basic all follow this; LA30,36,120; VT05,50/52,100; RK05,RL01/2.

Some heuristics in designing good products:

.all products whether they be revolutionary (we have yet to have any that are really in this category), or creating a new base, or evolutionary, should:

.offer at least a factor of two in terms of cost-effectiveness over a current product; If we build unique products that do not compete with ourselves, then we will have funds to build really good products.
.be based on an idea which will offer an attribute or set of attributes that no existing products have; For example, the goals and constraints for VAX included factor of two algorithm encoding and also offering ability to write a single program in multiple languages. VT100 got distinction by going to 132 columns and doing smooth scrolling.
.build in generality, and extensibiility; We have not, historically been sufficently able to predict how applications will evolve, hence generality and extensibility allow us and our customers to deal with changing needs. We have built several dead end

products with the intent of lower product cost, only to find that no one wants the particular collection of options. In reality, even the $200 calculators offer a familty of modular printer and mass storage options. For example, our 1-bit PDP-14 had no ability to do arithmetic or execute general purpose programs. As it began to be used, ad hoc extensions were installed to count, compare, etc. and it evolved into a digital computer.

.build complete systems, not piece parts. The total system is what the user sees. A word processing system for example includes: mass storage, keyboard, tube, mdoems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes.

. a new product base, such as a new ISP, physical interconnection specification, Operating System, approach to building Office Products must:

.start a family tree for which we expect significant evolution to occur on, otherwise the investment for a point product is so short term and hence is likely to not payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family.

.a product family can evolve several ways as described on page 10 of Computer Engineering; The evolutionary paths are lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

.lower cost products can't get by without adding functionality too, as in the VT100;

.constant cost, higher performance products are likely to be most useful, as economics of use are already established and a more powerful system such as the LA120 will allow more work to get done;

.a product evolution is likely to need termination after sucessive implementations, because new concepts in use have obsolesced its underlying structure. All structures decay with evolution, and the trick is to identify the last member of a family, such as the 132 column card, and then not build it. This holds for physical components, processors, terminals, mass storage, operating systems, languages and applications. Some of the signs of product obsolescence:

.it has been extended at least once, and future extensions render it virtually uninteligible; (For example, PDP-8 was extended three times.)
.significantly better products using other bases are available;

SELLING AND BUILDING THE PRODUCT
Buy in of the product can come at any time. However, if all the other rules are adhered to, there is no guarantee that it will be promoted, or that customers will find out about it and buy it. Some rules about selling it:

.it has to be producible and work; This, although seemingly trivial rule is often overlooked when explaining why a product is good or not.
.a business plan with orders and marketing plans from several marketing persons and groups needs to be in place; Just as it is unwise to depend on a single opinion in engineering for design and review, it is even more important that several different groups are intending to sell the product. Individual marketers are just as fallible as unchecked engineers.
.never build a product for a single customer, although a particular customer may be used as an archetype user. Predicating a product on a sale is the one sure way to fail!
.it should be done in a timely fashion according to the committed schedule, at the committed price and with the committed functions.

Now isn't it clear why building great products should be so easy?

Are there any heuristics that should be added? or are patently wrong? or need clarification?

Comments please!

GB2.S4.5

HEURISTICS FOR BUILDING GREAT PRODUCTS

Product goodness is somewhat like pornography, it can't fully be described, but we're told people know it when they see it. If we can agree on heuristics about product goodness and how to achieve it - then we're clearly ahead. Five sets of dimensions for building good products need be attended to (roughly in order of importance):

- maintaining a responsible, productive and creative engineering group;
- understanding product metrics (competitiveness);
- understanding design goals and constraints;
- knowing when to create new directions, when to evolve products, and when to break with the past; and

. having the ability to get the product built and sold.

ENGINEERING GROUP

As a company whose management includes mostly engineers, we encourage engineering groups to form and design products. With this right of organizing, there are these responsibilities:

. staffing with a chief designer/chief programmer who will formulate and lead the resolution of the problems encountered in the design; no matter how large the project, it must be lead from a "single head".

. having the skills on board to make the proposal so that we adhere to the cardinal rule of Digital, "He Who Proposes, Does"; Approving a plan, without the chief designer and sound team violates this! The plan must include the project organization.

. having management and a technical team who understand the product space and who have engineered successful products;

. understanding excellence and quality;

. understanding the performance and the learning curves that apply to design, design production processes, and manufacturing processes; the organization must be staffed with people who understand the product, the design process (CAD and management discipline) and the production introduction process. For complex projects employing more than a single design team (less than six engineers), a written design methodology must exist and include: all design processes as documents forming the design, design conventions, conflict resolution, criteria for task completion, the PERT structure, etc.

. having supporting skills and disciplines required in the respective product areas, eg. ergonometrics, acoustics, radiation, microprogramming, data bases, security, reliability;

. being open by having external reviews, and clearly written descriptions of the product for inspection;

for new product areas, we require breadboards in addition to the above heuristics. When the product gestation time equals the generation time, a full advanced development effort is most likely required to be successful.

. a group with no previous achievement must start small, be reviewed and grow when it has demonstrated success;

. continuous training to handle the increase in complexity that comes with technology.

PRODUCT METRICS KNOWLEDGE

Engineering is responsible for knowing the product area:

. metrics (cost, cost of ownership, cost to operate and use); we have classic failures because a CPU cost has been minimized, only to find the total system cost has barely changed 10% and the total cost to the customer is only 5% lower!

. major competitor cost, performance and functions together with what they will introduce within 5 years;

. leading edge, innovative small company product introductions;

. reasons why the product will succeed against present and likely future competition; sure success in the market is to introduce a needed function (eg. 32-bit address) by which all other products have to be measured.

. productivity, quality and design process metrics by which the project can be managed.

DESIGN GOALS AND CONSTRAINTS

The most important heuristic about goals and constraints is that they be written down and updated from the day the project starts. Virtually every product failure and period of product floundering is a result of no clear goals and constraints since everyone has a different idea of the product.

Design constraints are generally set as various kinds of standards. These are useful because they limit the choice of often trivial design decisions, and let us deal with the free choices. Goals are equally important. We should meet the standards unless they are unacceptable, and if so go about an orderly change. Standards can be grouped into four distinct sets:

. DEC Engineering Standards; These cover most physical structures and design practice for producibility, and assimilate critical external standards, such as UL, VDE, and FCC.

. official information processing and communications standards, from EIA, CBEMA, ANSI, ISO etc. such as Cobol '74, Codasyl, IEEE 488;

. defacto industry wide information processing and communication standards such as IBM SNA, Visicalc;

. standards implied by the architecture of existing DEC products:

  .architecture of computers, terminals, mass store and communications links; these include 8, 11's, 10/20, VAX, 8048, 8080, 8086, 68000; VT52, VT100, keyboards, Regis; MCP; HDLC, CI, SI.
  .physical interconnect busses such as CT, Q, U, NI, CI, etc. These insure that future system products can evolve from component or computer options.
  .operating system interface file commands, command language, human interface, calling sequence, screen/form management, keyboard, etc.

. These insure our customer software investment is preserved.

. Products must be designed for easy translation into in any natural language since we are an international company.

. In all cases, poor standards create to poor products, even though they may have made sense at one point of time. The historical English measures is a good case in point; Currently, the 19" rack and the metal boxes Digital makes to fit in them, and then ship on pallets to customers, act as constraints on building cost-effective PDP-11 Systems. This historical "mind set" standard is impeding the ability to produce products that meet the 20% cost decline. All products must have the goal of customer installability and maintainability.

WHEN TO CREATE AND WHEN TO EVOLVE

Given all the constraints, can we ever create a new product, or is everything just an evolutionary extension of the past? If revolutionary do we know or care where product ideas come from? The important aspect about product ideas is:

. Ideas must exist to have products! If we don't have innovative ideas to redefine or extend a market, then we should not bother building a product.

It is hard to determine whether something is an evolution or just an extension. The critically successful products all occur the second time around. Some examples: PDP 6,KA10,KI10,KL10,2080; Tops 10,Tenex,TOPS20; PDP5,8,8S,8I/L,8E/F/M; OS8-RT11; 11/20,40,34; RSX-A... M, M+; TSS-8,RSTS; various versions of Fortran, Cobol and Basic all follow this; LA30,36,120; VT05,50/52,100, 101 etc.; RK05,RL01/2.
A product tree showing product roots, gestation time and product life should be maintained by each engineering group.

GOODNESS

. All products whether they be revolutionary, creating a new base, or evolutionary, should:

. <u>offer at least a factor of two in terms of cost-effectiveness over a current product</u>; if each product is unique (not in competition with other products within the company), then we will have funds to build really good products.

. <u>be based on an idea which will offer an attribute or set of attributes that no existing products have</u>; For example, the goals and constraints for VAX included factor of two algorithm encoding and also offering ability to write a single program in multiple languages. VT100 got distinction by going to 132 columns and doing smooth scrolling.

. <u>build in generality, and extensibility;</u> Historically we have not been sufficiently able to predict how applications will evolve, hence generality and extensibility allow us and our customers to deal with changing needs. We have built several dead end products with the intent of lower product cost, only to find that no one wants the particular collection of options. In reality, even the $200 calculators offer a family of modular printer and mass storage options. For example, our 1-bit PDP-14 had no ability to do arithmetic or execute general purpose programs. As it began to be used, ad hoc extensions were installed to count, compare, etc. and it finally evolved into a really poor general purpose digital computer.

.

<u>be a complete system, not piece parts</u>; The total system is what the user sees. A word processing system for example includes: mass storage, keyboard, tube, modems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes. All to often we evolve a product because the CPU and memory cost has declined only to find the system cost has decreased only a few percent.

<u>Product Evolution</u>

. A product family evolution is described on page 10 of Computer Engineering along the paths of lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

. <u>lower cost products require additional</u> <u>functionality too</u>, as in the VT100;
. <u>constant cost, higher performance products are likely to be the most useful</u>, as economics of use are already established and a more powerful system such as the LA120 will allow more work to get done;

<u>Revolutionary New Product Bases</u>

. Good system products can only exist if we have good components. We should not depend on system markups and functionality to cover poor components and high overhead.
. We must carefully decide what components to make versus buy. It is very hard for an organization to be competitive without competing in the marketplace, hence unless we sell it, we should buy it.
. a new product base, such as a new ISP, physical interconnection specification, an Operating System, approach to building Office Products, must:

. <u>start a family tree from which significant evolution can occur</u>; The investment for a point product is so high that the product is very likely not to payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family.

<u>Product Termination</u>

. A product evolution is likely to need termination after successive implementations, because new concepts in use have obsoleted its underlying structure. All structures decay with evolution, and the trick is to identify the last member of a family, such as the 132 column card, and then not build it. This holds for physical components, processors, terminals, mass storage, operating systems, languages and applications. Some of the signs of product obsolescence:

.it has been extended at least once, and future extensions render it virtually unintelligible; (For example, PDP-8 was extended three times.)
.significantly better products using other bases are available;

SELLING AND BUILDING THE PRODUCT

Buy in of the product can come at any time. However, if all the other rules are adhered to, there is no guarantee that it will be promoted, or that customers will find out about it and buy it. Some rules about selling it:

. it has to be producible and work; this, although seemingly trivial rule is often overlooked when explaining why a product is good or not.
. a business plan with orders and marketing plans from several marketing persons and groups needs to be in place; just as it is unwise to depend on a single opinion in engineering for design and review, it is even more important that several different groups are intending to sell the product. individual marketers are

just as fallible as unchecked engineers.

. never build a product for a single customer, although a particular customer may be used as an archetype user; predicating a product on one sale is the one sure way to fail!

. it should be done in a timely fashion according to the committed schedule, at the committed price and with the committed functions;

. it must be understandable and easy to use. The small size, complete hardware books were the DEC trademark that established the minicomputer. We must revive these such that a particular user never need access more than one. Simplicity must be the rule for our documentation.

Now isn't it clear why building great products should be so easy?

Are there any heuristics that should be added? deleted? or need clarification?

Preliminary Draft for Comment by Digital Engineering Community

HEURISTICS AND COMMENTS FOR BUILDING GREAT PRODUCTS

Gordon Bell, Vice President, Engineering

Product goodness is somewhat like pornography, it can't fully be described, but we're told people know it when they see it. If we can agree on heuristics about product goodness and how to achieve it - then we're clearly ahead. Five sets of dimensions for building great products need be attended to (roughly in order of importance):

. a responsible, productive and creative engineering group;

. product and design metrics (competitiveness);

. design goals and constraints;

. product evolution, revolution and death; and

. the ability to get the product built and sold.

ENGINEERING GROUP

As a company managed primarily by engineers, groups are encouraged to form and design products. With this right, are responsibilities.

The Team must have:

- a chief designer/chief programmer to formulate and lead the resolution of the problems encountered in the design; No matter how large the project, it must be lead from a "single head". We often make two errors in leadership: having no clear technical leader/problem resolver, and abdicating to a committee.

  Committees do not do design! They are never held responsible, nor are they rewarded or punished. Committees can review.

- management who understand the product space and who has engineered successful products; The two most important jobs are:

  - making sure that everyone knows their job; and

  - setting and reviewing work on a timely basis, ie. MBO.

- team skills and resources to implement the proposal so that we adhere to the cardinal rule of Digital, "He Who Proposes, Does"; A plan must include the chief designer, team, project organization and resources (eg. computers). Supporting skills and disciplines are essential in the respective product areas, eg. ergonometrics, acoustics, radiation, microprogramming, data bases, security, reliability.

- an understanding of the design, design production (eg. CAD) processes, and manufacturing processes; Learning curves apply to all processes! The organization must be staffed with people who understand the product, the design process (CAD and management discipline) and the production introduction process. One or two out of three isn't enough.

Behaviorally, the team must:

. do it right the first time; Being correct has the highest payoff everywhere: timeliness, quality, lack of rework, and mfg. cost.

. execute the project in a timely fashion; Virtually ALL of our projects are late because we start too late, don't get it done on time because some critical invention is required, take too long to get it introduced, etc. For the very long, very late projects, the failure is lack of planning, tools and organization. Finally, people burn out. This suggests we:

  . limit projects to two years by a small team. We often make an aggressive business plan, then hire the team. They then find out they have neither tools nor technology to do the project.

  . not predicate a project on scheduling inventions in the design, process and CAD areas. If we can't see how to do the work in 2 years, then let's not start the project! This means the product must be cut down to fit the tools, people and process. Advanced developement is to insure that we can do development.

. have a written design methodology that includes: all design processes in the form of manuals, design conventions, conflict resolution, criteria for task completion, PERT structure, etc.;

. be open and have external reviews, and clearly written product d

breadboards in addition to the above heuristics. When the product gestation time equals the generation time, a full advanced development effort is the only way to be successful.

. start small, be reviewed and grow on its demonstrated success;

. learn, in order to handle the increase in complexity that comes with technology. Until there's a formal sabbatical program, individuals would do well to consider taking the equivalent of a semester of technical courses each 10 years.

PRODUCT METRICS KNOWLEDGE includes:

. products for which there'll be no competitor;

. all product cost metrics (cost, cost of ownership, cost to operate and use);

. all product performance and cost/performance metrics; These are the goodness measures of a product and tell how easily it will be to sell, and if we have improved. Cost and performance is measured against a state-of-the-art line represented by the first shipment of a more advanced product. Alternatively, when there's no direct comparison, the time goodness is determined from the day the product could have shipped. For example, because of parts availability, Nebula and CT could have shipped two and three years ago based on component availability.

- reasons why the product will succeed against present and likely future competition; sure success in the market is to introduce a needed function (eg. 32-bit address) by which all other products have to be measured.
- major competitor products by cost, performance and functionality; This should cover the past and future five years.
- leading edge, innovative, small company products;
- productivity, quality and design process metrics for projects.

DESIGN GOALS AND CONSTRAINTS

Design constraints are generally set as various kinds of standards. These are useful because they limit the choice of often trivial design decisions, and let us deal with important free choices, the goals. Goals are vitally important because they target our uniqueness.

Poor "mind-set" standards can create poor products, even though they may have made sense at one time. The historical English measures is a good case in point. Currently, the 19" rack and the metal boxes Digital makes to fit in them, and then ship on pallets to customers, act as constraints on building cost-effective PDP-11 Systems. This historical "mind set" standard often impedes the ability to produce products that meet the 20% per year cost decline curve.

- Goals and constraints must be written down and updated from the day the project starts. Virtually every product failure and period of product floundering is a result of no clear goals and constraints since everyone has a different idea of the product.
- A product can only have a few goals and constraints. The ranking is usually: it must work and have improved cost of ownership, be the shortest time to market, highest performance and lowest cost.

We must adhere to standards which we either follow or set!

- <u>If a standard exists, follow it or change it for all!</u> We lost the IEEE Floating Point format. It is likely we will eventually have to support it.

- <u>If a standard is forming go all out to set it.</u> When formed, then follow it. We didn't make DDCMP a standard. When HDLC came, we didn't use it. The result: expensive, low performance products.

Standards can be grouped into four distinct sets:

- DEC Engineering Standards; These cover most physical structures and design practice for producibility, and assimilate critical external standards, such as UL, VDE, and FCC.

- professional society, industry and area information processing standards, from EIA, CBEMA, ECMA, ANSI, ISO etc. such as Cobol '74, Codasyl, IEEE 488;

- defacto industry wide information processing and communication standards such as IBM SNA, Visicalc;

- standards implied by the architecture of existing DEC products to insure our customer software investments are preserved include:

  - architecture of computers, terminals, mass store and communications links; Our current ISP's include 8, 11's, 10/20, VAX, 8048, 8080, 8086, 68000; VT52, VT100, keyboards, Regis; MCP; HDLC, CI, NI, SI.

  - physical interconnect busses for computers and for interconnecting them CT, Q, U, NI, CI, etc. These insure that future system products can evolve from component and computer options between generations.

  - operating system interface file commands, command language, human interface, calling sequence, screen/form management, keyboard, etc.

- <u>Products must be designed for easy translation into in any natural language since we are an international company.</u>

- <u>All products must have be customer installable and maintainable.</u>

- <u>Portability is an important goal.</u> Personal computers must be portable! We must achieve this for all systems ASAP!

WHEN TO CREATE, WHEN TO EVOLVE AND WHEN TO STOP PRODUCTS

Engineering is responsible for designing evolutionary products in our markets AND for producing products that are natural to our tradition of supplying the most interactive, cost-effective computing. If a new product such as personal computing emerges and we do not have a product, engineering has failed, independent of being asked for it!

Given all the constraints, can we ever create a new product, or is everything just an evolutionary extension of the past? If revolutionary do we know or care where product ideas come from? The important aspect about product ideas is:

. Ideas must exist to have products! If we don't have ideas to redefine or extend a market, then we should not build a product.

It is hard to determine whether something is an evolution or just an extension. The critically successful products are likely to occur the second time around. Some examples: PDP 6,KA10,KI10,KL10,2080; Tops 10,Tenex,TOPS20; PDP5,8,8S,8I/L,8E/F/M; OS8-RT11; 11/20,40,34,44; RSX-A... M, M+; TSS-8,RSTS; various versions of Fortran, Cobol and Basic follow this; LA30,36,120; VT05,50/52,100, 101 etc.; RK05,RL01/2.

. A product tree MUST be maintained by each engineering group showing roots, gestation time and life.

Goodness and Greatness

All products whether they be revolutionary, creating a new base, or evolutionary, should:

. be elegant and high quality; Russ Doane's working definition is: "every feature contributes two benefits", like a double pun. Quality means no excess. Elegant, high quality designs, do double duty with a minimum use of resources. Quality is also the absence of errors, by being right the first time so that it doesn't have to be inspected or redone.

. offer at least a factor of two in terms of cost-effectiveness over a current product; We have classic failures because a CPU cost has been minimized, only to find the total system cost has barely changed 10% and the total cost to the customer is only 5%

lower! If each product is unique then we will have funds to build good products.

. be based on an idea which will offer an attribute or set of attributes that no existing products have; For example, the goals and constraints for VAX included factor of two algorithm encoding and also offering ability to write a single program in multiple languages. VT100 got distinction by offering 132 columns and smooth scrolling.

. build in generality, and extensibility; Historically we have not been sufficiently able to predict how applications will evolve, hence generality and extensibility allow us and our customers to deal with changing needs. Extendable products also permit mid-life kickers to products. We have built several dead end products with the intent of lower product cost, only to find that no one wants the particular collection of options. In reality, even the $200 calculators offer a family of modular printer and mass storage options. For example, our 1-bit PDP-14 had no arithmetic ability, nor could it be a general purpose computer. As customers used it, ad hoc extensions were needed to count, compare, etc. and it finally evolved into a really poor, general purpose digital computer.

. be a complete system, not piece parts; The total system is what the user sees. A word processing system for example includes: memory, keyboard, tube, modems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes.

. be a great system because the components are great; We should not depend on system markups and software functionality to cover poor components and high overhead.

.if we don't make it, buy it; We must carefully decide what

components to make versus buy. It is very hard for an organization to be competitive without competing in the marketplace, hence unless we sell it, we should buy it.

Product Evolution

A product family evolution is described on page 10 of Computer Engineering along the paths of lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

. lower cost products require additional functionality too; A lower cost product, with constant performance or constant function is risky because a new customer base and new way of marketing may be required. Some other company may, however, be successful with the concept. The PDP-8, based on new technology, was radically more successful than its higher priced predecessor, the PDP-5, because it was 2/3 the price and 6 times more performance. The PDP-8/S was a failure at 2/3 the price and 15 less performance than the PDP-8. There are similar stories about the LA 34, VT50/52 and PDT as replacement products.

. constant cost, higher performance products are likely to be the most useful; Economics of use, the marketing channel and customer base are already established and a more powerful system such as the LA120 will allow higher productivity (see Computer Engineering for the understanding and economics). In the 11's there was a successful evolution: 20, 40, 34 anChied 44. Not the 60. The 11/70 was probably our greatest success; it was billed as a mid-life kicker to the 11/45-55.

Revolutionary New Product Bases

. A new product base, such as a new ISP, physical interconnection, Operating System, approach to building Office Products, must start a family tree from which significant evolution can occur. The investment for a point product is so high that the product is very likely not to payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family. Point products with no follow-on will probably fail all roi tests.

Product Termination

. A product evolution is likely to need termination after successive implementations, because new concepts in use have obsoleted its underlying structure. All structures decay with evolution, and the trick is to identify the last member of a family, such as the 132 column card, and then not build it. This holds for physical components, processors, terminals, mass storage, operating systems, languages and applications. Some of the signs of product obsolescence:

. It has been extended at least once, and future extensions render it virtually unintelligible.

. Better products using other bases are available.

SELLING AND BUILDING THE PRODUCT

"Buy in" of the product can come at any time. However, if all the other rules are adhered to, there is no guarantee that it will be promoted, or that customers will find out about it and buy it. Some rules about selling it:

. it has to be producible and work, AND be useful to software; This, although seemingly trivial rule, is often overlooked when explaining why a product is good or not. If it is a piece of hardware that requires software to support it, the hardware must be available to the programmers who must support it. Software engineers approach new hardware with much caution! The often ask: is it significant? is it needed? why isn't it compatible with the past? If a hardware is viewed with distrust by software engineers it may be met with the same distrust by customers!

. a business plan with orders and marketing plans from several marketing persons and groups needs to be in place; Just as it is unwise to depend on a single opinion in engineering for design and review, it is even more important that several different groups are intending to sell the product. Individual marketers are just as fallible as unchecked engineers. This rule can and must be violated for revolutionary products!

. never build a product for a single customer, although a particular customer may be used as an archetype user; predicating a product on one sale is the one sure way to fail! Paraphrasing a remark by former GM executive Charles Wilson: if it's good for General Motors, it may only be good for GM.

. it must be done in a timely fashion according to the committed schedule, price and functions as previously described;

. it must be understandable and easy to use. The small size, complete hardware books were the DEC trademark that established the minicomputer. We must revive these such that a particular user never need access more than one. Simplicity must be the rule for our documentation.

What heuristics are missing? What heuristics do you disagree with?

What heuristics could be removed? reordered?

Could I please have your feedback before this becomes a final draft?

DESIGN GOALS AND CONSTRAINTS

Design constraints are generally set as various kinds of standards.

These are useful because they limit the choice of often trivial design decisions, and let us deal with important free choices, the goals.

Goals are vitally important because they target our uniqueness.

Poor "mind-set" standards can create poor products, even though they may have made sense at one time. The historical English measures is a good case in point. Currently, the 19" rack and the metal boxes

Digital makes to fit in them, and then ship on pallets to customers, act as constraints on building cost-effective PDP-11 Systems. This historical "mind set" standard often impedes the ability to produce products that meet the 20% per year cost decline curve.

. Goals and constraints must be written down and updated from the day the project starts. Virtually every product failure and period of product floundering is a result of no clear goals and constraints since everyone has a different idea of the product.

. A product can only have a few goals and constraints. The ranking is usually: it must work and have improved cost of ownership, be the shortest time to market, highest performance and lowest cost.

We must adhere to standards which we either follow or set!

.If a standard exists, follow it or change it for all! We lost the IEEE Floating Point format. It is likely we will eventually have to support it.

.If a standard is forming go all out to set it. When formed, then follow it. We didn't make DDCMP a standard. When HDLC came, we didn't use it. The result: expensive, low performance products.

Standards can be grouped into four distinct sets:

.DEC Engineering Standards; These cover most physical structures and design practice for producibility, and assimilate critical external standards, such as UL, VDE, and FCC.

.professional society, industry and area information processing standards, from EIA, CBEMA, ECMA, ANSI, ISO etc. such as Cobol '74, Codasyl, IEEE 488;

.defacto industry wide information processing and communication standards such as IBM SNA, Visicalc;

.standards implied by the architecture of existing DEC products to insure our customer software investments are preserved include:

.architecture of computers, terminals, mass store and communications links; Our current ISP's include 8, 11's, 10/20, VAX, 8048, 8080, 8086, 68000; VT52, VT100, keyboards, Regis; MCP; HDLC, CI, NI, SI.

.physical interconnect busses for computers and for interconnecting them CT, Q, U, NI, CI, etc. These insure that future system products can evolve from component and computer options between generations.

.operating system interface file commands, command language, human interface, calling sequence, screen/form management, keyboard, etc.

.Products must be designed for easy translation into in any natural language since we are an international company.

.All products must have be customer installable and maintainable.

.Portability is an important goal. Personal computers must be portable! We must achieve this for all systems ASAP!

WHEN TO CREATE, WHEN TO EVOLVE AND WHEN TO STOP PRODUCTS

Engineering is responsible for designing evolutionary products in our markets AND for producing products that are natural to our tradition of supplying the most interactive, cost-effective computing. If a new product such as personal computing emerges and we do not have a product, engineering has failed, independent of being asked for it!

Given all the constraints, can we ever create a new product, or is everything just an evolutionary extension of the past? If revolutionary do we know or care where product ideas come from? The important aspect about product ideas is:

.Ideas must exist to have products! If we don't have ideas to redefine or extend a market, then we should not build a product.

It is hard to determine whether something is an evolution or just an extension. The critically successful products are likely to occur the second time around. Some examples: PDP 6,KA10,KI10,KL10,2080; Tops 10,Tenex,TOPS20; PDP5,8,8S,8I/L,8E/F/M; OS8-RT11; 11/20,40,34,44;

RSX-A... M, M+; TSS-8,RSTS; various versions of Fortran, Cobol and Basic follow this; LA30,36,120; VT05,50/52,100, 101 etc.; RK05,RL01/2.

. A product tree MUST be maintained by each engineering group showing roots, gestation time and life.

Goodness and Greatness

All products whether they be revolutionary, creating a new base, or evolutionary, should:

. be elegant and high quality; Russ Doane's working definition is: "every feature contributes two benefits", like a double pun.

Quality means no excess. Elegant, high quality designs, do double duty with a minimum use of resources. Quality is also the absence of errors, by being right the first time so that it doesn't have to be inspected or redone.

.offer at least a factor of two in terms of cost-effectiveness over a current product; We have classic failures because a CPU cost has been minimized, only to find the total system cost has barely changed 10% and the total cost to the customer is only 5% lower! If each product is unique then we will have funds to build good products.

. be based on an idea which will offer an attribute or set of attributes that no existing products have; For example, the goals and constraints for VAX included factor of two algorithm encoding and also offering ability to write a single program in multiple languages. VT100 got distinction by offering 132 columns and smooth scrolling.

.build in generality, and extensibility; Historically we have not been sufficiently able to predict how applications will evolve, hence generality and extensibility allow us and our customers to deal with changing needs. Extendable products also permit mid-life kickers to products. We have built several dead end products with the intent of lower product cost, only to find that no one wants the particular collection of options. In reality, even the $200 calculators offer a family of modular printer and mass storage options. For example, our 1-bit PDP-14 had no arithmetic ability, nor could it be a general purpose computer. As customers used it, ad hoc extensions were needed to count, compare, etc. and it finally evolved into a really poor, general purpose digital computer.

.be a complete system, not piece parts; The total system is what the user sees. A word processing system for example includes: memory, keyboard, tube, modems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes.

.be a great system because the components are great; We should not depend on system markups and software functionality to cover poor components and high overhead.

.if we don't make it, buy it;   We must carefully decide what components to make versus buy. It is very hard for an organization to be competitive without competing in the marketplace, hence unless we sell it, we should buy it.

Product Evolution

A product family evolution is described on page 10 of Computer

Engineering along the paths of lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

. lower cost products require additional functionality too; A lower cost product, with constant performance or constant function is risky because a new customer base and new way of marketing may be required. Some other company may, however, be successful with the concept. The PDP-8, based on new technology, was radically more successful than its higher priced predecessor, the PDP-5, because it was 2/3 the price and 6 times more performance. The PDP-8/S was a failure at 2/3 the price and 15 less performance than the PDP-8. There are similar stories about the LA 34, VT50/52 and PDT as replacement products.

.constant cost, higher performance products are likely to be the most useful; Economics of use, the marketing channel and customer base are already established and a more powerful system such as the LA120 will allow higher productivity (see Computer Engineering for the understanding and economics). In the 11's there was a successful evolution: 20, 40, 34 anChied 44. Not the 60. The 11/70 was probably our greatest success; it was billed as a mid-life kicker to the 11/45-55.

Revolutionary New Product Bases

.A new product base, such as a new ISP, physical interconnection,

Operating System, approach to building Office Products, must start a family tree from which significant evolution can occur. The investment for a point product is so high that the product is

very likely not to payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family. Point products with no follow-on will probably fail all roi tests.

Product Termination

. A product evolution is likely to need termination after successive implementations, because new concepts in use have obsoleted its underlying structure. All structures decay with evolution, and the trick is to identify the last member of a family, such as the 132 column card, and then not build it. This holds for physical components, processors, terminals, mass storage, operating systems, languages and applications. Some of the signs of product obsolescence:

.It has been extended at least once, and future extensions render it virtually unintelligible.

. Better products using other bases are available.

SELLING AND BUILDING THE PRODUCT

"Buy in" of the product can come at any time. However, if all the other rules are adhered to, there is no guarantee that it will be promoted, or that customers will find out about it and buy it. Some rules about selling it:

. it has to be producible and work, AND be useful to software; This, although seemingly trivial rule, is often overlooked when explaining why a product is good or not. If it is a piece of hardware that requires software to support it, the hardware must be available to the programmers who must support it. Software engineers approach new hardware with much caution! The often ask: is it significant? is it needed? why isn't it compatible with the past? If a hardware is viewed with distrust by software engineers it may be met with the same distrust by customers!

. a business plan with orders and marketing plans from several marketing persons and groups needs to be in place; Just as it is unwise to depend on a single opinion in engineering for design and review, it is even more important that several different groups are intending to sell the product. Individual marketers are just as fallible as unchecked engineers. This rule can and must be violated for revolutionary products!

. never build a product for a single customer, although a particular customer may be used as an archetype user; predicating a product on one sale is the one sure way to fail! Paraphrasing a remark by former GM executive Charles Wilson: if it's good for

General Motors, it may only be good for GM.

.it must be done in a timely fashion according to the committed schedule, price and functions as previously described;

. it must be understandable and easy to use. The small size, complete hardware books were the DEC trademark that established the minicomputer. We must revive these such that a particular user never need access more than one. Simplicity must be the rule for our documentation.

What heuristics are missing? What heuristics do you disagree with?

What heuristics could be removed? reordered?

Could I please have your feedback before this becomes a final draft?

HEURISTICS AND COMMENTS FOR BUILDING GREAT PRODUCTS

Gordon Bell, Vice President, Engineering

Product goodness is somewhat like pornography, it can't fully be described, but we're told people know it when they see it. If we can agree on heuristics about product goodness and how to achieve it - then we're clearly ahead. Five sets of dimensions for building great products need be attended to (roughly in order of importance):

- a responsible, productive and creative engineering group;
- product and design metrics (competitiveness);
- design goals and constraints;
- product evolution, revolution and death; and
- the ability to get the product built and sold.

ENGINEERING GROUP

As a company managed primarily by engineers, groups are encouraged to form and design products. With this right, are responsibilities.

The Team must have:

. a chief designer/chief programmer to formulate and lead the resolution of the problems encountered in the design; No matter how large the project, it must be lead from a "single head". We often make two errors in leadership: having no clear technical leader/problem resolver, and abdicating to a committee.

Committees do not do design! They are never held responsible, nor are they rewarded or punished. Committees can review.

. management who understand the product space and who has engineered successful products; The two most important jobs are:

. making sure that everyone knows their job; and

. setting and reviewing work on a timely basis, ie. MBO.

. <u>team skills and resources to implement the proposal</u> so that we adhere to the cardinal rule of Digital, "He Who Proposes, Does"; A plan must include the chief designer, team, project organization and resources (eg. computers). Supporting skills and disciplines are essential in the respective product areas, eg. ergonometrics, acoustics, radiation, microprogramming, data bases, security, reliability.

. <u>an understanding of the design, design production (eg. CAD) processes, and manufacturing processes;</u> Learning curves apply to all processes! The organization must be staffed with people who understand the product, the design process (CAD and management discipline) and the production introduction process. One or two out of three isn't enough.

<u>Behaviorally</u>, the team must:

. <u>do it right the first time;</u> Being correct has the highest payoff everywhere: timeliness, quality, lack of rework, and mfg. cost.

. <u>execute the project in a timely fashion;</u> Virtually ALL of our projects are late because we start too late, don't get it done on time because some critical invention is required, take too long to get it introduced, etc. For the very long, very late projects, the failure is lack of planning, tools and organization. Finally, people burn out. This suggests we:

  . <u>limit projects to two years by a small team.</u> We often make an aggressive business plan, then hire the team. They then find out they have neither tools nor technology to do the project.

  . <u>not predicate a project on scheduling inventions in the design, process and CAD areas.</u> If we can't see how to do the work in 2 years, then let's not start the project! This means the product must be cut down to fit the tools, people and process. Advanced developement is to insure that we can do development.

. <u>have a written design methodology</u> that includes: all design processes in the form of manuals, design conventions, conflict resolution, criteria for task completion, PERT structure, etc.;

. <u>be open and have external reviews, and clearly written</u>

product descriptions for inspection; For new product areas, we require breadboards in addition to the above heuristics. When the product gestation time equals the generation time, a full advanced development effort is the only way to be successful.

- start small, be reviewed and grow on its demonstrated success;
- learn, in order to handle the increase in complexity that comes with technology. Until there's a formal sabbatical program, individuals would do well to consider taking the equivalent of a semester of technical courses each 10 years.

PRODUCT METRICS KNOWLEDGE includes:

- products for which there'll be no competitor;
- all product cost metrics (cost, cost of ownership, cost to operate and use);
- all product performance and cost/performance metrics; These are the goodness measures of a product and tell how easily it will be to sell, and if we have improved. Cost and performance is measured against a state-of-the-art line represented by the first shipment of a more advanced product. Alternatively, when there's no direct comparison, the time goodness is determined from the day the product could have shipped. For example, because of parts availability, Nebula and CT could have shipped two and three years ago based on component availability.
- reasons why the product will succeed against present and likely future competition; sure success in the market is to introduce a needed function (eg. 32-bit address) by which all other products have to be measured.
- major competitor products by cost, performance and functionality; This should cover the past and future five years.
- leading edge, innovative, small company products;
- productivity, quality and design process metrics for projects.

DESIGN GOALS AND CONSTRAINTS

Design constraints are generally set as various kinds of standards. These are useful because they limit the choice of often trivial design decisions, and let us deal with important free choices, the goals. Goals are vitally important because they target our uniqueness.

Poor "mind-set" standards can create poor products, even though they may have made sense at one time. The historical English measures is a good case in point. Currently, the 19" rack and the metal boxes Digital makes to fit in them, and then ship on pallets to customers, act as constraints on building cost-effective PDP-11 Systems. This historical "mind set" standard often impedes the ability to produce products that meet the 20% per year cost decline curve.

. Goals and constraints must be written down and updated from the day the project starts. Virtually every product failure and period of product floundering is a result of no clear goals and constraints since everyone has a different idea of the product.

. A product can only have a few goals and constraints. The ranking is usually: it must work and have improved cost of ownership, be the shortest time to market, highest performance and lowest cost.

We must adhere to standards which we either follow or set!

. If a standard exists, follow it or change it for all! We lost the IEEE Floating Point format. It is likely we will eventually have to support it.

. If a standard is forming go all out to set it. When formed, then follow it. We didn't make DDCMP a standard. When HDLC came, we didn't use it. The result: expensive, low performance products.

Standards can be grouped into four distinct sets:

. DEC Engineering Standards; These cover most physical structures and design practice for producibility, and assimilate critical external standards, such as UL, VDE, and FCC.

. professional society, industry and area information processing standards, from EIA, CBEMA, ECMA, ANSI, ISO etc. such as Cobol '74, Codasyl, IEEE 488;

. defacto industry wide information processing and communication standards such as IBM SNA, Visicalc;

. standards implied by the architecture of existing DEC products to insure our customer software investments are preserved include:

.architecture of computers, terminals, mass store and communications links; Our current ISP's include 8, 11's, 10/20, VAX, 8048, 8080, 8086, 68000; VT52, VT100, keyboards, Regis; MCP; HDLC, CI, NI, SI.

.physical interconnect busses for computers and for interconnecting them CT, Q, U, NI, CI, etc. These insure that future system products can evolve from component and computer options between generations.

.operating system interface file commands, command language, human interface, calling sequence, screen/form management, keyboard, etc.

. <u>Products must be designed for easy translation into in any natural language since we are an international company.</u>

. <u>All products must have be customer installable and maintainable.</u>

. <u>Portability is an important goal.</u> Personal computers must be portable! We must achieve this for all systems ASAP!

WHEN TO CREATE, WHEN TO EVOLVE AND WHEN TO STOP PRODUCTS

Engineering is responsible for designing evolutionary products in our markets AND for producing products that are natural to our tradition of supplying the most interactive, cost-effective computing. If a new product such as personal computing emerges and we do not have a product, engineering has failed, independent of being asked for it!

Given all the constraints, can we ever create a new product, or is everything just an evolutionary extension of the past? If revolutionary do we know or care where product ideas come from? The important aspect about product ideas is:

. <u>Ideas must exist to have products</u>! If we don't have ideas to redefine or extend a market, then we should not build a product.

It is hard to determine whether something is an evolution or just an extension. The critically successful products are likely to occur the second time around. Some examples: PDP 6,KA10,KI10,KL10,2080; Tops 10,Tenex,TOPS20; PDP5,8,8S,8I/L,8E/F/M; OS8-RT11; 11/20,40,34,44; RSX-A... M, M+; TSS-8,RSTS; various versions of Fortran, Cobol and Basic follow this; LA30,36,120; VT05,50/52,100, 101 etc.; RK05,RL01/2.

- A product tree MUST be maintained by each engineering group showing roots, gestation time and life.

Goodness and Greatness

All products whether they be revolutionary, creating a new base, or evolutionary, should:

- be elegant and high quality; Russ Doane's working definition is: "every feature contributes two benefits", like a double pun. Quality means no excess. Elegant, high quality designs, do double duty with a minimum use of resources. Quality is also the absence of errors, by being right the first time so that it doesn't have to be inspected or redone.
- offer at least a factor of two in terms of cost-effectiveness over a current product; We have classic failures because a CPU cost has been minimized, only to find the total system cost has barely changed 10% and the total cost to the customer is only 5% lower! If each product is unique then we will have funds to build good products.
- be based on an idea which will offer an attribute or set of attributes that no existing products have; For example, the goals and constraints for VAX included factor of two algorithm encoding and also offering ability to write a single program in multiple languages. VT100 got distinction by offering 132 columns and smooth scrolling.
- build in generality, and extensibility; Historically we have not been sufficiently able to predict how applications will evolve, hence generality and extensibility allow us and our customers to deal with changing needs. Extendable products also permit mid-life kickers to products. We have built several dead end products with the intent of lower product cost, only to find that no one wants the particular collection of options. In reality, even the $200 calculators offer a

family of modular printer and mass storage options. For example, our 1-bit PDP-14 had no arithmetic ability, nor could it be a general purpose computer. As customers used it, ad hoc extensions were needed to count, compare, etc. and it finally evolved into a really poor, general purpose digital computer.

. be a complete system, not piece parts; The total system is what the user sees. A word processing system for example includes: memory, keyboard, tube, modems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes.

. be a great system because the components are great; We should not depend on system markups and software functionality to cover poor components and high overhead.

. if we don't make it, buy it; We must carefully decide what components to make versus buy. It is very hard for an organization to be competitive without competing in the marketplace, hence unless we sell it, we should buy it.

Product Evolution

A product family evolution is described on page 10 of Computer Engineering along the paths of lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

. lower cost products require additional functionality too; A lower cost product, with constant performance or constant function is risky because a new customer base and new way of marketing may be required. Some other company may, however, be successful with the concept. The PDP-8, based on new technology, was radically more successful than its higher priced predecessor, the PDP-5, because it was 2/3 the price and 6 times more performance. The PDP-8/S was a failure at 2/3 the price and 15 less performance than the PDP-8. There are similar stories about the LA 34, VT50/52 and PDT as replacement products.

. constant cost, higher performance products are likely to be the most useful; Economics of use, the marketing channel and customer base are already established and a more powerful system such as the LA120 will allow higher productivity (see Computer Engineering for the understanding and economics). In the 11's there was a successful evolution: 20, 40, 34 anChied 44. Not the 60. The 11/70 was probably our greatest success; it was billed as a mid-life kicker to the 11/45-55.

<u>Revolutionary New Product Bases</u>

. <u>A</u> <u>new</u> <u>product</u> <u>base,</u> such as a new ISP, physical interconnection, Operating System, approach to building Office Products, <u>must</u> <u>start a family tree from which significant evolution can occur.</u> The investment for a point product is so high that the product is very likely not to payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family. Point products with no follow-on will probably fail all roi tests.

- be a complete system, not piece parts; The total system is what the user sees. A word processing system for example includes: memory, keyboard, tube, modems, cpu, documentation including how to unpack it, the programs, table (if there is one, if not then the method of using at the customer table), and shipping boxes.
- be a great system because the components are great; We should not depend on system markups and software functionality to cover poor components and high overhead.
- if we don't make it, buy it; We must carefully decide what components to make versus buy. It is very hard for an organization to be competitive without competing in the marketplace, hence unless we sell it, we should buy it.

Product Evolution

A product family evolution is described on page 10 of Computer Engineering along the paths of lower cost, and relatively constant performance; constant cost and higher performance; and higher cost and performance. In looking at our successful evolutions:

- lower cost products require additional functionality too; A lower cost product, with constant performance or constant function is risky because a new customer base and new way of marketing may be required. Some other company may, however, be successful with the concept. The PDP-8, based on new technology, was radically more successful than its higher priced predecessor, the PDP-5, because it was 2/3 the price and 6 times more performance. The PDP-8/S was a failure at 2/3 the price and 15 less performance than the PDP-8. There are similar stories about the LA 34, VT50/52 and PDT as replacement products.

. <u>constant cost, higher performance products are likely to be the most useful</u>; Economics of use, the marketing channel and customer base are already established and a more powerful system such as the LA120 will allow higher productivity (see Computer Engineering for the understanding and economics). In the 11's there was a successful evolution: 20, 40, 34 anChied 44. Not the 60. The 11/70 was probably our greatest success; it was billed as a mid-life kicker to the 11/45-55.

<u>Revolutionary New Product Bases</u>

. <u>A new product base,</u> such as a new ISP, physical interconnection, Operating System, approach to building Office Products, <u>must start a family tree from which significant evolution can occur.</u> The investment for a point product is so high that the product is very likely not to payoff. In every case where we have successful evolutionary products, the successors are more successful than the first member of the family. Point products with no follow-on will probably fail all roi tests.

<u>Product Termination</u>

. <u>A product evolution is likely to need termination after successive implementations, because new concepts in use have obsoleted its underlying structure.</u> All structures decay with evolution, and the trick is to identify the last member of a family, such as the 132 column card, and then not build it. This holds for physical components, processors, terminals, mass storage, operating systems, languages and applications. Some of the signs of product obsolescence:

. It has been extended at least once, and future extensions render it virtually unintelligible.

. Better products using other bases are available.

SELLING AND BUILDING THE PRODUCT

"Buy in" of the product can come at any time. However, if all the other rules are adhered to, there is no guarantee that it will be promoted, or that customers will find out about it and buy it. Some rules about selling it:

- <u>it has to be producible and work, AND be useful to software;</u> This, although seemingly trivial rule, is often overlooked when explaining why a product is good or not. If it is a piece of hardware that requires software to support it, the hardware must be available to the programmers who must support it. Software engineers approach new hardware with much caution! The often ask: is it significant? is it needed? why isn't it compatible with the past? If a hardware is viewed with distrust by software engineers it may be met with the same distrust by customers!
- <u>a business plan with orders and marketing plans from several marketing persons and groups needs to be in place</u>; Just as it is unwise to depend on a single opinion in engineering for design and review, it is even more important that several different groups are intending to sell the product. Individual marketers are just as fallible as unchecked engineers. This rule can and must be violated for revolutionary products!
- <u>never build a product for a single customer</u>, although a particular customer may be used as an archetype user; predicating a product on one sale is the one sure way to fail! Paraphrasing a remark by former GM executive Charles Wilson: if it's good for General Motors, it may only be good for GM.
- <u>it must be done in a timely fashion</u> according to the committed schedule, price and functions as previously described;
- <u>it must be understandable and easy to use</u>. The small size, complete hardware books were the DEC trademark that established the minicomputer. We must revive these such that a particular user never need access more than one. Simplicity must be the rule for our documentation.

What heuristics are missing? What heuristics do you disagree with?

What heuristics could be removed? reordered?

Could I please have your feedback before this becomes a final draft?

SUBJECT: HG, OR HGII

Given the slips in Hg, and the inevitability of HgII (Hg on an NI), should we reconsider Hg and go straight for HgII? This is more in line with DMC - based breadboard.

Also, why shouldn't MR contract (bid) to build it, given their experience in concentrators?

SUBJECT: RE: RE: ON HIERARCHIES

For certain kinds of tasks in organizations, maybe salary adminstration and some critical decisions, I really believe in hierarchical control. Maybe it's an issues of how much comes under the control of the hierarchy. I don't want very much to. In fact, for several years now I've tended to think of myself as a city planner rather than an architect in this regard because I can't get involved in the design of all the buildings. The task is to find the right interfaces, see that they are defined and then encourage development in a very decentralized fashion.

I do believe that much has to be hierarchical, especially many of the computer systems we build.

The main thing about Ethernet is that it looks like a number of quite independent groups can decide on their own intercommunication quite independent of any top level need.

They need it though and when they have it will start to recognize the need to communicate with others. This has best been done by providing the ability to communicate, not forcing it.

Right now, we have a mess in our order processing both because
we simultaneously (royal we here is my peers... not me) tell the marketing people to solve their own problem and at the same time tell the central data procecssing people to do it too. So its's a critical massless, incompetent mess.

Here, I'm advocating putting in some formal interfaces and building a Digital Backbone Network so that each group can work on it's own part and then communicate when they have it together. This is how we do many of the interface standards works in engineering.

COMPANY CONFIDENTIAL

Subject: **Meeting On High End Charter 3/27/79**

To: Bill Demmer, TW/D19
Ulf Fagerquist, MR1-2/E78
John Leng, MR1-1/A65
Larry Portner, ML12-3/A62

Date: 4/3/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

CC: OOD,
Brian Croxon, TW/C04
George Hoff, MR1-2/E47
Steve Jenkins, TW/C04
Jud Leonard, TW/C04
Dave Rodgers, TW/C04

The alternatives we discussed:

1. 10/20/VAX coupled nets and 10/20 follow on.

2. VENUS (high end VAX based on 780 structure and Jud's design).

3. Global network architecture for Interconnecting machines at all levels.

4. Technical market hardware/software.

5. Personal and VLSI VAXs.

6. Peripherals.

7. Significant attack on Cost of Ownership and Field Integration!

Our recommendations:

0. The main thrust of MR will continue to be the 10/20 customer base (#1 above). Several alternative machines must be considered:

   a. New technology gate array (both ECL and bipolar).

   b. Off-the-shelf ECL.

   c. Cost reduction of KL through a cost-effective power supply, bigger RAMS for microcode and for main memory, and use of 11/24 (versus 11/40).

d. Buyout (license) of Foonly systems.

e. Minnows interconnected via ICCS to KL's and VAX's.

1. Marlboro will be the site of the Venus work. Venus as a project will be moved there. (Subsequent decisions are indicated in the memo on 3/30/79.)

2. Several task forces will take place:

a. Interconnect-led by BJ, with Alan Kotok. Work will be centered in TW, preferrably under the leadership of Dave Rodgers. Work will center as a program in a fashion similar to VAX and Hydra.

b. George Hoff and Brian Croxon should work on 7.

c. A program for 5 will be started.

The criteria used in the recommendation included the fact that 1/3 of the system's engineering talent resides in MR and we want to retain this center as a combined hardware/software team. Also, the technology for gate arrays centered there and VENUS is most likely going to use them in some form. (John Leng and I have reservations about gate arrays generally and MCA in particular. This decision will be reviewed before we proceed to use them in VENUS.) MR has the experience for handling machines of the complexity now buildable for 100K. MR is used to building machines like the 780 that are used in a centralized, mainframe fashion.

I do have several additional concerns that must be addressed as we make the organization changes:

1. Manufacturing. VENUS is an 11/780 replacement. As such it is high volume and represents about 40% of our revenue, and will be produced in a high volume plant. Under no circumstances should we consider use of the MR manufacturing for anything but 36-bit computers and VAX breadboarding.

2. Engineering is not used to high volume and interfacing to these plants. It is essential that the VENUS team move to MR, and that MR be staffed with people who understand the high volume world. Note a factor of 5-10 more machines per year will be produced than what MR is now used to.

3. 10/20 follow-on. I believe minimizing hardware investment here is the right thing for our users. KL10 cost reduction and Minnow feel ok and even necessary to me. Possibly getting the 2020 into the ICCS may be of higher priority in order to start addressing the software networking and coexistence.

4. FS. Different attitudes.

In looking at the field support, start-up and other costs I continue to worry whether we can afford the plethora of larger machines now, proposed, and ultimately desired.

I would like you to explore building a basic computer or large number of common components that can execute either 10 or VAX/11 programs.

This should be part of the EBOD presentation.

As the Computer Museum leaves the space in MR2, we should plan a solely Digital exhibit. There are two possiblities (and a mixture):

ARTIFACTS BASED (LIKE CURRENT COMPUTER MUSEUM)
This would tell the evolutionary story of our products and the processes used to make them. When IBM started one of their recent ad campaigns on how they invented various technology of the computer, it triggered me to make a list which we might exhibit:

PDP-1, CRT's (first commercial interactive, precision and color),
mini as in the 5, 8 family, note that the inventor of the first microprocessor (Intel 4004 programmed it)
first commercial timesharing system,
on line program creation (editing) and debugging (DDT) and device independence (DDT) and basic structure which CP/M uses
UART (invented for ITT's ADX system) and use of Teletype,
LINC (and bringing over from Lincoln Lab) - the first personal computer, and DECtape (or LINCtape), we

should show the evolution to MINC and successors
first use of computer for controlling testing of modules and memories (PDP-4)... now a whole industry
Industrial modules and controllers (PDP-14)
PDP-11 architecture, including Unibus and family, evolving into VAX, use of caches in small machines, evolution of minis to super minis with mainframe power
Minicomputer timesharing springing from TSS-8 and RSTS, the basis of modern distributed processing
LSI-11, and reduction of minis to micros
DECnet
Use of networks within manufacturing
Word processing
The large cluster for 10/20/VAX/HSC and include Ethernet
Disk technology and includes tree
Terminal technology (and tree)
Module and circuit technology (starts with Lincoln Lab and includes use of ttl/s for first high performance machine)
interconnect technology (Wirewrap and multiwire users)
design aids over the last 25 years

HISTORY OF DIGITAL
A display of this sort would include products, but would be a more complete story of the growth of the company with growth graphs, the organization and key events in the life of the organization. It could include memorabilia, cover stories in managment and technical magazines, replics like those used in the PC announcement, films like the story of Avram (or one that could be put together with the cuttings of the film) which would try to say what the company was like in 1982, etc. Care would have to be taken to make it really lively versus being like the 3 volume history of P&G.

The Charles Babbage Institute is attempting to get into the business history of the industry. It's encouraging each company to archive documents and record its evolution. We could provide a service by trying it so that others would know how to do it. Such an archive could have some of the business school case studies.

What about trying to design such an exhibit? (Or trying to get John Jones to do it if he's still interested in eventually writing a book on Digital.)

A PUBLISHED HISTORY OF DIGITAL/PRODUCTS
Bernie Galler, the editor of the Annals of Computing History has been asking me for this paper. I thought I did this in the book, Computer Engineering, but it clearly is a book about the products. I dropped all people from it because of the conflicts in how we all remember the past. I'm going to send Bernie a copy of Computer Engineering and see what he would want relative to it.

Again, are you interested in writing or getting someone to write such a paper? (If a display were made in the museum, the paper would be relatively easy.)

Professor Bernard A. Galler
Computing Center
The University of Michigan
1075 Beal Avenue
Ann Arbor, Michigan 48109

Dear Bernie:

It was great to interact with you these last few days about "preserving history". It has given us a great deal to think about in terms of the magnitude of effort in archiving the critical artifacts for the "public" and scholars who visit the museum.

Gwen and I have been discussing your invitation to present a paper at JCIT. Right now, I think I must decline because of the time commitment to the museum (especially in light of a decision to move the museum to its own building in Boston) and because I am deeply involved in product development at Digital. I had been drifting more into broader and more general issues of computing, including the industry, and now am getting back into more detailed technical problem solving.

Enclosed is a paper I wrote for developing countries on the establishment of computing industries, which I submitted to Science several years ago (but they didn't publish). Israel is well beyond this position, but there are lessons there which they may not wish to re-learn. You're welcome to the paper.

Also enclosed is the book, Computer Engineering, in which several of us compile the stories of the evolution of DEC's machines. In regard to writing an article for the Annals, you might look at this as a starting point, and then have us go from there.

Sorry we can't come to Israel next May, but think I'd better help the museum in this next stage, and design some crucial products.

Sincerely,

Gordon Bell
Vice President, Engineering

Enclosures-2
11 April 1983

Mr. Larry Press
SigPC Notes
Box 5429
Santa Monica, CA 90405

Dear Larry Press:

Enclosed is a book written by several of us that gives dates of several machines you reference. It also references key articles. You can get the dates of other machines from the book, Computing Structures, by Allen Newell and I. An article in Creative Computing gives the origin of -- Spacewars -- first written for the PDP-1 (circa 1962). Note that it's still operational at the Computer Museum.

I hope you clearly distinguish/define personal computing, workstations, single user computers, timesharing, interactive computing.

Also enclosed is a copy of the Museum Report and some brochures on The Computer Museum. If you aren't already a member, let me urge you to join or to become a founder. If in your research, you find critical artifacts for the Museum, we'd appreciate knowing about them.

Sincerely,

Gordon Bell
Vice President, Engineering

MESSAGE ID: 5191028967

SUBJECT: LEARNING FROM CDC AND CRAY

GB4.S1.31

Neil Lincoln, designer for the CDC 205, described to our engineers their effort to build supercomputers hampered and harassed by the company. Our efforts at the high end don't sound so bad now. Also, I think our engineers appreciate that their management really cares and provides them with tools (2 terminals/person) versus card punches. We also care about doing things right and understanding technology.

He also talked to me on the history and folklore on how Eckert-Mauchley Computer Company and Electronics Research Associates became Univac. Eckert was an arrogant easterner and didn't believe the Minneapolis crew could do anything. They argued over binary (Minneapolis) vs decimal (Phil.) and ultimately drove the ERA group to form CDC after taking their proposal for a large machine and building LARC.

CDC's behavior may have caused Cray to leave. He told many Cray stories, but the most interesting attribute I deduced about Cray were:

1. his ability to constantly try to build better machines; and

2. his sensibility to throw every other one away -- 6600 (6800), 7600 (8600), Cray 1 (several tries) Cray 2 (Cray also designed the 160 and 1604).

Lots of failures are because one designs and markets evolutionary, poor products instead of starting over.

He was concerned about CDC management, who came up via a technical route, erred because the required knowledge had changed and because

CDC does less manufacturing. They're into credit, Plato-CAI, hams, hydro-ponic gardening, military contracting, plug-compatibles, joint ventures, funding losers like Microbit (at 5M/yr) their jobs, etc.

It seems there's too much ego involved to get out of the hobbies that all lose money. (Our hobbies aren't nearly as expensive, and they don't appear to cost quite as much.)

Recently I had to introduce Bob Trocchi to their education leader to discuss Tutor software, because they wouldn't talk to him. I called Bob Price, the President and within 30 minutes a meeting was scheduled. The one catch: Bob and I had to meet with them first to set the stage because Bob thought that all product work had to go via his office. I had to travel to Minneapolis. He also wanted me to brief him on Alpha Omega, our joint research plan. We discussed this in some detail and he was ready to change a part he didn't like. I said no, because:

1. The current sponsors agree and we have to start to work.

2. This is really an outline. The plan and work has to be specified and done by the group (and I would even entertain radical redirection).

Although he's quite bright, he doesn't seem to understand research, A/D for technology transfer, A/D and development. Also he didn't understand the area, and wondered why I did (it's something I've worked years on).

Thus, it would seem that - they suffer two seemingly incongruous problems: 1. under management -- too many areas; 2. over management -- getting involved and having to make decisions on everything. These both cause a 3rd, being superficial in the products and technology.

I also see them and others in a strategy malaise with no real clear direction: supercomputers are hard to build; the service business evolved because they had a base; they're coming after us with their old repackaged 6600/7600's; IBM compatibles are what everyone else is doing (also seeded by all the IBMers), stores are interesting; ... there are too many options and they now have no real expertise anywhere except as dabblers.

These first two are what I worry about: not having enough time, and then edicting solutions when things are a muck. I'm glad we don't dabble outside of computing -- but some of the applications we don't understand or use could take us that way.

Overall, we should win against most competitors because we really do

insist on quality and thoroughness.

Mr. Donald W. Davies
National Physical Laboratory
Teddington Middlesex TW11 OLW
England

Dear Donald:

I was delighted that you and Mrs. Davies could visit us here and speak at the museum, and give the two talks at Digital. Enclosed is an honorarium for the talks at Digital. The researchers and engineers at Digital were delighted with the talks with you on security and networking.

We would like to have a museum lecture after the fall of 1984 on the packet switching network development. This would occur after the museum is moved to its new home.

As you think about what you might do on retirement, I hope you might consider working here or being a consultant in some capacity.

Again, thanks for the stimulating interaction.

Sincerely,

Gordon Bell
Vice President, Engineering

Dr. Ellis Horowitz
Acting Chairman,
Computer Science Department
Salvatori Computer Science Center
University of Southern California
University Park
Los Angeles, California 90007

Dear Dr. Horowitz:

I have known Dr. Parnas since 1966 and feel that he would be an excellent addition to any Computer Science Department. I recommended that he be given tenure at CMU. During the time I have known him, he has worked deeply in a number of areas including simulation, parallelism, operating systems, and most recently on the structure and engineering of software systems, doing early work on modulating. Since I've not kept abreast of his recent work, my recommendation is based on his work prior to 1973.

He supervised a number of Ph.D. dissertations at CMU, and on the whole I believe his students were above average. He interacted well with most members of the CMU department, especially Habermann, Siewiorek, Wulf, Newell, myself, and graduate students.

In terms of various criteria, I believe that he is an above average university-level teacher as one would measure by listening to his lectures and student motivation. I believe that his greatest strength is his research as measured by the ideas that are generated in his papers and by the level of motivation in the graduate students with whom he works. I think he has also contributed to the computer science profession through committees, lectures, and consulting.

Sincerely,

Gordon Bell
Vice President, Engineering
Professor, Computer Science
and
Electrical Engineering
Carnegie-Mellon University,
on leave

Subject: **How fast can software be built? What is it worth?**

To: Larry Portner, ML12-3/A62   Date: 26 OCT 78
    Ulf Fagerquist, MR1-2/E78   From: Gordon Bell
CC: Peter Christy, ML12-3/A62   Dept: OOD
    Bill Demmer, TW/D19   Loc: ML12-1/A51 Ext: 223-2236

Development Speed

John Leng (rightfully) is somewhat scared of the strategy because of the software. He believes that no matter how many people on a project, it can only be done so fast. However, software production has gotten better and we should understand how and why.

In order to push the implementation of the strategy very hard, we are going to have to better understand just how fast we can get various pieces of software. I would like to approach this solely on the basis of characterizing software projects we know about. Can we look at:

1. Tops 20 and VAX/VMS
2. The BASIC +2's on 10 and 11
3. Fortrans on 10, 11 and VAX
4. Some editors
5. BLISS's.

In all these, the issues would be how much did we spend?
How long did it take?
How was the quality?

Value

We must account for our software base on 10's and 11's. I've thought about several Forrester-type models and they make sense, but need to be made specific. Can you get someone to model this?

We need this understanding in order to move faster, now that we've started.

Subject: Some Concerns I Have About the HSC50 Approach

To: Distribution

Date: 3/6/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Several things bother me about this product, but first let me avow that I: do not have a hit out on the product; respect the people working on it; will probably not forget the circumstances surrounding the way it it got started and where it is; and have not made up my mind on it.

Background Concerns

As a computer engineer, it really bothers me because we are adding a special box into a system that can only perform a particular function. This generally means higher costs, special system software, being locked into the structure, and the inability to migrate parts of the existing operating system, file manager or data base system out to the special box. Furthermore, at a time when all the systems are themselves being collapsed to only a few boards, we are adding a much larger system than the systems it serves, to do a special function...thus we aren't making a gain in cost. This is brought home extremely vividly by observing that a complete Minnow with 512 Kwords of primary memory and R80 is smaller than the HSC. If the HSC didn't exist, would we figure out a way to build structures, even for high end Dolphins such that support the high swapping rates? E.g., out of the multi Minnow (or Nebula) approach? Moreover, instead of transferring requests for pages, a user would probably transfer data base requests and I would expect the system to get a lot more work done. Note that in the 4331, IBM is saying something called "Distributed Data Base SW + HW to/from 43XX and 370". Could this be what I'm advocating?

Some questions that come to mind:

1. What are the real needs for it?
2. What happens if we didn't get it? What would the system look like?
3. Will it really be able to deliver for a reasonable cost, or are we building another proprietary Massbus?
4. Will it be so expensive to keep designing to that we will not be able to afford the reasonable devices that the world measures us by? What is the total cost to complete?
5. Could we test whether we can afford it by transferring the budget into the systems groups right now?
6. Though it's where IBM has been,

is it where IBM is going? Is it applicable to our price domain?

7. Is there an upper bound on the complexity and ultimate functions of HSC (i.e., physical records, RMS, and finally DBMS)? Can we afford these programs again?

8. It feels to me there is a really serious alternative to it by using one of our existing small systems in the form of Nebula, Minnow, the 11/23 or 11/24. Such a system would do all the control functions in exactly the same way that HSC does and would handle as many devices as the particular system could handle. It wouldn't be designed for worst case of the Dolphin where many pages per second are needed, but instead, would deliver all the pages that the disk and/or CCD cache with it could supply. Performance would be enhanced by adding multiples of these systems, rather than relying on making a central one bigger and faster. Would such a system work? How?

9. Are there similar issues for the Mercury? How does it look?

10. Can anybody make me feel better, cause this approach feels just awful?

I don't expect anyone to do anything because John, Bill and Ulf apparently believe we are going the right way. Clearly Sam, BJ, Alan, and Bill Strecker agree too.

However, in case there is an alternative approach could I get a couple of people to work with me to search it out by running some experiments and doing some cost analysis?

SUBJECT: HSC-50 BUSINESS PLAN

Unless I'm mistaken, I'd bet there is no way to make the
HSC50
a profitable item. The number of large systems we sell is to
small to swing it. Products are coming out like I was asking
for based on a backend database machine, despite the clear
prediction from the technical folks that this wasn't possible
or the right way to do the job. Putting another 11 there to

do the back end doesn't feel good. The alternatives could be to wait for Scorpio and put it there, using the DBMS on VAX
plus the other numerous DB software coming out on VAX. This would give added life to HSC. The other concern about HSC in the high end is that we will have to have the IBM channel interface to sell to the govt. If we sell there, then we can use this approach instead of HSC.

As an alternative, it has been suggested that we use COMET as the HSC. Frankly, I'd like to look at this one. Note we have a prototype of this already, where a second VMS is talking
to VMS and behaving as HSC. Clearly we can do something like
this and get the performance by various kludge techniques to get more bus bandwidth. Alternatively, we can simply have more
Comets so that we don't have to get so much overall performance.

Conceptually, no one could argue against the Comet = HSC50 approach, as it gives us all kinds of advantages. The only argument I have is how well would it work? Or how?

What you think? Can we take a look at it?

(Could you send me the business plan on HSC please?)

Subject: **High Data Rate in HSC50**

To: Bill Demmer, Ralph Platz,
Wayne Rosing

Date: 18 SEP 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1

Ext.: 2236

follow up 10/02/78

Given the high data rate required in HSC50 (see NDS), can the two use the same bus, backplane and cabinet?

Also, NDS doesn't get what I thought would fall out: It can be used stand alone and wind up with a small 11 system.

GB:ljp

CMU (H T KUNG) SYSTOLIC PROCESSORS

Friday, I attended a review of Kung's work, with people from ONR, Lockheed, GE, TI, Westinghouse, Intel and TRW. I made some interesting contacts with TRW and Lockheed that might be interesting as joint ventures or as buyers of Hydra. These folks are all working on systolic arrays (which I think may be due to Kung's incredible PR). All have or are building these beasts.

I've been working with H T Kung at CMU, looking at Systolic Processors (data pumps), and these seem to have a similar structure to array processors. (I really can't give you a crisp definition of what a Systolic processor is). It's unclear whether there's a real computer structure (i.e the Systolic Processor), a theory, or what. They all compute like mad, IF somebody spends the time to get the program. It looks like there are lots of cases that can't be programmed. Kung's 10 (Hydra size) board processor looks like it will compute at a 100 Mflop rate for a few well-defined problems. The machine is one of the most complex I know of and it's unclear that it will get done because of the engineering.

I've been advocating that we build this for Kung at ULTRA. Now, I'm skeptical because it looks quite hard... and may not be programmable for any reasonable set of problems! There is no way the group working on it will get it working because they lack the engineering (hardware and software) skills.

I'm going back to spend a day looking at the architecture in more detail because there are some interesting ideas there, especially in the notion of address generation. I doubt if we could get them to make the machine architecture reasonable.

THE UNIVERSAL HOST PROJECT
One of the faculty has been working on a very fast, quite general purpose, microprogrammable computer for the last couple of years. I've been trying to get them to stop it because of the incredible difficulty of the projects (at least 2 times harder than Hydra!) since they have a 25 ns ECL bus, and their own, 10 mips, special purpose bit-sliced micrprocessor that's oriented to generating addresses for signal processors. The review panel all commented on the idiocy of the project, without having the vast (versus half-vast) resources.

EMS: @CORE

Delighted that you are developing a display for CSD/LSI for Hudson. One way to make the promise of a "distributed museum" at least a partial reality is through cooperation with groups such as yours. I'd like to suggest the following scenario:

-- Four kinds of exhibits could be considered: 1) specialized large scale exhibits unique to each of the Hudson plants that the Museum could point to; 2) smaller exhibits (such as large scale photographs) that could be done in limited editions 2-5 and displayed at both Hudson plants, the Museum, and selected other locations; 3) audio/video presentations that could then be distributed to the museum and other sites; 4) and some exhibits from the Museum (such as our three minute video tape) that would broaden and add to the spectrum at Hudson -- and point from Hudson to the Museum in Marlboro.

-- A substantive schema should be developed for Hudson 1 and 2 with consultation with experts outside of DEC as well as inside. (I know Carver Mead has some ideas, for example.)

-- We would be pleased to come to a substantive review and believe that coordination through Charlie Conn's group in Industrial Design can help us to achieve appropriate standardization.

Subject: **Hydra**

To: Pete vanRoekens, TW/B10 Date: 14 DEC 78

From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

CC: Roger Cady, MK1-2/E25
Joe Carchidi, TW/D08
Bill Demmer, TW/D19
Bill Keating, ML12-3/A62
Larry Portner, ML12-3/A62

I understand the dilemma on Hydra now and concur with getting a really good product definition before we get the schedule. Bills have to understand and help with this. This seems to imply a branch on the VMS tree, versus a later release. A VMS release ultimately gets VMS too big because it doesn't need all the redundant operations. We have to get at the schedule versus product issue at the steering committee. Right now we must work on defining the right product. Also, I'm still worried about getting a better definition for TRAX-32.

Can we do a breadboard where the reliability functions are placed in the run time package layer? (Isn't this possible with a large, shared VM?)

HYDRA Documentation Hierarchy
(Relating to the Definition of the Hydra Software Project)

HYDRA SOFTWARE SCHEDULE

1. The goal for May 30 is to:
    1. provide the Hydra Technical Summary or the Hydra Product Brochure that summarizes the functions of Hydra as seen by a user or buyer
    2.identify and define the Functional Specifications for the entire system (especially the software) that forms Hydra
    3. assign responsiblity for each document type, including the Functional Specs
    4. hopefully, have a rough estimate of the time and effort required to implement the functions, including their integration and testing
    5. identify outside modules such as the languages, debuggers, etc. that have to be obtained

2. This effort will be followed by detailed Design Specifications which further refine the Functional Specifications and enables a software engineer to implement a given module.

3. Finally, a Project (Development) Plan will be made for the entire project which includes the Test Plan and Schedule.

4. The Project (Development) Plan will be executed.

DOCUMENTATION GOALS

The Goals for the Documentation are:

0. To have an owner for every document.
1. To be precise, yet concise and correct in order to minimize the time for the writer and reader. The dominant cost of information will be the propagation of erroneous information among engineers.
3. To specify everything on a breadth first basis. When information is unknown, a placeholder name will be given together with a simple description of the accuracy and precision of the information.
4. To practice the notions ala Parnas of "information hiding" and "need to know" by not giving needless information.
5. Have a format for each of the document types so that the design of the document, per se, is not a significant task. The emphasis is on the content, not the form. A consistent document format will aid the reader and insure that the writer has included the relevant data.
6. Have a completely orthogonal set of document types so that there is, ala Parnas "Everthing is specified in exactly ONE place". This means any changes have to be only made in one place and a reader would know where to obtain each kind of information. A paper by Parnas on this is forthcoming. I propose we import his document types intact, too.

DOCUMENT TYPES

The various documents (until we get the Parnas types) are defined as follows:

ONE TECHNICAL SUMMARY FOR HYDRA HARDWARE AND SOFTWARE, ESSENTIALLY A (NARRATIVE BILL OF MATERIALS)
Summmarizes the product as seen by the user. It is both an internal (to Hydra) and external (marketing) document. Similar to the VAX/VMS Technical Summary. It is readable, includes some rationale about the product, together with features and benefits.

It contains a Bill Of Materials of all the parts that form the system (eg. MPEXEC, UNIX, Emacs, C debugger, backpanel, streaming tape, CPU module). This is the definitive document that defines the product.

Written by Dave Fanger. Approved by Rich Billig

Under the control of Shanin, Chapin, and Moore

ONE PRODUCT BROCHURE
Taken entirely from the Technical Summary. Is not used within Hydra by anyone other than the marketing group, and necessarily lags the Technical Summary.

REFERENCE MANUAL (ONE PER MAJOR SYSTEM EG. C, COMMAND LANGUAGE)
Normally a document that is available to customers to define a particular machine (eg. assembly language, Fortran, C). We are not concerned with it's form or substance at this time, or how it differs from a FS.

FUNCTIONAL SPECIFICATION (ONE PER MAJOR PROJECT WITHIN HYDRA) (TA's SYSTEM SPECIFICATIONS ARE EQUIVALENT TO THIS, I BELIEVE)
A document that describes the "function" of a particular set of hardware or software (eg. a compiler, UNIX, CPU module, mPExec, memory management). The FS may include the design goals, perhaps some of the key design decisons, how various parts of a module fit together in order that a Hydra or

external "user" can best understand how to use the module. It may have examples. It's unclear how close this is to a Reference Manual, when it reaches its final design.

Performance monitoring and error recording call information access should be included whether its a procedure call, shared memory, or message passing port.

The Functional Specification goes through various "states" as the project progresses:

> FUNCTIONAL SPECIFICATION (PLACEHOLDER)- The initial realization that a particular process is required. This defines "roughly" what the module does (is used), is called and responds. The name, Unix 4.2 is an example of this level of spec.
>
> FUNCTIONAL SPECIFICATION (INITIAL DESIGN)- In the initial design, the various procedure calls are outlined together with the various parameters and error return mechanisms. The goal is to have something that is sufficiently concrete, that other modules can be "designed" using the various calling mechanisms. Version 0.3 of MPEXEC is an excellent example of this.
>
> FUNCTIONAL SPECIFICATION (DESIGN AND CODING COMPLETE)- Virtually identical to a Reference Manual because it specifies, exactly the function of a module and how it is used. The Memory Specification is an example of this.
>
> FUNCTIONAL SPECIFICATION (Version 1.0 ...)
> Version 1, denotes a product that's in the field.

DESIGN SPECIFICATION (ONE PER FUNCTIONAL SPEC)
A document that is hidden from all users and is only brought out for a design review, because it includes notes on how a module is built, perhaps some notes on alternatives, the data structures used to represent various objects presented to the user interface, and a method to test the design.

PROGRAM / LOGIC DIAGRAM SET (ONE PER FUNCTIONAL SPEC)

The actual implementation of hardware module or software.

TEST PLAN
Specification on how to test a particular module, including the test of constituent modules of the entire system. This may include the design of a system (ie set of modules) complete with Functional Specs.

PROJECT PLAN (TA's DEVELOPMENT PLAN)
This is a living doucment which contains a revision number. A plan for a module. It would contain timing estimates and possibly dates, on the work needed to completely implement a module, including:

- . UNIT IMPLEMENTATION
  - .Detailed Design, yielding Design Specs and Final Functional Specs
  - . Code
  - .Unit test of component parts of the compete system
- . SYSTEM TESTING

G Bell (for Steve Chapin, Steve Emmerich, Ike Nassi, Dave Schanin)
24 May 1984
We had a pretty thorough review of the hardware on Tuesday 11/20, and I feel much more positive about its ultimate convergence. The memo to the Hydra board on 18 July had the effect of Hydra starting to learn how to schedule and manage resources. Len is introducing more realism into Dave (and the rest of the team).

Their prediction that the Memory board will enter relayout on 12/15, followed by the processor board on 12/30. The current EMC and SCC boards will go into relayout 1/15, but the two machines: Beta 1 and Beta 2 (for internal use) will use old scc and emc's, and new dpc and smc. The 7/18 prediction was these would all enter relayout on 1/15.

Here's the current history and predictions:

Date	Sequent	2/6 GB	5/1 HSch$	7/18 GB	9/1 HSch	11/21 GB
Start	2/83		11/83	11/83		
Spec	7/83		1/84?	1/84		

Hdw up+					12/84	1/85
Up	1/84		9/84	1/85	>12/84	3/85
Beta(ext)	7/84	3-9/85*	12/84	5/85	3/85	5/85
FCS	11/84		1/85	10/85	5/85	8/85

$ Date given to Sperry in a document.
+Hardware is up solid enough to not be wasteful of programmer time. Diagnostics run and there are rudimentary handlers.
*Probability(.6-.9)

I believe the machine is going to eventually work and there doesn't appear to be any fatal flaws. There will be a continuation of nasty bugs that take time to find because we are building right at the edge of the logic and programming technology. We should do a careful review of the EMC and its programming asap. I don't think the architecture of the board was reviewed carefully if at all.

We also must do monthly status reviews to look at the gotcha's.
Rather than having special reviews, I would like to get Len and Russ to have really thorough reviews that we could attend.
HYDRA--

1. What structured/unstructured interaction do you want?

2. Interaction with lamP. They could come visit on 13th and 14th.
3. Interaction with Motorola and National to get what we want.

4. Performance hooks:
   a. floating point is the most critical
   b. vectors ala Masscomp
   c. ability to get a SKY special processor... contact when hardware
   d. high performance graphics processors... we need someone here now. This represents a significant OEM relationship opportunity.
   e. video input is critical

f. xerox printer is necessary and requires computes
5. Josh Fisher compiler requires: lockstep instructions and ability to
communicate variables between processors every few instructions--
ideally registers, but could be global Mp. What is cost, penalty?
6. It is highly desireable to operate HYDRA and lamP as relatively,
hardware protected multicomputers (with independent kernels) and
assuming errors in each of the kernels that could address other
Mp.

7. What's happening on packaging and cabling? (especially for
LAN/Comm)
8. Is it necessary to have a provision to add simple I/O in the form
of Motorola's I/O Channel or the STD Bus for cost or cabling?

9. What are the UNIX extensions?
10. Would Modula 2 make sense? It has mP operations.
Subject: Review of Hydra Operating System Software, 7 May 1984
To: Dave Schanin, Bob Puffer, Julius Marcus, Henry Burkhardt
CC: Steve Chapin, Steve Emmerich, Ike Nassi
From: Gordon Bell

Steve, Ike, Dave and I reviewed Steve Chapin's plan all day.

Action Items

0. Recruiting continues to improve. Needs are still 1 tools, 2-3 O/S and 1 network and 1 diagnostics persons. Two acceptances are likely this week. Everyone must help recruit!

1. Hydra is limping along with National's tools that have lots of "bugs" and "features". The cost was about 2 people and 1 month delay. A debugger is badly needed for the test bed. This is considered part of the

languages effort for now.

2. A high quality compiler may be needed for the product, as compilers continue to improve. Tartan Labs has a product that was offered to us as a free Beta site. Bill Wulf believes they have the quality product. Are we utlilizing it? Foundation is coming up with a plan for all languages including assemblers for the translators, loaders, runtime and debuggers. We need it. A new C may be essential to meet satisfy the quality demanded by the market.

3. Emacs is being used by Hydra, and will, no doubt, be part of the product, in addition to vi and se. Hydra will take responsibility if Emacs is a product. For now, it is.

4. Encore licenses --- ie. Henry or Karl need to immediately work the issue of UNIX and other software licenses for all of Encore since the prices may go up from ATT shortly.

5. System V (versus 4.2) plan is inadequate (see also Sperry concerns). Just having the library will not be enough. All the utilities and environment will be required. We can probably forget the 4.1 library. This should be deferred until we have Steve Emmerich's position paper.

6. The "tentative" current plan is to build about 10 testbeds for Hydra. A testbed is about 1/3 of what it should be with a 10 Mhz part, making the overall performance about 1/4 Mip, or about the same performance of a VAX 730. This should support about 2-3 heavy development users, or about 8 office users (about what a 730 does -- we have 16 terminals on the Encore 730 with 4 Mbytes). Other Encore companies should order them as appropriate. Hydra needs: 2 for Unix, 2 for networks and 6 for program development. This means that 2 people are required to build (in HYDRA manufacturing) and support (in Dudley's organization) the product. This is an excellent way to start behaving as a company.

7. A new approach is being used for mPExec and Unix which makes Unix a process. This is along the lines of Syte and Pyramid. It also is aimed at lowering the schedule risk. The schedule is to come for this

approach.

We discussed the approach to porting 4.2 (and System V) to a multiprocessor environment, using the National architecture. It is:

0. Go for a product that can be enhanced, but is generally right, versus going for anything that is interim and will be thrown out. The goal is to make a first ship in January. This means going for reliablity and the right structure, and then enhancing this structure. The FCS will work well, but not up to the level of a product a year later.

1. Port from VAX 4.2 to National architecture. This is to be complete and solid by June. It is operating now with most of the critical utilities. This has taken about 6 weeks longer than expected at this point due to poor National tools, flaky testbed hardware and to a lesser degree lack of hiring and learning. Steve felt that that the group accurately scheduled but didn't anticipate the poor tools and hardware. He sees no future "gotchas" in the software. Future schedules do not assume an improvement in tools!

2. Build useful single processor testbeds / user machines for Hydra and other Encore companies. These will be used for LAN DLA development, testing the O/S and for system software use within Hydra.

3. Run mPEexec on the uniprocessor testbed in September, and then convert it to run on a dual-processor Multibus testbed in Oct.

4. Move mPExec to Hydra.

5. The original view of mPExec as a platform on which to "jack-up" and hold Unix is being modified. The current view, which we all subscribe to is that UNIX is another process, and that a Unix user process call Unix and Unix calls mPExec (running in system space). The new schedule for this approach will be forthcoming soon.

6. mPExec spec will be completed by June 1, so we must resolve all ambiguities by then! Ike has a counter-proposal called Ports, which is designed to operate in a distributed environment. Ike, Steve, and Tony are meeting on Tuesday and Thursday afternoons to discuss mpexec and its evolution.

Some other issues came up:

0.Hopefully, the schedule slips is behind us and we can move into a mode of predictability as more comes under local control. The tendency to work from the fixed FCS date in January and schedule backwards is worrisome, especially in light of history. The only way to understand where we really are in terms of schedule is to posit this new one and then operate against it for the next 6 weeks or so to see how we do.

1. The approach to specs is sparse. Only a spec, eg. mPExec, which affects more than one module is documented.

2. A formal test suite is needed. We need to persue.

3. Unix is converted from an "events-based" process control, to a semaphores and messages approach.

4. The approach to to the product design is evolutionary: get it working, then form multiple processes that can be executed in parallel. This will take maybe a year to tune. We badly need to start gathering information now so that we can tune it.

5. Beware the C.io and C.diagnostics programs. These could easily become the bottlenecks to shipping.

6. We are going with TCP/IP and would like to evolve to included XNS for all their goodies. We need to have a Remote Procedure Call mechanism and for now, this might have to be invented (versus using Courier).

7. Several of us have concern about seperation of responsiblity for mPExec and UNIX. The author believes there should be two groups with a well-defined interface. mPExec should be treated as an extension to the hardware and programmed by about 2 people.

Subject: **Task Force for Hydra: A RAM + Expandable Computer (non stop)**

To: OOD, Roger Cady, Pete vanRoekens

CC: Marketing Committee

Date: 12 MAY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

Pete vanRoekens has agreed to head a task force to define the goals and constraints of this product. He will report to Roger Cady for this product/program definitional effort. Furthermore, I expect Roger Cady to be responsible to me for this effort.

In order to further co-ordinate this effort, he will meet with Roger Cady, Bill Demmer, and I weekly regarding short term resource needs, product definition and the establishment of the development project/program.

At the completion of this phase (Phase 0), the reporting relationship will be switched so that Peter will report within OOD for the implementation phase.

GB:ljp

PEOPLE

Hydra's enthusiasm and drive is contagious. They are verbal in computing, marketing and business. They take suggestions well, and respond appropriately. They are enjoyable to work with. I like them as individuals and as a team.

The team is young. They haven't "done" it before. This means we have to get them to ask for help and we have to press for decisions earlier so as to not spend so long... Brooks said: "you only run out of time".

Believe we'll soon need the mechanical engineer. The packaging is non-trivial. Am worried about purely electrical engineering problems including power, bus, emi, etc. I'm not sure if anyone understands the systems/performance aspects of computing. Still no UNIX experts. I'd like to have lots of them.

HARDWARE

. lots of surprises-- the design is fine now, but these take time to find and resolve

.board changed from 100 (Dave's pre ECC plan), 150 -> 180 -> now 255... and holding

.board partitioning has moved around. The current one which adds another board type feels good at last.

. bus changed from 100 -> 50 -> 80 ns and from 32 bits to 64 bits. The faster 50 ns cycle would have probably been better. I have no idea about how a wide bus affects performance-- it should be faster, especially for dp floating but can't prove it. We'll clearly sell it. The bus may be overdesigned for HYDRA, but hopefully is worth it for lamP. It does cost.

. The National chip isn't understood very well by anyone, including National. They are very cooperative and I've gotten them to accelerate their schedules to gather performance data. It's rumoured that they are working on an multiprocessor too. If true, then I want to find this out... and operate accordingly. This may explain why they give us so much attention. Understanding the chip is vital for their next products, our systems and lamP.

. Hydra has a structure that will not have performance problems, but it's critical to know how it will act for other chips and for lamP. I'm going to push the hell out of Dan to get this model. Every model I make gives a different answer!

. The design is complex... therefore

.We need to get a stronger commitment to a Quality Design Methodology. I wish we had bought the Lou Cohen Quality teaching company to teach them. Quality Design means: top down design, commitment to NO errors-- do it right the first time, formal checking with walk throughs, and when it comes to protyping-- checking with a simulator.

.Their simulator is poor! I'm going to try to get another one from VALID, but they're committed to Xerox (Versetec-- not known as a CAD company). But it is cheap. Russ and I visited VALID. I wanted them to get their system or import the ideas on hierarchical design. They have.

THE PRODUCT AND CRITICALITY OF SCHEDULE

. They don't have a reasonable way to schedule yet. A project of this size and complexity has to have inchstones measureable in days that are checked and co-ordinated. Their schedule tasks are too fuzzy and have to be much more crisp. Our very high priority is to get a scheduling system.

. **Encore Hydra vs Sequent:**

- 8 vs 16 processors
- 32 vs 16 Mbytes;
- 100 (50+ useable) vs 25-40? Mbyte/sec bus
- 255 vs 144 square inch boards
- 20 vs 12 slots
- ? vs ? price ... hopefully not in ratio of price
- 12 vs 21-24 month schedule
- 11/83 vs 2/83 company start
- ? vs 60 people (now)
- standard vs use of custom logic
- Xerox vs Mentor logic system
- extendable to lamP vs ? extendability
- first real project vs first and second timers
- none vs much UNIX and CS experience
- Dave Schanin vs Dave Rodger (former DEC engineer who was a leader on the VAX 780 and Ethernet)
- Steve Chapin vs ? on software...

. Note the competitors:

- Sequent intends to ship in Q4, with hardware apparently running now.
- Another vendor might have a dual processor that could be introduced in the fall and deliverable in the June 85. This dual could perform at 16 Hydra or greater.

.DEC has been quoting 64 processors to Universities with deliveries possibly as early as June (but I think this is optimistic). 16 of these can be clustered to give 1024 using the Computer Interconnect. This is a function of the MicroVAX chip which has a high likelihood of working when it comes out of the oven in Feb-Mar. Our business plan will give DEC the necessary goad/goal to move faster. This may also impact our next round of financing!

BOTTOM LINE
Delivering in 84 is super critical to us... much more than I thought earlier today! This means that all of us have to go flat out asap to make sure there are no false starts and we make every right decision.

EMS 10-JAN-79 17:53:37
260 1
To: Larry Portner
From: Gordon Bell
Date: WED 10-JAN-79 17:53:37 EDT
Subject: Discussion with dave cutler

As your indicated, dave isn't interested in the Hydra job for a multiitude of
reasons. However, he's concerned about us crying Product Wolf one more tim

sen He did agree to two things: 1. Consult to you and I (Mainly you) to help
get a viable organization so that the integrity of VMS is preserved as Hydra
is built. This would include working with the development person in
establishing ground rules. He has both M/m+ m/D and VMS/M experience here
that is invaluable.

2. Work with us as we go into this product resolution/definition phase to help
both in arbitration and product integrity. He will spend the month or two that

this takes.

Right now, I'm still planning to have the small meeting with technical people
to examine differences between latest Hydra Spec and the Hydra task force.
Fuller is writing the diffrerences document. This will be 1/2 day on hte
17th. It includes Sam, Dave, I, Joe, Dick and Joost Tell me if there is a
problem here.

Pete is also included, and Pete is still as uptight as ever.   He sees his
dream as a separate, focused product/development   as not being realistic
given all the concerns about Hydra as part of the corporate strategy and
Hydras   as compatible with VMS inside and out.

Command:

EMS   10-JAN-79 18:28:47 430 1

To: Larry Portner
CC: Peter van Roekens, Bernie Lacroute
From: Gordon Bell
Date: WED 10-JAN-79 18:28:47 EDT
Subject: Importance of Hydra

Dave Cutler and I talked about the above. He had two comments. We
(engineering management and Product lines) are crying wolf again. He also
quoted the small market that tandem was addressing. (5% was quoted in a
magazine).

The product lines aren't together on this at all. Even though there is money
for Hydra, the key limits are constrained software engineers. If we want to

get the impaortance raised, then slip release 2 to go for Hydra earlier...to
show the importance of Hydra. As an editorial aside, I think he has much
insight that we ignore as a society all the time (business does it with
energy) when we think we can trade money for anything else...in this case
people resources. Therefore, Hydra should have a budget on what can be
slipped in effect in other areas when we get into this people resources bind.
At a personal level, given release 2, I would talk about a slip to get Hydra
further faster...and I think we want to oopen this up with the VAX/vmmmsss
product managers. What do you say Bernie...How important is Hydra and
getting started in distributed processin to us?

Subject: Interest of Hydra outside Telco

(Send a copy of this to Bob Savell and John Adams and Charlie Spector) I
just discussed the importance of Hydra, in passing with the above of IPIPG (

IPG (less Charlie) and they believe in and need it urgently, hence we could go
on any limb of trading resources such that we get Hydra and slip other VMS
releass, I believe.   They want to move on it, and are even talking about

building a breadboard, or specialized/restricted product using the hardware only..and not touching VMS or the file system. I think Pete has to begin to get out of the Telco umbrella who is perceived as the godfather that isn't even going to sell it because their customer is UNIX based. Here, again the product manager structure has to start /get involved in Hydra and assess some of the priorities. Also, we have to get other product line input about the needs.

Subject: **IBM 38 and 8100-How Do We Stack Up?**

To: OOD,
Andy Knowles, ML5-2/A53

CC: Operations Committee

Date: 10/29/78 Sun 6:32:05
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

Now that we have our strategy and general direction in place, it's time to check it with what we know of the competition. Both the 8100 and 38 will hit us soon, but we have time to fine tune products and to reset any major problem areas (eg. communications interfaces, disks). I would like to devote the OOD meeting on Thursday November 9 to this, such that we can present our findings to the Marketing or Operations Committee by mid-November, assuming they are interested. The agenda, I'd like to see:

1. Presentation of what

IBM has (and when) and what our nearest products are based on 74, 2020, Comet, 44, Minnow and Nebula. What operating systems do we use to compete? Rather than get someone from the competitive group to tell us about the IBM system, one of us (or Julius or Andy) might present the IBM system, and Bill, Ulf and Larry should position us on the base system and software.

2. The component suppliers should speak too:

a. What disk(s), when, and how much?

b. How will our memory technology and prices compare at .5 Mbyte level?

c. What will we use for communications hardware and how's it compare?

d. How's the terminal picture including the specials?

e. What's the capability and performance of the software systems?

3. Should we change any directions?

I believe the first two descriptive topics could be with a relatively large group. Item 3 should probably be done with a relatively small group and especially include those responsible for each of the areas.

SUBJECT: IBM AT UNIVERSITIES (AND TECHNICAL MARKET) A STRATEGY?

GB5.55

IBM has moved back into an even more significant force in the technical marketplace than prior to the 1950's consent decree. For
example, CalTech got a gift of a 4351 + Floating Point Systems array
processor. Similar gifts are common; and we all know how they fought
at CMU and MIT. The rumor now is that they'll use the IBM PC with
16016 Softcard at CMU since the 68K based one wasn't useful.

A battle is shaping up at Stanford where they have the largest, but
ineffectively used mainframes. Also, they've given away about 200 PC's to Humanities and Business faculty. We haven't been in the humanities, but the PC's are an attempt to remove the 10.

Their product strategy:

1. PC's on 8086 until they can get their 801 and become unique again
   using the CMU software. Make sure they can run the software developed at MIT on our VAX gift in a UNIX environment.

2. Supply UNIX on 4300's to regain the technical marketplace from us.

3. Lock in with Series 1, System 38 and 370 in small to large corporations.

4. Try to make it all work together with SNA and their eventual

LANs.

I think we need to have some sort of marketing strategy as it's clear
they have one. What you say?

"CC" DISTRIBUTION:

FU 6/10   FOREST BASKETT   EMC:
DIETER HUTTENBERGER   OPERATIONS COMMITTEE: PRODUCT STRAT COMM:

WPS USERS - Leave HP mode and type <CR>

We got into the heart of the issue: IBM has made the commitment to the project. Doug noted that IBM moved very fast after receiving the proposal, and on the other hand we knew of the project and their desire to work with us for about a year, even though the proposal had not been made. We're second in the pipeline to agree to do a Technical Proposal with them! CMU does not believe that both DEC and IBM can do a Technical Study there in parallel, hence the question:

> Is there anything we can do to prevent IBM from making their Technical Study, or should we simply agree that they should go first and we will request a similar Technical Study period following IBM?

WHAT IBM IS GOING TO DO
IBM has proposed to be their partner on this project, subject to being able to reach agreement during the Technical Proposal making phase. They are meeting for a day during the first week of November in order to review and approve a memorandum of agreement ... for the technical study phase. They have designated a single individual to head the Technical Proposal group and have asked CMU to provide space for the 12 individuals they want to relocate in Pittsburgh. They study is supposed to take 3 to 6 months. Doug has worked with IBM before, and has been sceptical whether IBM can be flexible enough and understands the importance of the area enough, but so far he has been surprised and has stated that IBM may have changed.

WHAT WE MIGHT (MUST) DO IF WE WANT TO DO THIS PROJECT
Right now, we run the risk of not being able to be asked to make a Technical Proposal because we can not convince CMU that we can or are willing to do the project. I don't see how we can convince them otherwise in the short period between now and when they are meeting with IBM to make an agreement. We can not sit by even now, otherwise, by default they might enter into a non-cancellable agreement with IBM which says the two must go ahead subject to an adequate proposal.

Therefore there are significant risks now that IBM will get the project by default. We will be unable to convince them that we are serious enough, hence they won't even bother to allow us to make a Technical Proposal! We must still work during this time to determine how to even stay in the race.

Doug is calling me on Tuesday morning at 9:30, hence I would like to get together on Monday morning to decide what we say.

SUBJECT: B. O. EVANS' PRESENTATION ON JAPANESE SEMICONDUCTORS

On Friday, B. O. Evans, an IBM VP and person who headed the 360 and numerous other developments presented IBM's assessment of the Japanese Semiconductor industry to Ken, Win, Ted and I. It was clear, fact filled, very dense and high quality. The results:

- Japan's research spending is co-ordinated and at the same level as IBM's and the combined merchant semiconductor industry.
- Their spending has been co-ordinated to get them in caught up. Here, they operated for 5 years as Japan Inc., until they all disbanded to go back to their respective companies.

Japan is currently ahead in 64 K rams and this is only the beginning in the MOS area. They are hanging back in micros because they can copy them and not invest in the software.

. Japan will achieve 1 micron before 84, as evidenced by ISSCC papers, which are the best predictor. IBM is scared because they have NEVER been behind in semiconductors.

. Japan leads in every aspect of semiconductor design, device design, processing and processing equipment. They also are close to IBM in packaging, the key to using semiconductors.

. Through ARPA's VHSIC Program, the universities are starting to work, but it's not fundamental enough, it's aimed too much at design and architecture, difuse, un-disciplined and inadequate. He believes it's far too little, too late.

He has presented to various computer and semiconductor companies and to the Defense Science Board and to other National Committees including NAE. His proposal:

. Go into a mode that is very much like that used for war-time research.

. Put the work at the universities. Fund it out of Industry, Government and the Universities. Have industrial staffing.

. Operate the whole thing as a program in a very structured, top-down fashion aimed at results!

The response from the various sectors:

. Industry isn't concerned enough yet. The semis are asking

for tariff protection. They aren't competitive and they all
aspire to become computer suppliers.

. Government isn't concerned.
. Universities don't want any goals or control or interaction.
They want money with no strings.

I propose we should write a letter of support for the approach and start doing the things necessary to get such a program going.

gordon

PS
A recent Business Week article reports the formation of a MITI lab, like that that did the semiconductor work, for building a supercomputer that is aimed at 66 times Cray power by 1990. It's clear to me they can do it!

Subject: Keeping track of IBM trends

To: Dick Case, MK1-2/N38

CC: Ulf Fagerquist, MR1-2/E78

Date: 3/5/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

As per our discussion, it seems necessary to update our model of IBM and how it is moving. To this end, I'd like to get a table from which we can then do a number of plots. It would be for all their products, including:

360, 370, 3xxx, 43xx, the new H series (speculations)
Series 1,
Systems 3, 10, 15, 32, 34, 38
51xx
8100
System 7

For each system we would have the basic introuduction material, but the table would have:

 introduction date and fcs
 minimum, maximum, and average system price together with the monthly maintainence
 main memory in bytes for minimum and maximum configurations
 performance both at raw cpu and system load levels

We should also have a table showing the disk and tape introductions, and the prices, capacities, and controller characteristics.

Subject: **IBM WATCHERS**

To: All Watchers of IBM*

Date: 3/19/79
From: Gordon Bell/Richard Case

Dept: OOD/CSM
Loc: ML12-1/A51 Ext: 223-
2236/

MK1-2/N38 264-7307

There are many groups and individuals within Digital who are analyzing IBM products, technologies, policies, and services and their effects on the industry and our company. These studies and this knowledge should be shared across all groups within DEC. The purpose of this memo is to begin to gather and organize the "IBM Watchers."

Richard Case, of Commercial Systems Marketing, is the corporate IBM Competitive Analyst, replacing Larry Tashbook. Part of his job is to act as a central focus or "clearing house" for the many IBM watchers within Digital...hence an IBM watcher watcher.

If you have been looking into some aspect of IBM, Richard would like to know about your efforts. If you need to know information about our largest competitor, he would like to help you get the answers. If you need, have, or are purchasing IBM equipment, he would like to co-ordinate that hardware within the company.

Please fill in the attached questionnaire and send it to:

Richard Case, MK1-2 N38

along with any written reports or memos you think he and others would be interested in reading. Any sensitive information will be screened.

Richard will:

1. Publish a newsletter with IBM articles of interest.

2. Maintain and publish an index/database of subjects and people

and distribute information as it becomes available.

3. Let you know (before IBM does) if anyone else is buying the
same equipment you are.

4. Help to co-ordinate research and planning to avoid duplication of effort and expenses.

*Please disseminate as you feel appropriate

EMS 19-JAN-79
13:39:08 410 1
To: Roger Cady
From: Gordon Bell
Date: FRI 19-JAN-79 13:39:08 EDT
Subject: IBM -- Josephson Device Computer

IBM may have a Josephson Device Computer at the end of the next 15 years. It
is fantastically fast. Will send you specs of first target (25
ps cycle time). The technical problem seems to be mainly one of packaging!
It isn't clear how/what to do about secondary/ tertiary memory.

Command:

EMS 12-FEB-79
20:48:40 400 1
To: Bernie Lacroute, Mike Powell, Brian Croxon, Dave Rodgers, Bill Demmer
CC: Mary Jane Forbes, Ed Fauvre, OOD
From: Gordon Bell
Date: MON 12-FEB-79 20:48:40 EDT
Subject: Stopping the 11/74 and moving ahead with 11/70 multiprocessor
----

Today the Operations Committee voted to support the
Commercial Product Line,
Product Management, Service and Manufacturing recommendations
to stop the
11/74. The 11/70 multiprocessor will proceed ahead as
planned.

I am sorry that we did not decide earlier because it would
have meant that we
could have worked on products which would have gone to
market. However,
given that we are not marketing the 74, there is a
significant increase in
emphasis on marketing the 11/780 and I believe that this
effort will have
higher payoff.

I want to thank all of you who have been involved in the
engineering of the
74 and ask that you hang in there over these next few weeks
while we
structure the new engineering projects which are in a
general direction of
more VAX and better network support. Although it is unclear
as to the
specific project, we require significant work in the
interconnection and
front ending of computers, mass storage , and in both low and
high end VAX
systems including a VLSI VAX. Again, I am sorry about the
decision, I think
it is basically right and that we should proceed to develop
significant new
hardware.

Lewis M. Branscomb
IBM Corporation
Old Orchard Rd.

Armonk, NY 10504

Dear Lewis,

It was great to chat with you and hear your talk last week at the ICCC80 meeting. The Brazil paper that you had read was written after the enclosed paper on Japan. I think you might be interested in this as well. All of our efforts will be needed in keeping the US in the forefront...or viable.

The Digital Computer Museum, that Gwen and I started about a year ago, is aimed towards the computer professional, preserving and displaying materials of special historical interest. As part of the program we're video taping lectures on the first 10 computers. The next one, by John Atanasoff is on November 11, and then Konrad Zuse is coming on March 4, in case you can plan a trip to the museum coinciding with one of these unique events. (Our newsletter and brochure are enclosed for your information.)

I would like to make a personal plea that you could help me so that our Museum can make use of the services of Roberto Guatelli of New York, who builds calculator and computer models for IBM.
Michael Sullivan agrees in principle that Guatelli should be able to do some work for us, but has not yet cleared this through his superiors. A letter to Michael is enclosed describing exactly what we would like. I hope you think this is appropriate and will help us. I can see only positive benefits to IBM. As we need an exhibit that slows the card-based origin of computing. Also, two of the items will be needed when IBM decides on the artifacts for the 100th anniversary of Hollerith.

Cordially,

Gordon Bell
Vice President, Engineering
Keeper, Digital Computer Museum

Jerrier A. Haddad
IBM Corporation
Old Orchard Rd.
Armonk, NY 10504

Dear Jerrier,

Do hope that you can come to see the exhibits at the Digital Computer Museum at some time. A copy of our newsletter is enclosed announcing John Atansoff's lecture on November 11 and Konrad Zuse on March 4. Both should be very interesting.

Can you help me as Keeper of the Digital Computer Museum? We would like Roberto Guatelli to make some models for us, but apparently Michael Sullivan will has not been able to get the appropriate approvals. I can see only a positive benefit for IBM since the models we need are to show the card-based orgin of computing.

For example, two of the items we'd like will be required by IBM when it celebrates the 100th anniversary of Hollerith.

Please help.

All the best.

Sincerely yours,

Gordon Bell
Vice President, Engineering
Keeper, Digital Computer Museum

Enclosure: Museum Newsletter
October 10, 1980

Michael J. Sullivan, Manager
Corporate Exhibit Programs
IBM
Old Orchard Road
Armonk, NY 10504

Dear Michael,

Friday, October 3, we had lunch with Roberto Guatelli and Joe. We were hoping that they would agree to do some work for the Digital Computer Museum, but they said that they were not free to do anything for us until it was approved by IBM.

Specifically we would like the following:

- A replica of the Pascal calculator;
- A quarter scale model of the Jacquard loom, especially showing the card control mechanism;
- A scale model of card control mechanism of the Babbage analytic engine;
- A second copy of the Hollerith machine if one is ordered by IBM Germany.

In addition, from time to time, we would like to be able to commission Guatelli to make other things.

On all items obtained from Guatelli we would be willing to give IBM appropriate credits.

I hope you can decide quickly and in our favor.

Cordially,

Gordon Bell
Vice President, Engineering
Keeper, Digital Computer Museum

Subject: IBM's Got It Together: Now's the Time to Get Organized

To: OOD,
Jack Smith, ML1-4/A54
Dave Thorpe, ML1-4/P11

Date: 3/6/79
From: Gordon Bell
Dept: OOD
Loc: ML12-1/A51 Ext: 223-2236

---------------CONFIDENTIAL! DO NOT COPY OR DISTRIBUTE---------------

FOR DISCUSSION ONLY

For the first time, it feels like we have a very strong competitor in IBM. The recent announcements are in our price class with the same approach to computing that we have. While in the past, it felt like IBM considered the 250K boundary as sacred, so it could sell centralized systems to the top of an organization, now they are building systems that can be utilized by all parts of it because the prices and capabilities are right. Something we've been doing all along. Having contained Burroughs, Univac, Honeywell and forced them down into the mini range, they can now focus and come after us all with one offering.

It seems they have considered their key markets:

1. Their conventional base with the 43xx's as 370's as an alternative to minis. Note, the 43xx's can also be used in a distributed data base to either other 43xx's or to 370's (larger systems).

2. The 8100's are for communication intensive applications, e.g., office automation, many terminals, factories, real time.

3. Some hot entries, including array processing to get back into the scientific market. This, overall helps their image and gets them ideas to feed their future marketplace. We had gotten too strong there and it was beginning to affect future buyers.

4. Their small organization solutions with a modern computer in the System 38. Though comparatively low volume, it can be used to understand the single level memory system where the users are less sophisticated and undemanding.

5. The Series 1 is insignificant just to confuse things. It uses old technology, but they can fight with it. It still has better technology.

Also, there are undoubtedly more systems to come:

1. The small business/personal. The 51xx isn't that strong.

2. The hot, high end. This is harder, because of the big backlog in the 30xx's. I'll bet they were ready with something, but are sitting back on their backlog. The 30xx's weren't really that significant as warmed over 370's, but again there's no competition so why push things.

3. Some really good terminals. There has been nothing really good to hang on these systems yet.

4. Really good word processing.

Why it's so frightening, technologically:

1. <u>They appear to have automated</u> the hell out of <u>manufacturing</u>. Remember the Marvelous Module Making Machine that I urged us to work on for the last 5 years? They appear to have it. It is the only way to get the number of products this quickly.

2. <u>The automation of the design process</u> is equally impressive. It has tube-based logic input, automatic generation of test patterns and simulation, and at the system level, automatic generation of diagnostics.

3. <u>The gate array chips are impressive</u>, one chip though bipolar has the speed of ECL. Overall they are doing their designs with only 2 basic chip types, both of which are better than what we have in Comet and in the MCA.

4. Where they can't do it automatically, <u>manufacturing is also done by good product positioning</u> <u>with a</u> very <u>few</u>, <u>very high volume products</u>. While one would expect some very high end mass storage devices to be announced subsequently, <u>they have only announced 4 mass memory units to cover virtually our whole range</u>: a 1 megabyte floppy (load only), 50 and 600 Mbyte fixed disks, and 1 tape unit for storage and backup. It's not clear what the cost and price separation is. (By contrast, we are introducing or would like to introduce many products in a narrower space. Here, we definitely have to take their lead and eliminate some of the redundancy.)

SUBJECT: IBM'S AGGRESSIVE BEHAVIOR WITH UNIVERSITIES & RESEARCH

IBM has changed it's posture significantly with respect to
research and interfacing to universities. It is behaving and
selling itself as a responsive, aggressive, high technology
leader. In effect, it is returning to a position it once had
in
the early era where it built Mark I for Aiken at Harvard, the
SSEC for Wallace Eckert at Columbia, the Sage in conjunction
with
MIT, the 360/67 for Michigan. Furthermore, it is giving
4300's
to universities at the drop of a hat.

Now, it's going to build the ultracomputer for Jack Schwartz,
NYU, who also consults at IBM Research; the Connection
Machine
for MIT (a very large semantic network); and it's quite
likely to
get the CMU contract for the high performance personal
computers.
Finally, it's just announced a block mux to Unibus adapter
which
allows Unibus options to plug into 4300's and 370's. I
believe
the goal here is to be able to unplug 11's and use 370's so
the
experimental world can go to IBM.

WHAT CAN WE DO?
I now believe this kind of arrangement (university specifies
and
writes software and uses-- industry builds hardware) is ideal
and
the only one that works! The Japanese companies cooperate
with
their universities (and the Paris World Computer Center for
example) in this way too. When the university builds
hardware
(no matter what we give them), the results are poor... and we
don't assimilate the ideas. We should have done the building
for
CMU, LASL (another marginal design), etc. in multiprocessors.

We
might have built the LISP machines for MIT and avoided a new set
of competitors. Finally, we are no longer building the higher
risk, designs that could be done with customers such as LASL. I
think we need a group to do this kind of work within Research!

SUBJECT: I/C EXHIBIT FOR YOUR AWARENESS PROGRAM (>1)

An exhibit would have:

1. What it connects (i.e. where it's used in the system).

2. The need and advantages (and any limitations).

3. Cables, connectors, and how it is cabled into system or box.

4. Photo of use in breadboard or in context of use.

5. Circuit diagram and EMI characteristics.

6. Any modems (e.g. in Ethernet).

The interconnects to show are:

1. Standard Disk Bus

2. NI with a coax, modem at tap and cable to the computer.

3. NI used for interconnecting our small systems. - Let's mock up such a system.

4. BI - backplane, cable (if we now have one). Some system mock-up.

5. CI - also show tap on the wall. Are we now using the SDB cable?

6. Mercury - the elegant modules and backplane and how this eliminates the communication cable mess at the computer. Do we have any interfaces yet which have built-in modems to further reduce the marker of boxes at the site?

7. VT100, LA120, and LA34 and line printers using Comm. or whatever. Built in modems ala new terminals (LA34, VT100?) and VT100 with hard copy output.

Also let's look at the new modular jacks and cables used for EIA and/or 20ma and EIA 423 when no modems are used. We'd also give system block diagrams of all the systems and a single one ala your 1 page poster.

Let's also show block diagrams and photos of:

1. MINC - process I/O plus A/C and Interconnect.

2. Mock up of VT278 with modem or phone connection.

3. An 11/23 system with modem or phone connector.

4. PDT-150 with modem or phone connector.

Word length: 32 bits

Memory size: Memory Control Unit (MCU) provides facilities for controlling access from eight processor ports to a central memory having a 24-bit address space (16 million words).

Data transfer rate: 50 million words per second per port; total transfer capacity of 400M words per second.

Clock rate: 12 MHz

Central Processor: Provides both scalar (single operand) and vector (array) instructions at the machine level. 48 programmable registers consisting of 16 base address registers, 16 arithmetic registers, 8 index registers, 8 vector parameter registers.

Instruction format: Multiple pipelined instruction processing units. Instruction size, 32 bits with 16-, 32-, or 64-bit operands.

Technology: Pipeline architecture.

Power consumption: 500 KW

Size: 4000 square foot floor area (includes main frame, disks, operating system, etc).

Number produced: Seven.

Price: $8M-15M

Project start: March 1966

Project leader: Harvey Cragon

First delivery: 1971

Software: Fortran Compiler (NX and FX)

Use: Large scale scientific and technical problems.

Achievements: Pipeline processing capabilities as architectural attribute. Super computer capabilities along lines of CRAY-1, Star-100. Modular, high speed general purpose data processing system used for large scale scientific and technical problems.

Cray I Interface Module, Cray Research, Inc, 1976, Gift of G. Michaels and W. Becker, Lawrence Livermore Laboratories (D226.80).

PRIMARY MEMORY

Thin Film Memory, RCA, 1966-1970, Gift of Gordon Bell (D112.80).

Memory Driver, (D210.80).

PDP-11 Planar-structured Core Memory, Digital Equipment Corp, 1975, (D241.80).

SECONDARY MEMORY

Prototype RL01 Disk Drive, Digital Equipment Corp, 1975, Gift of Hertrich Development, Inc. (D163.80).

IBM Data Cell Cartridge, IBM, 1969, Gift of Lawrence Livermore Laboratories (D220.80).

A direct access storage device which stores data on individual magnetic strips. These strips are contained in removable, interchangeable data cells. The IBM 2321 Data Cell Drive has 10 data cells with 20 subcells per cell, each subcell has 10 magnetic strips. Each data cell can contain 39.2 million bytes or 78.5 packed decimal digits. A single 2321 data cell drive can have on-line access to a maximum of 392 million bytes or 784 million packed decimal digits and signs. (See IBM Manual GA26-3574-2 and GA26-5988-7.)

<u>IBM 2321 Data Strips</u>, IBM, 1969, Gift of Lawrence Livermore Laboratories (D219.80).

<u>IBM 1360 Photo-digital Storage System Module</u>, IBM, 1967-1969, 2.5x2x5 cm, Gray, Plastic, Gift of Lawrence Livermore Laboratories (D221.80).

A storage module has 32 chips of film, each chip contains 32 fields and each field has 128k bits(?). The Storage System is equivalent to magnetic tape 800 bpi. There are 10k cartridges in photostore on line. There is random access to any bit. The reading rate is 2x10**6 bps.

<u>CDC 38500 Cartridge</u>, Control Data Corp, Gift of Lawrence Livermore Laboratories (D222.80).

The original CDC 6600 was built under contract to Lawrence Livermore. Multiple arithmetic and logical units and ten peripheral processors, which were small computers themselves, made the 6600 a very powerful and fast computer. Peripheral processors direct, monitor and time-share the central processor.

Subject: **Inter-Computer Communications Switch (ICCS) Goals/Constraints for RAME Computer**

To: Roger Cady, Bill Demmer, Pete VanRoekens (RAME)

Date: 1 MAY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

CC: OOD, Bill Keating,

Reliable Available Maintainable

Expandable Computer Task Force

follow up 5/15/78

Background

I would like to have Sam Fuller, Bob Stewart and Bill Strecker define the ICC Bus immediately as part of the non-stop, RAME Computer Task Force. Although the reliable computer group has not yet moved rapidly, it is clear that the ICC Switch (probably a Bus) is needed with virtually any approach we use to providing high available systems -- unless we believe that a small multiprocessor will serve the marketplace. This is the only risk in beginning the ICCS without further definition from the top, but I believe it is negligible and I would rather have more detailed information that a focused localized task force would bring, rather than predicating a top-down architecture on what may not be implementable.

The bus as I see it is subject to goals (G), constraints (C), and certain implications (I):

G0. Provide high data bandwidth communications among main computers, file computers and front end computers at sufficiently high bandwidth to permit file transfers and paging-oriented operation. There should be no hierarchial relationship among machines, thus only one type of interconnection is required.

I. Disk data rates appear to be 1 Mbyte now, and going to 2 Mbytes in 1982. 10 Mbytes/single bus is what I'd feel comfortable with.

G1. Be oriented to the next 10 years (at least two implementations).

G2. Provide reliable communications by having alternative routing (wires) for communications and be adequately checked so that reliable transmission is insured.

I. This could be a simple parity scheme with retransmission or it could have error correction.

C3. Use existing cables and transmission technology so that an advanced development project isn't required to start the task.

I. Implies parallel transmission.

G4. Be adaptable in the future to serial or fiber optic technology when such is available.

G5. At the top most level, the user would give commands that are a subset of the DECnet commands.

G6. Oriented to a range of implementations over by being implementable at the low end with not more than one hex board (1978) of currently available logic to get an interface to a Unibus.

C7. Permit more than 16 computers to communicate with one another, although when the number of computers exceeds a nominal cable driving and/or receiving capability, special techniques (options or repeaters) may be employed.

G8. Be speed independent so that small C's are not constrained to have large buffers or expensive interfaces for very high data rate transfers.

I1. Use some sort of receiver controlled clock so that a transmitter can't overrun a small system.

I2. Permit a range of trading off various capabilities in the interface by using software instead of hardware.

C9. Be distance independent and not

confined to a single cabinet.

I. Have provisions for both internal and external cabinet cables.

C10. All interfaces would have embedded diagnostics for the line and interface so that MTTR is not increased for controller or link failures.

SUBJECT: COLLABORATION WITH ICL TO ESTABLISH A MAIL STANDARD

Rob Wilmot, President of ICL called me about our continuing on with standards for Ethernet. He wants to establish applications standards in this area so that there would be real meat behind the Ethernet approach. In this way, we'd build on the Ethernet standard that is now reality and make it even more meaningful.

The standard he wants to work on right now is MAIL!

I think we should proceed to discuss what this standard might look like, but the actual agreement should come to the Operations
Committee.

Would you Telex him with the responsible person for mail standards and then get together to scope the goals?

The pros of doing it:
1. Build on the momentum of Ethernet
2. Getting a standard... which we badly need for the plethora of
mail systems in house we aren't successfully standardizing worth
a damn. This would free lots of resources.

The cons:
1. It would permit the various Ethernet suppliers (eg. ICL, HP, Xerox, Siemens, CII, Philips, Olivetti) to say: We will support the mail standard and will have products that work with it.

What do youse think regarding the importance of this outside of
DEC?

3 January 1983

Dr. David A. Zein
Chairman, IEEE Computer & Technology Meeting
IBM Corporation
D/818,B/300-45A
East Fishkill, route 52
Hopewell Junction, New York 12533

Dear David:

Thank you for the invitation to speak at the IEEE Mid-Hudson Section Meeting on Computers and technology (CAT) to be held May 19-20, 1983.

I regret that I am really flat out, overcommitted and can't come at this time. Again, thanks for the honor.

Sincerely,

Gordon Bell
Vice President, Engineering

Mr. Edward A. Torrero
Senior Editor
IEEE Spectrum
345 East 47th Street
New York, New York 10017

Dear Ed:

Sorry I can't take on a writing task, but would review the issue when you get it.

What about a discussion on the U.S. inability to exploit and manufacture the results of research (especially versus the Japanese)?

How will we couple to the Japanese research versus how they couple to ours?

What about England as a source of ideas (especially versus the French effort)?

Sincerely,

Gordon Bell
Vice President, Engineering

GB5.17
Kim Igoe

Dear Kim Igoe,

Enclosed please find the questionnaire and check for $350 necessary to go forward with the Museum Assessment Program.

To help you, I am enclosing three sets of everything along with the MAP questionnaire: one for the AAM and one for each of the two on-site surveyors that you suggest. I have tried to be as complete as possible so that the surveyor can come to the site prepared and so that we can plan the visit to really get into some depth and set some priorities for ourselves. I believe that the trustees and I have a good idea of where we want to be some years hence; and now the question is the best, most efficient road to get there.

For the above reasons, I would like a surveyor who has helped an institution grow -- from an idea to a major established museum. Personally, Mike Spock is very helpful to have on our Board for this very reason -- he keeps warning me of the various pitfalls of growth along the way. Mike actually suggested that we start the MAP procedures and I am sure that he will be happy to be helpful in this project, provided he is in town, and I will be asking his advice about the final selection of a surveyor.

If possible, I would like to get some names before Christmas and select a person and a date for early in the year, so that we can compile all the information and have a report and our own proposal in the mail to The Computer Museum's Board in the spring.

Thank you for your help,

Cordially,

Gwen Bell

September 29, 1983

J. N. Snyder
Head of Department
Department of Computer Science
University of Illinois at Urbana-Champaign
1304 West Springfield Avenue
Urbana, IL 61801-2987

Dear Dr. Snyder:

I am very grateful to you and your department for inviting me to give the Eighth Gillies Lecture. Please extend my special thanks to Mrs. Snyder for the wonderful party and dinner on Sunday. I do hope it was up to Professor Gillies' standards. It was truly an honor to be in the company of the seven previous lecturers.

The very short time at the university with your impressive faculty and students was truly stimulating, but all too short. Hopefully the next visit will be longer. I particularly enjoyed the discussions on the Cedar Project, and I hope that the machine can somehow be built.

Of course the Computer Museum is deeply indepted to the department for the ILLIAC artifacts, and I hope that each of you will visit the museum in the future. I was impressed with your library and encourage you to send us books and reports that you retire from the library. Some of the Museum reports and brochures are enclosed.

Let me urge you to join the Museum as a member or founder and help preserve computing history.

Sincerely,

Gordon Bell
Chief Technical Officer
& Computer Museum Board Member

University of Illinois at Urbana-Champaign
1304 West Springfield Avenue
Urbana, IL 61801-2987

Dear Professor Muroga:

I thoroughly enjoyed the visit with you on Tuesday and the discussion of the computing evolution. The book on the Abacus and your other artifacts and library were especially nice.

As you know, the Computer Museum is dedicated to the preservation of important information processing artifacts. As such, we would be honored to accept and care for any papers, books, objects you have, including the various Abacii and Abacus references, the Toko WoKen Wire memory, Parametrons used in the machines you designed and other books from your library.

I am enclosing several reports and brochures on the Museum, and would like to encourage you to join and become a founding member. I would also ask you to present the brochure to friends who visit you from Japan because we want to acquire more Japanese artifacts of all types. The Museum also especially wants more Japanese visitors and members. In this regard, we have invited one of Japan's computer industry leaders to become a member of our Board.

I was pleased to accept the two books by you and have placed them in the Computer Museum.

Again, I enjoyed our visit.

Sincerely yours,

Gordon Bell
Chief Technical Officer
& Computer Museum Board Member

Dear Ms. Adams:

Could you please send me a copy of the current FORTRAN 8X draft together with proposals for extensions?

What is the status of the draft vis a vis the time when it will become a standard?

Sincerely yours,

Gordon Bell

SUBJ: **Individual Development Planning Kickoff**

TO: OOD

Date: 1/29/80 Tue
From: Gordon Bell & Larry Portner
Dept: OOD
MS: 12-1/A51/12-1/T32
Ext:2236/2471
EMS: @CORE

We have reviewed the Individual Development Planning (IDP) Process that is part of the Human Resource Program Plan being designed under OOD wide sponsorship. In order to kick-off the IDP Process, we are asking each of you to proceed to construct your own development plan along the lines specified in the attached document.

Although the construction of a development plan is the province of the individual, we strongly support each of you making a plan, because we believe it will:

1. be useful in your own career planning;

2. be a model for the rest of your organization and the company;

3. help us understand the problems in such an approach;

4. be a key document in recruiting from internal sources.

Note, that to start the process, each of you should list the questions that you'd like us to answer for this purpose (see page 4 for some examples). Each of us will write our own responses independently (the advantage of having two bosses!). Finally, we will proceed to meet separately and/or individually with you in order to get at a final plan.

We urge you to take this first step soon so that it can be implemented with your own direct reports this summer (i.e. see the implementation schedule on page 7 of the attached document).

John Meyer or Guy Fincke will be contacting each of you in February to review the I.D.P. Process and to answer any questions you may have in that regard.

SUBJ: **Digital Computer Museum**

TO: Dick Schneider, ML11-4/E53
CC: Jamie Parker, ML12-1/A51
Ext: 223-2236

Date: 1/15/80 Tue
From: Gordon Bell
Dept: OOD
MS: ML12-1/A51
EMS: @CORE
Follow Up: 1/18/80

Industrial design was called in on the museum project to bring their expertise and keep the amateurs from making mistakes. However, as the amateur, a number of mistakes have been made that are embarrassing to me. I want to take this memo to spell out the principles that I thought we had been working from and then to specifically review the current status.

Three principles were established at the outset that may not have been explict. But they were clear to me and many of the compromises that occured were when these were not followed. I am restating them so that they can be used from now on.

1. The Digital Computer Museum will be information rich -- using every opportunity to illustrate content; minimizing expenditure, space, and time on non-informative items.

2. The Digital Computer Museum will be an example of good design for showing off computers and artifacts relating to computers. Color, lighting, signage and decoration should focus attention on the displays.

3. The ROI will be based on a long-lasting preservation of the history of computing, not on "show booth like", short-lived displays and materials. This includes trading off to minimize daily, weekly...yearly maintenance.

On review of the museum after less than six months, I find that the kind of decisions on which industrial designers should have had expertise were poorly made. After taking two eminent computer historians through the museum I am embarrassed to have to apologize for a job that I considered at the time was done by professionals. Please see if you consider these the problems to be solved?

.<u>Signage and posters</u>. All signs and dry-mounted posters are buckling or were poorly done in the first place. A system has to be developed that will last.

Large signs were made with a lot of unused white space with no purpose and that presently interferes with the lighting. These need to be cut down, in addition to being better preserved without buckling.

Pictures above the PDP-l were "framed" with masking tape that is now peeling. These need reframing somehow. (I discussed this explicitly before mounting!)

The British Museum poster needs to be properly preserved and hung. A uniform framing system for all posters and other similar material such as photos needs to be recommended.

Outside, expensive typesetters were used, without developing our in-house facilities, spending $6,000 on signage that has had a very short life. The museum staff will and is developing its own interface with DEC typesetting. Now we can only get a close approximation to Memphis type.

.<u>Lighting</u>. The lighting varies from terrible (in the cases) to ok (for the TX-O). The bad lighting in the cases is compounded by the use of large cardboard signs with almost no information on them that masks the minimal light coming through the bottom of the cases. The principle of maximizing the information content was clearly violated in developing these large-sized signs that now also look messy. The counter-productive effect of bottom lighting on reading signs should have been a principle understood by industrial designers and explained to others. Industrial design did not question this nor were experiments established to determine the effectiveness of this lighting. The small expensive spots provided by Click will not correct the overall poor lighting in these cases. Suggestions for improving the lighting in the large cases must be presented after experiments have been made!

The lighting and development of the towers will be undertaken by the museum staff in conjunction with on-site maintenance and electrical people in Marlboro. Experimentation is the only way!

.<u>Decorating</u>. I consistently stated that the museum and its artifacts had to stand out without spending money on non-content items. Yet Industrial Design insisted on spending money on plants. On review, some of the plants -- in hokey boxes -- had been moved (inadvertently I hope) by maintenance in front of displays interfering with the main purpose of the museum. Here we have to maintain, water, care for something that's not only irrelevant, but interferes with the view!

Similarly industrial design insisted on spending money on a central carpet leading to the desk -- one visitor pointed out how inappropriate this was (the carpet to the queen). I also noticed that the rug is disfunctional and gets crumpled when large items are brought in through that entrance. The plain stone floor would be fine. Also, visitors come in from the outside glare, stub their toes, and fall on the soft carpet created to cushion falls it creates!

The seating area and its rug still look fine -- but I query how long it will be before the red fabric chairs start to look shabby. No roi was presented using a longer lasting material, i.e. leather.

It had been specified that the coffee tables were to do double duty to serve as display cases. This was not done. The museum staff is having these modified by the carpenters in Marlboro to hold and display early manuals.

.<u>Cases</u>. Only one set of cases were presented. These were an expensive investment meant to fit in with the columns. Without an alternative suggestion -- and roi, everyone bought in to these cases. There was no analysis of the problems of viewing small artifacts from two sides or the use of the cases for our purposes. (Now we are putting in cases 1/2 this width.) Then on implementation glass tops were put in without any alternative -- such as mirrorlite -- that might have maximized and reflected the light up out on the bottom. The expensive glass on the top has no functionality whatsoever.

The formica sliding doors on the bottom have now buckled with time, heat and humidity effecting the expansion/contraction of the plywood differently than the formica. The doors do not all completely close and leave unsightly lines of light on the side. This makes the cases look shoddy. Ditto for the tops of the towers (although there's no heat.

.<u>Posters</u>. The transformation of the DEC tree and calculator timeline into posters seem to be ok, but are taking time and expense. We hope that these will be accurate and information rich and that a solution will be worked out for their large-scale presentation in the Museum so that they will have equal value with the NSF tree. The deadline for having these up is April 1.

.<u>The Future</u>. I had hoped that this would be a good situation for industrial design to use their imagination and focus on the issue of spotlighting the computer and its history. I would like to trust you as experts in areas where those of us working on the museum are amateurs.

SUBJECT: INDUSTRIAL TERMINALS AND CONTROLLERS

GB4.S1.8

Our customers in Australia perceive we have no industrial terminals,
and Burroughs does! I know we have some older ones and CSS makes a
bar code reader. Bar codes can be printed on all new LA's, but we
don't advertise it or support it in software especially.

Also we have
voice entry VT100's that could have been marketed!

Before we go after the controller, let's simply advertise what we have
and go after what we need in the ticket, direct entry, voice, cash
drawer etc. area. They say, offer the set that Burroughs does. (This
may just be marketing?)

Industrial Controllers

Having thought about this a bit, why don't we simply start a standard
by getting with someone (e.g. Allen Bradley, GE) and start making
controllers that are compatible with their power busses?

There are several other simple, busses already to use. The HP simple
serial one, the Philips' HiFi bus. Ethernet chips running a simple
protocol are being used for component interconnect too inside Xerox
printers.

Failing these, let's start a standards effort and get controller
suppliers/users to go for it?

Your group convinced me we need a product, but I have yet to see a
goals statement for such a product.

Subject: **System's Information Architecture**

To: Bob Puffer

CC: Leo Bennett, Oleh Kostetsky,
Larry Portner

Date: 11 JULY 78
From: Gordon Bell
Dept: OOD
Loc.: ML12-1 Ext.: 2236

follow up 07/25/78

Could you ask Larry whether Oleh could get involved with the Curt Rawley architecture project?

It needs some clarity, wisdom and common sense system's design introduced into it...as it currently smells like the CAD IDEA system over again only grander.

Date: 4 OCT 76
From: Gordon Bell
Dept: OOD
Loc.: ML12-1
Ext.: 2236

F/U 10/12

In order to get much wider, more convenient access to both ours and other computer manuals, could we look at microfilming?

We need to give our product and development managers and engineers easy access to these machines which we don't now have!

What's the story on copyrighting?

Dear Larry:

Let me thank you very much for donating your PDP-1 machine to our museum project. It is in great condition and will be used in an exhibit at our Marlboro facility - hopefully, by the end of the summer.

I'm sorry for the delay in writing to you - the machine did arrive safe and sound. I'll let you know when the exhibit is in place.

Sincerely,

Gordon Bell

C. Boon
Managing Director
Pergamon Infotech Limited
Nicholson House Maidenhead
Berkshire SL6 1LD England

Dear Mr. Boon:

At the invitation of INFOTECH, I attended and delivered a lecture at a conference, sponsored by them, on November 26 and 27, 1980 at Nicholson House, Maidenhead, Berkshire. They agreed to pay my expenses. A bill for my airfare, $919.20, was submitted to them at my departure (November 27, 1980).

I have not received payment for this expense. When I called INFOTECH and talked with an associate of Bob Muller and Carol Start, I was informed to bring this lack of payment to the attention of Floyd, Nash and Company, 218 Strand, London, WC24 1DG,ENGLAND. They in turn sent a GENERAL PROXY statement (copy attached) which I executed and returned. I have heard nothing since.

When may I expect payment of this outstanding bill of $919.20 which INFOTECH owes me?

Sincerely yours,

Gordon Bell
Vice President,
Engineering
